

Demonstrating Parselmouth: Integrating Praat into a complex Python workflow

Yannick Jadoul, Bill Thompson, Bart de Boer – Artificial Intelligence Lab, Vrije Universiteit Brussel

Yannick.Jadoul@ai.vub.ac.be

Parselmouth

Interdisciplinary science requires interdisciplinary tools: as different scientific disciplines combine methods and approaches to research language and speech, existing algorithms and tools need to be combined. One of these tools is Praat (Boersma and Weenink, 2018), a software package implementing a wide range of acoustic and phonetic algorithms and analyses. While Python and other scripting languages often allow different parts of the research to be automated and glued together into a single workflow, doing so with Praat and its scripting language is not always as straightforward. To simplify the integration of Praat into a complex workflow, we have developed Parselmouth, a Python interface to Praat.

Why and when use Parselmouth?

- Complex workflows (vs. interactive views in Praat)
- Interactive and adaptive use (vs. preprocessing data)
- Integration with other Python libraries (e.g. NumPy)
- Custom control over data, results, or visualization

Installation and usage

```
$ pip install praat-parselmouth
```

```
>>> import parselmouth
```

Parselmouth @ GitHub

<https://github.com/YannickJadoul/Parselmouth>

Web service example @ ReadTheDocs

https://parselmouth.readthedocs.io/en/latest/examples/web_service.html

Plotting example @ ReadTheDocs

<https://parselmouth.readthedocs.io/en/latest/examples/plotting.html>

PsychoPy experiments example @ ReadTheDocs

http://parselmouth.readthedocs.io/en/latest/examples/psychopy_experiments.html

Python web server

- Web experiment, e.g. Amazon Mechanical Turk
- Praat functionality on web server
- Participant/client side independent from Praat

Python server

```
from flask import Flask, request, jsonify
import tempfile

app = Flask(__name__)

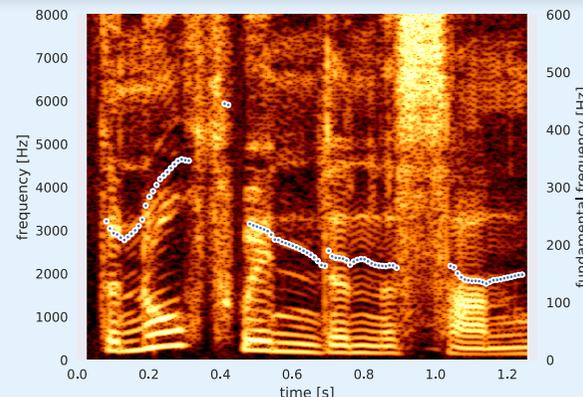

@app.route('/pitch_track', methods=['POST'])
def pitch_track():
    import parselmouth
    with tempfile.NamedTemporaryFile() as tmp:
        tmp.write(request.files['audio'].read())
        sound = parselmouth.Sound(tmp.name)
        return jsonify(list(sound.to_pitch().selected_array['frequency']))
```

Sample client

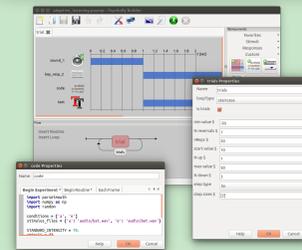

```
import requests
import json

files = {'audio': open('the_north_wind_and_the_sun.wav', 'rb')}
reply = requests.post('http://127.0.0.1:5000/pitch_track', files=files)
print(json.loads(reply.text))
```

Custom visualizations in Python

Adaptive PsychoPy experiments

- Experimental framework in Python with graphical user interface
- Insert custom Python code
- Access Praat functionality with Parselmouth
- Generate stimuli on the fly
- Adapt stimuli to responses

Before Experiment

```
import parselmouth
import numpy as np
import random

conditions = ['a', 'e']
stimulus_files = {'a': 'audio/bat.wav', 'e': 'audio/bet.wav'}

STANDARD_INTENSITY = 70.
stimuli = {}
for condition in conditions:
    stimulus = parselmouth.Sound(stimulus_files[condition])
    stimulus.scale_intensity(STANDARD_INTENSITY)
    stimuli[condition] = stimulus
```

Before Routine

```
random_condition = random.choice(conditions)
random_stimulus = stimuli[random_condition]

noise_samples = np.random.normal(size=random_stimulus.n_samples)
noisy_stimulus = parselmouth.Sound(noise_samples,
                                   sampling_frequency=random_stimulus.sampling_frequency)
noisy_stimulus.scale_intensity(STANDARD_INTENSITY - level)
noisy_stimulus.values += random_stimulus.values
noisy_stimulus.scale_intensity(STANDARD_INTENSITY)

# 'filename' variable is set by PsychoPy and contains base file name
# of saved log/output files, so we'll use that to save our custom stimuli
stimulus_file_name = filename + '_stimulus_' + str(trials.thisTrialN) + '.wav'
noisy_stimulus.resample(44100).save(stimulus_file_name, "WAV")
sound_1.setSound(stimulus_file_name)
```

After Routine

```
trials.addResponse(key_resp_2.keys == random_condition)
```

Demonstrating Parselmouth: Integrating Praat into a complex Python workflow

Interdisciplinary science requires interdisciplinary tools: as different scientific disciplines combine methods and approaches to research language and speech, existing algorithms and tools need to be combined. One of these tools is Praat (Boersma and Weenink, 2018), a software package implementing a wide range of acoustic and phonetic algorithms and analyses. While Python and other scripting languages are designed such that they allow automation and gluing together of different parts of the research into a single workflow, doing so with Praat and its scripting language is not always as straightforward. To simplify the integration of Praat into a complex workflow, we have developed Parselmouth.

Parselmouth is an open-source Python library^{1,2} that allows one to access Praat functionality and combine it with other Python tools and libraries, yet feels natural and simple to a Python user. As such, we believe Parselmouth can be useful in a variety of cases, ranging from the visualization of acoustic data or batch analysis of audio files, to computational models on speech perception and acquisition.

We also introduce the possibility of integrating Praat’s phonetic analysis and manipulation of responses and stimuli in an adaptive experiment, using Parselmouth. One widely-used Python framework for setting up and running “*a wide range of neuroscience, psychology and psychophysics experiments*” is PsychoPy (Peirce, 2007), which includes a graphical interface to build experiments with a minimal amount of coding.

We demonstrate the integration of Parselmouth into PsychoPy experiments with an adaptive staircase experiment (e.g., Kaernbach, 2001; de Boer, 2012) to determine the

minimal amount of noise that stops participants from correctly classifying a stimulus. Using Praat functionality through Parselmouth, at each step *during the experiment* a new audio stimulus is created with the desired signal-to-noise ratio. With the presented examples, we hope to illustrate the new, modern experimental setups and workflows that Parselmouth facilitates, advancing interdisciplinary research to answer questions in language sciences.
