1754. Bioarchaeological Analysis on the Early Life Stress of a Phrygian 'Young' Elite from Tumulus 52 in Gordion, Türkiye

Authors: Erge Bütün – Serpil Eroğlu (Hacettepe University | Human Behavioral Ecology and Archaeometry Laboratory - IDEA lab) – Donovan Adams (University of Central Florida) – Asuman Alpagut (Museum of Anatolian Civilizations) – Ali Büyükkarakaya (Hacettepe University | Human Behavioral Ecology and Archaeometry Laboratory - IDEA lab)
Format: Oral

Tumuli in Iron Age Anatolia, particularly in the Phrygian and Lydian heartlands, serve as monumental manifestations of social stratification and concentrated wealth. This study focuses on the bioarchaeological analysis of an elite individual recovered from Tumulus T 52, located in the South Ridge area of Gordion. Excavated in 2019 by the Museum of Anatolian Civilizations and the Gordion Project, T 52 is dated to the 8th century BCE—the era of King Midas—offering a rare opportunity to examine the biological costs of status during a pivotal historical period. The primary aim of this research is to evaluate the relationship between high social status and the indicators of physiological perturbations by analysing the preserved skeletal remains. Bioarchaeological analyses conducted on unfused epiphyses and dental remains have revealed that the individual was approximately 9 to 10 years of age at death. To reconstruct the child's health history, macroscopic and metric analyses of the remains were employed, specifically focusing on Linear Enamel Hypoplasia (LEH). The presence of these permanent stress markers indicates that the individual survived multiple episodes of systemic physiological stress between the ages of 2 and 5 years. By integrating these bioarchaeological indicators with the burial's material culture, this paper discusses the nuances of childhood stress within a stratified society. It challenges the assumption that elite status provided a total buffer against environmental or biological stressors, exploring the boundaries of inequality and biocultural adaptation in the Phrygian world.

920. Puberty and pathologies of the adolescents from the Military Hospital of the São Jorge Castle, Lisbon, Portugal (17th-18th centuries)

Authors: Carina Leirião (University of Coimbra, Research Centre for Anthropology and Health | HERCULES Laboratory, University of Évora) – Liliana Carvalho (University of Coimbra, Research Centre for Anthropology and Health) – Susana Henriques (CIDEHUS, Palácio do Vimioso, Largo Marquês de Marialva, University of Évora) – Ana Curto (HERCULES Laboratory, University of Évora | Department of Biology, Pólo da Mitra, University of Évora) – Sofia Wasterlain (University of Coimbra, Research Centre for Anthropology and Health)
Format: Oral

Puberty is characterized by changes in primary and secondary sexual characteristics, resulting in the attainment of reproductive maturity. The timing of these changes can be altered by several factors, namely chronic infectious diseases, malnutrition, metabolic deficiencies, and adverse environmental conditions. This work aims to estimate the timing of puberty and explore how some pathologies and physiological stress may have impacted it, among individuals from the Military Hospital of São Jorge Castle (17th-18th centuries). Osteological methods to estimate pubertal stages were applied to 98 individuals aged between 11 and 25 years old. Periosteal reactions, rickets, and physiological stress indicators (enamel hypoplasias, cribra cranii, orbitalia, humeralis, and femoralis) were recorded. No individual was in the stages of pre-puberty or acceleration, and the deceleration stage was the most common (40.8% of the individuals). In general, the age increased with the progression of puberty, being like the reported for the post-medieval sample of Middenbeemster. In total, 36.7% of the individuals showed some delay in their pubertal development, mostly in the maturation stage. Individuals with at least one sign of pathology or physiological stress presented a slightly higher frequency of delay (37.5%) than those without them (35.3%). Periosteal reactions, linear enamel hypoplasia, and cribra cranii were more common in individuals with delayed pubertal development. Although physiological stress indicators (all combined) were more frequent when individuals reached the pubertal stages at the expected age, the differences were not statistically significant ($p>0.05$). In 58.3% of the individuals with evidence of pathologies or physiological stress, the developmental delay was greater than two years, compared to 33.3% of those showing no such evidence. However, no specific relationship between the skeletal pathologies/physiological stress and the delay was found. This may indicate that the individuals suffered some kind of stress that may not leave signs on the bones.

899. 12,000 Years of Maternal Care: Isotopic and ethno-experimental reconstruction of maternal investment strategies in western North America

Authors: Alexandra Greenwald (University of Utah)
Format: Oral

Human mothers balance economic activities with infant and child care, including time and energy devoted to breastfeeding. These time and energetic trade-offs are especially challenging in societies whose subsistence regimes rely disproportionately on the resources women gather, tend, grow, or process, as in foraging populations in western North America. To address these maternal trade-offs and the unique behavioral and technological adaptations employed by an egalitarian foraging population in California over a 12,000-year period, I present two complementary datasets. First, isotopic reconstruction of breastfeeding, weaning, and early childhood provisioning derived from serial micro-samples of first molar dentin are employed as proxies for maternal investment strategies and population dynamics from the Pleistocene-Holocene Transition to the Spanish Colonial period. Duration of exclusive breastfeeding and weaning age shift significantly in response to major worldwide climatic shifts, attendant social change, and women's labor intensification. Second, I contextualize these results with ethno-experimental data on the energetics of maternal foraging with novel infant carrying technology that emerged in prehistoric western North America and was rapidly adopted by Indigenous communities on the continent. These data suggest that Indigenous cradle technology attenuated the energetic trade-offs experienced by breastfeeding mothers by increasing foraging returns relative to globally common modes of infant carrying. Together, these isotopic and ethno-experimental data sets highlight women's resilience and adaptation in the face of environmental and social change and the often-overlooked role of maternal decision-making on prehistoric population dynamics and the subsistence economy.

1477. Breastfeeding and weaning practices in the early medieval Dalmatian hinterland: Preliminary isotopic evidence

Authors: Tea Kokotovic (Institute of Archaeology, Zagreb) – Mario Novak (Institute for Anthropological Research, Zagreb) – Siniša Krznar (Institute of Archaeology, Zagreb)
Format: Oral

With the development and implementation of isotopic research in bioarchaeology, the reconstruction of breastfeeding and weaning patterns in past societies has been a topic of considerable interest. This method rests on the detection of elevated δ15N and δ13C values in subadult tissues, which are typically related to the onset of breastfeeding, and their subsequent decrease resulting from introduction of solid foods into the child's diet, continuing until the complete termination of breastfeeding. The early medieval period on the eastern Adriatic coast and its hinterland was a turbulent era characterised by the migration of new cultural groups and the establishment of the Croatian state. Historical sources on daily life and customs are scarce, therefore, most evidence derives from archaeological and bioarchaeological research. To date, bioarchaeological research has primarily focused on reconstructing daily activities and health status, while isotopic studies have concentrated on diet and dietary changes in adult populations. This study presents preliminary results of isotopic analysis of an aggregate subadult sample (n = 22) dating to the 8th–11th centuries from five sites in the Dalmatian hinterland (Vaćani-Grlo, Vaćani-Laluše, Dubravice, Stranče-Gorica, Kosa-Vrpolje). Changes in $\delta^{15}N$ values during the first eight years of life exhibit a clear breastfeeding and weaning curve. A period of exclusive breastfeeding is visible up to approximately one year of age, with a clear elevation in $\delta^{15}N$ values relative to the adult female mean (1.7–2.9‰). A drop to the level at or near the adult female mean (9.5‰) follows, lasting until approximately three to three and a half years of age, likely reflecting the weaning period. These findings are consistent with early childhood feeding practices documented in the Mediterranean region and reveal general breastfeeding and weaning trends in early medieval populations inhabiting the Dalmatian hinterland.

2008. Motherhood Written in Teeth: Sequential Dentine Carbon and Nitrogen Isotopes from Meso-Neolithic Western Iberia

Authors: Maria Ana Correia (Universidade do Algarve) – Andrea Czermak – Rick Schulting (University of Oxford) – Ricardo Godinho (Universidade do Algarve) – Dany Coutinho-Nogueira (Universidade de Coimbra) – Claúdia Cunha (Universidade Federal do Piauí) – Célia Gonçalves (Universidade do Algarve) – Cláudia Umbelino (Universidade de Coimbra)
Format: Oral

Motherhood is a biologically demanding and socially consequential experience, and breastfeeding and weaning lie at its core. While the transition from foraging to farming in prehistoric Europe is widely associated with major demographic change, direct evidence for how maternal feeding practices and infant diets shifted with the adoption of agriculture remains limited. This study compares childhood feeding practices across the Mesolithic-Neolithic transition in the western Iberian Atlantic Coast and explores how the adoption of agriculture may have influenced early-life diets. It presents carbon and nitrogen intra-tooth dentine data from first permanent molars of 40 individuals, namely 20 Mesolithic individuals from Cabeço da Amoreira, Cabeço da Arruda, and Moita do Sebastião, and 20 Neolithic individuals from Gruta de Melides, Casa da Moura, and Poço Velho. Because first permanent molars form incrementally throughout early childhood, sequential isotope sampling provides a fine-grained record of maternal investment during infancy, capturing breastfeeding signals, weaning trajectories, and the introduction of complementary foods through time. This study has broader implications for understanding motherhood as a driver of social and demographic change. Breastfeeding and weaning practices may affect female fertility and inter-birth intervals, and shifts toward earlier weaning and increased reliance on caregiver-supported feeding may have facilitated population growth in early farming societies. At the same time, these changes likely increased the demands of care labour and contributed to emerging divisions of labour and processes of social inequality often associated with the rise of agriculture. By tracing maternal feeding practices through isotope analyses of sequential dentine samples, this study highlights how everyday decisions made by mothers intersected with profound transformations in subsistence, social organisation, and inequality during the onset of farming.

2393. Breastfeeding in times of colonialism: The effects of the encomienda system of forced labor in maternal investment in the Antilles

Authors: Yadira Chinique De Armas (The University of Winnipeg) – Anouk Van De Ven (Leiden University) – Roberto Valcárcel Rojas (Instituto Politécnico de Santo Domingo) – Lourdes Pérez Iglesias (Departamento Centro-Oriental

de Arqueología, Holguín) – Jason Laffoon (Leiden University | Faculty of Science, Vrije Universiteit)
Format: Oral

The Caribbean was the first geographical region to feel the full impact of European colonial rule in the Americas. Colonization in the Antilles had a profound impact on indigenous populations and their lifeways, imposing new labor regimes, forcing depopulation and changing the type and frequency of physical activity and workload. We examined whether the stressors caused by the early Spanish colonial rule and the enforcement of the encomienda system of forced labor changed the breastfeeding and weaning practices (BWPs) in the indigenous community of Chorro de Maita in Cuba (cal 1465 – 1690 CE). To this end, 403 dentin samples from the first permanent molars of 37 adults from the site were processed for dentin collagen carbon (δ13Cco) and nitrogen (δ15Nco) stable isotope analysis. In addition, we explored the use of incremental dentine microsampling of bioapatite carbon (δ13Cbioapatite) and oxygen (δ18Obioapatite) stable isotope analysis to reconstruct BWPs in archaeology. In contrast to colonial narratives, we demonstrate that most babies were weaned at very early ages, which likely affected the mother-child bond and infant survival. This finding provided direct evidence of how the arrival of European colonizers affected the daily lives of the indigenous peoples of the Antilles. Archaeological knowledge of the past, beyond the narratives of Spanish colonizers, helps to decolonize the history of Indigenous populations in the Antilles, who have largely been studied as static and exotic counterparts to their European oppressors, as opposed to dynamic and diverse groups forced to adapt rapidly to a world conforming to European standards.

1402. Living at the Edge: Environmental Stress, Childhood Frailty, and Growth Disruption in a Late Medieval Rural Community (14th–15th c.)

Authors: Jiri Sneberger (Institute of Archaeology of the Czech Academy of Sciences, Prague | Nuclear Physics Institute of the Czech Academy of Sciences, Prague) – Eliška Zazvonilová – Jan Podhorský – Petr Čech (Institute of Archaeology of the Czech Academy of Sciences, Prague)
Format: Poster

Research into the extinct village and adjacent burial ground of Nesvětice (Northern Bohemia) prompted by the expansion of the Bílina mine, enabled a detailed anthropological analysis of a late medieval rural community (n= 217 individuals) living in a period of long-term environmental instability. The population under study is particularly interesting because this site, which had been continuously inhabited since prehistoric times, was the last to disappear, and with it the village itself. The late Middle Ages (approx. 14th–15th centuries) were a period of fundamental environmental change in Europe, transforming both the landscape and society. This poster summarizes basic demographic findings and the frequency of stress markers on the skeleton, documenting repeated episodes of malnutrition, disease or metabolic disease at critical stages of growth, that are high in the studied population. Demographic data suggest a relatively high representation of infants and young children in the burial population (136 nonadults, 81 adults). The frequency of stress markers (cribra orbitalia: 52%, porotic hyperostosis 27%, dental enamel hypoplasia: 69%) is high, in comparison with mining sites (Oškobrh – rural, Kutná Hora-Sedlec – town). The average stature was 162 cm, which is consistent with the above-mentioned comparative locations. Possible factors contributing to the high exposure to stress during growth in the study population include a lack of resources, particularly water. Further planned research, particularly isotope analysis, DNA, and analysis of historical data, will reveal more about the reasons for the decline of this poor rural community and its village.

2009. Reconstructing physiological stress from those who died young: Insights from enamel accentuated lines and isotopic signatures

Authors: Helena Álvarez Álvarez – Ani Martirosyan (Research Group in Biological Anthropology, Universitat Autonoma de Barcelona) – Carlos Tornero (ERC READ Biogeochemistry Laboratory, Universitat Autonoma de Barcelona) – Cristina Santos – Assumpció Malgosa – Xavier Jordana (Research Group in Biological Anthropology, Universitat Autonoma de Barcelona)
Format: Poster

Disruptions in enamel formation result in Accentuated Lines (ALs), which are associated with physiological stress that individuals experience during dental development. These stress events may be associated with nutritional changes, diseases or other environmental challenges, making ALs a valuable indicator of the infant's well-being in ancient populations. In this study, we aim to investigate stress patterns of early childhood by integrating histomorphometric analysis of dental enamel with δ15N stable isotope analysis from bone samples as a proxy of nutritional intake. We use a total of 48 deciduous and permanent teeth from 33 individuals who died during infancy recovered from three different archaeological sites in Northeastern Iberia spanning from the Bronze Age to the Medieval period: Cova des Pas (Menorca, 1100–800 BC), Olèrdola (Barcelona, 350 to 200 BC) and Sant Pere de Terrassa (Barcelona, 5th to 10th centuries AD). Dental thin sections were prepared and examined under a polarised light microscope. Crown formation time was calculated to establish the timing of enamel formation, and the occurrence and prevalence of ALs were recorded for each tooth. Histomorphometric results were correlated with previously obtained δ15N isotopic data from bone samples of the same individual, which provide insight into nutritional status. Results show an increase in both the occurrence and prevalence of ALs after birth, with notable peaks around seven months of age and towards the end of the first year. These results closely correlate with changes observed in the $\delta^{15}N$ levels. This pattern is likely due to dietary transitions related to breastfeeding practices and suggests that ALs may be used as a proxy for infant health status.

2145. Early-Life Stress, Growth, and Survivorship in an Urban Skeletal Population from Thessaloniki

Authors: Asterios Aidonis – Christina Kakasa – Elissavet Ganiatsou – Angelos Souleles (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace) – Vasileios Nanis (Laboratory of Biological Anthropology, Democritus University of Thrace | Ephorate of Antiquities of city of Thessaloniki, Ministry of Culture Greece) – Tania Protopsalti – Stavroula Tzevreni – Krino Konstantinidou – Stella Vasileiadou (Ephorate of Antiquities of city of Thessaloniki, Ministry of Culture Greece) – Christina Papageorgopoulou (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace)
Format: Poster

Linear enamel hypoplasia (LEH) is widely used as a marker of physiological stress during childhood and has been hypothesized to influence both growth and survivorship in past populations. This study investigates the relationship between early-life stress and later-life outcomes in the urban skeletal population from Thessaloniki (3rd c. BC–15th c. AD) by integrating adult body size and survival as proxies. Two-way analysis of variance (ANOVA) was conducted to examine the effects of LEH, sex, and their interaction on adult stature (N = 136). Results indicated that LEH had no significant effect on stature ($F(1,132) = 0.25$, $p = 0.616$), and there was no significant LEH and sex interaction ($F(1,132) = 0.70$, $p = 0.405$). In contrast, sex had a strong and significant effect on adult stature ($F(1,132) = 50.74$, $p < 0.001$), reflecting expected sexual dimorphism in the population. Survivorship patterns were assessed using Kaplan–Meier analysis and the relevant log-rank test, which revealed no significant differences in age-at-death distributions between individuals with and without LEH among females (N = 96; $\chi^2 = 0.12$, $p = 0.729$) or males (N = 128; $\chi^2 = 0.002$, $p = 0.965$). The findings suggest that survivors of early-life stress were able to achieve normal adult stature, consistent with developmental resilience and compensatory catch-up growth, and showed no evidence of differential survivorship. These preliminary results highlight the complexity of stress outcomes, suggesting that while enamel hypoplasia may serve as a useful marker of physiological stress, it does not appear to have a measurable effect on final adult stature or survivorship in this skeletal sample.

115 ARCHAEOLOGICAL COLLECTIONS, CONTEXT AND IDENTITY IN EUROPE: THEIR CLASSIFICATION AND PROTECTION

Theme: 1. Widening perspectives in material culture studies
Organisers: Patrícia Brum (Universidade Autónoma de Lisboa / Instituto Politécnico de Tomar) – Adolfo Silveira (CGEO / Universidade Autónoma) – Jean-Olivier Gransard-Desmond (ArkeoTopia)
Keywords: Artefact, Heritage, Narrative, Provenance, National Treasure, Legal framework
Format: Discussion session
Affiliation: Political Strategies Community - PSC

SESSION ABSTRACT

This session addresses a fundamental question: Is archaeological knowledge reflected or distorted in the classification of archaeological objects? While legal and administrative frameworks often privilege rarity, artistic value, or market worth, they frequently overlook the essential archaeological significance rooted in context, assemblages, and cultural processes. A primary concern is the widespread practice of classifying decontextualized objects—items acquired through auctions, donations, or antiquarian collecting without archaeological provenance. By elevating such objects to symbolic status as "national treasures," for instance, states risk promoting misleading or incomplete narratives of the past, while objects of genuine archaeological importance may remain unrecognized. This raises urgent questions about representation: Who determines what merits classification? Are current listings truly representative of diverse archaeological heritage? Should classification become a participatory process aligned with the Faro Convention's principles of community engagement? The session explores critical gaps in heritage governance, including the disconnection between legal concepts operating in political spheres and archaeological practice focused on scientific context. This divide leaves the public with simplified, object-focused understandings rather than appreciation for archaeology's interpretive complexity. Furthermore, many classified object listings remain inaccessible or unknown to both archaeological communities and local populations, limiting their potential value for research and social cohesion. Drawing on European case studies, participants will debate the implications of current classification practices for research, heritage protection, and public perception. The session aims to foster interdisciplinary dialogue bridging law, archaeology, and community participation, while critically examining whether "National Treasure" designations serve contemporary understandings of cultural property. Ultimately, we seek to move beyond protective classification toward frameworks that balance global heritage principles with local distinctiveness, ensuring that archaeological significance—not merely aesthetic or economic value—guides heritage governance and creates meaningful connections between collections and communities.

CONTRIBUTION ABSTRACTS

1123. Following Every Collector Stands an Archaeologist. Traveling Objects from the George Severeanu Museum in Bucharest (Romania)

Authors: Sorin Clesiu – Dan Pîrvulescu (Bucharest Municipality Museum)
Format: Oral

The George Severeanu Museum is a small-sized museum in Bucharest, yet it houses one of the most valuable private collections in Romania. Housed in the memorial home of the Severeanu family, built in the Belle Époque style, the museum brings together the artifacts collected by Dr. George Severeanu, a distinguished numismatist and passionate historian. Throughout his life, he promoted a significant part of his vast collection through exhibitions and scholarly publications. In this context, we will also discuss the close relationship between archaeologists and collectors of the time, emphasizing the pioneering stage of the legal and administrative framework for heritage management in that period. Our presentation proposes this collection as a case study, tracing its historical trajectory up to its current configuration as an exhibition intended for the general public. The analysis begins with the founding collector of the Bucharest Municipal Museum and the first legislative regulations concerning heritage protection, continues with his testamentary wish to donate the collection to the Romanian state in 1939, and extends to the fate of the collection during the communist and post-communist periods, when it became integrated into the concept of the "National Treasure." Twenty-eight years after 1989, the exhibition entitled "In the Footsteps of the Past. The Maria and Dr. George Severeanu Collection" was inaugurated, marking an opportunity for specialists to study each category of material and artefacts. The publication of catalogues and scholarly volumes led to the accurate placement of the collection's artifacts in time and space, through sustained documentary and archival research, in line with modern archaeology and the current scientific context. The collection includes ancient Greek vessels, clay figurines, bronze and marble sculptures, Roman glassware, gems and cameos, objects made of precious metals, and approximately 9,000 coins from various periods.

1629. A Modest Hoard, a Strong Context: A Horse-Harness Deposit from Pomerania and Heritage Practice

Authors: Kamil Niedziółka (Institute of Archaeology, University of Gdańsk) – Dawid Borowka (Department of History and Archaeology, University of Crete)
Format: Oral

In 2022, a hoard consisting of 25 bronze horse-harness fittings was discovered south of Gdańsk (Eastern Pomerania, Poland) during a legal amateur metal-detecting survey. The findspot was reported immediately. Two days later the deposit was investigated through a rescue excavation led by the local Monuments Protection Office. The objects formed a compact cluster in a shallow pit and were fully recorded in situ. Typological and distributional analysis assign the assemblage to Bronze Age Period V (c. 1000/950–800/750 BC) and links it to the Nordic Bronze Age traditions. Although modest in size, the hoard is a useful case for discussions on how archaeological collections can be classified, valued and protected. The circumstances of discovery are particularly significant: the amateur finders did not excavate the deposit themselves but cooperated with heritage service and later supported professional excavations, an approach still uncommon within heritage practice worldwide. This makes the case directly linked to ongoing work on amending Poland's Act on the Protection of Monuments and to the question of how reporting duties of amateurs can translate into real protection of archaeological context. Because the depositional context was documented, the assemblage can be compared reliably with other Late Bronze Age deposits from the South Baltic zone and used to refine interpretations of cultural processes during the Late Bronze Age. The paper addresses also the "afterlife" of a hoard in institutional care, from rapid conservation and radiocarbon dating to laboratory analyses and museum display which together generated significant local interest. The discovery was later recognised in a poll organised by a leading Polish popular-science archaeology magazine, mainly thanks to support of other amateur detectorists. Overall, we argue that the heritage and research value of "treasures" depends less on their scale than on context integrity, documentation quality and transparent pathways from discovery to curated collection.

2744. Archaeological collections in Ukraine in the context of wartime challenges and European integration

Authors: Kateryna Chuyeva (Independent scholar | The Ukrainian Association of Archaeologists)
Format: Oral

According to the Ministry of Culture of Ukraine, archaeological sites account for over 60% of officially registered cultural heritage sites. Hundreds of Ukrainian museums keep the archaeological collections, a number of them since the XIX century, and continue to accept artifacts to this day despite the wartime challenges. Official statistical data on archaeological sites and artifacts are incomplete, in particular due to limited resources and numerous challenges in the heritage management and preservation field that began to accumulate rapidly after 1991, and especially after 2014 and 2022. Every year brings a lot of archaeological discoveries even in times of war, but also information about new cases of looting of sites or confiscation of illegally obtained archaeological finds. The presentation will focus on the following topics: - What does archaeological collection management politics look like in Ukraine? What principles are used to select items for collections? - What kinds of gaps could / should be covered in the legislation in its museum policy and politics regarding the archaeological collections? - How should wartime challenges and the European integration process affect policies and politics in the field of archaeological collections, and have they affected? The complexity and systemic nature of the problems require professional discussion and updating of certain standards at the national level, but this must

be preceded by research into existing mechanisms and practices. The results of international professional discussions and recommendations developed by the international professional community are also extremely important for advocating positive change.

1890. Archaeological movable property of national interest or 'National Treasures': the case of the Roman chronology collection

Authors: Patrícia Brum (Universidade Autónoma de Lisboa / Instituto Politécnico de Tomar) – Maria João Torres Silva (ARTIS Faculdade de Letras da Universidade de Lisboa)
Format: Oral

As part of the doctoral research project "National Treasures of Roman Portugal in the 21st Century", this presentation presents Roman-period movable artefacts inscribed as national interest, examining their significance in the construction of Portuguese collective identities. Starting from a critical reflection on the concept of 'national treasure', the research interrogates the criteria underlying the classification of Roman artefacts in this category. Portugal's Roman heritage spans three formal categories defined by current legislation: immovable heritage (archaeological sites and architectural remains), movable heritage (everyday and artistic objects), and intangible legacies persisting in language, law and custom. The 2001 Framework Law on Cultural Heritage generated the 2009 decrees classifying immovable property as "National Monument", "Public Interest" or "Municipal Interest", and Decree-Law 148/2015 extended equivalent classifications to movable property, including the designation of "National Treasure". The institutional context of collection formation is significant. Several artefacts were recovered during excavations led by José Leite de Vasconcelos and Manuel Heleno, the founding directors of the National Museum of Archaeology — where the vast majority of this collection is currently housed. The 1980 exhibition Treasures of Portuguese Archaeology is particularly emblematic: organised around the founding mission of the Portuguese Ethnological Museum to document the origins of the 'Portuguese people', it classified most exhibits as 'national treasures', revealing the ideological frameworks that shaped early heritage categorisation. The analysis focuses on artefacts from key sites across Portugal — including the coastal settlement of Troia, the urban centre of Conimbriga and the Roman villa of Santa Vitória do Ameixial — which document Roman occupation across a range of contexts, from agricultural exploitation and commercial activity to urban settlement, offering a broad view of Roman life in Lusitania. The presentation presents preliminary conclusions on the criteria governing the selection and classification of these objects as 'national treasures'.

117 FACES FROM THE SOUTH. FIGURINES OF THE MEDITERRANEAN NEOLITHIC

Theme: 1. Widening perspectives in material culture studies
Organisers: Valeska Becker (University of Münster) – Rune Iversen (University of Copenhagen)
Keywords: Neolithic, Mediterranean, figurines, figurative finds, cultural context
Format: Discussion session

SESSION ABSTRACT

Anthropomorphic and zoomorphic figurines and other figurative finds – vessels, applications, reliefs, paintings, rock art etc. – have been widely discussed for central and southeastern Europe. However, the regions around the Mediterranean are often left out of the discussion or treated only marginally, maybe due to language barriers or an overall less well established understanding of the Neolithic cultural phenomena in the south of Europe. Still, research in the last decade has yielded a plethora of new finds that warrant attention and, what is more important, an evaluation regarding their placement within Neolithic Europe in general. This session aims to shed light on figurative objects from the Mediterranean: their shapes and decorations, their cultural context, their significance within their likewise societies, but also their possible connections, similarities to and differences from such objects from central and southeastern Europe. A focus should be on comparisons between figurative finds of different regions but also between cultural phenomena that make and use figurines vs. those that do not, or between figurative finds and other finds/features related to the ritual sphere, such as enclosures, burials or depositions. Changes in styles and numbers, but also in quantity or quality can get us closer to explore what figurative objects meant for Neolithic communities. Presentations can address figurines in their associated cultural context roughly between the seventh and the fourth millennium calBC.

CONTRIBUTION ABSTRACTS

2418. Zoomorphic Figurines of the Mediterranean and South-Eastern Europe - A Comparison

Authors: Julia Luckner (University of Kiel | Cluster of Excellence ROOTS)
Format: Oral

Neolithic animal figurines usually receive little attention in research, even though they played a central role in everyday Neolithic life in many regions of Europe. However, it is un-clear what the figurines were used for. Were they toys, teaching aids, ritual objects or something else entirely? What was their significance and function? In order to shed some light on this topic, this lecture will compare selected animal figurines from South-Eastern Europe and the Mediterranean Neolithic. This study will pay particular

attention to the context of the figurines, as this can provide clues as to their function and significance. This study pays particular attention to the context of the figurines, as this can provide clues as to their function and significance. The archaeozoological data from selected sites is also examined. The aim is to find out whether different animal species depicted as figurines had different meanings in the two regions under investigation. In addition, stylistic similarities and differences will be discussed, also to see whether different representations of the same animal species suggest different meanings. Furthermore, in addition to stylistic similarities and differences, the state of preservation of the animal figurines will also be taken into account.

2592. Where do you come from, my fair lady? "Archaic" Persistence vs Innovation in the Late Neolithic Continental Croatia

Authors: Marcel Buric (University of Zagreb, Department of Archaeology)
Format: Oral

The geographical position of continental Croatia during the Late Neolithic positioned it as a spatial nexus between two major cultural traditions: the Central European Linearbandkeramik (LBK) and the Southeastern European Vinča culture. The local Late Neolithic expression of this period, the Sopot culture, was once considered a primary impetus in shaping the Late Neolithic of Hungary and, indirectly, further north in Central Europe. Although Sopot ceramic production is chronologically, typologically, aesthetically, and technologically anchored in the Vinča tradition, particularly evident in its dark burnished wares, the fact is that its figural plastic art diverges markedly from the conventions prevalent in the area of the Central Balkans. This paper is an attempt for examining key similarities and differences in the style and manufacturing technology of the Late Neolithic figural plastic expression in continental Croatia, emphasizing the contemporaneous adoption of novel pyrotechnologies and stylistic principles alongside the persistence of distinctly archaic, Starčevo-derived modes of figurine representation.

2606. Ornithomorphic Vessels in the Neolithic: New Evidence from Slatina-Sofia, Central Balkans

Authors: Desislava Takorova (National Archaeological Institute with Museum - Bulgarian Academy of Sciences) – Vassil Nikolov (Bulgarian Academy of Sciences)
Format: Oral

Zoomorphic images are a significant element of the symbolic repertoire of early Neolithic communities and are attested from the very beginnings of the Neolithic in the Near East. As the Neolithic way of life expanded westwards, symbolic traditions accompanied this process, spreading across a vast geographical area and undergoing regional transformations. Animal representations were not only decorative elements, but also played an important role in the articulation of social identities and ritual practices. Bird images, although well documented in the Near Eastern Neolithic and parts of the eastern Mediterranean, remains relatively rare in the European Neolithic record. Isolated examples are known from various regions, including the western Mediterranean. Within this context, the presence of four ornithomorphic vessels from the early Neolithic settlement site of Slatina-Sofia, located in the Central Balkans, is particularly striking. Each vessel is unique in form and decoration, differing in the species of bird represented as well as in the specific manner of stylistic and morphological rendering. These finds raise several important issues related to the function, meaning, and symbolic value of ornithomorphic vessels within early Neolithic societies. Do these objects reflect shared symbolic concepts across the Mediterranean and Balkan regions, or do they represent localised reinterpretations of broader Near Eastern traditions? Furthermore, how did the semantics of bird images change through time and space? The material from Slatina-Sofia offers a valuable case study for exploring these issues within a wider Mediterranean Neolithic framework.

118 MOVING BEYOND ARCHAEOLOGICAL PREDICTIVE MODELS: UNDERSTANDING PAST HUMAN LAND USE WITH TOOLS AND THEORY FROM ECOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Peter Yaworsky (Aarhus University | University of Copenhagen) – Kenneth Vernon (University of Utah) – Anaïs Vignoles (University of Cologne | University of Kansas) – Elisabetta Canteri (University of Copenhagen) – Jesper Pedersen (University of Tübingen)
Keywords: Species distribution models, ecological niche models, eco-cultural niche models, ecology, behavioral ecology, land use
Format: Regular session

SESSION ABSTRACT

With the advent of powerful personal computers and the proliferation of high resolution remotely sensed data, landscape-scale archaeological data analysis has become commonplace. There are two veins within this type of work, classic archaeological predictive modeling and broader behavioral land use studies. Both use similar tools (i.e., logistic regression, machine learning) and data (i.e., presence, absence, climate, topography) to identify distinguishing patterning within environmental characteristics at archaeological site locations, but with different research goals. The goal of archaeological predictive modeling is to identify patterning between environmental characteristics and archaeological site occurrences to estimate the probability of unknown archaeological sites in areas lacking systematic inventories. Often, this a) is done using remotely sensed data from the present, b) is atheoretical, and c) has little consideration or interest in how past human land use decisions were structured and changed through time. More recently, archaeologists have begun adapting methods and theory from ecology with an explicit focus on understanding variation in human behavior, land use, and material culture. Distinguishing features setting apart the latter research from archaeological predictive models include a) use of paleoclimatic data to estimate conditions present during period of site occupation, b) explicit theoretically informed decisions in model construction and interpretation, and c) spatiotemporal predictions of habitat suitability. The focus of this session is on research falling under the latter, with discussions of, and case studies illustrating how we can push archaeological applications of methods and theory from ecology further to address a broader range of anthropological questions and develop a better understanding of human behavior.

CONTRIBUTION ABSTRACTS

1675. One theory, many models of habitat suitability

Authors: Kenneth Vernon (University of Utah Scientific Computing and Imaging Institute)
Format: Oral

Archaeological research into habitat choice behavior can be usefully divided into two main varieties: research focused on theory and the development of formal models irrespective of any or even all of the available data and research focused on empirics and the evaluation of statistical models fit to a finite subset of data. In ecology, the latter empirical models go by many names, more often than not Species Distribution Models, though it is probably more accurate to refer to them as Habitat Suitability Models. Of the former theoretical models, there are many, mostly owing to the challenges of formalization, but the core model is known as the Ideal Free Distribution, which is derived from Darwin's theory of natural selection. This paper seeks to spell out the differences between these varieties of research into habitat choice behavior, with a focus on modes of inference and explanation. Using an old verificationist argument, it is also shown that the Ideal Free Distribution has conceptual priority over all empirical models of habitat choice.

1992. Global, Regional and Local Patterning in Ceramic Assemblages: A Generative Simulation Framework for Hypothesis Testing

Authors: Anastasiia Korokhina (Leibniz-Institute for the History and Culture of Eastern Europe, GWZO | Institute of Archaeology, National Academy of Sciences of Ukraine)
Format: Oral

Studies of system-level dynamics in both ecological and archaeological research emphasize interactions among processes operating across multiple spatiotemporal scales. In community ecology, these processes concern species dispersal and abundance, but similar principles can be applied to archaeological assemblages, where dynamics may be encoded through the interplay of global, regional and local organizational impulses. This paper presents a generative modeling framework based on Approximate Bayesian Computation (ABC) for evaluating how these multiscalar processes jointly shape ceramic group distributions under conditions of sparse archaeological data. Competing hypotheses are formalized as data-generating models in which site-level assemblages arise from different combinations of latent compositional parameters, including: (i) global patterning, (ii) local preferences, and (iii) spatially structured or externally driven regional signals. From a historical perspective, these mechanisms can be interpreted as reflecting standardized production and consumption practices, external cultural, political, or economic influences, and local effects — while simultaneously providing a general framework for analyzing phenomena across diverse contexts. Synthetic populations are generated according to each model, and counts are subsampled to match archaeologically observed assemblages. Hypothesis plausibility is evaluated using the standard distance-based ABC rejection scheme, supplemented by Random Forest diagnostics and likelihood-based inference via a Bayesian multinomial model, which assesses scenario separability and provides an alternative inferential information. As a case study, compositional groups of Byzantine amphorae from the territories of Kyivan Rus' and the Kingdom of Poland are analyzed. The results indicate detectable signals consistent with a clustered structure of the consumption network and central-place influences. The proposed approach provides a flexible method for evaluating hypotheses regarding connectivity, structure, and constraint in archaeological material culture.

1526. Predictive modelling and settlement pattern analysis with a probabilistic approach in the Tiszazug microregion, Eastern Hungary

Authors: Gábor Mesterházy – András Füzesi (Hungarian National Museum, National Institute of Archaeology) – Norbert Faragó (Eötvös Loránd University, Institute of Arcaheological Sciences)
Format: Oral

The advantages of concurrently examining long-term archaeological settlement patterns and integrating temporal aspects into the modelling process have proven beneficial over the past few decades in microregional studies. These spatiotemporal investigations have provided a clearer understanding of how human activities occurred within the landscape, as well as how shifting environmental, social, and ecological conditions have necessitated and constrained human adaptation. This study aims to explore changes in

the Early (EN), Middle (MN), and Late Neolithic (LN) (6000–4300 BC) settlement patterns of the Tiszazug microregion in Eastern Hungary by integrating a microregional settlement database, chronological probability modelling, a radiocarbon-dated temporal framework, and predictive modelling. The Archaeological Topography of Hungary in the 1980s and 1990s identified 758 archaeological sites within the 546 km² Tiszazug microregion through extensive field surveys. During a recent complete chronological review of the collected artefacts, Bevan's and Crema's probabilistic method was applied to gain artifact-based chronological uncertainty of approximately 17,500 Neolithic finds. A site-based summary of the individual assessments aimed to balance the low count of highly diagnostic ceramics with the high count of moderately diagnostic ceramics in order to calculate the overall occupation probability of the sites during the Neolithic periods. The absolute chronological framework for the Körös culture (EN), Alföld Linear Pottery culture (MN), Szakálhát group (MN) and Tisza culture (LN) in the microregion was established using more than 60 collected and newly measured radiocarbon dates, highlighting asynchronous and overlapping cultural phases. KDE-based probabilistic settlement pattern analysis and maximum entropy predictive modelling were conducted to visualise and analyse culture-dependent occupation strategies throughout the Neolithic. The models indicate significant changes from the Early to the Late Neolithic in habitation areas and intensity, highlighting short- or long-lived local and microregional centres and their changing environmental conditions.

842. Evaluating SDM Style Inference Using Theory-Driven Simulation of Human Behavior across Spatiotemporal Environmental Change

Authors: Kurt Wilson (Lawrence University) – Brian Codding (University of California Santa Barbara)
Format: Oral

The archaeological record is a palimpsest of decisions made by people navigating and valuing landscapes that shifted across time. Recent advances in computation, paleoenvironmental data, and behavioral theory have enabled researchers to extract "site suitability" signals from this accumulated record, offering new insights into how past groups perceived and used their environments. Yet a central uncertainty remains: how reliably can we infer suitability from an archaeological record formed under environmental conditions that were themselves changing? To address this problem, we develop an agent-based model grounded in behavioral ecology to simulate the formation of archaeological landscapes across a range of environmental suitability patterns and volatility regimes. Using these controlled experiments, we evaluate the accuracy of suitability reconstructions derived from site locations under three common approaches: (1) a single static suitability surface, (2) a time-averaged surface reflecting long-term environmental conditions, and (3) a spatiotemporally sampled surface capturing suitability only when and where occupations occur. By systematically varying environmental predictability, we assess how each method performs under different levels of landscape stability. Our results identify the conditions under which SDM-style suitability estimates remain robust—and where they break down—as environmental volatility increases. Finally, we compare outcomes generated under Ideal Free (free-access) and Ideal Despotic (territorial) conditions, demonstrating how social organization shapes emergent settlement patterns and testing whether these differences remain detectable in the palimpsest record. Together, this work offers a theoretical baseline for understanding the limits of suitability inference in archaeology, highlighting when environmental reconstructions, social behavior, and long-term landscape dynamics can (and cannot) be reliably disentangled.

655. The population ecology of Classic Maya cities: Climate, conflict, and economies of scale

Authors: Weston Mccool (California Polytechnic State University)
Format: Oral

Urbanization was one of the most significant transitions in human history, yet explanations for the rise and expansion of early cities remain contentious. In this talk, we propose that simple models from population ecology can integrate existing theories for the development of early cities. Using newly synthesized paleoclimatological, paleoecological, demographic, and historical data from across the Classic Period Maya Lowlands (250–1000 CE) integrated with piece-wise structural equation models, we show that climate downturns, intergroup conflict, and strong economies of scale interact to promote the coevolution of urbanism and patron–client relationships, fueling city expansion, urban institutions, and systemic inequality. In addition, we elucidate how these non-linear pathways structure the persistence or dissolution of cities. This study underscores the importance of robust economies of scale in the development of early cities and provides a comprehensive framework for understanding the conditions that promote or hinder urbanization, offering insights applicable to both ancient and contemporary urban dynamics.

1907. Modelling farming systems and land-use variability in the Early Neolithic of the Iberian Peninsula (ca. 5600-4500 cal BC)

Authors: Juan Antonio Fernández-Morales – Daniel García-Rivero (Universidad de Sevilla)
Format: Oral

Research on Early Neolithic agriculture (ca. 5600-4500 cal BC) in the Iberian Peninsula has largely developed through regional approaches, mainly based on material culture, while the systematic integration of carpological evidence with geographical, settlement-type and archaeological variables –such as edaphic and topographic conditions, settlement type (cave or open-air), material culture and chronology- has been uneven and rarely addressed at a peninsular scale. Given the pronounced geographical and environmental diversity of Iberia, this study proposes a comparative framework to assess how these factors conditioned the organisation of agricultural systems among the earliest farming communities and their articulation with other components of the archaeological record. The analysis is conducted at the scale of the entire Iberian Peninsula, treating agriculture as the response variable, defined through quantitative archaeobotanical data, and using geographical, settlement-type, chronological and artefactual factors as explanatory variables. Geographical variables are derived through GIS-based analyses, extracting spatial information from edaphic cartography and digital elevation models. In a first phase, agricultural systems are identified and categorised through clustering analyses applied to available carpological assemblages. Subsequently, their relationships with the explanatory variables are evaluated using mixed-effects models that incorporate the hierarchical structure of the dataset (for example, region, site or chronological phase). Finally, using statistical prediction procedures, models are developed to check their likelihood based on observed data, and also to estimate the most probable agricultural system at sites that lack direct carpological evidence. This systemic approach enables exploration of the spatial variability of Neolithic agriculture beyond preservation biases, integrating agricultural systems within broader frameworks of human-environment interaction. From a theoretical perspective, the study contributes to an evolutionary and ecological reading of Neolithic agriculture, in which productive systems are understood as inherited packages of knowledge and of course as dynamic responses to geographically structured constraints and opportunities across the peninsular geography.

1695. Socioenvironmental Driven Shifts in Subsistence Farming Settlement Patterns: An example from the American Southwest

Authors: Ishmael Medina (University of California, Santa Barbara) – Weston Mccool (California Polytechnics, San Luis Obispo) – Kenneth Vernon (University of Utah) – Kurt Wilson (Lawrence University) – Peter Yaworsky (Aarhus University) – Jerry Spangler (Colorado Plateau Archaeological Alliance) – Brian Codding (University of California, Santa Barbara)
Format: Oral

Settlement and land use patterns are, in part, structured by underlying components of habitat suitability, which are closely linked to subsistence and economy. For subsistence farmers, habitat suitability is closely tied to the ability to reliably grow focal crops. Thus, subsistence farming societies should i) preferentially settle in and occupy the most suitable places for focal crops, and ii) as population increases, people will occupy lower quality farming habitats. Machine learning models trained on sites with cultigens can help identify places profitable for ancient agriculture. To demonstrate the utility of this approach, we focus on maize agriculture in the northern margins of the American Southwest. By comparing locations best suited for maize agriculture over time and relative to estimates of past population density, we suggest that Indigenous maize farmer settlement patterns follow predictions from an ideal distribution model, in which increasing competition drove farmers into less suitable farming habitats. The results from the observed environmental and demographic patterns help explain the spread and demise of Indigenous maize farming at its northern limit.

306. What's on the Menu and What's good? Using Ecological Niche Models to understand spatiotemporal variation in zooarchaeological assemblages

Authors: Peter Yaworsky (Aarhus University | University of Copenhagen)
Format: Oral

Models, methods, and theory developed by ecologists are often adopted and adapted by archaeologists. In recent decades, archaeologists interested in understanding how aspects of the environment influences and structures human dispersal and land use patterns have incorporated models used by ecologists understanding species' distributions. Here I will focus on models collectively referred to as ecological niche models (ENMs) and how they can be used in concert with anthropological archaeology to address important questions relating to human-environment interactions, subsistence variation, and species extinctions during the Late Pleistocene and early Holocene. At the core of these questions is understanding local hunting ecologies and human hunting decisions, or what's on the menu and what's good on the menu. Using ENMs, we can estimate species compositions of specific hunting ecologies in the past to understand what's on the menu. Then, using Prey Choice Model, we can estimate what's good on the menu based on subsistence payoffs, like calorie, fat, and other macronutrients. In combination we can a). derive expectations about human-animal interactions and the composition of specific zooarchaeological assemblages to better understand spatial and temporal variations, b). identify the hunting ecologies in which specific species should be hunted, and c). better define the role humans and climate played in specific extinction events.

370. Mechanistic models: their use in ecology and potential applications to archaeology

Authors: Elisabetta Canteri (University of Copenhagen)
Format: Oral

Ecological Niche Models (ENMs) relate species occurrence data to environmental variables in order to infer suitable conditions and predict potential species distributions across space and time. Widely used in macroecology and biogeography to identify and explain spatiotemporal patterns of biodiversity, ENMs have more recently been applied in archaeology to investigate hominin–environment interactions and the relationship between climate and cultural transmission, from the Palaeolithic to the Neolithic. However, as correlative approaches, ENMs do not explicitly account for dispersal, biotic interactions, evolutionary change, or behavioural adaptations to environmental variability—processes that play a key role in shaping species distributions and population dynamics through time. Process-based (mechanistic) models address these limitations by explicitly simulating ecological processes and population dynamics in response to changing climatic and environmental conditions. In this presentation, I provide an overview

of different types of process-based models, illustrate their application through reconstructions of muskox and reindeer population dynamics over the last 21,000 years, and discuss their potential relevance and applications in archaeological research.

2499. Working Toward Causality in Modeling Past Land Use Decisions

Authors: Brian Codding (University of California, Santa Barbara | University of Utah) – Simon Brewer (University of Utah)
Format: Oral

Models of past human settlement and land use decisions often emphasize predictive accuracy over interpretation, focusing on where or how many — rather than why — settlements occur. Yet if we want to understand the drivers of past land use change, research needs to work toward identifying causal relationships. Building on theory and methods in ecology, this paper explores how incorporating causal processes into statistical and machine learning models can improve our understanding of human-environment relationships and past land use decisions. We demonstrate the utility of these approaches using case studies in Neolithic Europe and Indigenous North America. Cases illustrate how common predictor variables such as climate may only have indirect effects on settlement decisions as mediated through endogenous factors such as habitat availability and inferred resource profitability. We also explore how these approaches can better account for the coupled climatic and anthropogenic factors that influenced past land cover and ecosystem change.

2585. Applying Ideal Distribution Models to Predict Settlement Patterns during the high Middle Ages in Denmark

Authors: A. Ja'Net Baide – Callum Dingley (University of Utah) – Weston Mccool (University of Utah | California Polytechnic State University) – Brian Codding (University of Utah | University of California, Santa Barbara)
Format: Poster

We employ ideal distribution models (IDM) from behavioral and population ecology to predict settlement patterns in historic Denmark during the Scandinavian Medieval Period (AD 1050 – 1536). Prior to the 14th century, Denmark is characterized by the Medieval Warm Period with favorable climate for agriculture, supporting a growth factor of 2.4x in population size and 50% expansion in arable land relative to the Viking Age. We apply the Ideal Free Distribution (IFD) model to predict past settlement patterns among stratified agrarian Danish society, to test whether past history of settlement expansion can be predicted by environmental suitability. Patterns consistent with an IFD support population settlement in the most suitable areas first, and with increasing competition, expansion to more marginal habitats. Archaeological data of deserted churches are compiled as a proxy for historical population distribution. Following the European Soil Data Centre, raster for productivity of wheat, barley, and arable land are used as an estimate for environmental conditions. This case study demonstrates the utility of IDM to predict optimal settlement strategies in the past, and to better understand changes in land use.

119 GOD OR DEAD? COMPARING FUNERARY AND RELIGIOUS RITUALS IN EUROPE (1000 BCE – 25 BCE)

Theme: 1. Widening perspectives in material culture studies
Organisers: Rebecca Perruche (Chrono-Environnement UMR 6249 CNRS) – Valérie Taillandier (InSitu Archéologie SA | Chrono-Environnement UMR 6249 CNRS) – Matthieu Demierre (UNIL)
Keywords: ritual practices, necropolis, place of worship, material culture, Iron Age, Late Bronze Age
Format: Regular session

SESSION ABSTRACT

During the first millennium BCE, sacred places and necropolises represent two categories of sites which, although distinct in their primary function — the former devoted to the worship of deities, the latter to honor of the dead — nonetheless belong to a shared symbolic and ritual sphere. Both are spaces where codified gestures are performed, expressing a relationship with the sacred, whether to honor divine powers or to maintain the continuity of ties between the living and the deceased. This functional proximity is materially reflected in a series of architectural and cultural convergences: enclosure systems, deposit pits, and ditched structures with circular or quadrangular layouts appear in both contexts, suggesting a comparable conception of delimited ritual space. Likewise, the nature of the artefacts — weapons and ceramics broken or not, animal remains, metallic and miniature objects — reveals a shared symbolic vocabulary in which the gods and the deads are closely intertwined. These morphological and behavioral parallels invite us to consider sanctuaries and necropolises not as isolated entities, but as complementary components of a complex religious and social system, within which ritual operates as a vector of communal cohesion and mediation between these different spheres. Therefore, we encourage papers and case studies exploring the relationships between cult places and funerary areas during the Late Bronze Age and the Iron Age, as well as during the transitional phases between or within these periods, with particular attention to their comparison in terms of material culture, architectural features and ritual practices. We invite reflections on the interaction and permeability between necropolises and places of worship: how do these spaces intersect, coexist, or borrow from one another? Regional studies are particularly welcome, highlighting how ritual gestures and their spatial or material expressions change over time, reflecting shifts in belief systems or social organization.

CONTRIBUTION ABSTRACTS

1645. Functional Ambiguity of La Tène Enclosures : cult, burial or living spaces?

Authors: Christelle Sanchez (Eveha International | UMR 6249 Chrono-environnement) – Matthieu Thivet – Emmanuel Hamon (Université Marie et Louis Pasteur | UMR 6249 Chrono-environnement)
Format: Oral

Extensive magnetic surveys at Verdun-sur-le-Doubs (Burgundy, France) have revealed several ditched enclosures on the southern periphery of the nucleated settlement. Two of these structures, subsequently excavated, are characterized by their small scale, measuring between 7 and 10 metres per side. Interpreted as the footprints of earth-and-timber buildings with load-bearing walls and peripheral foundation trenches, these remains raise significant functional questions. Their seamless integration into the urban fabric along a preferred East-West axis points to rigorous spatial planning. While morphologically similar to the funerary enclosures ubiquitous across Celtic Europe, these La Tène features often lack the material finds required for definitive characterization. However, European comparisons offer fresh perspectives: At Roseldorf (Austria), such enclosures are identified as sanctuaries, with functions linked to weapon deposits and feasting remains. The excavation of Enclosure 525, at Němčice (Czech Republic) confirmed this functional diversity, revealing a memorial dimension (residual human remains) associated with martial rites, including fragments of swords and bent spears. At Haselbach (Austria), micro-archaeology has provided "evidence of absence": the enclosure was intentionally kept clean, precluding any domestic waste, which suggests a space dedicated to intangible activities such as assemblies or trade. This paper seeks to define the function of the Verdun-sur-le-Doubs enclosures by cross-referencing multi-method geophysical data with recent excavation results (2023–2025). We will explore the hypothesis of "hybrid" spaces, where the maintenance of strict cleanliness and the proximity to ritual deposits may indicate places of worship or civic assembly at the heart of the urban fabric.

280. Long-term evolution of rituals in the Caisses de Jean-Jean in Mouriès (Fr)

Authors: Loup Bernard (Université de Strasbourg / CNRS UMR 7044)
Format: Oral

Known and excavated for nearly a century, Mouriès is one of the most important Iron Age settlements in the small Alpilles mountain range, at the interface between Mediterranean and Celtic cultures. The resumption of excavations and archival research highlights the site's ritual role, which is beginning to be better identified and appears to be fundamental. The functional changes at the site over time—Bronze Age steles, a necropolis between the 6th century BC and the Merovingian period at the foot of the site, and a communal hall in the 2nd century AD—were already known but little published. Recent excavations have uncovered numerous deposits of fauna (ovine and caprine) in pits between the end of the Iron Age and the beginning of the Roman period. Placed at the bottom of small pits, these deposits represent an example that seems to fit well with the theme of the session, particularly with regard to the cultural trajectories of these sites during the intermediate phases. The evolution from a stele sanctuary to a necropolis, habitat, cult site, and the establishment of a final habitat at the beginning of the Roman period is quite unique for Mediterranean Celtic culture. The presentation will also be an opportunity to seek comparisons with these practices, which appear to be poorly documented at present.

2179. Gallic beliefs in Mediterranean Celtic culture during the second Iron Age through funeral and ritual practices

Authors: Anaïs Masquelier (umr 5140 asm) – Réjane Roure (umr 5140 asm | Université de Montpellier Paul Valéry)
Format: Oral

In the lower Rhône valley, the rise of rescue archaeology has profoundly renewed regional funerary documentation, allowing a better understanding of the location of tombs in the occupied environment, as well as funerary rituals, individual and collective practices, in and around the tomb. These reflect complex symbolism, which must be integrated into a more comprehensive reflection on belief systems. At the same time, recent discoveries and projects in the last decades have led to a better understanding of Gallic ritual practices in this region. While it is still difficult to interpret the remains found with certainty, the repetition of practices, the renewal of studies and analyses have made it possible to better characterize a large number of discoveries that can clearly be considered ritual in nature. These remains—infant burials in domestic contexts, statuary evoking heroic worship, displays of severed heads and warrior panoplies, or even the manipulation of objects—appear in both public and private spaces and may thus reflect, similarly to well-identified cult sites, common beliefs. Thus, through this regional approach, the objective will be to analyze the spatial and gestural links between the various remains that may be related to rituals and known funerary practices, in order to highlight their common elements. The cross-referencing of these data, which are rarely compared in the South of France, will enable the approach of shared beliefs and their evolution in the Gallic groups of Mediterranean Celtic culture between the 6th and 1st centuries BC, in particular by examining their territorial settlements during this period.

478. Graves, cult, memories. Ritual practices and places from the late Bronze Age to early Roman period

in Lausanne-Vidy (Switzerland)

Authors: Lionel Pernet (Musée cantonal d'archéologie et d'histoire, Lausanne) – Romain Guichon (Archeodunum)
Format: Oral

Numerous excavations carried out since the 1950s beneath the Roman town of Lousonna, on the site of Vidy (Switzerland), have uncovered funerary and cultic remains dating from the first millennium BCE. A late Bronze Age necropolis yielded around 25 widely spaced cremation graves, with at least three tumulus and some non-sepulchral deposits. Some of the structures clearly reused slabs from a Middle Neolithic cemetery located on the same place. For the Iron Age, a recently published La Tène D1a burial site (150-110 BCE) shows in contrast 33 bi-ritual structures in a confined area, with original material deposits and only women and children among the inhumated people. An ancient burial mount seems to guide the spatial organisation of this cemetery and suggests a function of memory place. The same interpretation is possible for another Bronze Age tumulus redeveloped at the late La Tène period, with an external ditch containing human and non-human deposits. For the early Roman period, current excavations in the western necropolis of Lousonna reveal both material deposits and non-conventional inhumations, with Celtic and Mediterranean patterns. In the same area, animal burials are also attested in front of the so-called indigenous sanctuary, with three megaliths reused for Gallo-Roman rituals. The presentation will summarize these contexts focusing mainly on the interaction between cultic and funerary spaces and practices, as well as topographical and memorial aspects from a long-term perspective from late Prehistory to Antiquity.

176. Funerary and cult rituals in eastern Gaul: comparative study of the Jura massif and the Saône plains (4th-1st c. BCE)

Authors: Valérie Taillandier (InSitu Archéologie SA | UMR 6249 Chrono-Environnement) – Rebecca Perruche (UMR 6249 Chrono-Environnement)
Format: Oral

With the major structural transformations of Celtic societies during the 5th century BCE, the following century—and even more markedly the one after—witnessed profound changes both in belief systems and social practices. These developments are reflected, on the one hand, in the establishment and territorial anchoring of sanctuaries that now display purpose-built layouts and a clearly defined, regular, and standardized architectural form, and on the other hand in the abandonment of tumulus burial in favor of flat-grave necropolises organized in small family-based groups, sometimes associated with monuments no longer built in elevation but expressed through subsurface features. These changes were accompanied by significant evolutions in rites, practices, and choices related to the selection and deposition of artefacts intended for the deceased or for deities, as well as in the organization and performance of funerary ceremonies and cult activities. This paper aims to examine, within a territory encompassing both the Saône Valley and plains and the Jura Massif, how rites and practices observed in sanctuaries and necropolises coexisted and interacted over the four centuries preceding the beginning of Roman period. In particular, it seeks to compare the practices and the artefacts identified in the funerary sphere with those attested in the cultic domain, in order to assess convergences, divergences, and possible transfers of ritual behaviors between these two contexts.

122. Archaeozoology of two La Tène square enclosures (Objects 40, 41) from "cult district 2" in Roseldorf-Sandberg (Lower Austria)

Authors: Konstantina Saliari – Tim Langnitschke – Georg Tiefengraber – Veronika Holzer (Natural History Museum Vienna)
Format: Oral

The current contribution presents new research on the faunal remains from two square enclosures, Objects 40 and 41, located in "cult district 2" at Roseldorf-Sandberg. The function of several La Tène period square enclosures is often unclear and their interpretation sometimes ambiguous. The new archaeozoological data will offer crucial insights into the character of these structures. Based on archaeological finds, both Objects were interpreted as "small sanctuaries". A comparison between the faunal assemblages excavated in the settlement and "cult district 2" also revealed remarkable differences, supporting a different (ritual) function for Objects 40 and 41. However, it seems that different rituals were performed in the two enclosures, because of significant faunistic differences noted between them: in Object 40 cattle and horse prevailed, whereas in Object 41 non-adult pigs dominated. The highest number of identified faunal material was retrieved from Object 41 (1050 animal bones and teeth) offering the opportunity to investigate additional archaeozoological aspects. Notable observations were made concerning the skeletal element representation, which exhibited an overrepresentation of non-meaty regions for the non-adult pigs and for cattle (the second most important species). Furthermore, four skeletons of piglets were additionally documented in the trenches of Object 41. Interestingly, Object 41 contained a cremation burial in its center and a burial of a male individual lying in a crouched position in the southeastern part of the trench. Thus, one of the questions that we discuss is, if the faunal assemblages should be considered as grave goods for the deceased or remains of sacrifices. However, sacrifices might be quite complex to interpret, since it is rarely possible to understand to whom they were addressed to. Nevertheless, the archaeozoological results for both Objects indicate a costly selection of animals, reflecting their great social importance for the participants.

1214. Between Atypical Funerary Practices and Ritual Deposits: The Gallic Settlement of Verdun-sur-le-Doubs, Burgundy, France (2nd century BCE)

Authors: Emmanuel Hamon – Matthieu Thivet (Université Marie et Louis Pasteur | Chrono-environnement UMR 6249)
Format: Oral

The site of Verdun-sur-le-Doubs is a nucleated settlement dating to the 2nd century BCE, situated at the confluence of the Saône and Doubs rivers. Its advantageous location—at the northern end of the Saône corridor and at the intersection of major fluvial and overland routes—gave it considerable strategic importance within exchange networks, at the margins of Aedui and Sequani territories. Since 2019, the Gaulish settlement has been the subject of systematic excavations conducted within the collaborative research project "Saône–Doubs–Dheune Confluence in the Iron Age." Recent fieldwork has focused on the southern periphery of the settlement, an area marked by repeated evidence of atypical funerary remains and acts of violence directed at humans, animals, and artefacts. These practices appear to follow ritualized or socially regulated prescriptions and are primarily documented in two categories of features that may have functioned as symbolic or physical boundaries. The first consists of two wells located approximately fifteen meters apart, both containing articulated human skeletons with the lower limbs removed peri-mortem. One of these wells also yielded animal remains, suggesting a deliberately staged practice at the intersection of atypical funerary treatment, punitive violence, and ritual behavior. The second feature corresponds to a dense, linear concentration of material forming a boundary along the northern edge of the area. Dominated by faunal remains and amphorae, this assemblage also includes personal ornaments and metal objects—most notably a prisoner's shackle with its key—as well as several human skulls bearing traces of trauma or post-mortem manipulation. Taken together, these elements point to practices of exposure and socially performative display. Placed within the socio-economic context of a major settlement in eastern Gaul, these results highlight the complex social, political, and ritual roles of funerary practices, offering new insights into their function within broader community dynamics.

1299. Religious and funerary practices in the Swiss Plateau during the Second Iron Age: expressions of complex and intertwined symbolism

Authors: Matthieu Demierre (University of Lausanne)
Format: Oral

A survey of the funerary and religious practices of the populations of the Swiss Plateau during the Iron Age reveals striking similarities, particularly at the end of the period and among the elite. This is evidenced, for example, by the recurring discovery of horse and wild animal bones, the practice of depositing intact or fragmentary (pars pro toto) chariot parts, harnesses, weapons and adornments, and the selection of human bones, not to mention the deliberate breaking and selection of pottery. Often close to each other, the contexts in which they are found also show similarities in terms of their morphology (pits, ditches) and their general context (wet environment, geographical location, proximity to megaliths and earlier deposits). This paper aims to review the practices observed and assess their contribution to a complex symbolic system that was significant for the Celts of the Swiss Plateau. Using a selection of places of worship and deposits (Bern-Enge and Tiefenau, Port, La Tène), necropolises (Regensdorf, Frasses, Châbles) and sites where funerary and religious spheres coexist (Avenches, Mormont), it will question our ability as archaeologists to reconstruct the semiology hidden behind the observed gestures by placing them in their context.

120 TRACING ANCIENT FARMING: ISOTOPIC STRATEGIES TO EXPLORE AGRICULTURAL SYSTEMS

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Sayuri Kochi (Johannes Gutenberg University Mainz) – José Araus Ortega (University of Barcelona) – Ramiro Barberena (National Council of Scientific and Technical Research) – Francesca Cortese (University of Rome Tor Vergata)
Keywords: Subsistence, Palaeoecology, Stable isotopes, Archaeobotany, Zooarchaeology, Bioarchaeology
Format: Regular session

SESSION ABSTRACT

The interplay between humans and environments can be observed at any stages of production, distribution and consumption of staple foods in agricultural systems, and stable isotope analyses proved to be a powerful tool to characterize them. While for analytical and methodological reasons we tend to examine separately binomials of human-plants or human-animals' relationships, isotopic approaches allow us to reconstruct how were integrated all organisms as an agro-ecological community in a specific socioenvironmental setting, and the outcomes of its structure. Moreover, as a method grounded on biogeochemical principles, it is particularly suited to explore the human management of the agro-ecological factors enabling food production, as well as its constraints and limitations. In turn, the interpretation of isotopic data has its own methodological issues, and any case study must address similar questions: What are the particularities of local biogeochemical cycles? How is this isotopic variability reflected into producers and successive consumers? What is the magnitude of isotopic variation that is meaningful for the research question? Another common challenge is the construction of baselines for inter-site and diachronic comparisons, which are challenging for any model at broader

scales. A comparative perspective helps us to better explain the isotopic variations in terms of past farming practices, as similar biogeochemical processes may underly agricultural strategies divergent in their components, and vice versa. This session invites to present case studies from any period and region around the world, applying different isotopic markers to explore the human management of crops, livestock and environmental conditions for food production; the distribution of agricultural products at different scales; and the associated human dietary patterns. It also welcomes presentations combining different lines of evidence; as well as modern frames of reference and experiments that enhance our understanding of ancient agricultural systems.

CONTRIBUTION ABSTRACTS

2757. Growing conditions of cereals during the emergence of agriculture in the southern Levant: evidence from stable isotope signatures

Authors: Jose Araus – Salima Yousfi – Maria Dolors Serret (University of Barcelona) – Tobias Richter (University of Copenhagen) – Juanjo Ibañez (Institució Milà i Fontanals – CSIC) – Barbara Proserpio – Amaia Arranz-Otaegui (University of the Basque Country)
Format: Oral

Wheat, barley, and grain legumes are part of the group known as the "founder crops" of the Neolithic period in the Levant. These crops were fundamental to the transition from hunting and gathering to sedentary agriculture, a process that began around 12,000 years ago in the Fertile Crescent and is known as the Neolithic Revolution. Whether changes in environmental conditions, such as water availability and temperature, facilitated this transition is still under debate. Shubayqa (specifically Shubayqa 1, 3 and 6) and Tell Qarassa North are key archaeological sites in the Levant (Jordan and Syria, respectively) that document the transition from hunter-gatherers to farmers during the Late Epipalaeolithic and pre-pottery Neolithic interval. The carbon isotope discrimination ($\Delta^{13}C$) of seeds from different wild and domesticated species of wheat (Triticum boeticum/urartu, T. monococcum, T. dicoccoides), barley (Hordeum spontaneum), and legumes (Lens sp.), recovered from these sites, has been studied as an indicator of the moisture conditions of these crops. As an additional reference for understanding moisture conditions crop plants growth, the $\Delta^{13}C$ of seeds and tubers of Bolboschoenus maritimus recovered from the same sites was analyzed. This species belongs to the Cyperaceae family and is a perennial, hydrophytic, rhizomatous plant, characteristic of wetlands, riverbanks, marshes, lagoons, and ditches. Consequently, this species would show the maximum $\Delta^{13}C$ value expected under non-limiting moisture conditions. In addition, the nitrogen isotopic composition of the same samples was analyzed as an indicator of soil fertility and the potential occurrence of soil manuring. Finally, to allow for a diachronic comparison of the growing conditions, the isotopic values of the archaeobotanical remains were compared with the isotopic signatures of present-time samples of these species, growing in areas surrounding the sites.

2552. Agriculture at the frontiers of Neolithic expansion: stable isotope evidence from sites in Eastern Europe and Scandinavia

Authors: Sayuri Kochi (Johannes Gutenberg University Mainz) – Elena Marinova (State Office for Cultural Heritage Baden-Württemberg) – José Araus Ortega (University of Barcelona) – Sven Brömme (Max Planck Institute for Chemistry) – Gabriela Juźwińska – Magda Kapcia (W. Szafer Institute of Botany, Polish Academy of Sciences) – Maria Lityńska-Zając (Institute of Archaeology and Ethnology, Polish Academy of Sciences) – Tina Lüdecke (Max Planck Institute for Chemistry) – Aldona Mueller-Bieniek (Faculty of Archaeology, University of Warsaw) – Maria Ivanova-Bieg (Johannes Gutenberg University Mainz)
Format: Oral

The expansion of the pioneering farming communities across Europe has been characterized as a punctuated process over time, rather than a steady and uniform one. It remains debated to what extent the timing of this process was driven by cultural dynamics related to the adoption of new subsistence strategies, or by environmental factors that influenced the feasibility of food production. At higher latitudes, factors such as daylength were beyond the control of farmers, and cold stress can adversely affect crop growth and development. To assess the interplay between humans and environments in farming systems, stable isotope analyses of charred crops are a powerful tool, as they record plant growing conditions mediated by climate. Stable carbon isotope values depend on photosynthetic pathways, with isotopic discrimination in C_3 crops being positively correlated with water availability. Nitrogen isotope values are influenced by a variety of factors within the soil–plant system, including natural soil fertility and manuring practices. Here, we characterize the scope and limitations of Neolithic agricultural strategies at the frontiers of the initial Neolithic expansion through three case studies. From western Lesser Poland and the Carpathian Foothills region, we analyze six sites dating to the 6th–5th millennium BCE, where Neolithic communities approached the forest–steppe ecotone of eastern Europe. The second case study comprises two sites from the Kuyavia region in the North European Plain, dating to the 5th millennium BCE. We then present results for one site in Central Sweden dating to the 4th millennium BCE. Early Neolithic agriculture reached its northernmost extent here, corresponding to the border between boreal forest and taiga. Regional patterns are further discussed in comparison with previous findings from the southwestern frontier of the Linearbandkeramik expansion in Germany.

2372. Mapping Early Neolithic livestock mobility through multi-isotope analysis of sequentially sampled dental enamel

Authors: Phoebe Heddell-Stevens (Johannes Gutenberg University Mainz | Max Planck Institute of Geoanthropology) – Rosalind Gillis (ICArEHB) – Petrus Le Roux (University of Cape Town) – László Domboróczki (István Dobó Castle Museum) – Angélique Labrude (Centre de Conservation et d'Etude d'Alsace) – Krisztián Oross (ELTE Research Centre for the Humanities, Institute of Archaeology) – Joanna Pyzel (Maria Curie-Skłodowska University) – Maria Ivanova-Bieg (Johannes Gutenberg University Mainz) – Kyra Lyublyanovics (Hungarian National Museum, National Institute of Archaeology, Budapest)
Format: Oral

As farming spread across Europe, Early Neolithic communities were required to adapt livestock herding strategies to new climatic conditions, landscapes, and agro-ecological constraints. Livestock mobility and grazing regimes were central to these adaptations, yet direct evidence for how early farmers organised seasonal movement across landscapes remains limited. This study investigates seasonal movement patterns in cattle (*Bos taurus*) during the first 500 years of farming across multiple early Neolithic sites in Europe. We combine intra-tooth strontium ($^{87}Sr/^{86}Sr$) isotope analysis with zooarchaeological evidence and complementary stable carbon ($\delta^{13}C$) and oxygen ($\delta^{18}O$) isotope data to reconstruct livestock movement at a sub-annual scale. Sequential enamel sampling enables the identification of potential seasonal shifts between pastures, including movement across geologically distinct lowland and upland areas. The project uses existing regional strontium baseline datasets to identify livestock movements and seasonal ranging across varied environmental contexts. This paper presents preliminary results from an ongoing multi-isotope study, integrating isotopic geochemistry with zooarchaeological data to move beyond inferred models of transhumance. The study explores how early farmers structured livestock mobility and adapted herding practices to regional environmental variability, contributing to a more refined understanding of human–animal–environment interactions and the organisation of early farming economies in Neolithic Europe.

829. Dietary Evolution and Agropastoral Adaptation in Neolithic Alpine Societies: Diachronic Insights from the Valais Region (Switzerland)

Authors: Déborah Rosselet-Christ (ARCAN - Archaeology of Africa & Anthropology, University of Geneva) – Charles Le Moyne (Plant Humanities, Royal Botanic Gardens, Kew) – Massimo Chiaradia (Department of Earth Sciences, University of Geneva) – Jocelyne Desideri (ARCAN - Archaeology of Africa & Anthropology, University of Geneva)
Format: Oral

Funded by the Swiss National Science Foundation (SNSF grant 205059), the ALPS project employs an interdisciplinary framework—combining isotope geochemistry, dental non-metrics and calculus analysis, ancient DNA and paleopathology—to investigate Neolithic Alpine communities in Switzerland and Italy. By reconstructing dietary patterns, subsistence strategies, and mobility dynamics, this research seeks to understand how these populations adapted to the challenges of an alpine environment. This presentation focuses
on the evolution of agropastoral practices and dietary habits in the Sion region (Valais, Switzerland), covering the Middle Neolithic to the Bell Beaker period (4500-2200 BCE). Our analysis includes stable isotope ratios ($\delta^{13}C$, $\delta^{15}N$, $\delta^{34}S$) from 365 human individuals, 90 animals, and 15 seed samples, complemented by human dental calculus analysis from a subset of 69 individuals. Our findings indicate a gradual diversification of grazing environments, marked by a progressive expansion into higher-altitude areas beginning in the Final Neolithic. Herding practices underwent dynamic shifts, transitioning from open, humid zones (e.g., the Rhône Valley) to more varied landscapes, including high-altitude pastures, before reverting to more enclosed environments during the Bell Beaker period. Simultaneously, isotopic evidence reflects local soil management strategies (e.g., manuring), indicating optimised land-use and agricultural practices mastery. While human diets remained largely consistent over time, a subtle gender-based differentiation emerged during the Final Neolithic, suggesting distinct social or labour-related practices within communities. These insights deepen our understanding of subsistence and land-use trajectories in Alpine agropastoral societies, highlighting a diversification of grazing and agricultural practices. Although the drivers of these adaptations remain uncertain, they enhance the resilience and adaptability of Alpine agropastoral economies in response to environmental and socio-cultural pressures.

2448. Strontium isotopes and pre-Hispanic agriculture in the southern Andes (Argentina and Chile)

Authors: Maria Quintana (CONICET, Universidad Nacional de Cuyo) – Petrus Le Roux (Department of Geological Sciences, University of Cape Town) – María López (CONICET, Universidad Nacional de La Plata) – Carolina Belmar (Departamento de Antropología, Universidad de Chile) – Claudia Mallea (Instituto de Investigaciones Arqueológicas y Museo M. Gambier) – Gustavo Lucero (Departamento de Antropología, Universidad Católica de Temuco) – Andrés Troncoso (Departamento de Antropología, Universidad de Chile) – Carina Llano (CONICET, Instituto de Ingenieria y Ciencias aplicadas a la industria) – Ramiro Barberena (CONICET, Universidad Nacional de Cuyo)
Format: Oral

This study presents an approach anchored in strontium isotopes ($^{87}Sr/^{86}Sr$) to reconstruct pre-Hispanic farming areas and agropastoral strategies in a highland biogeographic corridor of the southern Andes. We focus on the linked valleys of Iglesia, Calingasta, and Uspallata (Argentina), and extend the analytical framework by presenting a first exploration for the Semi Arid region of Chile. We discuss case-studies from these valleys that allow evaluating farming areas across altitudinal gradients, seasonal mobility, and spatial conveyance of domestic plants. These valleys are emplaced between the Precordillera and main Andes ranges, characterized by striking geological and isotopic differences, that make Sr a robust tool to track the life-history of domestic plants. We characterize $^{87}Sr/^{86}Sr$ in archaeological and modern domesticated plants, wild flora, local fauna, and sediments to evaluate spatial variability and agricultural practices across the southern Andes. In the Valle de Iglesia, strontium isotopes reveal contrasts between the highland

Precordillera (2000-3500 masl) and the lowland valley contexts (<2000 masl). In this context, Pircas Negras site shows more radiogenic values, Las Quinas (valley) exhibits restricted variability, and Punta del Barro shows a broader dispersion, potentially reflecting more diverse farming areas and/or strategies. Samples from highland contexts in the Valle de Uspallata (Mendoza) and Calingasta (San Juan) allow evaluating seasonal highland farming in contexts above 2500 masl, contributing to explore broader agricultural dynamics. Data from Los Morrillos sites in Calingasta also suggest the conveyance of quinoa across the Andes. Comparative data from northern Chile situate these findings within broader discussions of agricultural experimentation, water management, and cultigen conveyance. Integrated into the isotopic framework, these observations underscore variability across valleys and highlight diverse cultivation and plant-movement strategies in arid highlands. These results highlight the value of integrating $^{87}Sr/^{86}Sr$, $\delta^{13}C$, and $\delta^{15}N$ isotopes isotopes with archaeobotanical evidence to reconstruct pre-Hispanic productive landscapes and adaptive strategies.

614. Reconstructing Bronze Age Agro-Ecological Systems in Italy: the PROTO-GREEN Project

Authors: Francesca Cortese (University of Rome Tor Vergata) – Marialetizia Carra (University of Bologna) – Mariateresa Cuda (Civic Museum of the Prehistory of Mount Cetona) – Alessandro Fedrigotti – Alex Fontana – Nicola Nannini (MUSE - Museo delle Scienze) – Adalberto Piccoli (Museo archeologico dell'Alto Mantovano) – Mattia Rossi (University of Parma) – Mario Rolfo (University of Rome Tor Vergata) – Paola Iacumin (University of Parma)
Format: Oral

The PROTO-GREEN project investigates how Italian Bronze Age communities employed agriculture and livestock breeding to adapt to environmental changes through stable isotope analyses of plant and faunal remains from UNESCO heritage sites. This contribution presents the methodological framework and preliminary objectives for isotopic analyses of carpological remains from northern Italian pile-dwelling settlements dated to the Early and Middle Bronze Age. Carbon and nitrogen stable isotope analyses will be conducted on seeds of broad beans (Vicia faba), emmer (Triticum monococcum/dicoccum), wheat (Triticum aestivum), and barley (Hordeum vulgare) from multiple Bronze Age sites including Molina di Ledro, Santa Maria in Belverde, La Bellanda and Bande di Cavriana. These analyses will provide insights into soil management practices, including manuring and irrigation strategies employed across different lacustrine and wetland communities dated from the Early to Middle Bronze Age. These isotopic approaches are particularly significant for the Bronze Age, as they can reveal economic transformations, climate-driven agricultural shifts, and the evolution of manuring practices during a crucial phase of agro-pastoral intensification. This multi-site approach enables reconstruction of integrated agro-ecological communities within diverse socioenvironmental settings and assessment of regional variability in farming practices. The isotopic characterisation of local biogeochemical cycles across these settlements will establish essential baselines for inter-site comparisons within Italian protohistoric contexts. Understanding the magnitude of isotopic variation related to water availability and nitrogen inputs allows us to characterize the agricultural strategies that supported these communities during a period of intensive agricultural development. The project outcomes serve as foundational data for future dietary studies and offer a comparative framework for understanding how past populations managed environmental factors enabling food production, providing insights relevant for sustainable agricultural practices today.

558. Agro-Ecological Adaptation in the Mid–First Millennium BCE: Stable Isotope Evidence from the Middle Gangetic Plain and Mainland Greece

Authors: Aarushi Yadav – Santosh Yadav (Lovely Professional University)
Format: Oral

Agricultural systems of the mid-first millennium BCE (c. 600–300 BCE) developed under divergent climatic constraints, requiring strategies to manage water availability, soil fertility, and production stability during a period of increasing social and economic complexity. In the Middle Gangetic Plain of South Asia and mainland Greece, farming communities operated within contrasting environmental regimes characterized by monsoon-driven precipitation and seasonally arid Mediterranean conditions, creating distinct challenges for long-term agricultural sustainability. This study examines these adaptive dynamics through a comparative synthesis of published stable isotope datasets ($\delta^{13}C$ and $\delta^{15}N$). Drawing on isotopic values from charred macro-botanical remains, faunal material, and human skeletal records, the paper explores how biochemical variability reflects interactions between cultivation practices and ecological constraints. The analysis focuses on three interconnected dimensions: isotopic indicators of water stress and potential irrigation; signatures of soil amendment, particularly the intensity of manuring inferred from $\delta^{15}N$ variability; and crop management strategies, including the use of C_4 millets alongside C_3 cereals to buffer against environmental uncertainty. By comparing datasets from distinct hydrological contexts, the study evaluates how agricultural resilience was structured through localized combinations of nutrient management, multi-cropping, and water regulation. The findings demonstrate that stable isotope analysis provides a high-resolution means of tracing how early agrarian societies managed resource constraints and mitigated environmental risk. Situating isotope values within broader archaeological and environmental frameworks, this approach contributes to understanding the ecological logic governing ancient agricultural systems. The results offer a deep-time perspective on human–environment interactions, highlighting long-term dynamics of sustainability, resource management, and climatic adaptation.

115. Between tradition and innovation: fluctuations in millet consumption in the Eastern Adriatic during the Bronze and Iron Ages

Authors: Valentina Martinoia (University of Udine) – Mario Carić (Institute for Anthropological Research) – Natalija Čondić (Archaeological Museum Zadar) – Slavko Galiot (Delmat Galiot Ltd) – Domagoj Perkić (Archaeological Museum Dubrovnik) – Dinko Tresić Pavičić (Kaducej Ltd) – Morana Vuković (Archaeological Museum Zadar) – Emily Zavodny (University of Central Florida) – Sarah Mcclure (University of California Santa Barbara) – Mario Novak (Institute for Anthropological Research | University of Primorska)
Format: Oral

The Bronze and Iron Ages in the eastern Adriatic were marked by major transformations in settlement organisation, subsistence strategies, and agricultural practices. Among these developments was the introduction of broomcorn millet, a fast-growing C_4 cereal well suited to the diverse and unstable environmental conditions of the Bronze- and Iron- Age Eastern Adriatic. Here, where archaeobotanical and zooarchaeological evidence remains uneven, stable isotope analysis provides a key line of evidence for assessing millet adoption in prehistoric diets. Previous isotopic research in Croatia consistently indicates predominantly C_3-based diets in coastal Bronze and Iron Age populations, with only sporadic evidence for millet consumption, while inland regions suggest more substantial incorporation of C_4 plants. Building on this background, this study presents the first regional-scale comparative stable carbon and nitrogen isotope analysis of human (n = 280) and faunal (n = 53) remains from Bronze and Iron Age contexts in the Eastern Adriatic, combined with a Bayesian two-endmember mixing model to estimate the contribution of C_4-derived dietary input. Our results indicate that millet became a significant component of human subsistence already from the Middle–Late Bronze Age transition. Faunal isotope data show no evidence for C_4 consumption among domestic animals, demonstrating that millet entered human diets primarily through direct consumption rather than via animal products. Moreover, while coastal communities display little to no evidence for millet use throughout the Bronze and Iron Age, inland groups exhibit increased C_4 input during both the Middle/Late Bronze Age and the Iron Age, although in a non-uniform and patchy manner. Overall, our findings refine the chronology of millet adoption in the Eastern Adriatic, pushing its earliest significant dietary contribution back to the Middle/Late Bronze Age transition, and highlight a context-dependent, regionally differentiated pattern of subsistence change shaped by local ecological conditions and broader social dynamics.

1865. Land Tenure and Multi-Seasonal Harvesting at Bronze Age Erdaojingzi, NE China Revealed by Integrated Archaeobotanical and Stable Isotopic Studies

Authors: Yufeng Sun (Institute of Archaeology, Chinese Academy of Social Sciences)
Format: Oral

In this research, stable isotope analysis of plants was integrated with macrofossil studies to investigate social conditions underpinning millet cultivation and mundane food production at the Bronze Age village Erdaojingzi (3600 – 3500 cal. yr BP), Northeast China. Specifically, we sought to answer two questions: 1) Did different households (or other groupings) manage cultivation collectively in similar environments, or did house groups have unequal access to (or ownership of) different farmlands? 2) Were millet harvests organized according to house group distinctions, or were they equally distributed among households? How were crops harvested in the field within this social context? Our results seem to suggest that both cultivation and harvest were configured in the context of the household economy. Millet was cultivated in environments only accessible to certain house groups, while the products were shared among household members rather than pooled across the whole community. The correlation between morphologically attested grain sizes and isotopic results indicated circumstances that grains from the same family plot were harvested multiple times sequentially, rather than in a single seasonal harvesting regime. Extensive archaeobotanical sampling at Erdaojingzi has enabled fine-grained analysis of how millet cultivation and production were woven into social conditions operating both in the field and within the settlement.

2630. Agro-Ecological Change and Settlement Decline: Stable Isotope Evidence from Medieval Deserted Villages (Czech Republic)

Authors: Libor Vobejda – Tereza Šálková Šálková (University of South Bohemia) – Lukáš Holata (Charles University) – Jan Ciglbauer (Palacký University Olomouc)
Format: Oral

The application of stable isotope analysis to the reconstruction of past agricultural systems has become increasingly widespread. Interpretations of isotopic ratios derived from archaeobotanical material are often based on combinations of modern experimental data and ethnographic analogies. In contrast, our approach integrates multiple types of archaeobotanical material originating from diverse archaeological contexts. This contribution applies stable carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) isotope analysis to reconstruct agricultural practices in deserted medieval villages and to compare them with the castle environment, understood as a locus of resource concentration and elite residence within the microregion. Stable isotope analysis of cereal grains provides a robust dataset for understanding farming practices, including manuring intensity and field location strategies. The inclusion of $\delta^{13}C$ and $\delta^{15}N$ values from arable weeds, charcoal, and wild forest fruits enables the integration of agricultural practices into a broader environmental framework, reflecting local ecological conditions. Stable isotope analysis of charcoal from different archaeological contexts further allows us to trace changes in forest management before and after the abandonment of medieval settlements. Our primary aim, however, is to contribute to the understanding of the mechanisms behind the abandonment of medieval villages through a comparative analysis of material from deserted rural settlements and from a nearby castle environment, interpreted as the microregional centre where resources from the surrounding landscape were likely concentrated. Comparing these environments allows us to identify differences that may help explain why some villages were abandoned while others persisted.

1165. The effect of manured grains on diachronic rise in δ^{15}N values in humans and animals of medieval Lithuania

Authors: Ruta Karaliute – Giedre Motuzaite Matuzeviciute (Lithuanian Institute of History)
Format: Oral

Stable isotope analysis of human bone collagen indicates a notable shift in the human diet in medieval Vilnius city (Lithuania). This shift is traditionally interpreted as evidence of increased consumption of animal-based products and/or an indicator of a higher social status individual. However, recent research suggests that additional factors may also be responsible for the observed increase in nitrogen levels within the food chain, such as agricultural reforms, deep ploughing and increased fertilization of land. As cereals constituted a significant part of the daily caloric intake of humans, changes in agricultural systems – particularly the introduction of more intensive farming practices and the expanded use of fertilizers – may have raised nitrogen baseline levels in crops and, consequently, in animal and human remains. This may ultimately bias the later interpretation of isotopic results. This study examines stable nitrogen isotope data from crops (285 samples), wild and domestic animals (240 samples) and human (564 samples) remains. It contains samples from the territory of contemporary Lithuania, dating from the Mesolithic period to the 18th century. The data indicates a correlation between major changes in agricultural practices observed around the middle of the 16th century, and rising δ15N values in crops, and, consequently, higher δ15N values in human skeletal remains. These considerations are essential for the refinement of future interpretations of past human diet and the prevention of the overestimation of animal-based food consumption in any other historical population.

1480. Exploring Long-Term Agricultural Development in the Southeastern Baltic through Stable Isotope Analysis

Authors: Kotryna Alma Bojarskaitė (Lithuanian Institute of History, Department of Archaeology) – Karolis Minkevičius – Gustė Mickevičiūtė (Vilnius University, Department of Archaeology)
Format: Oral

Stable carbon (δ^{13}C) and nitrogen (δ^{15}N) isotope analysis of archaeobotanical remains have only recently begun to be applied to the study of prehistoric farming practices and landscape management in the southeastern Baltic region. Existing stable isotope datasets from Lithuania are largely dominated by material dating from the Late Bronze Age (1100–500 BC) to the Roman Iron Age (1–400 AD), while agricultural practices of the subsequent Migration (400–800 AD) and Viking (800–1200 AD) periods remain less understood. From current evidence we know that intensive permanent-field agriculture was already in the Late Bronze Age, followed by reorganisation of agricultural practices in the Roman Iron Age. However, the lack of datasets from later periods limits our understanding of long-term prehistoric developments. This gap is particularly striking given archaeological evidence for broader changes after the Roman Iron Age in settlement patterns, functionality of hillforts, economy and social structure of the society. Archaeobotanical evidence indicates further agricultural transformation, including shifts in crop importance and emerging regional differences. In this context, stable isotope analysis offers a key tool for exploring these changes in terms of cultivation intensity, fertilisation practices, and land-use strategies that are not easily visible through plant macrofossil evidence alone. This paper presents the first stable isotope results from charred cereal grains dated to the Migration and Viking periods, recovered from a range of settlement contexts with a broad spatial and chronological representation. By integrating new data with previously published isotope datasets, the study provides new insights into previously unanalysed periods and offers a long-term perspective on agricultural development in the southeastern Baltic, tracing regional strategies of adaptation, resilience, and transformation from the Late Bronze Age through the end of the Iron Age.

2748. Crops and societies. Reconstructing Agricultural Trends through Archaeobotanical, Archaeogenetic, and Isotopic Data in Central and Eastern Europe

Authors: Julia Salova (University of South Bohemia in České Budějovice) – Leonid Vyazov (LEIZA-ZBSA Leibniz Centre for Archaeology | University of Ostrava) – Adéla Pokorná (Institute of Archaeology of the Czech Academy of Science | Charles University) – Mária Hajnalova (Constantine the Philosopher University in Nitra) – Vera Haponova (University of Edinburgh) – Ricardo Fernandes (Max Planck Institute of Geoanthropology) – Catriona Pickard (University of Edinburgh) – Jaromír Beneš (University of South Bohemia in České Budějovice)
Format: Poster

Over the last decade, large-scale archaeobotanical datasets have increasingly been employed to reconstruct supra-regional trends in agricultural development, moving beyond individual site interpretations toward broader assessments of crop distribution, land-use strategies, and economic organization. At the same time, advances in archaeogenetics and stable isotope analysis have significantly refined our understanding of population mobility, dietary practices, and social interaction in past societies. Together, these approaches provide new possibilities for examining the relationship between agricultural change and human migration. This study synthesises archaeobotanical evidence from Central and Eastern Europe between 1000 BC and 1000 CE and evaluates agricultural transformations in relation to patterns of mobility. We analyse diachronic shifts in cereal assemblages, crop diversity, and the balance between cultivated and gathered plant resources, and compare these trends with data derived from ancient DNA and isotopic indicators of diet and movement. Particular attention is given to periods of intensified mobility from the Iron Age and the Migration Period to the Early Medieval Period, when large-scale demographic shifts reshaped the cultural landscape of the region.

121 HIDING IN PLAIN SIGHT: ARCHAEOLOGICAL AND ARCHAEOMETALLURGICAL PERSPECTIVES ON NON-FERROUS METALLURGY ACROSS THE BALKANS, EASTERN MEDITERRANEAN AND MIDDLE EAST

Theme: 1. Widening perspectives in material culture studies
Organisers: Athina Nikolopoulou (National and Kapodistrian University of Athens | NCSR "Demokritos") – Demetrios Ioannides (The Cyprus Institute)
Keywords: non-ferrous metallurgy, Balkans, Eastern Mediterranean, Middle East, Archaeometallurgy
Format: Regular session

SESSION ABSTRACT

The study of technology and production forms an essential component of Archaeology, offering insights into the organisation, economy, and identity of ancient societies. Among technological practices, metallurgical production, particularly of non-ferrous metals, has been linked to the development of communities, craft specialisation, and interregional connectivity. Metallurgy evolved both independently and through interaction between metallurgists and communities, shaped by technological innovation as well as ideological and commercial exchange. The study of the chaîne opératoire - from mining and smelting to melting, refining, cupellation, casting, and object manufacture, "resonates" with broader social and cultural aspects and choices. Each stage, and the location where it was carried out, reflects decisions regarding technological choices, resource management, knowledge transmission, and the organisation of labour, embedded within distinct local and regional contexts. Interdisciplinary approaches integrating archaeological and analytical methods play a crucial role in reconstructing the production sequence and thus in unveiling aspects of specialisation, technological exchange, trade, and social stratification in antiquity. This session invites contributions focusing on metallurgical and metalworking practices across the Balkans, Eastern Mediterranean, and Middle East (BEMME). We particularly welcome papers that combine archaeological and archaeometric perspectives to investigate the production sequence of non-ferrous metals, such as copper, lead, and silver. By situating the technological evolution and choices within their cultural and socio-political framework, the session aims to highlight the diversity and interconnectedness of metallurgical traditions across the region. Completed and ongoing studies from researchers at all career stages are welcome.

CONTRIBUTION ABSTRACTS

880. Following in the footsteps of the Neolithic metalwork in north-eastern Aegean: reconstructing chaînes opératoires from archaeological material

Authors: Valentine Martin (University Paris 1 Panthéon-Sorbonne | ArScAn UMR 7041 | Free University of Berlin)
Format: Oral

The earliest metallurgical activities in north-eastern Aegean have been traced to the fifth millennium BC. These appear to have taken place locally: finished products, waste products and evidence of copper smelting have been found at nearby sites, including Dikili Tash, Sitagroi, and Promachon. However, the technological details of this craft, which consists of producing small copper ornaments (beads, rings, pins, appliques) and tools (drills, chisels, hooks, needles), remain somewhat unclear to us. To reconstruct the chaînes opératoires, a multi-scale approach must be applied to the archaeological material. Indeed, this is necessary to address the multiple issues related to its context: the Neolithic copper artefacts are mostly fragmented and tiny finds, affected by significant conservation problems, which can make any type of analysis difficult. This is without considering the challenge of identifying the structures and tools associated with these metallurgical activities. It should also be emphasised that presence in the field is, as far as possible, necessary for optimised data acquisition and conditioning. By using different approaches, we aim to adapt to the diversity and specific nature of those copper finds. Macro- and microstudies, archaeometric analyses and archaeological experiments have been combined to obtain results on the chaîne opératoire of Neolithic copper objects. Further analysis or additional methods are also being considered for future research.

2098. Copper ornaments from the Cucuteni-Dâmbul Morii settlement (Iasi County, Romania)

Authors: Radu Balaur („Alexandru Ioan Cuza" University of Iasi, Arheoinvest Center)
Format: Oral

In the Chalcolithic, copper metallurgy is a significant topic of discussion. This raised the issue of procuring raw materials and developing processing techniques. Possible workshops for the Cucuteni cultural area are mentioned at Poduri–Dealu Ghindaru, Hăbășești, or Brânzeni VIII. According to spectrum examinations, these items are typically made from native copper, with or without accompanying elements. Skilled and perhaps itinerant artisans are credited for the craftsmanship. The discovery of raw material, wires, plates, and sheets suggests that the processing procedure involves basic hammering and additional heating of the copper bars and

wires, at least for the items known to exist from the Cucuteni A-B phase. This study presents the copper artifacts found in the A-B phase settlement of Cucuteni-Dâmbul Morii. These are classified as ornamental objects, such as beads, spiral rings, and bracelets. With one exception, the copper artifacts were discovered in five different dwellings. An elemental examination was also performed for these artifacts, on the core and surface, analyzing the metal and corrosion products. For this purpose, a scanning electron microscope SEM model VEGA II LSH coupled with an EDX detector type QUANTAX QX2 was used. The investigated objects were made of copper, with no other trace of foreign elements. For one of the pieces from dwelling no. 12, a series of elements originating from corrosion was identified, an aspect that reveals the lack of the metal core and its replacement with corrosion products, thus indicating a high degree of degradation. The analyses performed on the surfaces of the artifacts identified elements originating from corrosion products and elements originating from the soil, accumulated following depositional processes. Thus, products such as oxides (CuO, Cu2O, Fe2O3, Fe3O4, SiO2, etc.) and basic carbonates (CuCO3.Cu(OH)2, CuSO4.3Cu(OH)6, etc.) were identified.

1626. Tracing Ancient Silver Production at Laurion: Integrating Ore Geochemistry, Lead Isotopes, and Archaeological Evidence

Authors: Frank Hulek – Yannis Bassiakos (N.C.S.R. Demokritos) – Kerasia Douni (Ephorate of East Attica) – Eleni Filippaki – Anno Hein (N.C.S.R. Demokritos) – Moritz Jansen (German Mining Museum) – Konstantina Kaza-Papageorgiou (The Archaeological Society at Athens) – Panagiotis Voudouris (National and Kapodistrian University of Athens)
Format: Oral

The Laurion district in southeastern Attica was one of the most important mining and metallurgical regions of the ancient Mediterranean, with silver exploitation beginning in prehistoric times. Its geological diversity and rich argentiferous lead deposits supported large-scale mining activities that played a crucial role in the economic and political development of ancient Athens. Mining started already in the Early Bronze Age, and for a long time the ore deposits of the so-called "First Contact", were exploited. Ancient written sources associate the intensification of silver production with the late 6th or early 5th century BC, yet the archaeological and chronological attribution of specific ore bodies remains problematic. This intensification has traditionally been linked to the exploitation of the so-called "Third Contact," a deep ore-bearing zone rich in argentiferous galena. However, this association relies largely on historical narratives, as secure archaeological correlations are lacking. Previous geological and geochemical research suggests that the Laurion mineralization may have been formed through more than one metallogenetic event, during, albeit, the Upper Miocene times. This paper presents results from the LAURICON project (WIDERA/Marie Skłodowska-Curie), conducted at the Laboratory of Archaeometry, NCSR "Demokritos." More than 50 plumbiferous ore samples from across the Laurion district were analyzed using mineralogical and chemical analyses to investigate any variability between ore types that are associated with the known contacts in term of differing mineralogical and/or chemical characteristics. Lead isotope analyses are in progress. In addition, approximately twenty litharge samples from archaeological excavations were studied with the same as above techniques, thus allowing links to be established between ore sources and ancient and prehistoric settlements in the wider Laurion region. By integrating archaeometric data with archaeological evidence, this study contributes to a more robust chronological framework for mining at Laurion and to broader discussions of metal production and circulation in the Aegean.

1198. Recovering the Unseen: Micro Residues and Metallurgical Practice in the Early Cycladic Bronze Age

Authors: Demetrios Ioannides (STARC, The Cyprus Institute) – Rosie Campbell (AEGIS, Université catholique de Louvain | Vrije Universiteit Brussel) – Michael Boyd (STARC, The Cyprus Institute | British School at Athens | McDonald Institute for Archaeological Research, University of Cambridge) – Thilo Rehren (STARC, The Cyprus Institute)
Format: Oral

The Keros–Dhaskalio complex constitutes a key locus of Early Bronze Age (EBA) technological practice, with small scale primary smelting and extensive secondary metalworking attested across the settlement. Within this broader industrial landscape, the present study focuses on an understudied class of evidence: copper micro residues — minute spills and droplets of molten metal recovered through the project's systematic sieving and fine fraction recovery strategy. These residues, typically lost in conventional excavation, preserve high resolution snapshots of metallurgical action at the scale of individual gestures, offering an unparalleled opportunity to examine production behaviour in detail. Microstructural and chemical analyses (optical microscopy; SEM–EDS) document the compositional variability and formation processes of these copper spills, while their secure contextual attribution allows correlations with broader assemblages of slag, metallurgical ceramics, and workshop features. Preliminary results confirm our understanding of the copper based metallurgical activities studied previously, but increase the resolution of these datasets by providing additional information on the production of arsenical copper on the site, reinforcing Dhaskalio's role as a major EBA metalworking centre. A further component of the study involves the spatial reconstruction of metallurgical activity through a 3D GIS based model charting the distribution of micro residues alongside larger metallurgical debris. The emerging patterns illustrate both the spread and character of metalworking (primary vs secondary) along the various trenches of the settlement. Together, these findings demonstrate how micro residues — recoverable only through meticulous excavation methods — can significantly refine interpretations of early metallurgical organisation, technological choice, and inter island connectivity within the evolving craft landscape of the Early Cycladic world.

576. Tracing early brass production in Southeast Arabia: Materials, provenance, and processes at Early Bronze Age Umm an-Nar (UAE)

Authors: Daniel Berger (Curt-Engelhorn-Zentrum Archäometrie) – Tatiana Valente (Department of Culture and Tourism, Abu Dhabi)
Format: Oral

Recent excavations on Umm an-Nar Island (Abu Dhabi Emirate, UAE) are reshaping interpretations of this pivotal Early Bronze Age settlement in Southeast Arabia (2700–2000 BCE). Targeted fieldwork has revealed a complex occupational sequence, including evidence for seasonal aggregation, ritual activity, and extensive long-distance exchange networks linking the Gulf with Mesopotamia and the Indus Valley. Of particular relevance are copper-based fragments of objects and small, unworked prills/ingots, which indicate frequent use and circulation of metal on the island despite the absence of clear evidence for on-site production. Here we present archaeometallurgical results for a selected set of ten metal items, simple strips, pins or wire fragments, and casting waste, analysed by chemical methods and lead isotope analysis; three specimens preserved in metallic form were additionally examined metallographically. EDXRF analyses yielded unexpected compositions: two artefacts contain remarkably high zinc concentrations of 25 and 27 mass%, while a third is characterised by very high lead of 18 mass% alongside 5% zinc. Because these materials derive from recent excavations in undisturbed contexts securely dated to the Bronze Age, they represent, to date, three of the earliest known brass objects not only in Southeast Arabia but globally. These findings raise fundamental questions concerning raw-material provenance, the source and introduction of zinc, and the metallurgical pathways by which zinc could have been retained through smelting and remelting. The talk addresses these issues to provide new insights into the site's history and its wider cultural and economic entanglements.

473. A metal detector survey of el-Ahwat reveals the largest bronze working assemblage in the early Iron Age southern Levant

Authors: Karan Desai (University of Haifa) – Shay Bar (Zinman Institute of Archaeology, University of Haifa) – Michal Artzy (The Leon Recanati Institute for Maritime Studies, University of Haifa) – Tzilla Eshel (School of Archaeology and Maritime Cultures, University of Haifa | Zinman Institution of Archaeology, University of Haifa)
Format: Oral

Copper and bronze artifacts recovered from the early excavations at el-Ahwat, situated in the central hill country of the Southern Levant, significantly challenge previous expectations concerning metallurgical practices in the region's marginal areas during the Early Iron Age [1-2]. To fully understand the scale and scope of the bronze working industry at the site and to elucidate the chaîne opératoire of bronze production, a metal detector survey (MDS) was conducted throughout the entire site. The survey revealed 265 copper based artifacts, 91 of which were identified as belonging to bronze working debris (denoted spills). This is contrast to other bronzeworking sites in the Early Iron Age in the Southern Levant, which usually indicate small scale operations, focused on recycling [3]. The metal spills were subsequently analyzed using portable X-ray fluorescence (pXRF) to better understand their bulk compositions. Although the use of pXRF on oxidized surfaces does not yield quantitatively verifiable results, the data does suggest certain consistent patterns, enabling interpretations regarding possible bronze working practices. Specifically, the analysis indicated lower sulfur values in bronze spills compared to copper spills. Furthermore, tin values within the bronze show a distinct bimodal distribution between samples with less than 2 wt% Sn and samples clustering around 9 wt% Sn. Based on these results, we propose two principal conclusions: first, that imported copper was likely refined prior to being alloyed with tin; and second, that the bronze production system employed two parallel processes. One process involved the manufacturing of high-tin bronze by alloying new copper with tin metal, while the other produced low-tin bronze, likely as a result of recycling bronze scrap mixed with pure copper.

331. Scientific studies of Balkan white metal jewellery of the 19th-20th centuries

Authors: Quanyu Wang (Shandong University)
Format: Oral

Blue copper corrosion was identified on Balkan 'silver' jewellery in preparation for the exhibition 'Traditional jewellery and dress from the Balkans" at the British Museum. How can copper corrosion products be present on white metal thought to be 'silver'? Does the 'silver' contain copper and what its purity is? These questions prompted scientific examination of the metals used for the jewellery, including 90 Bulgarian and 30 Yugoslav pieces. It was hoped that the technical investigation would help better understand the materials used and contribute to the wider study of 19th to 20th century Balkan jewellery. The objects were analysed by X-ray fluorescence spectroscopy, from which some items were selected for metallography and compositional analysis using SEM-EDX. They were found to have been made using a variety of alloys, including copper-silver-arsenic (Cu-Ag-As), copper-silver, copper-nickel-zinc (Paktong), copper-nickel (cupronickel), copper-zinc (brass), copper, silver, as well as arsenic brass. No association between jewellery types and the alloys used for their production has been found. Most of the items studied have multi-components which are soldered together. The Cu-Ag-As alloys were found to be dominant among the jewellery and were used for the main components in the majority of the items. Silver plating and gilding have been applied to some pieces. The alloys of Cu-Ag-As are similar to aghiari, an alloy of copper-silver widely used in Greek traditional jewellery with silver contents of less than 50% and arsenic being added to produce a silvery colour. It seems that aghiari-type alloy may have been widely used in Balkan traditional or folk jewellery to reduce material cost.

1075. Functional assessment of bronze weapons from a "warrior burial" at Plasi Marathon: archaeological and analytical perspectives

Authors: Angeliki Charalampous – Michel Roggenbucke (National and Kapodistrian University of Athens) – Eleni Filippaki (NCSR "Demokritos") – Yiannis Papadatos (National and Kapodistrian University of Athens)
Format: Oral

The excavations of the National and Kapodistrian University of Athens at the site of Plasi, in Marathon, revealed a burial dating to the beginning of the Late Bronze (Late Helladic I phase), which was accompanied by four bronze weapons, a sword, a knife, a spearhead and a dagger. Despite the fact that such burials have traditionally identified as "warriors", serious doubts have been expressed about the identity of the deceased. For this reason, important parameters for their identification as warriors is the technological and functional characteristics of the weapons, as attested by the composition of the alloys that were used for their manufacture, and the metalworking techniques that were employed. The choice of appropriate alloys and metalworking practices is essential for achieving the mechanical properties required for a weapon to be functional in combat. Consequently, this information can provide important insights into whether these weapons were intended for practical use or had a more symbolic role, emphasizing other aspects, such as the social status or the political power of the deceased. To address these questions, three analytical techniques were applied on the weapons from Plasi, X-ray fluorescence technique, using a portable device (p-XRF), scanning electron microscopy (SEM) coupled with an energy dispersive spectrometer (EDS) and optical microscopy (OM). The results of these analytical techniques not only provided valid answers to questions regarding the utility of these weapons, but revealed also a much more complex picture, which will be discussed within the broader context of early Mycenaean warrior ethos.

1051. Casting strategies of Eneolithic shaft-hole axes from Poland. An archaeometallurgical study of hammer-axes from Kałdus and Karłowice Małe

Authors: Jędrzej Kubiak (Nicolaus Copernicus University in Toruń)
Format: Poster

In studies of the oldest copper metallurgy in Central Europe, the technology used to produce massive axes is of key importance. There are several more or less confirmed hypotheses about the methods used to cast these objects, which point to the possibility of using open sand moulds, single-piece or two-part moulds, cores or piercing the shaft holes. The presented research focuses on reconstructing the production technology of two Eneolithic copper axe-hammers from the area of present-day Poland. The first one was part of a treasure discovered at the Funnel Beaker Culture site in Kałdus, which dates back to the second half of the 4th millennium BC. The second axe is an out-of-context find from Karłowice Małe, which can be linked to the Funnel Beaker Culture or the Lendzielsko-Polgar Culture and dated to the end of the 5th and the first half of the 4th millennium BC. The research involved elemental composition analysis, casting defect analysis and surface structure analysis of the original hammer axes and their copies, which were obtained during experimental casting sessions conducted under semi-controlled conditions. The experimentally obtained traces and casting defects on the copies of the hammer axes are consistent with those observed on the original artefacts. The results of experimental casting allow us to conclude that the analysed axes were cast in sand and clay moulds, and the hole for the handle was pierced after casting or formed using a core. The research complements our knowledge of axe production technology in Central Europe in the 4th millennium BC and provides a good starting point for further experimental and comparative research in this field.

2353. Forms of Copper and Modes of Circulation in the Bronze Age Aegean

Authors: Athina Nikolopoulou (National and Kapodistrian University of Athens | NCSR "Demokritos")
Format: Poster

Copper ingots are among the most recognizable metal forms of the Bronze Age Aegean and are generally understood as deliberately cast units intended for storage and transport. Their recurring morphology reflects shared technical practices and an awareness of copper as a measurable and transferable resource within emerging exchange systems. By contrast, axes are typically interpreted as functional tools marking the completion of production. Yet in many cases, their formal consistency and comparable weight ranges invite reconsideration of their role within early systems of distribution. Selected archaeometric observations further indicate convergences in both composition and certain aspects of metal processing between axes and ingot material, raising the question of whether the two categories operated within the same broader framework of copper circulation. Approaching the evidence in this way shifts attention from strict typological divisions to the organization of copper itself. Rather than assuming a clear separation between raw material and finished artefact, it becomes possible to consider that different forms of copper — including ingots and axes — could participate in parallel modes of storage, transfer, and redistribution. In this perspective, metal mobility in the Bronze Age Aegean appears structured, yet not limited to a single formal expression.

122 MIGRATION AND MOBILITY: ADVANCES IN EXPLORING THE BELL BEAKER PHENOMENON

Theme: 7. Interaction, connectivity and mobility
Organisers: Nicoline Schjerven – Fredrik Dahlberg (Department of Historical Studies, University of Gothenburg) – Julien Vitani (University of Paris 1 Panthéon-Sorbonne)
Keywords: Bell Beaker, Mobility, Migration
Format: Regular session

SESSION ABSTRACT

In this session, we aim to explore the Bell Beaker migration and mobility during the pivotal period of the 3rd millennium BC. Human mobility and interaction between cultures are central themes in the development of interdependent networks between populations. Migration, whether driven by necessity, opportunity, or curiosity, has long facilitated the formation of social and economic networks. When people travel, they carry with them not only objects but also knowledge, ideas, and beliefs, all of which develop through contact and exchange with other communities. The Bell Beaker phenomenon is an enigmatic area of study through which to trace these processes. The scientific contributions to mobility studies (e.g., isotopes, aDNA, 14C) have changed how we address migration and mobility research. We can explore the complex relationships between people, places, and practices through increasingly larger data sets, however, it also requires a discussion what these contributions mean for our understanding of prehistory. We welcome papers and posters that address, but are not limited to, the following topics: · Gendered dimensions of mobility · Circulation and communication of people, materials, and ideas · Scientific contributions to mobility studies (e.g., isotopes, aDNA, 14C) · Intersections between individual agency and collective dynamics This session encourages both case studies and theoretical reflections that contribute to a more nuanced and methodologically integrated understanding of Bell Beaker networks.

CONTRIBUTION ABSTRACTS

367. Migrations and admixture of Late Neolithic European populations and the emergence of Corded Ware and Bell Beaker cultures

Authors: Eva-Maria Geigl (University Paris Cité - CNRS - Institut Jacques Monod) – Oguzhan Parasayan – Thierry Grange (Université Paris Cité - CNRS - Institut Jacques Monod)
Format: Oral

Archaeological evidence points to the 3rd millennium BCE as period of great changes that ultimately ended the Neolithic. Cultural elements from the eastern European steppes expanded westwards into Central Europe catalyzing the emergence of the Corded Ware Culture (CWC), which spread into northern Europe. Archaeogenetic research has shown that the spread of the CWC was associated with the spread of the steppe-ancestry, well documented in central and northern/northwestern Europe, to the exclusion of France. On the other hand, and just a few centuries later, the Bell Beaker phenomenon (BBP) arose and spread at unprecedented speed over Europe creating a pan-European cultural network. Its origin, however, is still not universally accepted owing mainly to chronological problems. While the spread of the BBP was associated with the spread of steppe-ancestry, its early expressions and occurrences were not, rendering the situation inconclusive. We generated whole genome sequences of Late Neolithic individuals in the Paris Basin and conducted a high-resolution analysis of ancient genomes in 3rd millennium BCE Europe. The analyses revealed the hitherto unknown Europe-wide dynamics of population admixtures during this period that coincide with the major cultural transitions. The data allowed us to elaborate a model that proposes a synthesis of archaeological and genetic evidence to explain the emergence of the BBP in the 3rd millennium BCE and the associated restructuring of the genetic landscape in Europe.

590. The Bell Beaker Phenomenon in the Southern Upper Rhine Valley: Vessel Decoration as a Means of Identification?

Authors: Katalin Puster (Eberhard Karls Universität Tübingen | Landesamt für Denkmalpflege im Regierungspräsidium Stuttgart)
Format: Oral

The Upper Rhine region is a key area for current research into the Bell Beaker Complex. According to the latest findings, it could be the melting pot in which the typical Bell Beaker Phenomenon emerged, and the starting point from which it spread. A comprehensive archaeological and anthropological study of graves in South Baden, compared with those in the southern Upper Rhine Valley, reveals evidence of flexible gender roles and distinct ceramic decoration development in the latter region. In this area, it seems that vessel decoration served as a means of identification within the Bell Beaker East Group. The corded pottery, which was particularly influential in the early stages, and the absence of metope decoration, which is typical of the Western Group, alongside the clear burial customs, which are typical of the Eastern Group, illustrate the area's independent role. This self-definition could be based on the region's special historical role and geographical location as the westernmost part of the Bell Beaker East Group.

951. Mobility, Inequality and Funerary Practices during the Bell Beaker Period: A Transnational Perspective

from the Rhine to the Seine Valleys

Authors: Lisa Gaignard (Paris 1 Panthéon-Sorbonne | UMR 8215, Trajectoires) – François Giligny (Paris 1 Panthéon-Sorbonne | CNRS, Centre National de la Recherche Scientifique | UMR 8215, Trajectoires) – Clément Nicolas (CNRS, Centre National de la Recherche Scientifique | UMR 8215, Trajectoires) – Alessandra Varalli (Aix-Marseille Université | CNRS, Centre National de la Recherche Scientifique | Ministère de la Culture | UMR 7269, Lampea | INRAP, Institut National de la Recherche en Archéologie Préventive)
Format: Oral

The Bell Beaker phenomenon is characterized by the wide circulation of grave goods, ideas and people across large parts of Europe. The region extending from the Rhine Valley to the Seine Valley represents a key cultural crossroads between Central Europe and the Atlantic façade, making it a particularly relevant area for investigating patterns of mobility during the Bell Beaker period. Funerary practices offer a privileged perspective on both social inequality and mobility. This communication will presents the preliminary results of an ongoing research project (Master's thesis and newly started PhD) synthesizing published data on Bell Beaker burials from a transnational perspective. The dataset has been carefully selected using a combination of geographical, geological and archaeological criteria, in order to reduce interpretative biases. Structure were selected using a polythetic approach to ensure secure attribution to the Bell Beaker phenomenon while preserving the wide diversity of funerary practices. The analysis highlights the considerable variability of funerary practices observed across the Rhine–Seine landscape, including differences in burial architecture, body treatment, grave goods and biological informations of the individuals. This variability reflects social hierarchies at both the individual and populations levels, while also pointing to varying degrees of cultural connectivity and mobility. The spatial distribution of burial types suggests the coexistence of local traditions and shared supra-regional norms, indicating the circulation of ideas alongside the possible movement of individuals. By integrating funerary evidence within a broader geographical framework, this study provides new insights into exchange networks and mobility patterns during the Bell Beaker period. This communication will also outlines future research directions, including the integration of published ancient DNA data and the generation of new isotopic analyses, which will allow a more refined discussion of individual mobility and its relationship to social inequality.

296. Gender, Mobility and Transregional Marriages in Beaker Central Europe

Authors: Jan Turek (Center for Theoretical Study, Charles University, Prague)
Format: Oral

When analysing levels of population mobility in prehistory, one potential indicator is particularities within burial assemblages. For the Corded Ware and Bell Beaker periods, these considerations also involve the gendered symbolism of burial ritual and gender-specific grave goods. The Bell Beaker period is commonly associated with long-distance contacts and marriages of individuals across the so-called Chalcolithic Frontier in north-western Europe (Brodie 2001). An illustrative example is the high-status burial of the Amesbury Archer. Isolated occurrences of exotic artefacts within culturally distinct settings may likewise be linked to a form of individual mobility. Examples include a wholly unique burial containing Coțofeni-style pottery in the Moravia region (Czech Republic) and occurrences of Bell Beaker and Proto-Nagyrév pottery in the Vojvodina and Srem areas (Serbia), both located roughly 500 km from the artefacts' common distribution. Recently traces of four wheeled carriages were identified in some elite Corded Ware burials in Moravia, perhaps indicating an eastern origin of the individuals buried with them. Differences in burial rite may also testify to long-distance marriage. It is possible that nearly 20 % of all Bell Beaker burials in Moravia that diverge from the regional norm by employing cremation represent women married in from the Carpathian Basin, where cremation predominated. This interpretation is further supported by the presence of female-gendered grave goods accompanying these burials.

822. Moving People, Shifting Societies: Mobility and Social Reorganization in the Neolithic Alps

Authors: Jocelyne Desideri (Archaeology of Africa & Anthropology - ARCAN, University of Geneva) – Anouk Bystritzsky (InSitu Archéologie SA, Sion) – Massimo Chiaradia (Department of Earth Sciences, University of Geneva) – Mila Courlet (Archaeology of Africa & Anthropology - ARCAN, University of Geneva) – Julie Debard (InSitu Archéologie SA, Sion) – Anja Furtwängler – Johannes Krause (Max-Planck-Institute, Leipzig) – Antoine Mailhot – Axelle Paszkowiak – Déborah Rosselet-Christ (Archaeology of Africa & Anthropology - ARCAN, University of Geneva)
Format: Oral

The SNSF-funded project ALPS (10521F-205059; 2022–2026) examines Neolithic societies (c. 5500–2200 BCE) of the Swiss–Italian Alps, a mountainous corridor where environmental constraints and cultural interactions jointly shaped long-term social trajectories. By mobilizing an integrated analytical framework - combining stable isotope geochemistry, dental nonmetrics, ancient DNA and palaeopathology - the project interrogates how diet, mobility and social organization co-evolved in early Alpine agropastoral communities, with a particular focus on the Bell Beaker period as a moment of major social reconfiguration. ALPS is anchored in a uniquely continuous funerary record from eleven necropolises, including Petit-Chasseur (Sion) and Saint-Martin-de-Corléans (Aosta), encompassing nearly 400 individuals from the Middle Neolithic to the Bell Beaker period. This diachronic, spatially coherent dataset offers a rare opportunity to trace biological and social change within a well-defined Alpine territory over more than three millennia. Multi-isotopic analyses ($^{87}Sr/^{86}Sr$, $\delta^{18}O$, $^{143}Nd/^{144}Nd$), combined with dental and genetic markers, show that although

the overall proportion of non-local individuals remains relatively stable across the Neolithic (around 30%), the Bell Beaker period is distinguished by a specific social pattern of mobility. In contrast to the Late Neolithic, when mobility is strongly male-biased and includes children, Bell Beaker mobility remains substantial but is largely restricted to adult males. When considered alongside funerary practices, this pattern points to a reorganization of gender roles, integration strategies and social differentiation, supporting the interpretation of the Bell Beaker period as a distinct social configuration rather than a simple continuation of earlier Neolithic dynamics.

2571. Settlement site selection, distribution of buildings: legacies of mobility on the Loriol Bell beaker site, Rhône Valley, France.

Authors: Karine Raynaud (Eveha Agence de Lyon)
Format: Oral

In this presentation, we aim to explore how Loriol domestic site provide new data regarding the mobility of ideas, knowledge and traditions during the end of the 3rd millennium BC. Considering the choice of site location, congregated dwellings, architectural standards and relation ship to natural environment, the Loriol site appears as a imported model. Specifically built at the confluence of the Rhône and Drôme rivers, orientation of Bell Beaker dwellings show a common denominator with remote area as north of Swiss Plateau or Netherlands; it supports the idea of a physical relocation of the occupants. If lack of typical domestic features lead to questions about economic and material life, search for a broad-spectrum environment is illustrated by the selected living space, wheter temporary ("on the way to") or permanent. Apart of that, livestock farming and agriculture refer to a cultural background supposed to follow or accompany human mobility and interaction between local cultures.

29. From cerealisation to mobility

Authors: Jens Johannsen (The Agency for Culture and Palaces, Denmark)
Format: Oral

The presentation highlights the role of subsistence practices in Bell Beaker mobility. In the Late Neolithic of Southern Scandinavia, the influence from the Bell Beaker Phenomenon includes a shift toward greater reliance on plant-based subsistence. This shift is reflected, among other things, in crop diversification and changes in material culture. The new subsistence practices led to increased food production and more sedentary lifeways. Sedentism and enhanced food availability are well-known drivers of demographic expansion, and this cerealisation of Southern Scandinavia thus appears to have supported substantial population growth, which in turn generated waves of human mobility across the region. Archaeological evidence suggests that these movements initially radiated from Jutland into western Sweden and southwestern Norway, followed by later dispersals from western Sweden into eastern Denmark and eastern Norway. These intertwined developments contributed to the gradual cultural and genetic unification of southern Scandinavia, laying the groundwork for the emergence of the Nordic Bronze Age.

125 MERC ROUNDTABLE: PUBLISHING MEDIEVAL ARCHAEOLOGY — STRATEGIES, CHALLENGES, AND OPPORTUNITIES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Jakub Sawicki (Institute of Archeology of the Czech Academy of Sciences) – Aleks Pluskowski (University of Reading) – Pam Crabtree (New York University) – Andreia Rodrigues (University of Évora)
Speakers: Cécile Lagane (Université de Caen Normandie) – Roland Filzwieser (University of Vienna) – Rosie Bonté (Brepols) – Miroslav Dejmal (Masaryk University) – Magdalena Bis (Polish Academy of Sciences) – Maciej Radomski – (Polish Academy of Sciences) – Emma Lockwood (Routledge Taylor and Francis Group) – Piotr Strzyż (University of Lodz)
Keywords: science studies, global middle ages, publishing, editorial, medieval europe, Evaluation
Format: Round table
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

Medieval archaeology differs from other "branches" of archaeology not only in its chronological scope but also in its specific thematic focus. This distinctiveness stems from the close integration of archaeological research with a broad range of non-archaeological sources, which often shape the subjects and approaches adopted by specialists in this field. Such factors strongly influence what and how we publish, the structure of scholarly works, and the nature of the key problems addressed. Publication practices and priorities vary considerably across regions and countries, reflecting differing research traditions, interpretative frameworks, and even nation-building narratives. At the same time, the contemporary academic environment imposes further constraints on publication strategies, as national evaluation systems frequently prioritise certain journals or databases (for example, the Polish journal ranking system assigning points, or the emphasis on SCOPUS and WoS-indexed journals in the Czech Republic). These mechanisms inevitably shape how and where researchers choose to publish their results. Conversely, there is a growing call to open medieval

archaeology beyond its traditional "national" frameworks — to internationalise and even globalise its research questions, ensuring that the discipline does not become a scholarly enclave. Within this context, a number of issues remain open for discussion: How can our publications effectively reach their intended audiences amid the growing volume of academic output? What balance should be struck between publishing in national languages and in English to ensure accessibility and visibility? This Roundtable brings together editors-in-chief of leading medieval archaeology journals from across Europe to reflect on the current state of the discipline and its publication landscape, and invites a wider audience to join this stimulating discussion.

126 ISOTOPIC AND MULTI-PROXY INSIGHTS INTO PALAEOCLIMATE, ECOSYSTEMS AND PREHISTORIC HUMAN DECISION-MAKING IN EURASIAN PREHISTORY

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Mónica Fernández García (University of Lancashire | IPHES-CERCA) – Jennifer Jones (University of Lancashire) – Rosa Arniz-Mateos (Leibniz Zentrum für Archäologie, LEIZA)
Keywords: biogeochemistry, palaeoecology, palaeoclimate, human adaptation, Prehistory, Eurasia
Format: Regular session
Affiliation: Palaeolithic and Mesolithic Community - PaM

SESSION ABSTRACT

Climatic and environmental conditions influence human behaviour and choices in the present, just as they did in the past. Over the past decades, advances in biomolecular approaches to the archaeological record have provided new tools to study past ecological and biological processes, enabling access to quantitative data to characterise ancient climates and ecosystems. These methods can be applied to a variety of commonly recovered bioarchaeological remains - such as animal bones (small and large mammals, fish, birds), mollusc shells, charcoal, and sediments - offering new insights into climate oscillations and human-environment interactions. This session will focus on reconstructing past climate and ecosystem dynamics across diverse Eurasian ecosystems from the Pleistocene to the Middle Holocene, and on evaluating the impact of changing conditions on prehistoric human populations, from Palaeolithic hunter-gatherer-fisher groups to the first Neolithic agricultural and pastoral communities. The session will primarily focus on stable isotope and geochemical techniques ($\delta^{18}O$, $\delta^{13}C$, $\delta^{15}N$, Sr, $\delta^{34}S$, Ca, etc.) applied to bioarchaeological remains as proxies for reconstructing long- and short-term palaeoclimatic records. Studies incorporating biomolecular approaches (e.g., proteomics, metabolomics) and spectroscopic techniques for trace-element analysis of calcium carbonates (e.g., LIBS, LA-ICP-MS, ICP-MS) are also welcome. The session aims to characterize Quaternary climatic fluctuations, such as glacial-interglacial dynamics, and to evaluate their impact on human decision-making processes. It will also compare methodologies to assess their strengths and limitations, fostering an interdisciplinary dialogue on human-environment interactions. Open science principles (e.g., data sharing, repositories) and strategies for data management will be discussed not only to support collaborations and research transparency, but to strengthen the reproducibility of palaeoclimate and ecosystem reconstructions. By integrating past climate evidence with open science, this session will offer perspectives relevant to present and future climate change and resource management, drawing on prehistoric examples of adaptability and sustainability during abrupt climate shifts.

CONTRIBUTION ABSTRACTS

1747. Palaeoclimatic reconstructions using oxygen stable isotopes of bison tooth enamel: preliminary results from Notarchirico (southern Italy).

Authors: Lilian Reiss (UMR 7194, CNRS, Museum National d'Histoire Naturelle) – Beniamino Mecozzi (Independent researcher) – Francesca Alhaique (Museo delle Civiltà) – Marta Arzarello (Università degli Studi di Ferrara) – Michael Joachimski – Christoph Mayr (Friedrich-Alexander-Universität Erlangen-Nürnberg) – Alessio Iannucci – Raffaele Sardella (Sapienza Università di Roma) – Kate Britton (University of Aberdeen) – Marie-Hélène Moncel (UMR 7194 HNHP, CNRS, UPVD, Muséum National d'Histoire Naturelle, Paris)
Format: Oral

The Middle Pleistocene site of Notarchirico (Venosa Basin, Basilicata, southern Italy) represents a key site for some of the earliest Acheulean occupations in Europe and covers a sequence of almost 100 ka, documenting different climatic conditions throughout both interglacial and glacial periods. Here, we present preliminary results of palaeotemperature reconstructions using oxygen stable isotopes from bison enamel phosphate, which provide time-series proxy data for the isotopic composition of local precipitation ingested by this obligate-drinking herbivore. Bison teeth from different archaeological layers were sampled sequentially to obtain a high-resolution isotopic information and to capture seasonal climatic shifts. Samples originated from layers D and E (approx. 657 – 660 ka), both of which can be attributed to Marine Isotope Stage (MIS) 16, and layer I1b (approx. 690 ka), which corresponds to MIS 17. $\delta^{18}O$phosphate generated so far indicate a more strongly seasonal environment and generally cooler winter periods during MIS 16 than during MIS 17, with data from MIS 17 showing less pronounced seasonal variability and indicating slightly warmer and more humid conditions overall. While pilot data should be considered preliminary, slightly warmer mean annual temperatures were calculated for MIS 17 than for MIS 16 at this location. These initial results provide direct evidence of climate variability throughout the Notarchirico sequence and are consistent with other large mammal biochronological data, which suggest warm-temperate conditions during MIS 17 and cooler conditions during MIS 16.

1828. Reconstructing seasonal mobility and home ranges of European Late Pleistocene reindeer using multi-isotope analysis, niche modelling, and spatial assignment

Authors: Sarah Barakat (Department of Archaeology, University of Aberdeen) – Mael Le Corre (Department of Archaeology, University of Aberdeen | BioArch– UMR 7209, Muséum national d'Histoire naturelle) – Elodie-Laure Jimenez (Department of Archaeology, University of Aberdeen) – Rebecca Lam (CREAIT Network, Memorial University, St. John's) – Vaughan Grimes (Memorial University, St. John's) – Olivier Bignon-Lau (Technologie et Ethnologie des Mondes Préhistoriques) – Emmanuel Discamps (TRACES, University of Toulouse Jean Jaurès) – Kate Britton (Department of Archaeology, University of Aberdeen)
Format: Oral

Reconstructing Late Pleistocene prey-species palaeoecology provides insights into the ecological plasticity of ungulate taxa and is essential to understanding human behaviours, hunting strategies and landscape use. Strontium (87Sr/86Sr) isotopic analysis is commonly used to assess the geographical origins of remains; and advances in mass spectrometry and sampling methods have produced increasingly high-resolution data. Despite this, interpretation of 87Sr/86Sr data in overly homogenous or heterogenous lithologies landscapes remains challenging. Multi-isotope analysis should be implemented to enhance precision, and sulfur isotope approaches are emerging as a leading, complementary technique. Sulfur, δ34S, found in bone collagen alongside carbon (δ13C) and nitrogen (δ15N), can be used in mobility studies due to natural variations in sulfur values across differing lithologies and strong influences from the sea-spray effect; this allows identification of mobility over geologically varied regions and with distance to the sea. By combining 87Sr/86Sr and δ34S isotopic analyses archaeologists can explore life movement histories and infer species-specific spatial behaviours, alongside investigating dietary niches. Building on recent 87Sr/86Sr experimental studies, isoscape mapping, and isotope niche modelling– alongside the increasing knowledge of δ34S isotopic spatial (and temporal) variability– this study combines techniques to explore variability in migratory behaviours of Late Pleistocene reindeer. We present a combination of intra-tooth 87Sr/86Sr, with bulk bone collagen δ34S, δ13C, and δ15N data from Late Pleistocene (MIS 5 to MIS 2) reindeer across the Paris Basin, Aquitaine Basin, and Pyrenees to compare mobility and dietary behaviours through time. Red deer, equids, bovines, and roe deer palaeoecology are also discussed in reference to reindeer. Results show movement patterns between the river basin regions of France through time, while δ34S data show refined home range sizes of the key prey ungulates. This approach permits new insights into long-term changes in the migratory behaviour of reindeer in relation to environmental and climatic changes.

2208. Isotopic perspectives on mammoth ecology and human subsistence in Geißenklösterle and Hohle Fels

Authors: Manhon Mouhat Bourquard – Britt Starkovich – Nicholas Conard – Hervé Bocherens – Dorothée Drucker (Senckenberg Centre for Human Evolution and Palaeoenvironment | University of Tübingen)
Format: Oral

The Middle Palaeolithic-Gravettian transition (ca. 60,000 to 30,000 cal BP) in the Swabian Jura marks a pivotal shift in human-environment interactions. Focusing on the woolly mammoth (*Mammuthus primigenius*), this research investigates its dual role as both a landscape engineer and a crucial resource for hunter-gatherer societies. This study presents a high-resolution chronological and isotopic reassessment of mammoth remains from the complete sequences of Geißenklösterle and Hohle Fels. We employ a multi-proxy approach, integrating collagen stable isotope ratios ($\delta^{13}C$, $\delta^{15}N$, $\delta^{34}S$) from mammoth and associated large mammals to reconstruct the palaeoecological conditions of the Middle Palaeolithic to Gravettian succession. The isotopic results will be compared to other local environmental proxies such as pollen and micromammals. By analysing these sequences, we investigate how MIS 3 climatic fluctuations influenced mammoth mobility, paleobiology, and consequently, human prey selection and raw material procurement. Our results refine the understanding of ecological niche partitioning during the Middle to Upper Palaeolithic transition, providing a robust framework for regional comparisons and enabling us to assess correlations between climatic events and shifts in resource management, specifically clarifying Pleistocene human-mammoth interactions. Sulfur isotopic values reveal an increase in mammoth mobility at Hohle Fels during the Gravettian compared to the Aurignacian, possibly driven by increased climatic pressures and the intensified hunting practices of Gravettian populations. This research provides a robust quantitative dataset for reconstructing the Swabian Jura's "mammoth steppe" dynamics and contributes to a broader Eurasian synthesis of human-environment interactions. Furthermore, this work evaluates cultural transitions and the adaptability of Palaeolithic groups to climate variability, providing long-term perspectives on human resilience. By integrating paleoclimatic and faunal evidence, it also clarifies the socio-economic importance of megafauna. Ultimately, this research provides a high-resolution perspective on hunter-gatherer adaptability and human–environment dynamics in Central Europe.

2252. A regional palaeoenvironmental synthesis of the MIS 3-2 transition in Iberia through stable isotopes

($\delta^{18}O$, $\delta^{13}C$) on small-mammal remains

Authors: Mónica Fernández García (University of Lancashire | IPHES-CERCA)
Format: Oral

This study presents the first regional synthesis of palaeoenvironmental evolution in the Iberian Peninsula based on stable oxygen and carbon isotope ($\delta^{18}O$, $\delta^{13}C$) analyses of rodent tooth remains covering the MIS 3–MIS 2 transition. Rodents, commonly found in archaeological deposits, are sensitive tracers of local environmental conditions, providing high-resolution insights into landscape structure and climatic parameters associated with the conditions experienced by human occupations. This period is crucial for evaluating environmental dynamics linked to the progressive extinction of Neanderthals in Iberia, as well as the arrival and consolidation of modern human populations in the region, largely characterised by short and recurrent occupations until the advanced Upper Palaeolithic. The Iberian Peninsula played a key role as a refugium during unstable (MIS 3) and cold phases (such as the Last Glacial Maximum); however, environmental responses were spatially heterogeneous, and Mediterranean areas may have oscillated between temperate, favourable conditions and episodes of increased aridity. The synthesis includes sites with MIS 3 deposits (Abric Romaní, Teixoneres) as well as sequences spanning the MIS 3–MIS 2 transition (Xaragalls, Cova de l'Arbreda, Cova de les Cendres, Cova de les Malladetes and Cova Foradada), covering approximately 60,000 to 20,000 years ago. The dataset combines results from both phosphate and carbonate fractions within a unified interpretative framework, allowing direct regional comparison and integration with equivalent datasets and other proxies. The combined isotopic record indicates a predominance of Mediterranean environmental conditions, with generally temperate temperatures comparable to present-day values and no abrupt shifts throughout the sequences. Subtle isotopic variations suggest episodes of increased aridity and humidity, tentatively correlating with stadial and interstadial phases. Integrating multiple isotopic records at a regional scale, this work presents a regional isotopic curve that refines palaeoenvironmental reconstructions and contextualises human settlement patterns in the Iberian Peninsula during the MIS 3–MIS 2 transition.

1902. Pre-Holocene Climate Variability in Crete from Speleothem Stable Isotopes and Trace Elements

Authors: Vasile Ersek – Dimitra Skoulikari (Northumbria University) – George Iliopoulos (University of Patras) – Chuan-Chou Shen (National Taiwan University) – Diana Sahy (British Geological Survey) – Micheline Campbell – Hubert Vonhof (Max Plank Institute for Chemistry) – James Bendle (University of Birmingham)
Format: Oral

Crete occupies a strategic position at the crossroads of European, African, and Asian climate systems, yet it remains conspicuously absent from regional palaeoclimate syntheses covering the pre-Holocene. Here we present the first speleothem-based Last Glacial climate reconstruction for the island, using stalagmites from Chainospilios cave in central Crete. Preliminary U-Th dating indicates growth spanning ~55,000 years BP, encompassing the Last Glacial Maximum, and the Younger Dryas. Stable isotope analyses ($\delta^{18}O$, $\delta^{13}C$) are used to reconstruct regional hydroclimate variability and vegetation dynamics, while LA-ICP-MS trace element analysis will capture local environmental signals around the cave site. Together, this multi-proxy approach will reveal how this climatically sensitive region responded to major global climate perturbations and to other known regional climate events. These records will provide critical palaeoenvironmental context for Late Pleistocene faunal extinctions and early human presence on Crete, offering new evidence on human-environment interactions during abrupt climate shifts in the Eastern Mediterranean.

423. Seasonality from Mg/Ca ratios of Patella spp. during the Mesolithic-Neolithic transition in Žukovica cave (Korčula, Croatia)

Authors: Rosa Arniz-Mateos (Leibniz Zentrum für Archäologie) – Dinko Radić (Centar za kulturu, Vela Luka) – Stašo Forenbaher (Independent scholar) – Preston Miracle (McDonald Institute for Archaeological Research University of Cambridge) – Niklas Hausmann (Leibniz Zentrum für Archäologie)
Format: Oral

Mg/Ca ratios of shell calcium carbonates can be used to determine the seasonality of mollusc collection at archaeological sites. Previous studies using modern and archaeological specimens have confirmed the potential of trace element analysis and techniques such as laser-induced breakdown spectroscopy (LIBS) to provide relevant information about human behaviour and site use of prehistoric groups during the mid-Holocene in the Mediterranean. Establishing shell collection patterns is crucial to understand subsistence strategies and coastal settlement patterns of these populations. In the present study, we analysed archaeological mollusc shells (*Patella* spp.) from the Late Mesolithic to Early Neolithic contexts (7 ka cal BC - 5.5 ka cal BC) at the key archaeological site of Žukovica cave located in Korčula island, Croatia. Our aim is to identify seasonal mollusc collection patterns and to assess their role in the subsistence strategies of the communities undergoing the transition from hunter-fisher-gatherer lifeways to early herding, who inhabited Žukovica. The analysis in progress will provide high-resolution data on the timing of mollusc shell collection over a time span of 1,500 years. This approach will allow us to identify possible differences in mollusc exploitation patterns during the Late Mesolithic to the Early Neolithic periods, determining whether marine molluscs were collected year-round or only in specific seasons of the year. The results will be integrated at the excavation unit level with other archaeological findings —such as domesticated and wild terrestrial fauna, fish remains, pottery, stone tools and human bones— to have a wider overview of their subsistence economy in the context of the Neolithic dispersal across the central Mediterranean.

826. Bioapatite $\delta^{18}O$ as a Complementary Paleoclimate Proxy in Greece: Insights from the Neolithic to the Present

Authors: Elissavet Dotsika (National Centre for Scientific Research "Demokritos") – Pavlos Meratzis (National Centre for Scientific Research "Demokritos" | School of Mineral Resources Engineering, Technical University of Crete) – Platon Gamaletsos (School of Mineral Resources Engineering, Technical University of Crete) – Panagiotis-Leandros Poutoukis (CERTH, Centre for Research & Technology)
Format: Oral

Oxygen isotope records ($\delta^{18}O$) from speleothem waters are among the most widely used indicators for paleoclimate reconstruction. In the present study, however, $\delta^{18}O$ measured in bioapatite is applied as a paleoclimatic proxy. We present new bioapatite $\delta^{18}O$ data covering the period from the Neolithic to the present day in Greece, evaluated alongside regional speleothem archives. The measured values range from –15.9‰ to –2.5‰ (VSMOW-equivalent) and show marked temporal and spatial variability. Boxplot distributions and regression analyses point to a gradual long-term shift toward more negative $\delta^{18}O$ values through time (approximately –0.5‰ per millennium), as well as clear geographic patterning, with coastal sites generally yielding more enriched values and inland or mountainous regions displaying more depleted signatures. Comparison with speleothem records reveals both similarities and consistent offsets, indicating that the two proxies reflect partly different, yet complementary, aspects of climatic and environmental change. Taken together, the results suggest that bioapatite $\delta^{18}O$ represents a robust and independent archive for tracing paleoclimatic and paleoenvironmental variability in the Eastern Mediterranean. The study provides the first systematic evidence that bioapatite $\delta^{18}O$ can record hydrological signals in parallel with speleothems, offering an additional line of insight into long-term climate and human–environment dynamics in the region.

2068. A Detailed Climatic Context for Crete, Greece: Speleothem-Based Climate Reconstruction from the Late Bronze Age to Present

Authors: Dimitra Skoulikari (Northumbria University) – James Bendle (University of Birmingham) – George Iliopoulos (University of Patras) – Chuan-Chou Shen (National Taiwan University) – Diana Sahy (British Geological Survey) – Micheline Campbell – Hubert Vonhof (Max Plank Institute for Chemistry) – Vasile Ersek (Northumbria University)
Format: Oral

Crete's unique position in the eastern Mediterranean and its extensive archaeological record make it an ideal location for investigating past climate dynamics and human-environmental interactions. Despite this potential, Crete's paleoclimate remains underexplored. Intense human occupation since the Neolithic has complicated the use of terrestrial climate archives, as sediment profiles devoid of human influence are scarce. Stalagmites therefore offer a unique opportunity to provide high-resolution Holocene climate records for the island. Crete hosts thousands of caves many of which have been used by humans for millennia, meaning these archives exist near and are intertwined with human occupation sites. Consequently, paleoclimate information derived from stalagmites has direct relevance to understanding past human populations. The Holocene is marked by multiple abrupt climate change events documented throughout the eastern Mediterranean and linked to major cultural transitions. However, due to the highly variable climate across the Mediterranean, locally derived paleoclimate records are essential for exploring differences in the amplitude and duration of these events. Many studies have demonstrated variable responses between regions and within subregions, highlighting the need for additional local records to better understand past Mediterranean climate variability and human responses to it. Here we present the first speleothem-derived Holocene paleoclimate reconstruction for Crete. A stalagmite from Chainospilios Cave in central Crete, spanning from the Late Bronze Age (ca. 3,300 years BP) to near-present, is being precisely 230Th-dated and a multi-proxy approach is being employed. Coupling stable isotope ($\delta^{18}O$ and $\delta^{13}C$), LA-ICP-MS trace element, and fluid inclusion analyses will enable identification of local and regional hydrological changes, exploration of past vegetation dynamics, and reconstruction of drought episodes. This record will reveal how Crete responded to global and regional climate shifts while providing a crucial local climatic context for understanding human-environment interactions during key periods of cultural change and development on the island.

699. Rhythms of the Coast: Seasonal shellfishing during the Late Neolithic at Cabezo del Plomo (Murcia, SE Spain) through $\delta^{18}O$ values

Authors: Alberto Marchán-Fernández (University of Salamanca | GIR PREHUSAL, University of Salamanca) – Asier García-Escárzaga (University of Burgos, Burgos, Spain | IsoTOPIK Lab, University of Burgos) – Jesús F. Jordá Pardo (Universidad Nacional de Educación a Distancia | GIR PREHUSAL, University of Salamanca) – Esteban Álvarez-Fernández (University of Salamanca | GIR PREHUSAL, University of Salamanca)
Format: Poster

Cabezo del Plomo is a Chalcolithic settlement located in Mazarrón (Murcia, south-eastern Spain). The site occupies an area of approximately 3,200 m^2 and is partially enclosed by a defensive wall along its southern and western sides. It is situated on a flat-topped hill at around 90 m above sea level, from which there is a clear view of the Bay of Mazarrón and the Moreras wadi. The settlement is characterised by a stone-built wall measuring approximately 130 m in length, about 1 m in width and up to 2 m in height, and reinforced by eight bastions spaced roughly 10–15 m apart. Within the enclosed area, eleven circular stone-built structures have been documented and interpreted as huts or domestic dwellings. Archaeological excavations conducted between 1979

and 1985 investigated four of these structures, yielding abundant ceramic remains, lithic assemblages, and both marine and terrestrial faunal remains, among other materials. Radiocarbon dates place the occupation of the site between the Late Neolithic and the Chalcolithic. This poster presents the results of the analysis of marine and terrestrial invertebrate remains recovered from one of the aforementioned domestic structures. Radiocarbon dating of one of the shells assigns this assemblage to the Late Neolithic. The archaeomalacological study was first conducted from quantitative, taxonomic, taphonomic and biometric perspectives. Secondly, stable oxygen isotope ($\delta^{18}O$) analyses were carried out on specimens of *Phorcus turbinatus*, the most representative marine gastropod species in the assemblage, in order to determine their seasons of capture. The results are compared with available data from other sites of similar chronology along the Mediterranean Levant of Spain and contribute to a better understanding of marine resource exploitation at Cabezo del Plomo and along the eastern coast of the Iberian Peninsula.

1921. Palaeoenvironmental reconstruction of the Roman Basin (central Italy) during the Middle Pleistocene using oxygen and carbon isotopes from large-mammal teeth

Authors: Francesca Giustini (Consiglio Nazionale delle Ricerche) – Francesca Alhaique (Museo delle Civiltà) – Mauro Brilli (Consiglio Nazionale delle Ricerche) – Alessio Iannucci – Raffaele Sardella (Sapienza Università di Roma)
Format: Poster

The urban area of Rome and its surroundings - the Roman Basin- is one of the most significant prehistoric regions of the Tyrrhenian sector in central Italy, owing to the abundance and richness of its archaeo-palaeontological sites and materials dating to the Middle Pleistocene (MIS 15–MIS 9). The abundance, taxonomic diversity and excellent preservation of mammalian remains make the Roman Basin an exceptional context for reconstructing palaeoclimatic, palaeoecological and palaeoenvironmental conditions from a biogeochemical perspective. This study presents the results of stable isotope analysis ($\delta^{13}C$ and $\delta^{18}O$) performed on tooth enamel from large mammals (*Palaeoloxodon antiquus* and *Bos primigenius*) recovered from several sites within the Roman Basin. The specimens derive from historical collections preserved at MUST (Earth Science University Museum, Sapienza University of Rome) and at MUCIV (Museum of Civilizations, Rome) and originate from the sites of Casal Selce (MIS15), Ponte Molle and Tor di Quinto (MIS13), Castel di Guido and Malagrotta (MIS11), Sedia del Diavolo, Vigne Torte, Prati Fiscali and Batteria Nomentana (MIS9). This study will contribute to a more comprehensive understanding of how faunal communities responded to climatic fluctuations during the Middle Pleistocene. This work has been supported by the Italian Ministry of University and Research, PRIN 2022 scorrimento – Prot. 2022JWFEKE "The evolution of mammals in changing ecosystems of the Middle Pleistocene of Italy".

1943. Late Quaternary paleoenvironment of the Fucino Basin: Faunal and stable isotope evidence

Authors: Mauro Brilli (Consiglio Nazionale delle Ricerche) – Francesca Alhaique (Museo delle Civiltà) – Dušan Borić (Sapienza Università di Roma) – Emanuela Ceccaroni (Soprintendenza Archeologia, Belle Arti e Paesaggio province di l'Aquila e Teramo) – Francesca Giustini (Consiglio Nazionale delle Ricerche) – Beniamino Mecozzi (Independent Researcher)
Format: Poster

Several caves, located at approximately 700 m above sea level, open along the margin of the Fucino Basin, a tectonic depression in the central Apennines. The basin, bordered by mountain ranges reaching 2000 m a.s.l., is today an upland plain. However, during the Late Pleistocene, a shallow lake intermittently occupied the area, and it still covered about 150 km² in historical times prior to land reclamation. Several caves were excavated during the 1950s and 1960s. In the Late Quaternary, most of the caves experienced human occupation as testified by lithic assemblages and faunal remains. Radiocarbon dates constrain the stratigraphic sequences between 18 and 10 ka cal BP. Zooarchaeological evidences suggested that humans occupied this region year-round, taking advantage of the favorable microclimate created by the lake. In addition, carnivores also frequented these caves and contributed to the accumulation of bones. This contribution examines the faunal remains from four caves in the Fucino Basin: Grotta di Ciccio Felice, Grotta La Punta, Grotta Maritza, and Grotta Ortucchio. Stable isotope analyses ($\delta^{13}C$ and $\delta^{18}O$) have been performed on the enamel of 90 teeth housed at Museo delle Civiltà (MUCIV). The analyzed specimens include *Bos primigenius*, *Capra ibex*, *Rupicapra rupicapra*, *Equus ferus*, *Equus hydruntinus*, *Cervus elaphus*, *Capreolus capreolus*, and *Sus scrofa*. The aim of this research is to integrate faunal data with stable isotope signatures from diverse herbivore and omnivore taxa, investigate spatial and temporal variability in the palaeoenvironment of the Fucino Basin, and reconstruct dietary strategies of herbivorous mammals. Carbon isotope data, from -8 to -13‰ VPDB, suggest an environment dominated by C3 plants in open and dry habitats, such as grasslands and steppes. Differences among mammals reflect differences in feeding strategies and habitat preferences. The oxygen isotope data, from +23 to +28‰ VSMOW, indicate the use of local water resources.

2458. Multi-isotope analysis reveals differences in reindeer behaviour between two Last Glacial cold stages in Central Europe

Authors: Phoebe Heddell-Stevens (Max Planck Institute of Geoanthropology | Friedrich Schiller University) – Olaf Jöris (Leibniz-Zentrum für Archäologie, MONREPOS | Johannes Gutenberg University Mainz) – Michael Baales (Ruhr University Bochum) – Tim Matthies (Johannes Gutenberg University Mainz) – Martin Street (Leibniz-Zentrum für Archäologie, MONREPOS) – Thomas Higham (University of Vienna) – Petrus Le Roux (University of Cape Town) – Mary Lucas (UiT Arctic University of Norway) – Patrick Roberts (Max Planck Institute of Geoanthropology | University of Cologne)
Format: Poster

Large herbivores were integral to Late Pleistocene ecosystems, yet how they adjusted their movement and foraging strategies to rapid climatic oscillations remains unclear. Here we investigate how reindeer (*Rangifer tarandus*) responded to two severe cold stages of the Last Glacial Cycle in Central Europe. Using multi-isotope analyses ($^{87}Sr/^{86}Sr$, $\delta^{18}O$, $\delta^{13}C$) of sequentially sampled tooth enamel from reindeer assemblages at Lommersum (Aurignacian; Heinrich Event 4, ~40 ka BP) and Kartstein (Final Palaeolithic; Younger Dryas, ~12 ka BP), we reconstruct patterns of seasonal mobility and habitat use. Intra-tooth isotope profiles indicate that reindeer during the earlier cold stage maintained more consistent seasonal ranges across similar lithologies, whereas those dating to the Younger Dryas likely exploited more distinct summer ranges. We suggest that these contrasting mobility patterns reflect changes in landscape structure, potentially linked to increased habitat fragmentation during late-glacial reforestation. Our results demonstrate behavioural plasticity in a key boreal-arctic ungulate and highlight the role of vegetation dynamics in shaping the spatial ecology of large herbivores during Late Pleistocene environmental instability.

127 3D DOCUMENTATION TECHNIQUES IN ARCHAEOLOGY: OPPORTUNITIES AND CHALLENGES FROM PRACTICAL APPLICATIONS

Theme: 1. Widening perspectives in material culture studies
Organisers: Marina Weiss (Freie Universität Berlin | Humboldt-Universität zu Berlin) – Emilia Jastrzębska (Polish Academy of Sciences | Royal Lazienki Museum in Warsaw) – Philippe Kermeen (Independent) – Marco Hostettler (Institute of Archaeological Sciences, University of Bern) – Estelle Rault (Archeologie Alsace UMR 7044)
Keywords: 3D modeling, photogrametry, documentation, digital humanities, low visibility, small finds
Format: Regular session

SESSION ABSTRACT

The growing availability and user-friendly nature of digital documentation technologies are reshaping how archaeologists record and interpret finds. Although still developing as a standard workflow, 3D modelling is gaining momentum for its ability to produce non-destructive, metrically accurate, and visually rich representations of portable objects and archaeological contexts. This session offers a constructive forum for discussing current approaches, focusing on the two primary capture methods, photogrammetry (Structure from Motion) and Structured Light Scanning (SLS). Its central objective is to support archaeologists and heritage specialists in choosing the most suitable technique for their research context by comparing accuracy, workflow complexity, cost, equipment requirements, and adaptability to diverse recording environments. In addition to laboratory-based applications, the session addresses the challenges of documenting objects and contexts in environmentally or spatially constrained settings. Conditions such as low light, reflective or refractive surfaces, suspended sediments, dense vegetation, confined architectural spaces, or structural obstructions complicate accurate data capture and require tailored and often innovative methodological adaptations. By bringing together expertise from both controlled and challenging environments, the session encourages practical exchange of technical strategies and problem-solving approaches. Beyond creating visually compelling models, we emphasize how 3D data can function as a reliable analytical source for metric comparison, morphological study, typology, long-term digital preservation, and dissemination of complex archaeological evidence. We also reflect on how digital documentation informs interpretive frameworks, linking technical practice with questions of style, function, materiality, and cultural context. We welcome contributions presenting case studies from archaeology, art history, conservation, and digital humanities, as well as those comparing instruments or software, discussing field and laboratory challenges, or highlighting adaptive workflows and open-source or low-cost solutions. The session seeks to define a more integrated and methodologically resilient future for the 3D documentation of archaeological materials.

CONTRIBUTION ABSTRACTS

245. TEMPA 3D: Technological assessment of Mesolithic portable art via sumbillimeter image-based 3D modeling

Authors: Simon Radchenko (University of Stavanger)
Format: Oral

The rapid improvement in how digital data in archaeology are accessed and produced brings, on the one hand, the significant democratization in the use of these powerful tools. On the other hand, it provides a foundation for a more thorough and reflexive interpretation of 3D data. While 3D modeling, at first glance, seems scientific per se, its true research potential is revealed only after 3D documentation is complete and undergoes further processing. However, the processing stage is never linear and often raises more questions than answers, especially regarding data representation, informativeness, and the ability to be successfully extrapolated to larger datasets. To what extent can 3D data cope with research questions that we aim to answer using these methods? Is digital modelling the most rational and sustainable way to answer them? How can it be paired with other digital recording techniques? This talk aims to unpack the relationship between 3D documentation, the technological study of portable art, and other digital recording techniques within a single research framework. Building on the challenges of the TEMPA-3D research project, it

reflects on the limitations of 3D studies of portable art and examines the potential to overcome them. TEMPA 3D revealed three approaches to enhance 3D data and maximize output: a "reciprocation" approach paired with experimental archaeology or field research; a multiscale use of 3D data—from microSfM to regular photogrammetric setups; a combination of SfM with a variety of 2D imaging techniques. This approach effectively challenges the idea of 3D documentation as a self-standing means of comprehensive technological assessment of surface modifications, especially for small artifacts and portable art objects.

1364. Photogrammetric Documentation of Small Lithic Finds: A Workflow-Based Case Study of Chalcolithic Axes and Adzes from Northern Jordan

Authors: Ziyi Shao (School of Archaeology, University of Oxford | Department of Anthropology, University of Toronto)
Format: Oral

This paper presents a workflow-focused case study of photogrammetric documentation applied to small lithic finds (~5–10 cm in length), using bifacial tools from the Chalcolithic site of WZ121 near Tubna, northern Jordan. The study evaluates a controlled laboratory protocol for recording small artefacts, employing a fixed DSLR camera, turntable-based photography, adhesive clay to stabilise object orientation, and coded targets with scale bars to support reliable calibration. Photographs were captured in systematic rings from multiple elevations and processed in Agisoft Metashape through alignment, camera optimisation, and merging of dorsal and ventral image sets. This workflow produces high-accuracy, metrically reliable 3D models suitable for analytical comparison. The paper also foregrounds practical challenges encountered during implementation, including inconsistent coded-target detection, shifting camera focus during rotation, and surface artefacts caused by reflectivity. The resulting models are evaluated for their analytical potential in lithic analysis through comparison with traditional hand-drawn illustrations and orthomosaic imaging. Situating observed morphological and surface features within existing lithic and excavation literature informs functional interpretations related to heavy-duty woodworking and hafted tool use.

2310. Photogrammetry of Tower-House Figurines: A Methodological Framework for Future Research at Tell el-Ghaba

Authors: Alicia Flores Martín (Archaeological Mission at Tell el-Ghaba | Independent researcher)
Format: Oral

Tell el-Ghaba is an archaeological site dated to the Third Intermediate and Saite Periods, located in North Sinai, near the Pelusiac Branch of the Nile. Between 1995 and 2010, fieldwork conducted by the Argentinian Mission revealed the presence of two casemate structures identified as tower houses. This type of construction was widely used in several regions of Egypt and appears, according to the available data, to have been particularly prevalent in Lower Egypt. Archaeological remains of these buildings, documented in a wide range of settlements, generally consist only of foundations, which considerably limits the study and interpretation of their architectural features and functions. The first stage of this research consisted of a comparative analysis of tower houses identified at a selection of archaeological sites in the Nile Delta and North Sinai. The present study focuses on tower-house figurines. These models, which may have served as lamps, provide valuable information regarding the vertical development of these constructions, an aspect that cannot be reconstructed on the basis of the archaeological remains alone. In recent years, digital technologies have come to play a key role in archaeological research. Among them, photogrammetry has become one of the most widely used methodologies. In this study, photogrammetric analysis is applied to the tower-house figurines, allowing the creation of highly accurate three-dimensional models. These models enable detailed observation, analysis, and comparison of architectural elements, contributing to a deeper understanding of tower-house architecture. Through this approach, the present work advances not only the study of material culture but also the architectural analysis of tower houses, complementing the data obtained from archaeological excavations and opening new perspectives for future research.

157. Spinning in Circles: 3D Modelling Ring Dance Figurines from Iron Age Cyprus

Authors: Marina Weiss (Freie Universität Berlin | Humboldt-Universität zu Berlin)
Format: Oral

Ring dance figurines from Iron Age Cyprus (ca. 1125/1100–310 B.C.E.) represent some of the most visually and conceptually complex small finds within the island's coroplastic and sculptural repertoire. Composed of multiple figures arranged in circular formations, these objects challenge conventional modes of visual access and documentation. This paper builds on an ongoing doctoral project on the archaeology of dance in Iron Age Cyprus and focuses specifically on the creation and analytical use of 3D models of ring dance figurines produced through Structure from Motion (SfM). The contribution addresses two interconnected aspects. First, it reflects on methodological considerations involved in modelling ring dance figurines, whose circular compositions and densely articulated forms require particular attention during image acquisition and model construction. Rather than aiming for technical exhaustiveness, this discussion highlights how object design directly shapes documentation strategies and outcomes. Second, the paper explores how interactive 3D models contribute to the study of these figurines beyond documentation alone. Digital manipulation of the models allows for a mode of visual engagement that approximates the potential handling of the objects, making visible sequences of figures that cannot be grasped from a single viewpoint. Such modes of engagement foreground the importance of movement, rotation, and temporality in both the perception and conception of these artefacts. In this way, working with 3D models opens up new perspectives on how viewing practices are embedded in the design of ring dance figurines. By combining methodological reflection with interpretive analysis, this paper demonstrates how 3D modelling can support a more nuanced understanding of dance representations and their visual logic within the archaeological record.

708. From Excavation to Conservation: 3D Scanning and Digital Twin Analysis of Asymmetry, Deformation and Craftsmanship in a Roman Bronze Situla

Authors: Anna Gebarska (Smarttech) – Joanna Zagorska-Telega (Jagielonian University in Krakow, Institute of Archaeology)
Format: Oral

In August 2024, during archaeological excavations at a bi-ritual cemetery in Kazimierza Wielka (site 12, Świętokrzyskie Voivodeship, Poland), a bronze situla of the Eggers 18 type - a Roman import - was discovered in a cremation burial together with weaponry. The vessel is distinguished by decorative attachments and three small dolphin-shaped legs. To preserve as much technological information as possible and to support conservation decision-making, a two-stage high-resolution 3D documentation campaign was conducted: immediately after discovery and again after completion of the conservation treatment. Measurements were performed using a SMARTTECH3D MICRON3D high-resolution 3D scanner (stereo 20 MP) and SMARTTECH3Dmeasure software. A series of arbitrary cross-sections and surface analyses revealed pronounced asymmetry of the vessel body, including a critical lack of symmetry in the attachment zones, which is essential for archaeometric interpretation. "Before vs. after" model comparisons enabled evaluation of conservation impact, identification of areas affected by advanced degradation, and quantification of localized deformations and indentations (up to approximately 1.4 mm). In addition, deviation-map analysis supported the assessment of the distribution and relative volume of corrosion products and concretions. Separate 3D scanning of the handles/attachments (atazz) and the dolphin-shaped legs, combined with direct shape comparison, indicated high similarity in selected regions and differences attributable to final fitting to the vessel body. When correlated with conservation observations and material studies (including pXRF and SEM/EDS), the results support a hypothesis that some decorative details were likely produced using reusable templates and assembled using different soldering/brazing techniques. The study demonstrates that high-resolution 3D metrology is an effective tool for conservation expertise, technology-oriented comparative studies, and long-term monitoring of metal archaeological artefacts.

2264. The design, fine-tuning, and adaptation of a modern AI model for 3D pottery reconstruction

Authors: Cristina Mircea – Ioan Gabriel Mircea – Sorin Nemeti (Babes-Bolyai University)
Format: Oral

The purpose of the presentation is to introduce an AI model capable of reconstructing 3D vessels given a collection of 3D reconstructions of actual ceramic fragments found across an entire archaeological site. The first step in training involves the algorithmic generation of synthetic datasets using 3D models of pots and vessels, which are then digitally fragmented. These fragments undergo simulated erosion, tearing, and scratching to accurately replicate the conditions found in real archaeological pottery excavations. The initial version of the AI will be trained on synthetic data, but its optimization will be realized on a dataset obtained by 3D scanning actual pots and vessels that were physically created and broken into pieces. To test the model's ability to sort through real archaeological data and provide practical archaeological recommendations, a dataset comprising actual pottery fragments excavated from a real archaeological site (the Roman castrum of Potaissa in Turda, Romania) will be used for performance evaluation.

1178. Building Workflows for Building Stones – 3D Documentation of Architectural Stone Carvings

Authors: Ákos Ekrik (ELTE Research Centre for the Humanities Institute of Archaeology | ELTE Faculty of Humanities Doctoral School of History)
Format: Oral

The documentation of architectural stone carvings presents recurring challenges in archaeological practice, including limited accessibility, large size, and inadequate storage conditions. This paper aims to present and compare 3D documentation workflows for architectural stone carvings based on two case studies from Hungary. The methodological framework is primarily based on photogrammetry, which currently represents one of the most accessible and cost-effective solutions for documenting large and complex stone artifacts. The workflows developed during the author's MA and PhD research are compared in order to highlight their practical advantages, limitations, and applicability in different research contexts. The first case study focuses on the stone material of a demolished medieval parish church in Noszvaj, originally built in the 13th century and later modified during the Gothic period. The second case study examines the architectural stone carvings of the Inner City Parish Church in Pest, a monument with a complex building history spanning from the medieval period to the early modern era. Beyond documentation, the paper outlines further possibilities for data processing and analysis, including profile extraction and surface analysis. The standardized 3D datasets also provide a foundation for future database development and AI-assisted analytical systems.

2328. 3D analysis of the illumination effects in Medieval churches in Bukovina, Romania

Authors: Marc Frincu – Maitane Urrutia-Aparicio (West University of Timisoara) – Manuela Incerti (Università degli Studi di Ferrara) – Vasileia Lianou (West University of Timisoara)
Format: Oral

The Medieval Church of Patrauti, Bukovina, has been extensively documented via images and videos that show the illumination of various biblical scenes throughout the year. The illumination effects might be linked to the solstices and the equinoxes, as well as to the Easter Sunday of the foundation year (Herea, 2020), underpinning the power of the light in medieval architecture, guiding the viewers throughout the day and the year and focusing them on specific scenes. The study and reproduction of these effects is however limited by the necessity of being there in-person. As such 3D modelling of the church's interior enables a systematic and in-depth study of this illumination by using sky simulators for the period the church was built. Evidence also points to illumination effects in other churches from the same period. As a result this provides a baseline for detailed studies based on 3D models of churches loaded in tools like Stellarium. In this talk we present preliminary results on 2 churches showcasing several scanning techniques outlying their pros and cons. In addition we investigate the potential of 3D reconstruction techniques based on architectural models of churches that are no longer standing.

1225. From Ambient Light to Partial Pressures: Photogrammetric Documentation in the Submerged Cave Systems of Quintana Roo, Mexico

Authors: Loren Clark (Scripps Center for Marine Archaeology, UCSD | Cultural Heritage Engineering Initiative, UCSD) – Julien Fortin (CINDAQ) – Dominique Rissolo (Scripps Center for Marine Archaeology, UCSD | Cultural Heritage Engineering Initiative, UCSD) – Andreas Rosland – Samuel Meacham (CINDAQ)
Format: Oral

The extensive network of cave systems and cenotes across the Yucatan Peninsula preserve a wealth of archaeological and paleontological evidence. Burn features, human and faunal remains, mining pits, pottery, and structural modifications in the caves across cultural time periods make these sites attractive for research due to the fact that preservation of traditional archaeological sites on the surface is not guaranteed. These now-submerged landscapes offer scientists the unique opportunity to observe and sample features in stable, low energy settings with little to no modern disturbance. However, the same conditions that are ideal for the preservation of delicate archaeological and paleontological features, make documentation and access less optimal. Variable light conditions and complex morphology in the cave entrances, subsurface dry cave sections, and underwater cave passages make collecting, aligning, and visualizing these datasets challenging. This paper will focus on the ongoing solutions tested as part of the Human and Faunal Access project, which focuses on select submerged and partially submerged cave systems along the eastern coast of Quintana Roo and aims to tackle questions about human and faunal access and use of the caves during the Late Pleistocene/Early Holocene. In order to understand how humans and animals moved through the then-dry caves, our team has focused on creating continuous multimodal, multiresolution 3D models of the cave systems, primarily through the use of surface and subsurface photogrammetry. Due to the challenging environment, our team has created sets of optimal workflows for documenting each section of the cave environment. Beyond changing lighting and camera settings, these workflows prioritize the physical logistics involved in data collection in each area, which involve a wide range of time and equipment considerations. The challenges of working in these environments reminds us, as scientists and practitioners, the importance of evaluating our methods and datasets before beginning interpretation.

2569. Between Documentation, Visualisation and Analysis: Matching Simple Solutions to Simple Questions — Some Reflections from a Polish Perspective

Authors: Maksym Mackiewicz (Archeolodzy.org Foundation, Świdnica)
Format: Oral

The rapid development of digital imaging methods in recent decades has made three-dimensional digitisation of cultural heritage widely accessible. Photogrammetry and 3D scanning are now commonly regarded as standard archaeological tools rather than technological novelties. The growing availability of relatively inexpensive and user-friendly devices has significantly improved documentation efficiency and opened new areas of application. At the same time, 3D data are often reduced to visually appealing representations and exhibition content, while the analytical potential is frequently pushed into the background. Then applications of this techniques is justified more in terms of "modern methodology" than actual research value. The paper presents a synthesis of the author's collaboration with academics and museum professionals, based on projects conducted in Poland, in which the author - an archaeologist working with digital recording methods - was responsible for the acquisition and processing of 3D documentation. An important aspect of this cooperation was an effort to emphasise the analytical value of 3D documentation and to develop research questions that could benefit from three-dimensional data. The case studies presented in the paper include material of varied chronology and character, ranging from prehistoric stone tools analysed through comparisons of morphometric parameters to cast bronze objects examined for traces of production in the same moulds and for deformations related to use. Another important aspect concerns the enhancement of poorly visible details on objects of different scales, from the reconstruction of fine ornamentation and traces of processing to the reading of faint inscriptions. Such tasks rarely follow universal protocols and require case-specific methodological choices combined with critical assessment of the obtained results. They therefore also provide an opportunity to evaluate the methods and tools applied and to raise broader questions about possible alternative approaches to the research problems addressed.

669. Different Materials, Different Techniques, Different Algorithms — Comparable Results?

Authors: Marcin Maciejewski – Aleksander Mazurek – Patryk Maruszczak (Institute of Archaeology of Maria Curie-Skłodowska University)
Format: Poster

During the 3D digitisation of artefacts held in the collections of the Institute of Archaeology of Maria Curie-Skłodowska University, conducted to test the archaeological research data repository RADOGOST, two principal methods were employed: photogrammetry (Structure from Motion, SfM) and Structured Light Scanning (SLS). Specific advantages and limitations characterise each of these approaches. Importantly, the SLS scanner used in this project is metrologically certified, which allows not only the production of digital surrogates suitable for a wide range of analytical applications but also their use as reference models. This makes it possible to compare 3D models generated using different software packages and workflows and to assess their geometric accuracy and level of detail. The poster focuses on a direct comparison of 3D models produced using SLS and SfM. The analysis is based on artefacts manufactured from different, most frequently used raw materials, allowing us to evaluate how material properties influence the outcomes of each digitisation technique. Rather than relying on subjective visual assessment, the comparison emphasises quantitative analyses of meshes using CloudCompare software. While every digital copy of an artefact constitutes a valuable research resource—particularly given its potential for reuse across diverse analytical contexts, ease of dissemination, and the risk of damage or loss of the original object—we aim to move beyond general statements about usefulness. The results of our analyses are intended to support more informed methodological choices, taking into account specific research objectives, collection characteristics, and the financial resources available to individual research teams. This poster is part of the DARIAH-PL Digital Research Infrastructure for the Arts and Humanities (KPOD.01.18-IW.03-0013/23) project funded by the European Union NextGenerationEU, Poland's National Recovery and Resilience Plan A2.4.1 Investment in the development of research capacities Scheme A: Research Infrastructure - projects from the Polish Map of Research Infrastructure (PMIB).

2659. The world under our feet: photogrammetry record of the two restricted access tombs from ancient Naissus

Authors: Jugoslav Pendic (Institute BioSense)
Format: Poster

The site dubbed Jagodin Mala is located within urban areal of the city of Niš and represents a host of burials that have been explored since 1887/1888. They are dated to period from 313 AD to first decades of the VII century. Due to complex environment, many of the tombs are either closed off to public or made inaccessible even for expert assessment (sealed by concrete slabs or by other means). Those that are not sealed or of restricted access, are exposed to a variety of harmful effects, including water drainage, unregulated and unauthorized waste disposal and general negative effects of changing environmental conditions. The tombs that are closed off to the public are likely to fare better by a margin but remain out of reach to any interested party. There is a great need to conduct a thorough survey of all the endangered tombs, to be followed by extensive conservation activity. This poster presents results of 3D scanning process applied in low light, spatially constrained conditions of the two tombs (Sever - jug and tomb with painted figural representation of st.Peter and Paul). It makes a short resume on the conditions of the tombs and constraints encountered and delivers a more detailed representation of the solutions applied to achieve optimal reconstruction quality, ending it with discussion of the potential positive outcomes of the effort invested.

129 CULTURAL REFLECTIONS IN ARCHITECTURE AND CULTURAL HERITAGE: UNDERSTANDING THE NEW THROUGH THE OLD

Theme: 1. Widening perspectives in material culture studies
Organisers: Leif Östman (Novia, University of Applied Sciences) – Magnus Rönn (Kulturlandskapet) – Helena Teräväinen (Aalto University) – Athanasios Kouzelis (Technological Educational Institute of Athens)
Keywords: Heritage Impact Assessment, Cross cultural-analysis, Redesign, Tourist culture, Documentation of cultural heritage
Format: Regular session

SESSION ABSTRACT

This session explores how knowledge of the built environment forms a cornerstone for development related to architecture, urban design, and archaeology. By examining style, function, context, and the creation of meaning, we deepen our understanding of the values, qualities, and identities embedded in the past as means to explore issues about heritage as sustainable development. We particularly welcome perspectives that bridge theory and practice, and that address the session's core questions through comparative or cross-regional analysis. The themes for the session: 1. Use and misuse of the concept of classic design: There is growing criticism of modern architecture, with calls for a return to and reproduction of classic design. What does 'classic' mean in architecture and archaeology? Which ideologies drive the demand for classic design, and how can professionals navigate diverging values in this debate? 2. Re-design of qualities and reconstruction of historic values: There is growing criticism of modern architecture, with calls for a return to and reproduction of classic design. What does 'classic' mean in architecture, urban design, and archaeology? Which ideologies drive the demand for classic design, and how can professionals navigate diverging values in this debate? 3. Preservation and reuse: Long-term sustainability in the built environment requires preservation, maintenance, adaptation, and reuse. The session addresses how professionals can balance the tension between preservation, transformation, and sustainability,

and how to find equilibrium between renewal and conservation. 4. Heritage management and cultural tourism: Cultural heritage attracts tourism, but also brings demands for space and leisure cultures that may be foreign to the existing fabric. What constitutes authentic heritage in a changing world? How do key actors legitimize exploitation and manage cultural losses? How can Heritage Impact Assessment (HIA) provide support in legislative, operational and stakeholder dialogues.

CONTRIBUTION ABSTRACTS

155. Use and misuse of the concept 'classic' in architecture and archaeology

Authors: Athanasios Kouzelis (professor emeritus)
Format: Oral

The paper aims to investigate the origin and use of the concept 'classic' in architecture and archaeology based on the assumption that the relationship between the origin and application of the term has been a subject of theoretical antinomy. The main research question concerns what kind of morphological language characterized the so-called 'classic architecture' and how it was defined by specific technical methods and aesthetic perceptions in the era in it was created. Based on this approach, the use and misuse of the term both in architectural practice and in archaeological research work on architectural monuments of the classical era is then investigated under the light of historical criticism. The anticipated outcome of this research is a) to highlight the importance of 'classic' as a cultural resource and a factor of symbolism of architectural works b) to interpret its use in the historical evolution of architectural morphology and the archaeological research of monuments of the classical era and c) to conclusively demonstrate its misuse by hybrid approaches to classical architectural morphology, both in theory and in practice.

39. The rise and fall of modernism: The return of classicism in architecture

Authors: Magnus Rönn (Kulturlandskapet)
Format: Oral

The objective is to show how classism is reborn and replaces modernism. The story has two parts. The first part presents the rise of modernism in architecture as a response to new needs and interests expanding from the collapse of classicism through the First World War, followed by a new design. The theory assumes that architecture can be understood in a historical scheme: emergence-development-decay-disappearance. Modernism is seen as a lifespan of one hundred years in a nature cycle such as spring, summer, autumn, and winter or biologically oriented as childhood, youth, middle age, and old age. Architecture as art and technology cannot escape its recycling destiny (von Wright, 1994) The return of classicism in architecture coincides with the disappearance of modernism as a dominant pattern of thinking. The driving forces behind this cyclical process are the ability of industrialism to transform cultures through capitalist forms of production and a deeply rooted notion of architecture as expression and visualization of its contemporary society. The second part is a case study showing how place, space, and form are expressed in the transformation of modernism into a new type of classicism in architecture. Three design developer competitions in Sweden for new housing are selected as illustrative examples. The competition is future-oriented by nature and produces knowledge through design proposals. They are models illustrating how the future will look on the site if the winning solution is implemented as a built environment. For this reason, competitions in architecture can be assumed to be able to shed light on cyclical processes in society. An initial review indicates that politicians have had a dominant role in selected competitions. At the heart of the transformation is the complex relationship between politics and architecture as culture, profession, and expression of societal interests.

925. The attitude towards urban design and its shift from the International Style to Post Modernism

Authors: Urban Nilsson (Nyréns Arkitektkontor in Stockholm | In cooperation with University of Gothenburg)
Format: Oral

The International style was seen as the architectural answer to the needs of modern society. The private and public sectors joined forces during these years of modernisation. The driving narrative was progress through the shaping of a new city fabric. As the International Style reached its peak in the 1970s, in Sweden the increasing scale of the projects and a drop in artistic level, led to a debate on city planning. The pendulum of public opinion and politics swung from consensus enhancing the modern project to challenging the erasing of heritage. As a reflection of this sentiment the Swedish parliament moved back to its old building. From focusing on objects fulfilling different needs, a change can be noted towards a width in perspective where the city is seen as an organism. This postmodern attitude was reflected and spread by the Internationale Bauaustellung in Berlin in the 1980s, which was a testbed for renovating and adding within an existing city fabric. A railway yard – Södra station - was turned into a part of the city, thus overcoming barriers. The Berlin experiences echoes – street-grid, blocks, squares and parks. At present the market hall in the area is undergoing revitalisation. Klarahuset exemplifies a time where the cultural values were seen as secondary while use and image were primary, resulting in a varied exterior combining old and new. The shift of attitude in the urban design is evident in these Stockholm-cases, from 1980 -95, reflecting a rich variation of expressions. Scholars and critics would argue that the diverse landscape of urban design still is under the influence of a postmodern diversity. Yet, due to undercurrent conservative tendencies of society: are we now facing a shift to contemporary classicism?

237. Memory, authenticity, and the design tool of cultural heritage

Authors: Su Yin (UCL)
Format: Oral

Memory is a vital component in heritage conservation. It connects the past with the present, guiding efforts to sustain the heritage places. Memories of how places once looked or were used inspire current preservation actions, ensuring that the essence of these sites is retained. Heritage discourse often emphasises these memories, helping to shape the vision for future conservation. In this research, the Chinese Traditional Village— Shaozhuang Village in Shandong Province will be applied as the case study. The ponds in the village, part of the heritage management project, serve as a node to examine how very different things where the memory about the past, ponds project taken at present and expectation about future entangle together. The document analysis, interview, participant observation will be applied as methods. By valuing and incorporating collective memories, heritage management can create a more authentic and meaningful connection to the past, ensuring that cultural and historical significance is conserved for future generations.

1548. The 'classic' courtyard: a missed opportunity for the construction of modern times Athens

Authors: Antigoni Katsakou (Oxford Brookes University)
Format: Oral

The domestic architecture of classical antiquity in the city-state of Athens was based on the central courtyard. This space provided a suitable setting for the typical household's collective life, securing privacy while allowing everyday activities to unravel in the open air. Can the classical courtyard be framed as an asset for the design of contemporary collective housing in the Greek metropolis? The much-debated polykatoikia – the typical multi-storey residential building which became increasingly popular in the aftermath of World War II, and marked the rapid urbanisation of Greece's built environment – offers little opportunity for meaningful social interaction, particularly with regard to shared outdoor spaces. Nevertheless, there have been a few enlightened examples of early polykatoikias, especially from the interwar period, which utilised the courtyard as a design device to effectively organise the residents' communal life, by providing easily accessible space for respite. This paper examines a few, selected case studies of early polykatoikias, as well as relevant, more recent examples to better understand the potential of courtyards for more humane manifestations of collective housing buildings. Using typomorphological analysis and graphic diagrams, the paper reflects on the ecological and social benefits that the courtyard upholds for the effective reuse of the limited open spaces within existing polykatoikias, as well as for the future development of collective housing typologies. Ultimately, the study seeks to explore potential avenues for reconsidering well-established practices of the housing stock, using the courtyard as a design feature of 'classic' quality, while questioning the properties of what can be understood as 'classical' design.

616. Dwelling at the Margins: Meaning Making Through Building Traditions in Mwanza, Tanzania

Authors: Leif Östman (Novia, University of Applied Sciences)
Format: Oral

This paper investigates building and dwelling as existential practices in informal settlements in Mwanza, Tanzania. It argues that building traditions should not be understood as fixed cultural forms, but as lived, adaptive, and continually evolving modes of meaning making. These practices unfold in contexts marked by uncertainty and scarcity and are juxtaposed here with a comparable case from a middle class neighbourhood in Mwanza and with an emerging development in metropolitan Finland. Drawing on a phenomenological framework, the study conceptualizes building as a form of dwelling—a way in which people orient themselves in the world through constructing, reusing, and caring for their homes and neighbourhoods. This perspective highlights how the meaning of place emerges through embodied action, shared routines, and collective traditions rather than through formal representation. Building appears as an ongoing negotiation between humans, materials, and urban conditions, where heritage is understood as a dynamic process rather than an object of preservation. A reflexive discussion addresses the positionality of the European researcher and the epistemological tensions that arise when marginal building practices are interpreted through Western professional lenses. The analysis also considers the risk, from a Heideggerian standpoint, that Gestell—a techno economic mode—obscures the poetic dimensions of dwelling that persist even in precarious environments. The empirical material consists of analyses of emerging neighbourhoods, timed participatory observations along selected spatial stretches, interviews, and examinations of formal planning documents. The study facilitates the unconcealment of world making—to allow different traditions and practices to appear by placing them in dialogue with other, with thematically related environments. Ultimately, the paper demonstrates how building at the margins offers insights into human meaning making that exceed the economic rational logics dominating contemporary Western construction traditions.

1129. Crowing Tourism Extending Threats and Possibilities on Cultural Heritage Sites

Authors: Helena Teräväinen (Aalto University, School of Arts, Design and Architecture, Dep. of Architecture)
Format: Oral

Cultural heritage (cultural environment or built heritage and archaeological sites) includes objects for conservation but also interesting places to be visited, to learn about and in other responsible ways to be used. The maintenance needs financial contribution, where the local forces are not sufficient, instead visitors are usually today welcome. But obviously the attractiveness is sometimes too powerful, and cities like Venice or Rome, according to the news, would like to prevent or at least rather limit the number of tourists. The attractions on World Heritage list are benchmarking many well investigated targets, which can be used as examples also on more local cases. The UNESCO Sustainable Tourism Programme (from 2011) represents an approach based on dialogue and stakeholder cooperation where planning for tourism and heritage management is integrated at a destination level, the natural and cultural assets are valued and protected, and appropriate tourism developed. Cultural and social rights are included in the 2030 Agenda, but how is cultural heritage – evidence of human culture and history – taken account? Is cultural heritage included only part of the environmental assessments accordingly sustainable development and when is the Heritage Impact Assessment (HIA) in use? The aim of this paper is to investigate the usability of Heritage Impact Assessment in handling cultural heritage places and the tourist impacts. The research method in the first part of the study is the literature review in international scientific journals and data bases. The second part is presenting some ephemeral case studies done in recent years in places listed as UNESCO World Heritage, in those where the author has conducted field research. The places are presumably Ouro Preto in Brazil, Sassi Di Matera and Venice in Italy. The literal findings of HIA will facilitate the analysis of the development of the example cases.

651. Archaeological Data in the Study of the Spatial and Functional Structure of Lithuanian Manors

Authors: Virginija Ostasenkoviene (Klaipeda University Institute of Baltic History and Archaeology | Daugyvene Cultural History Museum–Reserve)
Format: Oral

Archaeological research on Lithuanian manor estates is still a relatively recent phenomenon. It began in the final decade of the 20th century and has intensified primarily over the past two decades. By 2023, archaeological investigations had been carried out at 247 manor estates and manor sites, accounting for nearly 40% of all protected manors. One of the key aspects of studying manor estates is their location within the landscape and their built environment, including the spatial arrangement of manor buildings, their layout, construction techniques, building materials, and functional purposes. The formation of the structural layout, development patterns, and functional zones of most manor estates extended over more than one century: some buildings deteriorated naturally, others were demolished, while still others were rebuilt or newly constructed. Certain aspects of these transformations are documented in surviving manor inventories and, more rarely, in plans. Therefore, as with other Early Modern period (16th–18th centuries) sites investigated using archaeological methods, data obtained from manor excavations must be correlated with historical information, surviving inventories, and other written and iconographic sources. Another important aspect of archaeological research is the analysis of finds recovered from the cultural layers of manor estates, such as construction ceramics (bricks, roof tiles, stove tiles, and floor tiles), plaster, window glass, and iron fasteners (nails, hinges, loops, etc.). These materials provide an opportunity to discuss, at least in part, the equipment, decoration, and interior features of manor buildings. Archaeological data thus constitute a crucial source for identifying former manor sites, investigating the development of lost manor estates, and reconstructing the characteristics and functions of their buildings. The aim of this presentation is to highlight the role of archaeological data in reconstructing the spatial structure of manor estates.

91. Reusing the Past: Early Christian Architecture and Meaning-Making in Late Antique Dardania

Authors: Zana Hoxha (Institute of Albanology - Prishtina)
Format: Poster

This poster explores how early Christian architecture in Late Antique Dardania transformed existing Roman urban and funerary landscapes through processes of reuse, reinterpretation, and continuity. Rather than representing a radical break with the Roman past, the appearance of Christian sacred spaces is examined as a negotiated dialogue between inherited architectural forms, local traditions, and emerging religious identities. Drawing on selected case studies from Dardania, including urban centres and fortified landscapes, the poster highlights how churches, martyria, and burial-related structures were embedded within pre-existing civic fabrics, necropolises, and earlier defensive sites. Architectural elements associated with Roman public, domestic, and funerary contexts were selectively appropriated and re-signified, allowing continuity in material culture while enabling new theological and communal meanings. Through spatial organization, placement, and material reuse, architecture functioned as a key medium through which the "new" Christian order was legitimized and anchored in the "old." The poster also reflects on the relevance of these ancient practices for contemporary heritage discourse. The layered character of early Christian sites in Dardania raises questions about authenticity, preservation, and sustainable reuse, particularly in regions where heritage is closely linked to identity and memory. By combining archaeological evidence with interpretative perspectives from heritage studies, the contribution demonstrates how long-term architectural transformations can inform present-day approaches to cultural sustainability. Overall, the poster emphasizes that continuity and change are not opposing forces, but interconnected processes through which societies construct meaning across time.

130 WHEN ARCHAEOLOGISTS MEET CONTEMPORARY ARTISANS: CONTRIBUTIONS AND DIFFICULTIES OF A PARTICIPATORY EXPERIMENTAL APPROACH

Theme: 1. Widening perspectives in material culture studies
Organisers: Sarah Georgel-Debedde (UMR 7041 Archéologies et Sciences de l'Antiquité) – Valentine Martin (Université Paris 1 Panthéon-Sorbonne | UMR 7041 Archéologies et Sciences de l'Antiquité | Freie Universität Von Berlin) – Elisa Eschenlauer (Université de Genève, Laboratoire d'archéologie préhistorique et anthropologie)
Keywords: Experimental archaeology, Artisan, Craftspeople, Collaboration, Participatory approach
Format: Regular session

SESSION ABSTRACT

Experimental archaeology has proven to be a valuable approach for widening perspectives in material culture studies, particularly for reconstructing chaînes opératoires. But the question of who conducts the experiments remains a methodological problem. The degree of skill exhibited by the experimenters is a pivotal factor in the formation of traces and must be considered when interpreting experimental data. Consequently, numerous scholars have emphasised the value of collaboration with expert artisans, as this allows for the construction of an experiment grounded in practiced skills. However, this approach raises critical questions about the artisan's role and the dynamics of the archaeologist-artisan partnership, which this session aims to explore. What role should artisans play in the experimental process, from the development of the protocol to the interpretation of data? Are they mere executants or active collaborators? How do they engage with archaeological questions? How does their involvement influence the outcome of experiments? For craftspeople practicing in accordance with their technical traditions, adapting to a predefined experimental framework can prove challenging, particularly when required to diverge from their routine. To what extent do the practices of artisans affect the progress of the experiment and the resulting data? At the same time, craftspeople can bring experience-based solutions that raise new hypotheses or reshape archaeological interpretations (e.g., solutions to a technical constraint, choice and adaptation of tools, organization of craft space, etc.). How can the experimental protocol exigencies be combined with the autonomy of artisans, and how can a productive dialogue be developed between archaeologists and craftspeople? Contributions reflecting on these methodological and practical issues are welcome. Submissions may focus on past, ongoing, or forthcoming projects and are encouraged to address the process of establishing collaborative protocol, the level of artisan involvement, the choice of technical context, and the lessons learned from such interdisciplinary exchanges.

CONTRIBUTION ABSTRACTS

346. Between archaeologists and artisans – universal expertise and localised skills in historical perspective

Authors: Nathan Schlanger (Ecole nationale des chartes, Paris)
Format: Oral

Western science is notably characterised by multiple encounters (often asymmetrical and occasionally coercive) between those who systematically search for explicit knowledge and those who tacitly or even unwittingly possess it – that is, between scientific "seekers" of expertise and native "purveyors" of skills. In the archaeological domain, and specifically in the study of ancient material culture and technologies, this tension connects scientific experimenters, with their explicit protocols and universalizing agendas, and craftfull artisans, engaged as part of their livelihood in materially creative activities. As it developed since the early 19th century, archaeology drew on several such encounters where "native skills", whether "primitive" (ethnography) or "vernacular" (folklore), were sought after and valued by a gradually professionalised and methodical discipline. This was the case with prehistoric stone tools and their initially controversial recognition, through artisanal insights, as genuine artificial human productions. Examples drawn from both Europe and sub-Saharan Africa will serve me to highlight some of the cognitive and ideological challenges implicated in the expert appropriation of skills.

1034. Experimental archaeology of goldsmithing and blade shapening: hand intelligence in Bronze Age Eastern Mediterranean metalwork

Authors: Romain Prévalet – Nathalie Thomas (Laboratoire ArScAn, CNRS UMR 7041)
Format: Oral

Experimental archaeology of craftsmanship and manual skills involves very close collaboration with contemporary artisans, following a strict protocol structured around a multidisciplinary methodology. Indeed, the reality of experimental studies in an artisanal context demonstrates both the ease of undertaking enriching work in the short, medium, and long term. These studies guide the protocols and results of experimental tests towards comparisons and creative hypotheses that are interesting to explore in both scientific and creative contexts. Through several examples of the reconstruction of techniques, gestures, and tools related to metalworking (gold jewelry and cutlery) in the eastern Mediterranean during the Bronze Age, our aim is to show how the experience of today's craftsmen, who do not practice their trade under the same conditions, do not perform the same gestures identically, and do not use the tools of the past, has been able to enrich our knowledge and our vision of the hand in relation to raw materials, technical

constraints, and the choice of one tool over another. Overall, it is the intelligence of the hand that we wish to highlight through the craft professions selected and presented in this study. The approach to the experience of the profession draws on a variety of methods, as well as multiple specialties and collaborations. Thus, data is obtained from a range of methods: observations at different scales and expert analysis of the designed object and the tools used at very high magnification, studies of wear and tear, recording and integration of friction, measurements and comparisons of surfaces, anthropogenic (and natural) modifications of the material, use of ancient historical literature and the work of past experimenters, such as Renaissance alchemists, and ethnographic exploration in various contexts of production and use.

1873. Collaborating with a cutler through a use-wear lens: Beaker armplates and copper daggers at the core of a participatory experiment

Authors: Julien Vitani (University of Paris 1 Panthéon-Sorbonne | UMR 8215 Trajectoires | UMR 7041 ArScAn)
Format: Oral

The function of Bell Beaker stone armplates remains debated among three main hypotheses : mere ornaments, archer's wristguards, or portable whetstones for copper blades. My doctoral research contributes to this functional debate through a traceological analysis of a French sample. To support the interpretation of the archaeological wear patterns, I conducted three experiments designed to provide traceological referential frames that may be characteristic of the three above-mentioned functional hypotheses : manufacturing stone armplates, employing them as wristguards, employing them as arm-whetstones for copper daggers. In this paper, I present the third arm-whetstone experiment, which involved the collaboration with a modern French cutler through a participatory approach. To generate sharpening traces that correspond to the archaeological possibilities, this experiment was carried out in two key stages: making a Bell Beaker-like copper dagger, then sharpening its cutting edges using Bell Beaker stone armplates replicas as arm-whetstones. Given my limited know-how in the related techniques, substantial collaborations were required, including the active contribution of a professionnal cutler. This participatory experiment is outlined here following a twofold structure. For each stage, I present the archaeological issue, experimental objectives and methodology, and the inevitably incomplete protocol I introduced to my craftsman partner. I then report how he responded to my initial inputs, addressing archaeologically-based constraints while completing the forging and sharpening protocols through his craftsmanship. Certain « unrealistic » adaptations that arose during our discussions, particularly those designed to aid the traceological reading of experimental specimens, are also highlighted. In conclusion, I reflect on the lessons learned from this two-voiced experiment. I assess the archaeological compatibility of the experimental outcomes and their relevance for the traceological analyses of the study corpus.

1202. Making and repairing a Mycenaean copper cauldron: understanding the techniques of the past with modern coppersmith

Authors: Morgane Monnier (Paris 1 Panthéon-Sorbonne | UMR 7041, ArScAn)
Format: Oral

Experimental studies specifically addressing the production of metal artefacts are being developed within research on ancient metallurgical practices. However, key questions persist regarding copper-based containers, such as the manufacture of copper and bronze sheets, the gestures and techniques used to shape and assemble them, the repair methods employed, and the criteria for distinguishing manufacturing marks from traces of use. This communication will present my experimental programme conducted collaboratively by participants with different levels of expertise: a novice, a mediator experienced in public metallurgy demonstrations, and a master coppersmith. The objective is to reproduce a Mycenaean copper cauldron from a repository of traces observed on archaeological artefacts. The experimentation pursues several aims: providing practical training in copperworking to improve understanding of the artefacts, and testing hypotheses derived from archaeological observation or formulated during the experimentation. The protocol is deliberately broad, enabling hypotheses and ideas to be explored and verified directly. This approach enables the confirmation or rejection of proposed manufacturing and repair techniques for Bronze Age copper cauldrons. My presentation will expose the initial findings and, above all, how an expert craftsman's eye looks at and interprets traces on archaeological objects. However, conducting this work in a modern workshop necessarily involves contemporary tools, which may influence the traces observed on the experimental vases. The involvement of a modern coppersmith can also shape the results, both through his material expertise and because he brings his own working methods and has to adapt them to the constraints of the experiment to reconstruct Bronze Age techniques. Discussing the approach taken in my study of copper cauldrons will offer an opportunity to examine the profits and limitations of combining modern expertise, practical experience and macroscopic observational data in defining and understanding ancient copper-alloy working techniques.

1929. The experimental approach of the AJC in Bélesta (Pyrénées-Orientales, France): methodological issues and contributions of an initial exploratory phase

Authors: Joséphine Caro (association pour les journées de la céramique | umr 5608 traces | acter) – Méline Cattiaux (association pour les journées de la céramique | umr 5608 traces) – Claire Gazaniol – Emily Hainsworth (association pour les journées de la céramique) – Manon Géraud (association pour les journées de la céramique | umr 5608 traces | inrap) – Guillaume Roguet (association pour les journées de la céramique | acter)
Format: Oral

The "Association pour les Journées de la Céramique" (AJC) was created in 1994 through a partnership between professional potters (J.-M. Giorgio and B. Bonafous) and museum curators (V. Porra and J. Pernaud). Its aim is to experiment with different techniques for shaping and firing pottery based on archaeological and even ethnographic documentation. The technological and chronological themes addressed have varied over the years. Currently, the association has around thirty members, including professional and amateur potters, archaeologists, ceramologists, geologists and museum curators. In 2025, a new cycle of experiments began on the subject of Early Neolithic productions in southern France. More specifically, the aim is to address shaping with Spiralled Patchwork Technique (SPT), recently defined on the basis of specific macro-traces observed on archaeological artefacts (Gomart et al. 2017). Within this framework, an initial exploratory approach was carried out, reproducing types of pottery and decorations characteristic of the Early Neolithic period according to specific chaînes opératoires, from the gathering of raw materials to firing (Bonafous et al. 2026). This phase, which required several working sessions spread over a year, appears crucial in the experimentation process as it establishes a dialogue between pottery artisans and archaeologists. During this phase, the archaeologist conveys the scientific issues and the available archaeological data and documents the technical gestures performed. The potter guides the technical choices at each stage of the chaîne opératoire and reports his observations, which often generate new questions. The results obtained are discussed collectively in order to improve methodological tools and further the investigations. Gradually, these exchanges lead to the development of an analysis grid based on a common language and shared knowledge. Thus, the exploratory phase lays the foundations for a protocol that can be adapted to the various research themes carried out within the framework of the AJC.

1741. Artisans and Archaeologists actively collaborating: Insights from the TERRACOT Project

Authors: Mireia López-Bertran (Universitat de València) – Jaime Vives-Ferrándiz (Museu de Prehistòria de València) – Patricia Varea-Milan (Independent scholar/artisan) – Dario Perez Vidal (Universitat de València)
Format: Oral

Focused on the study of terracotta figurines from eastern Iberia dated between the 3rd and 2nd centuries BC, the TERRACOT project aims to reconstruct technical gestures through the analysis of chaînes opératoires and embodied technological knowledge. In this context, the participation of a trained craftsperson is essential. The TERRACOT project offers a productive framework for examining the dynamics of collaboration between contemporary artisans and archaeologists. Our collaboration with a local potter and artisan allows us to test and refine hypotheses regarding the operative sequences identified in the figurines. Throughout the project, the artisan has reproduced a selected group of figurines by following the technical procedures documented during the analytical phase. The dual expertise as both an artisan and an archaeologist enables the craftwoman to engage critically with the research questions and to contribute actively to the interpretation of technical choices, gesture variability, and tool-use evidence. This partnership has significantly enriched our understanding of the repertoire of gestures involved in figurine production and has highlighted a greater complexity in the identification of tool marks.

1191. Rebuilding the Missing Dome: Experimental and Ethnoarchaeological Insights into Iron Age Earthen Ovens

Authors: Maria Carme Belarte (Institut Català d'Arqueologia Clàssica | Institució Catalana de Recerca i Estudis Avançats) – Maria Anguera – Marta Mateu (Institut Català d'Arqueologia Clàssica) – María Pastor Quiles (Universitat d'Alacant) – Marta Portillo (Institució Milà i Fontanals / Spanish National Research Council)
Format: Oral

The partial preservation of certain architectural features in the archaeological record —particularly earthen constructions— poses challenges for understanding building techniques as well as the functions and uses of these structures. This paper examines a specific category of features interpreted as domestic ovens (i.e., closed combustion structures) at Iron Age sites in the Western Mediterranean. We assume that these installations were once covered by earthen domes that are now completely or macroscopically missing. As a result, we lack information about both the construction of these domes and the ways in which food and fuel were handled inside the ovens. To reconstruct and interpret this missing knowledge, we employed experimental and ethnographic approaches. We built replicas of different types of combustion structures (hearths and ovens) based on data from Iron Age sites in the Mediterranean area of the Iberian Peninsula, complemented by ethnographic parallels. These replicas were tested through repeated firings, allowing us to evaluate their performance and their potential use for cooking. For the ovens in particular, we were able to compare the archaeological remains with contemporary structures still built and used in the Rif region, northern Morocco. The research included informal interviews and discussions with both users and craftswomen specialized in constructing these ovens, whose technical knowledge informed our understanding of construction and use. We subsequently integrated their knowledge into our experimental programme. Although the women interviewed did not take part directly in the experiments, the information obtained from discussions with them—as well as our own observations of how these ovens are used—proved essential. While we are aware of the limitations inherent in using ethnographic analogies to interpret the archaeological record, the information gathered has been invaluable for understanding how Iron Age ovens may have functioned, especially regarding fuel management and cooking processes.

2576. Joining Timber, Joining Forces: Collaborative Experimental Work in Minoan Construction

Authors: Valentin Loescher (Paris 1 Panthéon-Sorbonne University) – Paul Bacoup (UC Louvain) – Niki Apostolou (University Paris-Est Créteil | University of Thessaly) – Elena Maragoudaki (independent researcher) – Nikos

Daroukakis (independent carpenter) – Eleftheria Tsakanika (National Technical University of Athens)
Format: Oral

Wood played a fundamental role in the architecture of the Bronze Age in Greece, serving both structural elements (timber reinforcements, polythyra, windows frames, etc.) and non-load bearing elements (door leafs). One of the key issues raised by the study of Minoan architecture concerns the level of skilled craftsmanship and the technical expertise required for the design, production, and assembly of these elements. Within the framework of the ANR TiMMA project (funded by the French National Research Agency, ANR 21-CE27-0029), an interdisciplinary and experimental approach was conducted on Minoan timber structural systems (timber reinforcements in masonry, roof, door and window frames and a door leaf), incorporated in the reconstruction of a Minoan mudbrick Protopalatial building in Malia, Crete (EFA project), using Bronze Age tools. This paper presents the collaborative and interdisciplinary dimensions of the experiment. The protocol was built involving archaeologists, architects, civil engineers and craftspeople. The manual labor was carried out by archaeologists with diverse skill levels in woodworking. On site, the work was done under the guidance of a professional carpenter, whose know-how proved crucial in addressing technical solutions to material constraints, construction procedure, tools maintenance and use. Constant dialogue with civil engineers and architects also helped to adapt to the different challenges that arose during the design and construction (raw timber material, wood dryness, construction system, joints, assemblage procedure, etc.). This hands-on methodology offered a framework for learning through making. The collaborative process provided valuable insights into the scale of labor, time investment, toolkits, and woodworking techniques involved in manufacturing such architectural elements. At the same time, the interdisciplinary dialogue proved demanding, as differing professional perspectives occasionally led to long discussions, regarding procedures, methods, and expected outcomes. Drawing on this experience, the paper will try to reflect on the dynamics and value of collaborative and interdisciplinary experimental work.

1783. Acts of Art(e)Facts: Objects acting as Subjects

Authors: Annika Larsson (TexArk - The Society of Textile Archaeology & Culture Studies | Uppsala University)
Format: Oral

I have a double doctorate in archaeology and textile science. Academic competence in both disciplines is necessary for transdisciplinary knowledge about history as well as current research fronts, but also to ask relevant questions in this mixed area. However, theoretical knowledge is not enough when it comes to craft-/artistic-based research. At least one more competence must be required: practical skills. But, craft/art skills based on criteria in our own society are not always relevant for historical research. To understand foreign cultural heritage, researchers must have ability to discover and analyze latent stories hidden in different human expressions (Gadamer 1997). When meeting objects as subjects, hidden stories appear. A fourth aspect is thus demanded: cultural familiarity. Once, I had to make comparisons between expressions in Viking Age textiles and Central Asian brick-work/ceramics. Knowing almost nothing in pottery – let alone working with foreign clays, pigments, glazes, firing, and least of all when it came to high-developed Persian ceramic art compared to simple Scandinavian pots. Should I ask an Iranian ceramicist skilled in Persian techniques, although hardly familiar with Viking textile culture? Instead: From taking throwing courses supervised by well-trained craftsmen and parallel consultation with historically oriented Persian artists – who guided me through an almost endless training in copying bowl shapes, colors and pattern designs from the actual area – I began my own journey until techniques, shapes and decorations were incorporated into my own body language. After years of processing, I considered myself prepared to conduct a scientific-based dialogue with the foreign artefacts. New knowledge was now created also about the expressions in Viking textiles. Not to mention what was finally revealed when the acts-of-art(e)facts-method was integrated into a case study at Abbegg-Stiftung (Switzerland). Conclusion: Craft research laboratories for personal learning/anayzing in cultural craft/art acts is far underestimated by archaeologists.

131 PATHWAYS THROUGH THE PAST: REASSESSING SOUTH CAUCASUS ARCHAEOLOGY FROM THE NEOLITHIC TO THE EARLY IRON AGE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Mariam Eloshvili (Ilia State University | Society of Young Archaeologists) – Ana Davitashvili (University of Warsaw | Society of Young Archaeologists)
Keywords: Caucasus Archaeology, Migration and Mobility, Trade and Exchange, Chaîne Opératoire, Environment and Landscape
Format: Regular session

SESSION ABSTRACT

The Caucasus remains one of the most dynamic and diverse regions for archaeological investigation. Despite more than a century of research, many fundamental questions about human adaptation, interaction, and cultural transformation across this complex landscape remain open. Building on the discussions initiated in our previous EAA session (#924), "Roads, Passes and Valleys? Recent Discoveries and Perspectives in Caucasus Archaeology," this continuation seeks to broaden the chronological scope from the Neolithic and Bronze Ages to include the Early Iron Age, thereby enabling a more comprehensive understanding of long-term socio-economic and cultural developments in the region. During the past year, numerous new studies have been conducted across these periods, and many of the researchers involved have expressed their willingness to present their latest results. Several participants from the previous session also encouraged the chronological extension, emphasising the need for comparative dialogue between Bronze and Early Iron Age developments. The session invites contributions that present discoveries, methodological innovations, and reinterpretations of earlier materials. We encourage interdisciplinary approaches that integrate archaeological, bioarcheological, environmental, and technological data to illuminate the connections between local developments and interregional dynamics. • Migration and Mobility – purposes, mechanisms, and consequences of movement across and beyond the Caucasus; • Trade and Exchange – raw materials, production networks, and evolving patterns of connectivity; • Chaîne Opératoire – technological practices and the life cycles of materials from acquisition to discard; • Ecology, Environment, and Landscape – human–environment interactions and adaptive strategies; • Household and Community – perceptions of domestic and social spaces in different cultural contexts; • Bioarchaeology – zooarchaeological, palaeobotanical, palynological, and human osteological perspectives. Through this expanded temporal framework and renewed focus on interdisciplinary collaboration, the session aims to foster dialogue among researchers exploring the diverse cultural trajectories of the Caucasus.

CONTRIBUTION ABSTRACTS

2463. Materialising Belief: Architecture, Ritual, and Identity at Khramis Didi Gora

Authors: Mariam Eloshvili (Ilia State University | Society of Young Archaeologists)
Format: Oral

The Late Neolithic settlement of Khramis Didi Gora, the largest known hill settlement of the Shomu–Shulaveri cultural complex in the South Caucasus, offers important evidence for exploring symbolic practices and belief systems embedded within domestic and communal space. This paper examines how ritual behaviour and symbolic meanings were materially expressed at the site, drawing on a comprehensive reanalysis of legacy excavation data from nine successive building horizons. Particular attention is devoted to architectural features and spatial arrangements that transcend purely functional interpretations. The repeated reconstruction of stable household complexes suggests the persistence of socially meaningful units closely tied to place, memory, and lineage identity. Within this framework, symbolic practices appear to have been deeply integrated into everyday domestic life rather than segregated into exclusively communal or monumental contexts. A key focus of the paper is a distinctive structure interpreted as a possible ritual building, characterised by the incorporation of ox horns into its walls, an element widely recognised as symbolically charged in Neolithic societies. The spatial entanglement of this structure with adjacent household complexes suggests that ritual activities operated at an intermediate social level, likely serving related households or lineage groups rather than the entire community. This architectural configuration points to belief systems centred on shared ancestry, household continuity, and collective identity. By situating the evidence from Khramis Didi Gora within broader discussions of Neolithic symbolism and ritual practice in the South Caucasus, this paper argues that belief systems were materially negotiated through domestic architecture, spatial continuity, and repetitive ritual acts. The site thus provides valuable insight into the ways symbolic meaning and social identity were constructed and maintained within Late Neolithic communities.

2437. The "Life Cycle" of Sickle Inserts from Khramis Didi Gora: Results of Technological and Use-Wear Analysis

Authors: Nikolozi Kakabadze (Sokhumi State University) – Mariam Eloshvili (Ilia State University) – Aleko Zavradashvili (Ivane Javakhishvili Tbilisi State University)
Format: Oral

Khramis Didi Gora is an important Late Neolithic archaeological site in the Southern Caucasus, where a wide range of stone tools reflects diverse aspects of economic activities. This poster focuses on the study of sickle inserts recovered from the site and aims to reconstruct their "life cycle," from raw material selection to final use. The technological study of the sickle inserts shows that the assemblage includes Shomutepe-type inserts, characterized by specific manufacturing traits and relatively stable forms. The treatment of the working edges and overall morphological features indicates a purposeful production process. Traceological analysis revealed use-wear traces related to the processing of plant materials, as well as residues of adhesive substances. These data confirm the intensive use of sickle inserts in agricultural activities. The quantitative distribution of the sickle inserts and the observed use-wear patterns highlight their significant functional role within the economic system of the site. The results contribute to a better understanding of Late Neolithic agricultural practices in the Southern Caucasus.

1111. Human-Animal Relationships during the Chalcolithic: Evidence from Yeghegis-1 Rock Shelter, Armenia

Authors: Satenik Mkrtchyan (Institute of Molecular Biology, National Academy of Sciences, Armenia | Max Planck Institute of Geoanthropology) – Gayane Nazaryan (Institute of Molecular Biology, National Academy of Sciences, Armenia) – Noel Amano (Max Planck Institute of Geoanthropology) – Mariam Saribekyan (Institute of Archaeology and Ethnography, National Academy of Sciences, Armenia) – Levon Yepiskoposyan (Institute of Molecular Biology, National Academy of Sciences, Armenia) – Patrick Roberts – Mariya Antonosyan (Max Planck Institute of Geoanthropology)
Format: Oral

The Chalcolithic period in the South Caucasus (c. 5500–3500 BCE) was marked by changing social organization, increased mobility, and growing economic complexity. While recent research has significantly expanded our knowledge of this period, key questions remain regarding subsistence systems, herding practices, animal exploitation strategies, the use of secondary animal products, and human adaptation to diverse environmental settings. Faunal remains from Yeghegis-1, a rock shelter in southern Armenia occupied during the late 5th and 4th millennia BCE, are examined to explore Chalcolithic lifeways in the region. By integrating taphonomic assessment, morphological analysis, and collagen fingerprinting (ZooMS), the study reconstructs patterns of bone accumulation, biodiversity, and human-animal interactions. The assemblage is well preserved, with clear evidence of anthropogenic modification to bone surfaces. Caprines dominate the faunal spectrum throughout the occupation sequence, underscoring their central role in local subsistence practices. Age-at-death distributions and culling profiles indicate mixed herd management strategies geared toward the exploitation of multiple animal products, including wool, hair, and milk. In contrast, cattle herding and hunting appear to have played a limited role in the animal economy at Yeghegis-1. These results contribute to a broader understanding of Chalcolithic subsistence and herding strategies in the Lesser Caucasus and highlight the value of combining zooarchaeological and biomolecular approaches in regional studies.

1. Tracing Prehistoric Journeys: Rock Art, Mobility, and Cultural Interaction in the Kura-Araxes Basin

Authors: Levan Losaberidze (Flinders University)
Format: Oral

The Kura-Araxes basin, located in the Southern Caucasus and often referred to archaeologically as the Kura-Araxes oikumene, has long served as a core settlement and interaction zone throughout the Holocene. Characterized by diverse landscapes – ranging from highlands to lowlands – and rich natural resources, including obsidian, copper, gold, and salt, the region played a pivotal role in the emergence and development of archaeological cultures during Late Prehistory. Beyond its archaeological significance and resource-rich landscapes, the basin preserves a substantial yet understudied corpus of rock art that offers direct insight into prehistoric lifeways. The dense network of internal rivers within the Kura-Araxes basin, shaped by past volcanic activity, created natural communication corridors along valleys that were effectively used by prehistoric communities. Within these highly interacted landscapes, local groups practiced rock art traditions depicting hunting scenes, rituals, and transport, which likely reflect aspects of their daily life, such as seasonal movements to pasturelands and long-distance journeys undertaken to access obsidian or other valuable resources. A new spatial analysis of this overlooked yet significant phenomenon suggests that rock art may represent a missing link in understanding social behaviour, cultural dynamics, and mobility networks across the region.

1215. Studying architecture through a microscope: the case of Aradetis Orgora in the Early Bronze Age

Authors: Sebastiano Claut (Università di Torino) – Giovanni Boschian (Università di Pisa) – Elena Rova (Ca' Foscari University)
Format: Oral

Aradetis Orgora is a multiperiod settlement in the Shida-Kartli region of Georgia, located on a natural hill overlooking the Kura River. Between 2013 and 2016 it was excavated by a Georgian-Italian joint expedition that revealed occupational phases spanning from the Early Bronze Age to the Hellenistic period. The Kura-Araxes period (corresponding to the KA 2 phase in the traditional tripartite periodization) is particularly significant for the architectural evidence excavated in Sector B. In spite of the limited excavated surface, this was characterised by a high heterogeneity in terms of building plans, materials and techniques unearthed in the different levels. Samples for soil-micromorphological analysis were collected from buildings, floors and different types of installations of the different phases of Kura-Araxes occupation at the site. The paper will present the results of this microscopic approach to the study of building materials, which reveals interesting otherwise not visible features and sheds light on the building processes, use and life of the analysed structures.

1336. Function and Use of Lithic Projectile Points in the Kura–Araxes Culture: Evidence from the Irmis Rka and Chobareti settlements

Authors: Aleko Zavradashvili (Ivane Javakhishvili Tbilisi State University)
Format: Oral

The Kura-Araxes culture existed during the 4th and 3rd millennium BCE and covered the territories of the South Caucasus, northwestern Iran, and eastern Türkiye. This primarily agropastoral society is characterized by a variety of lithic projectile points. Since the discovery of this culture, numerous excavations have been conducted, resulting in the discovery of a substantial number of projectile points. Based on the morphological characteristics, they are divided into three groups: tanged, concave-based, and flat-based points. The study aims to analyse projectile points from the Irmis Rka and Chobareti settlements in southwest Georgia. In addition to typological and technological assessment, the artifacts were analysed under the optical microscope in order to determine their function. As a result, several pieces show a combination of macro and micro wear traces, which is expressed in tip fractures, notching, edge scars, bright spots, and polish lines on the surfaces. According to the experimental series conducted by researchers, the use-wear traces detected on the samples are diagnostic for projectile points. However, some of the pieces show evidence of secondary use. Moreover, for source determination purposes, X-ray Fluorescence (XRF) analysis was performed on two obsidian samples, one from each site. Both of the artifacts were traced to the Chikiani source in Georgia. The results indicate

that the projectile points served both primary and secondary functions within the Kura-Araxes communities at the Irmis Rka and Chobareti settlements. Nevertheless, it remains difficult to determine whether these tools were primarily used for hunting or for intercommunal conflicts. The scarcity of wild animal remains at both sites suggests that hunting played only a minor role in the subsistence practices. In addition, the XRF analysis provides insight into patterns of raw material procurement and possible territorial movement of these populations.

1830. Dating survey sites through surface pottery. A Working Typology for the Gardabani Region of Southern Georgia

Authors: Michela Ferracin – Joel Lovat – Francesco Bianchi – Elena Rova (Ca' Foscari University)
Format: Oral

The paper will present and discuss the preliminary list of diagnostic ceramic features used by the Georgian-Italian GIGAP project for dating the sites of the 2023-2025 Gardabani survey. Although Gardabani region is strategically located in the Middle Kura valley between Georgia, Azerbaijan and Armenia, it was until recently the object of few archaeological investigations, making it, from an archaeological point of view, a poorly known area. A first chronological framework for local pottery, to be implemented and anchored to absolute dates by means of future excavations in the area, was established by focusing on visually identified fabric types, as well as on selected diagnostic items with parallels in excavated sites in the neighbouring regions. Pottery collected thus far on the field was identified as spanning from the Late Chalcolithic (?) to the Medieval/post-Medieval period, with the Late Bronze/Early Iron Age standing out as an especially well-represented phase. The later Iron Age/Hellenistic to Late Antiquity period is apparently also well represented, but needs to be further specified and internally better subdivided. Possible reasons for the absence (or non-identification) of pottery belonging to other periods (Neolithic, Early/Middle Bronze Age, etc.) will also be discussed.

1734. Dating survey sites through surface pottery. From Field Challenges to Methodological Strategies in Gardabani (Southern Georgia)

Authors: Francesco Bianchi (Ca' Foscari University) – Stefania Fiori (Kiel University) – Michela Ferracin – Elena Rova (Ca' Foscari University)
Format: Oral

Based on the experience of the 2023-2025 survey carried out in the southern part of the Gardabani district of Georgia by the GIGAP project of Ca' Foscari University of Venice in collaboration with Ilia State University of Tbilisi and Gardabani Local Museum, the paper offers a reflection on the challenges and limits posed by dating survey sites through pottery collected on the surface in areas where visibility is limited, modern disturbances pervasive, collected material scanty and mostly extremely fragmentary, and pottery sequences quite rough due to the dearth of excavated sites. Pending future excavations in the area, the association of visual fabric inspection with a preliminary list of selected, very diagnostic items derived from previous literature provided a first reference framework for dating the Gardabani survey material. One has to be aware, however, that the length of the chronological intervals that can be identified in this way is so great, and visibility and sampling problems on the field so high, that any result should be considered as a mere working hypothesis. The paper aims to spark a discussion among experts of archaeological science about the feasibility of quantitative approaches in such a context. Will they supplement our results or the methodological challenges and limits that hindered our study will also affect them?

2487. Genetic Structure and Population Dynamics of Bronze Age Communities in the South Caucasus

Authors: Cecilia Paradiso (University of Roma Tor Vergata) – Ruzan Mkrtchyan – Hasmik Simonyan (Yerevan State University) – Liana Bitadze (Ivane Javakhishvili Institute of History and Ethnology, TSU) – David Gagoshidze (The University of Georgia) – Nikoloz Gobejishvili (European University, Tbilisi and Georgian National Museum) – Revaz Papuashvili – Kristine Shavlakadze – Nino Kobalia (Georgian National Museum) – Ashot Piliposyan (Armenian State Pedagogical University)
Format: Oral

The South Caucasus played a central role in human evolution and mobility since the Upper Palaeolithic, facilitating Neolithic agricultural dispersals from Anatolia and later interactions with northern Caucasus populations contributing to Steppe-related ancestries. During the Bronze Age, it acted as a crossroads between Anatolia, the Levant, Iran, and the Eurasian steppe. Here, we present new ancient DNA data from 80 Bronze Age individuals, including 51 individuals from Armenia dating to the 3rd–2nd millennium BCE, and 29 from Georgia from 2nd–1st millennium BCE. Armenian individuals derive from five collective burials located along the shores of Lake Sevan, while Georgian individuals originate from five sites in central and western Georgia, extending to areas close to the Black Sea coast. Our aims are to characterize genetic structure and kinship relationships, shedding light on social organization and population dynamics, and to reconstruct past demographic events and ancestral genetic contributions. DNA was extracted from teeth and petrous bones and consequently sequenced using Illumina technology. Preliminary results indicate generally good DNA preservation, with endogenous DNA contents ranging from ~20% to 75%. Authenticity was supported by characteristic ancient DNA damage patterns, as well as low contamination estimates. Preliminary population genetic analyses indicate that Bronze Age Armenian individuals cluster with previously published Middle–Late Bronze Age and Chalcolithic individuals in a genetic cline from Anatolian Neolithic and Steppe ancestry, reflecting the high genetic complexity of the South Caucasus.

Ongoing work focuses on increasing genome-wide coverage beyond 0.5× to enable genotype imputation. Acknowledgment The last five authors that contributed to the preparation of this paper are: Samantha Rossini (University of Rome Tor Vergata), Paolo Abondio (University of Rome Tor Vergata), Francesca Bertoldi (University of Venice Ca' Foscari), Pier Francesco Fabbri (Florentine Museum and Institute of Prehistory) and Gabriele Scorrano (University of Rome Tor Vergata).

1377. Clay stamp seals as markers of intercultural connectivity in the South Caucasus (late 2nd and early 1st millennium BCE)

Authors: Tamar Chogovadze (Tbilisi State University)
Format: Oral

During the Late Bronze-Early Iron Age, the South Caucasus was characterized by intense cultural changes and the emergence of the different yet interconnected archaeological traditions. While intercultural interaction in this period has mostly been discussed through metal artifacts, pottery, and burials, clay stamp seals represent an understudied but highly informative type of material. This research reconsiders clay stamp seals as an alternative pathway for investigating cultural connectivity in the South Caucasus during the period of the second half of the 2nd millennium BCE and the first half of the 1st millennium BCE. The study is based on a comparative typological and stylistic analysis of clay stamp seals from Georgia, Armenia, and Azerbaijan. These objects, predominantly decorated with geometric motifs such as swastikas, spirals, crosses, concentric circles, became widespread across the region from the late 2nd millennium BCE onwards. Two main morphological groups can be distinguished. The first group is primarily associated with the Samtavro culture in Shida Kartli and includes stamp seals from Kvemo Kartli, Western Georgia, and Armenia. The second group is concentrated in Eastern Georgia - Kakheti Region and North-Western Azerbaijan (including Ganja–Gazakh and Shaki–Zagatala regions). Although both groups share general formal and ornamental characteristics, they differ in size, handle morphology, base thickness, carving depth, and motif execution. These differences point to regionally specific production traditions and suggest that clay stamp seals can be used to trace cultural boundaries in the South Caucasus. Petrographic analysis of seals from Georgia (conducted by A. Rogava, Georgian National Museum) indicates that while most seals were produced locally, occasional interregional movement of such objects did occur. By combining all the above-mentioned, this study offers a new perspective on Late Bronze–Early Iron Age connectivity and highlights the importance of the clay stamp seals in the archaeology of the South Caucasus.

1264. Assessing mobility at the Beshtasheni (Georgia), Late Bronze-Early Iron Age cemetery, through strontium stable isotope analysis

Authors: Ana Davitashvili (Department of Bioarchaeology, University of Warsaw) – Jacek Hamburg (Krukowski Polish-Georgian Interdisciplinary Research Center) – Arkadiusz Sołtysiak (Department of Bioarchaeology, University of Warsaw)
Format: Oral

This study examines patterns of human mobility at the Beshtasheni cemetery in the Tsalka region of southern Georgia. Excavations conducted between 2012 and 2016 documented 45 graves dating predominantly to the Late Bronze–Early Iron Age (second half of the 2nd millennium BCE to the beginning of the 1st millennium BCE), providing an important context for exploring population dynamics in the region. The aim of the study is to assess whether individuals buried at Beshtasheni were local to the area or originated from geologically distinct regions. Strontium isotope (87Sr/86Sr) analysis was conducted on human dental enamel, which reflects environmental signatures during tooth formation time. The study integrates isotopic data with archaeological, osteological, and radiocarbon evidence. A total of 17 human and 2 animal (sus scrofa) teeth were analysed and compared with a locally established bioavailable strontium baseline derived from modern plant samples. The results show that most individuals exhibit strontium isotope ratios consistent with the local baseline. Human values closely overlap with those obtained from pigs, assumed to reflect local feeding conditions, indicating predominantly local childhood origins. Although some isotopic variability is present, only four individuals fall outside the main human–faunal cluster. Three of them are still within the local bioavailable 87Sr/86Sr range, suggesting limited individual mobility rather than large-scale migration. Overall, the strontium isotope evidence indicates a largely local population at the Beshtasheni cemetery, with minor variation reflecting movement within the broader local landscape or the presence of a small number of non-local individuals.

1234. Archaeological excavations at the Bronze Age sites of Doghlauri and Berikldeebi (Central Georgia): Preliminary Results of the 2025 field season

Authors: Nikoloz Gobejishvili (European University | Georgian National Museum) – David Gagoshidze (The University of Georgia) – Kristine Shavlakadze (Georgian National Museum)
Format: Oral

The 2025 field season at Doghlauri and Berikldeebi, located in the Shida Kartli region of Central Georgia, revealed burials dating from the Early Bronze to the Late Bronze-Early Iron Age. These excavations are part of an ongoing three-year interdisciplinary project investigating population dynamics and cultural developments in the South Caucasus between the 4th and 1st millennia BCE. At Doghlauri, nine burials representing several chronological phases were excavated (five EBA, one MBA, two LBA, and one transitional LBA–EIA). These include a number of burial types, such as simple pit graves, stone-covered burials and a stone-lined chamber tomb containing multiple individuals. Variability is evident both in the disposition of the dead and in the associated grave goods - pottery, weaponry and jewelry, reflecting diverse social structure. Furthermore, several burials show evidence of disturbance and re-use, suggesting complex and long-term funerary practices. At Berikldeebi, excavations focused on a small Middle Bronze Age kurgan with a dromos. The structure contained limited human remains but substantial animal deposits and associated artifacts, suggesting ritualized practices and the secondary treatment of the dead. The kurgan intersected two Chalcolithic and one Early Bronze Age pits. This presentation outlines the excavation method, stratigraphy, burial typology, and preliminary artifact analysis from both sites. Current interdisciplinary studies include radiocarbon dating, ancient DNA, stable isotope analysis, physical anthropology, and palynological research. These approaches aim to reconstruct patterns of mobility, diet, health, and the environment to contextualize cultural transformations between the Bronze and Iron Ages within broader regional processes. The 2025 fieldwork provides a significant new dataset for Shida Kartli and establishes a foundation for integrated bioarchaeological research on long-term cultural and demographic processes in the South Caucasus.

701. Chemical and Multivariate Analysis of Ceramic Materials from the Chovdar Necropolis (Late Bronze–Early Iron Age)

Authors: Lola Ekber (Institute of Archaeology and Anthropology, ANAS)
Format: Oral

This study focuses on the investigation of the chemical composition and technological characteristics of ceramic materials dating to the Late Bronze–Early Iron Age (12th–8th centuries BC) from the Chovdar necropolis, located in western Azerbaijan. Within the scope of the research, 17 ceramic samples representing five archaeological sites were analysed using the PED-XRF method. The distribution of major oxides and selected trace elements was evaluated in order to assess raw material provenance and production technologies. The analytical results indicate that all samples are generally aluminosilicate-based materials. The dominance of SiO_2 and Al_2O_3 confirms that the raw materials primarily consisted of clay minerals and quartz components. Elevated MgO and CaO contents observed in several samples suggest the use of carbonate- and magnesium-rich additives, which likely influenced the thermal behaviour and firing properties of the ceramics. The relatively stable distribution of Fe_2O_3 reflects the use of locally available, iron-rich raw materials. The behaviour of trace elements (including Ni, Cr, Sr, Ba, Zr, Pb, Sb, Sn, among others) reveals both shared geochemical signatures and local anomalies. Conceptual PCA and cluster-based interpretations demonstrate that the samples can be broadly divided into two principal geochemical groups: one representing typical aluminosilicate-based ceramics, and the other characterised by carbonate–magnesium influence. A pronounced enrichment in Pb, Sb, and Sn observed in one specific sample suggests a functional or technological context associated with metal-related activities.Overall, the results indicate that ceramic production at the Chovdar necropolis was not based on a single, uniform technological tradition but rather involved diverse raw material choices and production strategies. This variability reflects the technological complexity and specialised production practices characteristic of the Late Bronze–Early Iron Age communities in the region.

748. Models of Temples Found in Armenia and Their Archaeological Context

Authors: Astgh Poghosyan (History Museum of Armenia)
Format: Oral

Beginning in the 12th century BCE, the significance of temples and the economic systems that developed around them increased markedly in the Armenian Highlands. The temple, understood as a "sacred space," was conceived as the foundational structure upon which urban life could emerge. One of the clearest expressions of this growing importance is the appearance of temple models dating to the 1st millennium BCE. Although their number is relatively limited, notable examples have been uncovered in the northern regions of Armenia - particularly Tavush and Lori - as well as finds from Gavar (Gegharkunik). The majority of these models are crafted from metal, primarily bronze, with one clay specimen discovered at the Astghi Blur site near Yenokavan (Tavush). Based on their form, the models can be classified into two main categories: enclosed structures and open-air sanctuaries. The latter depict ritual scenes in which human figures are shown engaged in ceremonial acts. Whether made of metal or clay, these models provide valuable insights into the architectural features of temples of the period. In some cases, they even reveal aspects of internal design, which, when compared with archaeological data and known temple complexes, allow for partial reconstruction of the spiritual concepts, rituals, and practices of the era.

980. Fortified settlement networks on Mount Aragats' northwestern slopes: Lernakert in the Late Bronze and Early Iron Ages (15th–8th centuries BCE)

Authors: Benik Vardanyan (Institute of Archaeology and Ethnography, Armenian Academy of Sciences | Shirak Armenology Research Center, Armenian Academy of Sciences) – Sabine Reinhold (German Archaeological Institute) – Mariam Saribekyan (Institute of Archaeology and Ethnography, Armenian Academy of Sciences) – Dirk Mariashk (German Archaeological Institute) – Noushig Zarikian (Institute of Archaeology and Ethnography, Armenian Academy of Sciences)
Format: Oral

In the 2nd half of the 2nd millennium BCE, the Armenian Highland and surrounding areas underwent major socio-political transformations. It is marked by the rise of fortified settlements and strongholds, often accompanied by large cemeteries. Recent archaeological research at the northern and northeastern slopes of Mount Aragats in Armenia has shed light on settlement patterns,

land use, and the regional community hierarchy. In this context, the Lernakert archaeological sites, situated at the northwestern slopes of Mount Aragats, provide valuable insights into the socio-economic structures and defensive systems of the Late Bronze and Early Iron Ages (15th–8th/7th centuries BCE). This talk presents discoveries from Armenian–German excavations to explore the interconnected system comprising the fortresses 'Veri Berd' and 'Vari Berd', their neighboring cemeteries, and related archaeological features. The research includes (a) an analysis of the architectural and defensive components of the fortresses, (b) a review of the stratigraphic layers and material remains, (c) an accurate timeline using radiocarbon dating, and (d) present how the fortresses are embedded in the local archaeological landscape by mapping graves and other landscape features, supported by GIS-based analysis. By combining the Lernakert evidence with neighboring settlement clusters, we will examine how the fortresses fit within the wider local settlement structure, their possible interconnections, and the rationale for their cemetery locations, and compare these patterns with the results of the Project ArAGATS investigations. Initial findings suggest continuous habitation and cultural evolution, reinforcing the significance of the Lernakert complex in broader discussions of the Late Bronze-Early Iron Age transition in the South Caucasus.

1584. Tracing Cultural and Trade Networks: Colchis in the Late Bronze and Early Iron Age

Authors: Gvantsa Vachadze (Georgian National Museum)
Format: Oral

This study investigates glass artifacts, including beads, pendants, and small sculptures, distributed in the Colchian culture from the Late Bronze to Early Iron Ages. Combining stylistic analysis with non-destructive laboratory methods, including LA-ICP-MS (Laser Ablation Inductively Coupled Plasma Mass Spectrometry), in collaboration with the IRAMAT CEB, University of Orleans/CNRS, our research aims to explore the role, diversity, and production recipies of glass items while tracing the cultural affiliations and potential origins of some raw glass groups. Our findings are based on data gathered from the laboratory examination of approximately 140 glass beads and fragments discovered in the collective cemeteries of Tsaishi, Ergeta, Paluri, and Mukhurcha, located in the central part of Colchis. The study not only highlights the uniqueness of certain glass artifacts but also sheds light on the economic and social interactions within Colchis and its neighboring regions. It emphasizes the exchange between Eastern and Western cultures, particularly with regions such as Iran, Mesopotamia, Syro-Palestine, and Egypt, demonstrating the far-reaching trade and cultural ties during this period.

1370. Hidden within the Colchian Marshes: New Discoveries on the Settlement System of the Kutaisi Zone

Authors: Jacek Hamburg (Krukowski Polish-Georgian Interdisciplinary Research Center) – Roland Isakadze (Kutaisi Historical-Architectural Museum-Reserve | Akake Tsereteli State University | Georgian National Museum in Tbilisi) – Shalva Buadze (Kutaisi Historical-Architectural Museum-Reserve | Akake Tsereteli State University | Niko Berdzenishvili Kutaisi State Historical Museum) – Teona Bubuteishvili (Kutaisi Historical-Architectural Museum-Reserve | Akake Tsereteli State University)
Format: Oral

Colchian settlement mounds, characteristic of western Georgia during the Bronze Age and Early Iron Age, are traditionally grouped into three major zones: the Black Sea coastal area, the extensive lowlands between the Inguri and Ghubistskali rivers, and the Kutaisi zone, which has been investigated by a Polish–Georgian team since 2021 as part of the Kutaisi Archaeological Landscape Project (KALP). These surveys have identified settlement sites to the west, south, and south-east of the city, as well as within Kutaisi itself. Sites across all three zones are classified into three principal types: (A) artificial hilltop settlements fortified with moats and embankments; (B) settlements situated on natural rock hills; and (C) unfortified dune settlements located near rivers or along the seashore. Preliminary dating indicates a chronological range from the Middle Bronze Age to the Early Iron Age. A nucleated pattern of settlement expansion, along with a hierarchical system of larger settlements surrounded by smaller ones, has been observed, reflecting the development of this settlement system. The research team has documented archaeological and interdisciplinary evidence within Kutaisi (e.g., Dateshidze Hill, Gabashvili Hill, and the immediate environs of the Bagrati Cathedral) as well as in areas around the city (e.g., Sakulia, Patriketi, Meskheti, Maghlaki, etc.). The data confirm the presence of a vibrant Colchian settlement during the Late Bronze–Early Iron Age period within the city of Kutaisi. Excavations conducted within the city have uncovered remains of an extraordinary canal system, as well as houses constructed using the wattle-and-daub technique, some of which employed river stones as foundations. While no excavations have yet been carried out at sites outside the city, surface surveys, pottery analysis, geoarchaeological drilling, core sampling, and radiocarbon dating of materials recovered during coring have provided valuable insights into local settlement patterns and a preliminary chronology.

874. Typology and Technology of Neolithic Mud-Brick Architecture in the South Caucasus

Authors: Nana Dalakishvili (Sokhumi State University) – Mariam Eloshvili (Ilia State University, School of Art and Sciences) – Emmanuel Baudouin (Maître de conférences, Université Paris Nanterre)
Format: Oral

Mud-brick was one of the principal construction materials in Neolithic architecture across the South Caucasus; however, its typological diversity and technological characteristics have not yet been systematically examined. This presentation offers a synthetic analysis of published archaeological data from Neolithic settlements in the region, focusing on brick morphology, dimensional

variation, tempering materials, manufacturing techniques, and surface treatment. Through a comparative evaluation of excavation reports, the study identifies both shared technological traditions and localized construction practices. These differences reflect adaptations to environmental conditions, the availability of raw materials, and functional requirements within Neolithic domestic architecture. Variations in brick composition and production techniques also provide insights into architectural decision-making related to structural stability, durability, and the organization of living space. The presentation proposes a preliminary typological framework for Neolithic mud-bricks in the South Caucasus, enabling systematic comparison between sites and contributing to a more nuanced understanding of regional architectural traditions. By integrating typological and technological perspectives, the study aims to provide a methodological basis for future research on earthen architecture and prehistoric building practices in the South Caucasus.

132 LANDSCAPES OF INTERACTION: HUMANS, ENVIRONMENT, AND TERRITORY IN THE ANCIENT MEDITERRANEAN THROUGH DIGITAL PERSPECTIVES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Niccolò Cecconi (Sapienza. Università di Roma. Dipartimento di Scienze dell'Antichità) – Lauren Malkoun (New York University Institute for the Study of the Ancient World) – Claudia Moricca (Sapienza università di Roma. Dipartimento di Biologia Ambientale)
Keywords: Landscape Archaeology, Digital Archaeology, Bioarchaeology, Mediterranean Archaeology
Format: Regular session

SESSION ABSTRACT

This session explores the dynamic relationships between humans and their environments in the ancient Mediterranean, highlighting how digital methodologies can deepen our understanding of these interactions. It aims to reconstruct and interpret ancient landscapes as evolving spaces shaped by both natural processes and human agency by integrating archaeological, environmental, and digital data. Digital tools such as relational databases, GIS platforms, and spatial modeling play a crucial role in transforming fragmented evidence into structured systems of knowledge. Therefore, this session hopes to encourage discussion that addresses shared methodologies and infrastructures for managing heterogeneous datasets (textual, cartographic, iconographic, architectural, environmental, three-dimensional, paleo-/archaeobotanical, and bioarcheological) within coherent spatial and chronological frameworks. We invite contributions that investigate the spatial dimension of human experience and the long-term processes linking cultural and ecological change. Particular attention is given to multi-layered and diachronic contexts ranging from the Protohistoric to the Medieval periods where environmental and historical reconstructions shed light on settlement dynamics, resource management, and the transformation of territorial systems. Case studies addressing diverse Mediterranean settings, i.e. mountains and plains, rivers and lakes, coasts and islands, deserts and valleys, are especially encouraged, as are papers exploring how communities adapted to and reshaped their surroundings over time. We particularly welcome research grounded in paleoenvironmental reconstructions and studies that examine how geographical and ecological factors influenced social organization, landscape perception, and the evolution of territories in the ancient world. In line with the FAIR principles, the session promotes open, interoperable, and reusable research practices. By fostering shared and sustainable models of data management and analysis, it seeks to advance collaborative and interdisciplinary approaches to the study of human–environment interactions across the ancient Mediterranean.

CONTRIBUTION ABSTRACTS

1987. Open-Access Remote Sensing for Monitoring and Multi-Hazard Assessment of Cultural Heritage Sites

Authors: Kyriakos Michaelides – Stylianos Hadjipetrou – Stavros Patsalides – Marinos Ioannides – Athos Agapiou (Cyprus University of Technology)
Format: Oral

Remote cultural heritage sites are increasingly affected by environmental and human-related pressures that threaten their preservation and long-term stability. Soil erosion, flooding, landslides, urban expansion, and uncontrolled tourism are among the main factors contributing to site degradation, while climate change further intensifies these processes through changing environmental conditions and more frequent extreme events. Although remote sensing and geospatial technologies have advanced significantly, many existing monitoring approaches remain fragmented and difficult to apply consistently across large or remote areas. This research is developed within the framework of the ARGUS project (Non-destructive, scalable, smart monitoring of remote cultural treasures), funded by the European Union under the Horizon Europe programme (Grant Agreement No. 101132308). ARGUS aims to advance preventive preservation strategies for remote built heritage by developing digital tools for effective monitoring that combine advanced digitisation approaches, non-destructive monitoring methods, artificial intelligence technologies, and decision-support tools for risk assessment and mitigation. Within this framework, the present study focuses on the use of open-access remote sensing datasets and complementary geoenvironmental information for the monitoring and assessment of threats affecting

remote heritage sites. The proposed methodology combines satellite and aerial data analysis with GIS-based modelling and temporal analysis to identify and evaluate multiple hazard factors affecting cultural heritage landscapes. The integration of heterogeneous datasets within a multi-hazard framework enables continuous observation of site conditions and supports a better understanding of how risks evolve over time. The results demonstrate that open-access remote sensing data can support efficient, repeatable, and scalable monitoring strategies, offering practical tools for heritage management and conservation planning, and highlighting the added value of interdisciplinary digital approaches for protecting cultural heritage amid ongoing environmental and societal change.

1729. Laying the Foundations: A Preliminary Analysis of the Character and Landscape Context of Urbanising Communities in the Iron Age Mediterranean

Authors: Dominic Pollard (University of Cambridge) – Manolis Mavromatis (New York Univeristy) – Christina Stefanou (New York University)
Format: Oral

The middle centuries of the first millennium BCE witnessed the widespread development of urban and urbanising political communities across the Mediterranean. While the regional manifestations of this trend have been variously discussed and compared, few attempts have been made to systematically collate, digitise and comparatively analyse data on Iron Age urban sites in their landscape contexts across the Mediterranean basin. The result is that much remains implicit about our understanding of the fundamental dimensions (scale, population, density, territorial extent etc.) of urbanisation in the Iron Age Mediterranean, and the degree of variability in these metrics within and between regions. In this paper, we present the preliminary analyses of a large, GIS-based dataset of urban sites from across the Mediterranean world in the mid-first millennium BCE, incorporating Iberia, the Central Mediterranean, the Aegean, Cyprus, and the Levant. We examine the distributions of indices of urban development across these sites, to better establish their range and variability, as well as the environmental correlates of site locations (elevation, topography, distance to coasts, cultivability etc.) to draw out commonalities and contrasts in how such communities were oriented in relation to their local landscapes. Finally, based on a second, higher-resolution dataset of digitised archaeological surveys from three case study regions, we situate the development of these urban centres within their regional demographic and settlement histories, to illustrate the diachronic processes by which urban communities emerge via the opportunities and constraints of their local landscapes. Inspired by similar comparative studies of urban sites in the Bronze Age (e.g. Whitelaw 2017), our aim is to better clarify the characteristics, variability, and regional distinctiveness of urbanisation in the Iron Age Mediterranean.

912. Modelling the impacts of the deep mythic past on the historical Mediterranean with MANTO

Authors: Greta Hawes (Macquarie University)
Format: Oral

MANTO (https://manto.unh.edu/viewer) is a born-digital LOD resource that models the spatial dynamics of Greek myth through the data collected from heterogeneous ancient sources (texts, material artifacts, inscriptions, and papyri). Its data adhere to FAIR principles and are available for reuse under a cc-by-nc licence. In this paper, I describe the ways in which MANTO offers new perspectives on how the physical landscape of the historical present was conceptualised in antiquity as shaped by mythic events in the deep past. These connections encompass a range of formally separate phenomena, including physical survivals (the preservation of mythic relics), local cultic and artistic practices, onomastic assertions (eponymic and etymological traditions) and disputes over the 'real' locations of mythic events. In systematising and capturing these connections, MANTO's ontology surfaces phenomena that had been largely ignored in analogue resources dedicated to ancient storytelling. Building a resource using digital tools allowed us to both reconceptualize the nature of Greek mythic knowledge, and to structure this knowledge using networks and maps, rather than the linear lists of past encyclopedias. This technological shift facilitates new possibilities for analysing and visualising the deep past of the Mediterranean, as well as the historical contingencies that supported the storytelling that created these stories. MANTO thus encourages a deeper and more nuanced understanding of the cultural landscape of antiquity.

816. A River, Hills, and the City: Long-Term Transformation of the Southeastern Athenian Landscape (from Neolithic to the Byzantine period)

Authors: Lauren Malkoun (New York University - Institute for the Study of the Ancient World) – Niccolò Cecconi (Sapienza Università di Roma) – Anthi Konstantakopoulou (Independent researcher)
Format: Oral

The southeastern sector of Athens - encompassing the Olympieion, the Ilissos Valley, Cynosarges, the suburb of Agrai, and the area of the present-day National Garden - offers a key case study for examining long-term interactions between human communities and their environment. This part of the city is defined by a complex geomorphological setting, consisting of a coastal fluvial plain associated with the Ilissos river basin, punctuated by limestone hills such as the Acropolis and Mount Lycabettus, and by continuous human occupation since the Neolithic period. These characteristics have generated a stratified landscape in which natural processes and human agency have been closely intertwined over time. This paper proposes an interdisciplinary methodological framework aimed at reconstructing the paleoenvironment and historical landscape of this area through the integration of topographic and territorial analyses with the systematic organization of heterogeneous datasets. Archaeological, geomorphological, and paleoenvironmental evidence are examined in conjunction with historical, literary, epigraphic, geographical, and cartographic sources,

allowing for a critical assessment of both the physical evolution of the terrain and the social and cultural practices that shaped its use. Literary and epigraphic sources provide insights into cultic, social, and administrative activities linked to specific places; geographical and cartographic evidence contributes to the reconstruction of territorial organization and landscape change; geomorphological and environmental data clarify fluvial dynamics and natural transformations; and archaeological remains document settlement patterns, infrastructure, and material interventions in the landscape. Relational databases, GIS platforms, and spatial modeling techniques are employed to manage, correlate, and analyze these diverse datasets within a coherent spatial and chronological framework. Through this integrated approach, the landscape is interpreted as a dynamic and adaptive system, continuously reshaped by the interaction between environmental processes and human strategies of occupation, exploitation, and territorial transformation.

1533. Settlement Strategies, Land Use Choices, and Human Agencies: A Comparative Case Study from the Island of Kos, Dodecanese, Greece

Authors: Calla Mcnamee (University of Calgary) – Salvatore Vitale (University of Pisa) – Toula Marketou (Archaeologist of Dodecanese, retired) – Maria Michailidou (Honorary Director of Antiquities)
Format: Oral

This paper utilizes survey data to explore the environmental and social factors that impacted land use choices through the Bronze Age (BA) on Kos, Dodecanese, Greece. Between 2018-2023, the Kos Archaeological Survey Project (KASP) conducted an intensive and fine-grained pedestrian survey covering over ca. 1000 hectares of the northeastern sector of the island and incorporating artifact counts and surface collection at 10m intervals. Through this work and its documentation in an integrated database linked to ArcGIS, we examine how the spatial distribution and intensity of land use changed through time. We combine our archaeological spatial information with coarse and fine grained digital data on landscape and environmental characteristics, such as landform, slope, and vegetation, while addressing the difficulties of obtaining and integrating environmental and archaeological data of different scales. Despite these methodological questions, our work suggests that environmental characteristics, particularly those directly related to subsistence practices, such as proximity to arable land and grazing habitats, factored into the patterns of land use and settlement choices through time. At the same time, we propose that human agency, as well as demographic and socio-cultural changes, including population expansions and contractions, regional interactions, and increasing social stratification, also contributed significantly to land use decisions. While our paper focuses on the Koan BA, evidence from two other major chronological phases, the Hellenistic to Late Roman and the Byzantine periods, provide comparative case studies that further illustrate the diversity of factors contributing to settlement dynamics on the island.

2361. Tracing the ancient in contemporary landscape: a multidisciplinary diachronic study of the hinterland of the Greek colony of Abdera (Greece)

Authors: Isabel Mattuzzi – Josep Maria Palet Martínez (ICAC - Catalan Institute of Classical Archaeology) – Eurydice Kefalidou (National and Kapodistrian University of Athens) – Merkouris Georgiadis (University of Crete) – Maria Chrysafi (Ephorate of Antiquities of Xanthe) – Constantina Kallintzi (Emeritus Ephor of Antiquities of Xanthe) – Alfredo Mayoral Pascual – Arnau Garcia-Molsosa (ICAC - Catalan Institute of Classical Archaeology)
Format: Oral

This work focuses on long-term human occupation and landscape transformations in the hinterland of the Greek colony of Abdera since its foundation by Ionian settlers in the seventh c. BC. Its aim is to discuss the diachronic evolution of settlement organization and territorial structuration, by analyzing the relationships between settlements, mobility networks and physical context, considering taphonomic biases and evaluating the role of environmental and historical factors. The research adopts a multidisciplinary approach combining: 1) chrono-typological quantification of sites using legacy datasets, remote sensing and extensive survey; 2) detection of historical landscape features (road networks, field systems and geomorphological features) preserved in contemporary landscape or visible in historical cartography and aerial photographs, followed by their classification and regressive analysis, based on morphology, written sources, relations with sites, and radiocarbon dating; 3) integration of archaeological and geomorphological data, enriched with the study of pedo-sedimentary sequences. Extensive survey allowed to confirm the information about 73% of previously known sites surveyed, identify new chronological phases in at least 2 cases, and locate about 20 new sites. A dense network of roads, paths and tracks have been detected, highlighting superimposed radial and orthogonal systems from different periods and distinct developmental stages of the main communication axes. Several elements of the historical road network have also been documented in the field (e.g. remains of stone paving and entrenched paths). GIS analyses further contribute to assessing the relationships between settlements, mobility networks and physical environment. These results significantly improve previous knowledge of settlement systems and communication networks, while highlighting the relevant, but not exclusive, role of topography and geomorphological processes in landscape structuration. This study illustrates how multidisciplinary approaches, supported by GIS-based digital tools, enable the integration of heterogeneous data, contributing to a deeper understanding of human-environment interactions and long-term landscape shaping processes in ancient Mediterranean.

718. Digital Archaeobotany for Ancient Landscape Reconstruction: the ARBOREA Database

Authors: Claudia Moricca – Rachele Nicolini (Sapienza University of Rome) – Erasmo Di Fonso (University of Bari Aldo Moro) – Laura Sadori (Sapienza University of Rome)
Format: Oral

Archaeobotanical data are essential for reconstructing long-term human-environment interactions, yet plant macro-remains remain unevenly integrated into digital landscape studies of the ancient Mediterranean. This paper presents ARBOREA – ArchaeoBOtanical geoReferenced rEcords of Ancient Italy, a relational and GIS-enabled database developed to collect, standardize, and compare published archaeobotanical data on plant macro-remains from central Italy, spanning Protohistoric to Modern contexts. The contribution is framed within the broader research activities of Spoke 8 of the NRRP project CHANGES, which aim to bridge critical gaps in the state of the art of Italian archaeobotany through two complementary strategies: the study of plant remains from previously unpublished archaeological contexts and the digitalization of archaeobotanical heritage. Digitalization efforts include the production of systematic high-quality photographic documentation of selected archaeobotanical collections and the development of shared digital infrastructures for data organization and reuse. Within this framework, ARBOREA was conceived as a dedicated platform to address the fragmentation and limited accessibility of archaeobotanical legacy data, which are often dispersed across publications and grey literature. The database integrates taxonomic, chronological, and spatial information within a coherent structure and offers a web-GIS interface for exploring assemblages across different ecological settings and archaeological contexts, including settlements, sanctuaries, and fortified sites. This enables multi-scalar and diachronic analyses of plant use, vegetation dynamics, and resource management practices, contributing to the reconstruction of ancient landscapes and territorial systems. Designed according to FAIR principles and interoperable with national initiatives such as BRAIN (Botanical Records of Archaeobotany Italian Network), GNA (Geoportale Nazionale Archaeologia), and ArcheoSITAR (Sistema Informativo Territoriale Archeologico di Roma), ARBOREA demonstrates how structured digital approaches can enhance the role of archaeobotany in interdisciplinary research on human–environment interactions in the ancient Mediterranean.

2316. Beyond Otium and Negotium: a multi-proxy study of the Villa of Titus and its environmental context (Rieti, Lazio)

Authors: Erika Zane – Erica Rowan – Simon Blockley (Royal Holloway University of London) – Myles Mccallum (Saint Mary's University)
Format: Oral

Roman luxury villas set within visually striking landscapes are often simplistically interpreted as spaces of otium, framed through models that privilege leisure and display while neglecting production. Such interpretations have contributed to a separation between residential and productive spheres, frequently rejecting the concept of the villa as an integrated economic unit. This paper challenges these assumptions through a multi-proxy investigation of the Villa of Titus (Lazio, Italy), a 1st-century CE villa overlooking Lake Paterno, near the ancient Via Salaria. By situating the villa within its wider environmental and territorial context, the study reassesses the relationship between elite residences, agricultural production, and landscape exploitation. Since 2018, the site has been excavated by a joint research team from Saint Mary's and McMaster Universities. Within this broader project, an interdisciplinary collaboration between the Classics and Geography departments at Royal Holloway University has undertaken extensive environmental sampling. Archaeobotanical data (plant macrofossils, charcoal, pollen, and fungal spores) from both the archaeological site and Lake Paterno were analysed. Furthermore, environmental variables of the surrounding landscape were modelled using a GIS platform to produce agricultural potential maps of the studied areas, reconstruct land use, and evaluate locational choices linked to environmental aspects. The results indicate a central role for agriculture across the villa's Roman phases and throughout successive occupation periods (1st century BCE–9th century CE), suggesting that productive activities were significant to the villa's economy. This case study demonstrates that elite residential display and agricultural production were not mutually exclusive but often deeply intertwined. By questioning the enduring otium/negotium dichotomy, this paper highlights the value of multi-proxy and digitally integrated approaches for revealing often-overlooked aspects of the Roman landscape and for advancing more nuanced interpretations of human–environment interactions in Roman Italy.

703. Reconstructing the Ancient Landscape of Southern Umbria. An Integrated Digital and Interdisciplinary Framework

Authors: Niccolò Cecconi (Sapienza. Università di Roma. Dipartimento di Scienze dell'Antichità)
Format: Oral

This paper presents an interdisciplinary methodological framework for the analysis and interpretation of ancient landscapes, aimed at reconstructing long-term processes that shaped the relationships between human communities and their environments. The proposed approach combines territorial analysis with the systematic organization and integration of heterogeneous datasets, including archaeological, historical, cartographic, environmental, and topographical evidence. Digital tools play a central role in this framework, particularly relational databases, GIS platforms, and spatial modeling techniques, which enable the correlation, visualization, and interpretation of data within a coherent spatial and chronological structure. The methodology is applied to a case study in central Italy, focusing on southern Umbria and specifically on the lower Valnerina area, encompassing the municipalities of Terni, Arrone, Montefranco, Ferentillo, and Polino. This region is characterized by a complex geomorphological setting and a long-term continuity of human occupation from the Protohistoric period through the Middle Ages. By integrating archaeological records, paleoenvironmental indicators, and historical sources, the landscape is interpreted as a dynamic system continuously reshaped by the interaction between natural processes and human agency. A diachronic perspective allows for the identification of settlement strategies, patterns of resource exploitation, transformations in territorial organization, and adaptive responses of local communities to the opportunities and constraints posed by fluvial and mountainous environments. Particular attention is given to the role of river systems, communication routes, and marginal zones in structuring settlement dynamics over time. Ultimately, the paper aims to contribute both to the historical reconstruction of the lower Valnerina landscape and to a broader methodological discussion on the role of digital technologies in the study of long-term human–environment interactions, supporting interdisciplinary research, heritage protection, and landscape management strategies.

525. LiDAR and landscape archaeology: a case-study from Sellano (PG) between prehistory and the Middle Ages

Authors: Matelda Albanesi – Maria Romana Picuti (Independent Researcher) – Andrea Conte (Sapienza University of Rome)
Format: Oral

This paper presents the preliminary results of a landscape archaeology project focusing on the territory of Sellano (PG), with particular emphasis on the integration of existing archaeological records and remote sensing data, especially LiDAR. The study area, situated between the Umbra Valley and the Nera Valley, remains relatively underexplored archaeologically and is characterised by considerable morphometric and morphological complexity. As such, it provides a suitable framework for a systematic assessment of long-term settlement dynamics from prehistory to the medieval period. The research began with the identification and mapping of known archaeological sites based on bibliographic and archival sources, alongside data from previous field surveys. In parallel, the examination of LiDAR datasets — currently only partially available for the area — enabled an evaluation of the detectability of recorded sites and the identification of topographic anomalies potentially indicative of previously undocumented archaeological features. On this basis, broad chronological phase maps were developed to outline general trends in patterns of territorial occupation. Particular attention is also given to the morphometric properties of settlements, with the aim of identifying recurring locational preferences and settlement patterns between prehistory and the Middle Ages. The study ultimately aims to assess the value of LiDAR not only as a tool for site detection, but also as an instrument for territorial analysis capable of integrating diverse datasets and offering new interpretative perspectives on the historical development of the Umbrian landscape.

2052. Deep Connectivity at Abellinum: Integrated GPR and UAS Approaches in Mediterranean Archaeology

Authors: Alessandro Visconti (Università degli studi di Salerno)
Format: Oral

Recent advances in non-invasive methodologies are profoundly reshaping landscape archaeology, particularly in complex Mediterranean hilly inland contexts where accessibility, vegetation cover and deep stratigraphy constrain traditional fieldwork. This study presents an integrated, multi-scalar framework combining low-frequency Ground-Penetrating Radar (GPR) and high-resolution Uncrewed Aerial Systems (UAS) photogrammetry to investigate buried and exposed archaeological remains within a unified spatial model. The approach is illustrated through the case study of Abellinum, a Roman urban settlement developed on a volcaniclastic terrace overlooking a major valley corridor, where topography and human agency jointly shaped an evolving territorial system. The site, already occupied in the Samnite period, underwent significant architectural developments in the Roman period, evolving as an urban center and retaining its role in the landscape into Late Antiquity. Low-frequency GPR (<100 MHz), integrated with Real-Time Kinematic Global Navigation Satellite System (GNSS RTK) positioning and high-resolution surface models, enabled deep subsurface imaging and precise spatial correlation between buried structures and topographic features. The analytical integration of geophysical anomalies, elevation data and stratigraphic evidence, within a GIS- based framework, situates subsurface patterns within a coherent urban system adapted to the terraced morphology of the plateau, clarifying the dynamic relationship between human occupation and environmental constraints. This integrated approach reconstructs the orthogonal organization of the urban layout within the investigated sectors, confirming the continuity of the decumanus and cardo, the internal articulation of insulae and the adaptation of built structures to the morphology of the plateau. The integrated archaeological map, based on excavation records, stratigraphic and standing architectural evidence, refines the interpretation of settlement organization and movement corridors extending beyond the currently exposed remains, demonstrating how interoperable digital and geophysical frameworks enhance analytical resolution and support sustainable, non-invasive heritage management.

1947. Reconstructing the Roman Landscape Between Tilurium and Aequum Through LIDAR Data Analysis

Authors: Jelena Lapić – Miroslav Vuković (University of Zagreb, Faculty of Humanities and Social Sciences)
Format: Oral

The Roman military fortress Tilurium (present day Gardun, Dalmatian hinterland, Croatia) was most likely built at the beginning of the 1st century. Following the suppression of the Batonian revolt, two legions were permanently stationed in Dalmatia: legio XI at Burnum and legio VII at Tilurium, both receiving honorary title Claudia Pia Fidelis in 42. Legio VII remained at Tilurium until the latter half of the 1st century, when it was redeployed to the Danubian frontier in Moesia. During the first half of the 1st century, a detachment of legio XI was likewise present at Tilurium. Auxiliary units are also attested at the site. Following the departure of the VIII voluntariorum civium Romanorum, Tilurium continued to function as a beneficiarii station. Following the departure of legio VII, no further legionary units were stationed at Tilurium. Nevertheless, numerous veterans remained in the surrounding area, many of whom settled there prior to the legion's transfer to Moesia. In the aftermath of the Scribonian revolt, veterans were also settled in the newly founded colony of Aequum (present day Čitluk, Dalmatian hinterland, Croatia), which Emperor Claudius

founded after the year 45 through a land grant discharge (missio agraria). As the only colonial settlement in the interior of Dalmatia, Aequum was built on a hilltop plateau with its urban layout following a deliberately planned orthogonal layout. This study investigates the boundaries and the spatial characteristics of the legionary territory (prata legionis) as well as Roman land division system (centuriatio) using LIDAR and historical data to reconstruct the Roman period landscape between the military camp of Tilurium and the colony of Aequum. LIDAR data analysis provided evidence of the preservation of the Roman centuriation system as well as indications of the extent of the legionary territory (prata legionis) and associated structures within the specified area.

2327. Landscapes of Power: A GIS-Based Study of Hospitaller Commanderies in the Medieval Crown of Aragon (12th–14th c.)

Authors: Bet Mallofré López (Universitat de Barcelona)
Format: Oral

This paper examines the landscapes shaped by the Order of Saint John of Jerusalem within the Crown of Aragon between the twelfth and early fourteenth centuries, offering a spatial and diachronic contribution to the study of frontier societies in the medieval Western Mediterranean. While the Hospitallers have long benefited from a robust historiographical tradition, their territorial organisation—particularly the configuration of both male and female commanderies—remains insufficiently understood from a landscape archaeological perspective. This study integrates evidence from textual sources, cartographic materials, and archaeological and architectural remains with digital tools such as relational databases and Geographic Information Systems (GIS), enabling the localisation, characterisation, and diachronic analysis of Hospitaller commanderies. The resulting dataset supports the creation of an open access catalogue and facilitates spatial, chronological, and territorial analyses, including the Order's interaction with other military institutions across the Crown of Aragon. Spatial and chronological assessments further allow the examination of commanderies in relation to settlement patterns, communication routes, agricultural potential, and their relationships with other powers operating within the Crown. The results highlight how the Hospitallers' organization of the surrounding landscape enabled them to consolidate territorial power, develop their institution, and interact with a fluctuating border. By presenting the methods employed for data extraction and spatial modelling, alongside the results obtained, this contribution demonstrates how digital infrastructures and landscape-based approaches can enhance our understanding of the long term dynamics linking institutional organisation and territorial development.

1961. From cursus publicus to barīd: change and persistency of the terrestrial communication routes in the Levant

Authors: Adam Pažout (Universitat Autònoma de Barcelona)
Format: Oral

Pre-modern land-based empires relied on an intricate system of state post, comprised of roads, relay stations, road stations, inns and messengers to exercise control in the provinces and to project power from the imperial centre. Despite differences in the organisation of the systems, the role of the state communication system and the material infrastructure requirements (roads and stations) remained essentially the same throughout the ages. This opens an opportunity for a diachronic analysis of various communication systems to evaluate their functionality, performance in relaying information between different places, environmental and social circumstances and interactions that shaped them, and persistency of the routes and nodal points in time and space. The principal goal of this contribution is to unravel patterns of change and persistency of the physical infrastructure of the network(s) – roads and nodal points – in the ancient and Medieval Levant. Three different communication networks are analysed and compared: Roman cursus publicus, Early Islamic (Abbasid) and Middle Islamic (Mamluk) barīd. The data for Roman network was collected by the project Itiner-e, while data on the cursus publicus were inferred from Roman itineraries listing various mansiones and mutationes. The Early and Middle Islamic road network and barīd, digitized by the VIA-TARIQ project, is based on Arabic Medieval geographers. Spatial analysis in GIS is employed to explore a) persistency of the layout of the communication routes, b) clustering of road stations and nodal points across periods, c) coincidence of routes and natural movement corridors. Network science methods are used to explore d) change and persistence of the important nodal points using degree and betweenness centrality, and e) effectivity of the network in transmitting information using edge betweenness and closeness metrics. The interdisciplinary approach allows to evaluate the multi-faceted environmental, historical, and social factors that shaped the pre-modern communication networks in question.

557. Mapping Settlement Location Patterns through pseudo-stochastic Least-Cost Analysis

Authors: Stefano Apra (Institute for the Study of the Ancient World - New York University)
Format: Oral

FETE (From-Everywhere-to-Everywhere) was theorized by White and Barber (2012) as an advanced framework for least-cost analysis. While traditional Least-Cost Path Analysis deterministically connects predefined points, FETE models potential mobility across an entire landscape. By computing cost-based trajectories between all possible locations, FETE simulates movement patterns without aprioristic assumptions about routes or endpoints, thus overcoming some of the main limitations of LCPA. The potential of FETE in archeology is significant, as it allows us to study ancient landscapes in hitherto unseen ways, exploring the interaction between mobility, settlement patterns, and terrain morphology. Until now, no openly available software has been able to process

the amount of data generated by FETE without unrealistic computing time. This paper introduces Trajecta, a new open-source and free-to-use software developed specifically to overcome these challenges. To illustrate its capabilities and its potential in the study of the Ancient World, a trial study is at the core of the presentation. Specifically, FETE was conducted for northern Transjordan to model mobility across the region during the LBA and IA. The case study is not random: thanks to its favorable position and morphology, Transjordan is known to have been a prominent commercial crossroads. In these periods, the region was traversed by a major, yet unidentified route – the 'King's Road' – which allowed for a commercial continuum within the eastern Levant. Trade allowed Jordanian settlements to prosper. These observations lead us to ask to what extent the morphology and mobility of the territory may have influenced local settlement patterns. Thus, Trajecta allows us to address these specific questions, while also providing new and far-reaching insights into large-scale movement dynamics and their role in the interaction between humans and the landscape. White, D.A., Barber, S.B. 2012. Geospatial modeling of pedestrian transportation networks: a case study from precolumbian Oaxaca, Mexico. JAS39:2684-2696.

1484. From Text to Terrain: A FAIR, Spatial Evidence Graph for Ancient Mediterranean Ecologies (500 BCE–300 CE)

Authors: Federico Di Pasqua (University of Zurich)
Format: Oral

Understanding human–environment interactions in the ancient Mediterranean requires methods that can integrate heterogeneous evidence—texts, archaeological observations, spatial authorities, and environmental datasets—within shared spatial and chronological frameworks. This paper presents Ecologies of the Ancient Mediterranean, a spatially-aware AI research platform designed to connect place-linked ecological knowledge in ancient sources to landscapes, material evidence, and environmental reconstructions, while preserving auditability and scholarly control. The platform combines three components. First, it implements an explicit, versioned Ancient Ecology Vocabulary (e.g., water infrastructure, land-use practice, hazard event, storage/provisioning, institutional action, and crisis framing) to ensure that extraction and annotation are conceptually stable and interoperable. Second, it builds a place-anchored knowledge graph that links textual attestations (literary, epigraphic, papyrological) and archaeological records to persistent gazetteer identifiers (e.g., Pleiades) and to time-bounded entities (events, practices, interventions). Third, it layers graph-augmented retrieval over semantic search to support map-based querying and citation-driven exploration, enabling users to move systematically between (a) attested passages, (b) inferred practices/events, and (c) interpretive framings (e.g., divine causation, mismanagement, natural cycles) without collapsing these evidentiary layers into a single "fact." A case study on water management and risk in the Nile Valley demonstrates how the system aligns textual claims about infrastructure, shortage, and repair with spatial distributions of hydraulic features and selected environmental datasets, and how it can diagnose systematic divergences attributable to genre, elite bias, or uneven preservation. By foregrounding FAIR-aligned identifiers, provenance and licensing metadata, and reusable semantic layers, the platform offers a sustainable model for collaborative digital landscape research and for integrating ecological, cultural, and historical signals across the ancient Mediterranean.

1590. Archaeobotany at Carthage (Tunisia): plant use and social-cultural change during the Punic period

Authors: Cecilia Armenio (Department of Science of Antiquities, Sapienza University of Rome | Department of Environmental Biology, Sapienza University of Rome) – Lorenzo Nigro – Federico Cappella (Department of Oriental Studies, Sapienza University of Rome) – Mounir Fantar – Moez Achour (Institut National du Patrimoine, Tunis) – Laura Sadori (Department of Environmental Biology, Sapienza University of Rome)
Format: Oral

This study focuses on the analysis of plant macro-remains recovered from the Phoenician-Punic site of Carthage (Tunisia), conducted within the framework of the Archaeological Mission to Carthage, under the scientific cooperation agreement between the Institut National du Patrimoine de la Tunisie (INP) and Sapienza University of Rome. Specifically, the botanical remains were recovered through flotation from two distinct areas: the southern sector of the Dermech necropolis, within the Antonin's thermal bath complex, and the Odeon Hill, which hosts Punic tombs, two of which were sampled. The study aims to use archaeobotanical evidence from the city of Carthage to support interpretation of social, cultural, urban change through the reconstruction of plant use. In particular, this study highlights the importance of integrating archaeobotany, together with other specialized approaches, as an active component of archaeological excavations and missions. The archaeobotanical evidence from Dermech contributes to the interpretation of the reuse of the archaic funerary area, which was transformed into an artisanal zone during the 5th century BC, where plants may have played a role as raw material in industrial and craft activities. Conversely, data from the Punic tombs on the Odeon Hill provide insights into the role of plants in funerary and sacred practices, broadening our understanding of ritual behavious and mortuary traditions at Carthage. Data from Carthage will enrich a large catalogue of archaeobotanical evidence from archaeological sites of the Mediterranean basin.

1041. Satellite Imagery as an Effective Tool for Identifying and Documenting Submerged Coastal Archaeological Sites

Authors: Eliška Chimalová (University of South Bohemia in České Budějovice)
Format: Poster

Mediterranean coastal zones harbor numerous archaeological sites that have been submerged due to rising sea levels and coastal erosion. These sites are increasingly endangered, as both processes are expected to intensify in the coming decades. The documentation and protection of this cultural heritage are often complicated, since underwater archaeological research is constrained by high costs, logistical demands, and, in some cases, limited accessibility of fieldwork environments. This study demonstrates the potential of freely available satellite and aerial imagery as a low-cost, non-invasive tool for the preliminary identification and assessment of shallow submerged archaeological remains along Mediterranean coastlines. The presented methodology evaluates a structured analytical workflow based on the visual analysis of satellite imagery and its comparison with published geophysical case studies from selected Mediterranean sites. The results indicate that, under favourable environmental conditions, submerged structures such as harbours, villas, breakwaters, and other architectural remains can be identified and documented in the form of georeferenced imagery. In several cases, the results are comparable to those obtained through significantly more resource-intensive techniques, including sonar surveys and airborne laser bathymetry. The poster discusses the main advantages and limitations of satellite-based approaches and outlines potential directions for future development, including the automation of detection processes. It also highlights the effectiveness and accessibility of the proposed workflow as a tool for the monitoring of endangered submerged coastal archaeological sites.

1141. Late Chalcolithic Plant Exploitation and Agricultural Practices at Arslantepe (Türkiye)

Authors: Silvia Cristofoli – Francesca Balossi Restelli – Cristiano Vignola – Laura Sadori – Alessia Masi (Sapienza University of Rome)
Format: Poster

This study focuses on charred botanical macro-remains (seeds, fruits, and wood) recovered at Arslantepe (Türkiye), one of the earliest primary states in Southwestern Asia. The site is characterized by continuous human occupation from at least the 5th millennium BCE to the Roman-Byzantine period. This research examines plant remains from the Late Chalcolithic 2 (Period VIII in the site, 4400-4300 BCE), the earliest phases excavated so far at the site. The main objective is to reconstruct the interaction between population and the surrounding environment by investigating agricultural practices, diet, and wood exploitation. The archaeobotanical analyses were carried out on 152 samples from 17 domestic contexts. Charcoals provide information about past woodland cover and the use of wood resources. These remains, deriving from fuel and timber materials in different dwellings, indicate the presence of mainly Quercus dec. (deciduous oak), Pistacia (pistachio), Alnus (alder), and Ulmus (elm). Other taxa are Juniperus (juniper), Rosaceae Maloideae and Prunoideae (including apple, service, plum trees), Populus (poplar), Tamarix (tamarisk), and Fraxinus (ash). The identification of carpological assemblage includes a variety of seeds, fruits, and other plant parts. Cereals are dominant and are mainly represented by Triticum turgidum subsp. dicoccon (emmer), T. monococcum (einkorn), T. aestivum subsp. aestivum/T. turgidum subsp. durum (bread/durum wheat), Hordeum vulgare (barley), with minor taxa such as T. spelta (spelt), Avena (oat), and Secale (rye). Legumes are present but in lower proportions and include Lathyrus oleraceus (pea), Vicia faba (broad bean), Cicer arietinum (chickpea), and Vicia lens (lentil). Weedy plants associated to cultivated taxa are rare (Aegilops, Bromus, Galium). These results enhance the archaeobotanical research at the UNESCO site of Arslantepe and contribute to reconstruct socio-economic dynamics in a crucial period that formed the basis of the proto-state development in Türkiye.

2196. Sustenance to Ritual in Monte Cimino: an archaeobotanical perspective

Authors: Danica Desilva – Andrea Cardarelli – Lorenzo Cardarelli – Cristiano Vignola – Alessia Masi (Sapienza Università di Roma)
Format: Poster

This study investigates the Final Bronze Age archaeological site located on Monte Cimino (Soriano nel Cimino), a volcanic massif in Southern Etruria in central Italy, approximately 70 km north of Rome. The site has been extensively investigated from an archaeological perspective, allowing it to be identified as a fortified settlement with an elevated area that, due to its location and archaeological evidence, can be regarded as an acropolis, within which a monumental cult area has been excavated. This study increases that knowledge through the investigation of archaeobotanical remains that were retrieved during the excavation campaigns, thereby providing a better understanding of past human-plant relationships, with particular attention to the activities testified in the site. The analysed samples, including carpological and anthracological remains, are attributed to settlement phases 1B, 2A, 2B and 3B, all of which date to the Final Bronze Age (Protovillanovan culture, 12th-10th centuries BC), and were retrieved from contexts within the acropolis. The archaeobotanical assemblage is rich (57 taxa), mainly consisting of charcoals, charred seeds and caryopsis. The most represented taxa is Fagus sylvatica (beech) among charcoal fragments and Triticum turgidum ssp. dicoccon (emmer) and Hordeum vulgare (barley) within cereal grains. Across the investigated phases, a considerable variety of woody taxa has been identified suggesting that wood resources were exploited for different purposes, including construction and fuel. Considering the cultivated and edible plants, a change in agricultural and dietary habits has been evidenced with a shift from a mixture of wild fruits, oil and medicinal plants to a specific collection of cereal species. The plant assemblage studied hence provided valuable insight into the activities of the local community, displaying in particular how a mixed woodland dominated by mesophilous taxa had played a significant role in ritual practices.

2398. Eight years of integrated archaeological research at Vilavella del Castellet: digital documentation of pastoral adaptation in a Medieval mountain settlement

Authors: Sabina Batlle Baró (Departament de Biblioteconomia i Documentació, Universitat de Barcelona | Laboratori d'Arqueologia Medieval, Universitat de Barcelona) – Xavier Costa Badia (Departament d'Història i Arqueologia, Universitat de Barcelona | Laboratori d'Arqueologia Medieval, Universitat de Barcelona) – Júlia Coso Álvarez (Departament d'Humanitats, Universitat Pompeu Fabra | Laboratori d'Arqueologia Medieval, Universitat de Barcelona) – Walter Alegría Tejedor (Departament d'Història i Arqueologia, Universitat de Barcelona | Laboratori d'Arqueologia Medieval, Universitat de Barcelona) – Marina Fernández Liarte – Paula Melero Pérez (Laboratori d'Arqueologia Medieval, Universitat de Barcelona)
Format: Poster

This poster presents the results of eight years of archaeological research (2016-2023) at Vilavella del Castellet, a medieval rural settlement (11th-13th centuries) located in La Terreta, a valley in the Pallars Prepyrenees (Catalonia, Spain). The site exemplifies human adaptation to mountainous environments through a husbandry-based economy, challenging conventional models of medieval agricultural settlement. Strategically positioned along a transhumance route, Vilavella del Castellet demonstrates how communities reshaped their territorial engagement in response to geographical and ecological constraints. Our methodological approach integrates digital tools to document and analyze the complex relationship between settlement organization and environmental affordances. Photogrammetry provides three-dimensional documentation of structures and stratigraphic sequences, while total station surveys capture precise spatial data. All archaeological and topographic information is managed through GIS platforms, enabling multi-layered analysis and visualization of settlement patterns and architectural features. Key findings include distinctive building techniques utilizing large rocks collected from nearby scree slopes, reflecting direct material adaptation to the mountain landscape, and evidence of ovine-centered economic strategies rather than typical agrarian models. The project piloted a portable PostGIS database deployed on tablets for real-time field data collection, streamlining the recording of contextual information, photography, and preliminary spatial data. In accordance with the FAIR principles, excavation reports are openly shared via the Zenodo repository, with datasets planned for open dissemination. This research demonstrates how integrated digital methodologies can illuminate the dynamic interplay between environmental conditions, resource management, and territorial organization in marginal Mediterranean landscapes.

2408. A GIS Survey of the Sanctuary of Eukleia, Aigai: Mapping Coins and Lamp Fragments

Authors: Seraphina Vasilodimitrakis-Hart (Aristotle University of Thessaloniki)
Format: Poster

This project is part of a continuing collaboration with the lead archaeologists in charge of excavation at the Sanctuary of Eukleia at Aigai. The first objective of the project was to create a dynamic catalogue of the coins and lamp fragments found during excavations of the main terrace of the sanctuary plotted on a map of the site that can then be updated and changed as more artifacts are discovered. The initial focus for this project was on building up layers that could be useful for the future work and additions of the archaeologists working at the site. Mapping the lamp fragments and coins found at Aigai with GIS contributes to the understanding of the chronological relationships between the structures and stratigraphy at the Sanctuary. This database approach reveals the areas of the Sanctuary most in use in different time periods. Using the QGIS mapping software, this work forms the starting point of a wider mapping project. As a free and open-source application, QGIS is an accessible mapping tool, with an extensive and easy to navigate online manual and instruction videos. This beginner-friendly aspect makes GIS the ideal software for a collaborative project like this one, since future work at the site may not necessarily be done by people knowledgeable in GIS-use. Future work mapping the site will help elucidate the chronological relationships of the structures and finds at the site and contribute to the understanding of the ancient site of Aigai. This project displays the spatial and chronological relationships between the structures and artifacts at the site, amongst other criteria. A QField interactive field project was used in 2025 to map the new findings at the site as they were unearthed. The static and interactive maps produced from this work are resources for future exhibitions and reports.

2613. Exploring Sacred Landscapes. A Preliminary Case Study of Valnerina's Sanctuaries and their Natural Contexts.

Authors: Niccolò Cecconi (Sapienza. Università di Roma. Dipartimento di Scienze dell'Antichità) – Lauren Malkoun (New York University Institute for the Study of the Ancient World) – Marta Flati – Anna Bontempi (Università degli Studi di Perugia)
Format: Poster

The Valnerina region, in southern Umbria, preserves a network of high-altitude sanctuaries that illuminate the interplay between sacred space and natural landscape from the pre-Roman to Roman periods. This spatial analysis focuses on Monte Torre Maggiore (Terni), Monte Moro (Montefranco), and Monte di Arrone (Arrone), investigating how their placement reflects both environmental and cultural considerations. These sanctuaries are strategically located near prominent peaks, dense woodlands, and watercourses, integrating panoramic visibility, access to resources, and symbolic associations with water into their ritual function. Importantly, these sacred sites occupy a transitional zone at the interface of multiple cultural spheres (Umbrian, Sabine and Latine) highlighting their role as mediators in a contested and culturally dynamic territory. Their proximity to significant urban centers such as Carsulae

and Interamna Nahars further underscores the connection between ritual landscapes and socio-political networks, suggesting that these sanctuaries functioned both as focal points of local cultic activity and as nodes linking broader regional interactions. The combined spatial, environmental, and cultural analysis reveals that high-altitude sanctuaries in the Valnerina were not isolated religious sites but integral components of a complex territorial system, where natural morphology, access to key resources, and interregional cultural dynamics intersected to shape enduring sacred landscapes.

133 LATE BRONZE AND IRON AGE ENCLOSURES BETWEEN THE DANUBE AND THE DON

Theme: 7. Interaction, connectivity and mobility
Organisers: Oleh Bilynskyi (National University of Kyiv Mohyla-Academy) – Joanna Markiewicz (Jagiellonian University in Cracow) – Alisa Demina (National University of Kyiv Mohyla-Academy) – Barbora Danielová (Orava museum of P. O. Hviezdoslav) – Alexandru Berzovan (Iaşi Institute of Archaeology)
Keywords: enclosure, hillfrot, Late Bronze - Iron Age, Carpathian region, Pontic forest-steppe, nomads
Format: Regular session

SESSION ABSTRACT

The settlement landscape of Central and Eastern Europe underwent significant changes in the Late Bronze - Iron Age. The widespread emergence of diverse forms of enclosures marked new approaches to territorial control, defense and regional interaction. Alongside the growing number of hillforts, many sites developed into agglomerations with nearby settlements, forming more complex spatial patterns. Yet while some of these centres flourished and developed, others faced decline, destruction, and abandonment. At the same time, another major factor influenced developments in both the Pontic and Carpathian regions: the appearance of nomadic groups associated with the historical Cimmerians and Scythians. While nomadic aggression is apparent, as shown by the destruction of hillforts across Central and Eastern Europe, the relations between nomadic and settled populations were more complex. Could these contacts, connected with trade, political change, and relations with the Mediterranean world, have contributed to new regional dynamics? The tightening of interregional networks may have contributed to the growing complexity of societies. Climate changes in the first millennium BC could be seen as another factor driving diversification in local and regional economies. What role did enclosures play in these processes? Does the variety of designations: natural or artificial, hillfort or stronghold - represent the actual diversity of strategies in managing resources, securing territories and sustaining livelihoods? This session invites contributions that address these questions and topics, such as: Cimmerians, Scythians and "nomadic factor": conflict, coexistence, and hybrid frontiers between steppe and forest-steppe; Origin of the fortification tradition and its development; Regional case studies from the Carpathian territory to the Pontic forest-steppe; Technological choices in enclosure construction and maintenance; Symbolic and landscape dimensions of enclosure and visibility; Environmental and climatic factors influencing enclosure strategies and settlement hierarchies; Changing functions of enclosures: from refuge and military strongholds to economic, trade and religious centres.

CONTRIBUTION ABSTRACTS

126. The Beginning of the Iron Age on the Border of Forest and Forest-Steppe in Eastern Europe

Authors: Evelina Kravchenko (Institute of Archaeology of the NAS of Ukraine) – Nataliya Bilas (Ivan Franko's Lviv National University) – Zoya Ilchyshyn (Preventive Archaeological Service of the NAS of Ukraine) – Denys Slusar (Ivan Franko's Lviv National University)
Format: Oral

The presentation examines the archaeological sites of the Early Iron Age in Eastern Europe and northern Pontus, namely the formation of groups of archaeological sites of the northern Forest-Steppe, southern Polissya and Roztochchya in Ukraine and eastern Poland. The issue of the emergence of hillforts, fortified settlements and settlements with natural protection is considered, modern conceptual generalizations and the latest research on the mentioned sites are analyzed. Attention is focused on the study of groups of sites in their connection with large fortified settlements and agglomerations. The issue of the formation of a contact zone along the border of forest and forest-steppe sites along the tributaries of the Dnieper - Pripyat`, Psel, Sula, Seim, Supoy, Vorskla and the emergence of a trade route, which was later marked by archaeological finds of items imported from Greek centers, is considered. Research in recent decades shows that the Carpathian and Roztochchia regions were not aloof from the general processes of socio-economic development of Central and Eastern Europe. The population of these regions was a link in the general historical and natural processes of the beginning of the Iron Age, one of the most important of which was the formation of a system of trade routes, the intensification of contacts between rather distant regions. Climatic changes and increased precipitation in the north improved the conditions for movement by waterways.

1060. Early Iron Age hillforts of the 7th-6th centuries BCE in Eastern Podolia

Authors: Oleksandr Shelekhan (Institute of Archaeology NAS of Ukraine) – Oksana Lifantii (National Museum of the History of Ukraine)
Format: Oral

The Early-Scythian culture area lay between the Dniester and Vorskla rivers, while the steppe remained depopulated mainly in the 7th–6th centuries BCE. However, a vast settlement structure is seen to the north of the steppe region. The most recognisable local groups are the Dnieper and Vorskla groups, for which large-scale excavations have been conducted for more than a hundred years. East Podolia is the least studied region. Today, the low level of regional exploration, stemming from a shortcoming, could become a positive feature. We can now obtain new information by studying the local monuments at a higher methodological level. For example, here we can see an area of the East-Podolian group outlined after the archaeological surveys. There are two main Early-Scythian sites of the region – Nemyriv and Severynivka hillforts, which are grouped with the open settlements. The local farmers tended to settle on the high plateau between the Dniester–Buh watershed and the Sob River. It is the area of the grey forest soils, while the black chornozem soils with the Steppe landscape remained unpopulated. Monuments such as Trahtemyriv and Severynivka are clear evidence of the diverse character of Early Scythian culture. The local population and nomadic peoples created a recognisable culture in the middle of the 7th century BCE. Later, Severynivka, together with Chotynies and Wicina, became evidence that, at some point in the 6th century BCE, the Scythians conducted a series of raids into Central Europe, causing destruction and shifts in the cultural landscape. Perhaps they contributed to the decline of the Lusatian culture, thereby allowing tribes of the Pomeranian culture to assume a leading role in the region. Maybe some part of the Podolian population participated in those campaigns, and after their conclusion, they migrated east, where they occupied the new eastern frontier of Scythia.

1048. Settlement Structure of the Scythian-Period in the Basin of the Siverskyi Donets River as Component of the Eastern European Space

Authors: Vitalii Okatenko (Institute of Archaeology of the National Academy of Sciences of Ukraine) – Roman Tymoshevskyi (Central European University)
Format: Oral

The Siverskyi Donets Forest-Steppe occupied an important strategic position within the Eastern European forest-steppe zone. During the Scythian period, this was determined by its immediate proximity to several densely populated regions of both the Steppe and the Forest-Steppe. This physico-geographical zonality is clearly reflected in the economic and cultural differences of the populations inhabiting these regions. In the 6th–4th/3rd centuries BCE, the basin of the Siverskyi Donets River was one of the most densely populated areas of the forest-steppe zone of Eastern Europe. Over recent decades, through the use of modern GIS technologies and remote sensing methods, we have identified and investigated new settlement structures, including 9 fortified settlements (hillforts). At present, a total of 27 fortified settlements are known within the region. Settlement structures tend to gravitate toward the ancient Muravskyi Trail, which began functioning in the 6th century BCE. This ancient route of communication with other regions was intersected by the so-called Perekipskyi Rampart, located along the boundary between the steppe and forest-steppe zones. Fortified settlements appeared in the region under the influence of specific socio-political and economic processes in the mid-6th century BCE and differ in their topography, internal layout, and defensive structures. This variation may reflect both their original functions (such as settlement centers of defined territories, refuge forts, or enclosures for livestock) and correspond to changes in societal needs. In selecting locations for fortifications intended for economic and military purposes, considerable importance was attached to the natural relief, soil characteristics, and the availability of water sources. Local population group of the Siverskyi Donets region represented a socio-economic unity of two different modes of life: semi-nomadic and sedentary agricultural populations. The most important source base for the study of these issues is the comprehensive investigation of habitation sites.

1090. Spatial analysis of the Scythian period Trakhtemyriv agglomeration

Authors: Sviatoslav Syrotiuk – Oleh Bilynskyi – Valerii Moroz (Archaeology department, National university of Kyiv-Mohyla academy)
Format: Oral

The Trakhtemyriv Peninsula is one of the most densely populated areas with Scythian-period sites in the Forest-Steppe zone. Among the reasons for this are the location of a probable crossing over the Dnipro River and a specific, clearly delimited landscape which, on the one hand, was highly productive economically and, on the other, provided a degree of isolation from neighbouring territories. At present, more than 30 settlement sites and several barrow cemeteries dating to the Scythian period are known from this area. The settlement sites include three hillforts: Chernyshi, Vikha, and Trakhtemyriv. The latter is a giant hillfort with an area of around 600 hectares and includes its own acropolis, Mali Valky. All these sites are linked not only by their attribution to the same period, but also by their interconnections, which make it possible to regard them as a distinct Trakhtemyriv agglomeration. A comparable situation is known, for example, at the Bilsk hillfort. In such a context, methods of spatial analysis are particularly effective, as they allow the identification of resource zones, zones of visibility, and specific routes of communication among sites. Our research also includes the reconstruction of the paleoecological environment, which supports the results of the spatial analysis.

2388. Geophysical investigations of the Chernyshi hillfort (V-IV BC)

Authors: Alisa Demina (National University of Kyiv-Mohyla Academy) – Marcin Przybyła (Jagiellonian University) – Marcin

Przybyła (Independent Researcher)
Format: Oral

Scythian hillforts are a widespread phenomenon in the forest-steppe zone of the Northern Pontic region. Although defensive interpretations are predominant, substantial variation in size and internal organisation suggests a broader range of functions. At the same time, data on the internal layout of these sites remain limited due to their scale and the constraints of excavation. This makes non-invasive approaches particularly valuable. This paper presents the results of a geomagnetic survey conducted in 2025–2026 at the Chernyshi hillfort, located on the right bank of the Dnipro River, by the archaeological expedition of Kyiv-Mohyla Academy. The survey identified a dense concentration of subsurface anomalies interpreted as structural remains, together with clearly defined ditch and embankment. Spot excavations were carried out to validate the geophysical data and enabled a preliminary classification of the recorded anomalies. The results show that structural remains are concentrated in the central part of the hillfort, while areas adjacent to the embankment are largely free of structures. Analysis of surface finds also supports this pattern. The assemblage includes a significant proportion of imported ceramics, mainly Greek amphorae, which date the main occupation of the site to the 5th–4th centuries BC. These findings contribute to discussions on the function of Scythian hillforts and their role in long-distance exchange networks.

2007. Metal Pins of the Forest-Steppe Scythia as an Indicator of Production Centres: Case Study on Bilsk Hillfort

Authors: Yuliia Khodukina (National University of Kyiv-Mohyla Academy) – Iryna Shramko (V. N. Karazin Kharkiv National University)
Format: Oral

Pins are among the most numerous categories of metal ornaments of the Early Iron Age and, at the same time, an important source for reconstructing production practices and socio-economic processes within the population of the Forest-Steppe Scythia. This presentation examines the assemblage of pins from the Bilsk hillfort — one of the largest centres in the region, well known for its concentration of craft and metallurgical finds. The total analyzed material comprises 273 metal pins (bronze, iron, and bimetallic). The collection includes complete ornaments, pieces with broken ends, specimens without heads, as well as blanks and defective items. In combination with finds of slag, bronze droplets, casting moulds, and bronze-casting furnaces, this material allows pins to be interpreted not only as elements of personal adornment but also as products of local craft production. A detailed analysis of their find contexts (pits, dwellings, and cultural layers) further allows reconstruction of their use, deposition, and potential production areas. To this point, particular attention is given to the phenomenon of typological uniformity and similarity: a significant portion of the pins displays repeated forms and proportions, indicating standardization and an organized mode of production. Considering pins in this context provides a new perspective on the role of ornaments as indicators of production and economic activities on the hillforts of Forest-Steppe Scythia.

923. Kapulivske Hillfort on the Lower Dnipro: the Central Settlement Structure of Scythia

Authors: Oleksandr Kariaka – Yurii Boltryk (NASU Institute of Archaeology)
Format: Oral

The lands surrounding the Lower Dnipro constitute one of the most bioproductive parts of the Eurasian Steppe. From Herodotus to the present day, numerous authors have compared the Dnipro to the world's greatest rivers, regarding it as one of the cradles of the earliest civilizations. The area of modern Nikopol, Kapulivka, Kamianka-Dniprovska, and Znamianka represents a zone of high concentration of Scythian settlement structures and kurgan necropolises, as well as world-renowned royal burial mounds. In addition to the well-known sites, the poorly studied Kapulivske hillfort played a significant role in the region. It became known through numerous collections of artifacts. One of the authors, using aerial photographs and a series of satellite images, managed to identify a partially preserved system of defensive structures—ramparts and ditches. The main one, the outer defensive rampart, has been traced over a length of 5.37 km. The area of the right-bank plateau enclosed by this rampart, covering 730 hectares, represents the core territory of the hillfort that has survived to the present day. Its significance as a powerful settlement structure is emphasized by chains of numerous kurgans and ancient hollow ways radiating from the hillfort to the north and west. Kapulivske, together with the agglomeration of the Kamianske and Znamianske hillforts, played a major role in the formation of the central core of the Scythian state in the 5th–3rd centuries BCE. Key overland communication routes converged on these hillforts, leading through numerous kurgan necropolises from the ancient cities of the Pontic coast to the hillforts of the forest-steppe zone of Eastern Europe.

1346. Late Scythian Hillforts: Origin and Development

Authors: Oleksandr Symonenko (Institute of Archaeology of NAS of Ukraine) – Denys Sikoza (Kherson Regional Inspectorate for the Protection of Sites) – Olena Dzneladze (Institute of Archaeology of NAS of Ukraine)
Format: Oral

The Lower Dnieper Late Scythian subculture was formed by migrated people of Dniester region's Scythian culture of the late 4th - 3rd century BC. Hillforts under discussion are dated to the mid-2nd century BC – mid-3rd century AD and placed on the banks of Lower Dnieper: twelve on the right bank and five on the left. They were founded on strategic positions on high shore, towering up the water edge from 11 to 48 m. The area of hillforts is from 8 to 35 hectares. Two types of hillforts could be classified: cape (on headland of bedrock shore, formed by ravines) and coastal (on rectangular or square section of bedrock shore). Defensive structures of cape hillforts were built across the cape, separating the acropolis or contour the cape. The ramparts and moats of the coastal fortifications were closing the area from three sides and were confined by ravines. There are six cape and eleven coastal hillforts. Hillforts were fortified by two lines of defense. The outer line consisted of a rampart with moat of ca. 1.4-4.5 m deep and 4.5-11 m wide in front of it. Inside the outer line of defense was a second rampart forming a square (coastal hillforts) or triangular (cape hillforts) acropolis. Stone wall ran along the ridge of rampart. The area of acropolis ranged from 1.3 to 3.6 hectares. The walls of 2 to 4.5 m thick were laid from quarry stone in the opus incertum technique and filled with crushed stones on clay solution. The reconstructed height is from 3 to 5 m. The inner core of earthen ramparts was laid from large limestone blocks, arranged randomly but with signs of regular masonry. Thus, Late Scythian fortification is of local origin with some features of antique tradition.

878. Urbanisation Processes in the Early Iron Age Pontic Forest-Steppe Region

Authors: Oleh Bilynskyi (Department of Archaeology, National University of Kyiv-Mohyla Academy) – Manuel Fernández-Götz (School of Archaeology, University of Oxford)
Format: Oral

This paper will examine the processes of urbanisation that took place among so-called "Scythian" societies of the Eastern European forest-steppe zone during the Early Iron Age. The evidence from this region will be placed within the framework of recent studies on urbanisation in Iron Age temperate Europe, as well as within wider theoretical and methodological discussions on early urbanisation. Our study employs a context-dependent definition of urbanism, allowing this phenomenon to be evaluated within its specific social and environmental settings. Previously proposed criteria are systematically compared with archaeological evidence from the territory of Forest-Steppe Scythia. Settlements are analysed through several interrelated parameters. Particular attention is paid to the number and size of the fortified sites and to their potential demographic capacity, including a discussion of the phenomenon of megasites, which in this region is represented by "gigantic-hillforts". The emergence of elites and patterns of social inequality are examined on the basis of burial evidence and its spatial relation to settlement structures. Production activities at the sites are discussed in terms of both the quantity of known artefacts and the technologies employed, with special emphasis on technological innovations. Internal and external trade networks are also addressed, with a primary focus on contacts with Greek poleis along the northern coast of the Black Sea. Potential collective gathering places are analysed through the presence of "empty spaces" within hillforts, group ritual practices associated with the construction of ashmounds, and other cultic features. Finally, we will also address the evidence for collective work as represented by the construction of large-scale fortifications.

1359. Ditch, rampart, pallisade. Reflections regarding the defensive systems of Late Iron Age hillforts between the Eastern Carpathians and Prut

Authors: Alexandru Berzovan (Iași Institute of Archaeology)
Format: Oral

Between the 5th and 3rd centuries BC, on the territory located between the Eastern Carpathians and the Dniester, a very large number of hillforts were built, approx. 130 according to the most recent estimates. They bear witness not only to large-scale collective efforts, but also to significant social and political developments. Through this presentation we have set out to discuss the issue of the defensive systems of the fortifications located between the Eastern Carpathians and the Prut, on the nowadays territory of Romania. The most commonly used defensive system consists of a simple „dump" rampart, with an adjacent ditch and a wooden palisade on the top. Despite its (apparent) simplicity, the construction of such a defensive system involves, among other things, certain empirical knowledge of geotechnics, used to build structures that are as durable and efficient as possible. Another type of defensive system was the stone "wall", represented in the present case (the Cotnari-Cătălina fortress) of two stone paraments, reinforced with wooden beams, the interior space being filled with earth and stones. It is a fortification system amply attested in Central and Eastern Europe in Bronze and Iron Ages - so-called „Pfostenschlitzmauer". The „timber-box" ramparts, well attested in contemporary fortifications located in the space between the Prut and the Dniester, are less present west of the Prut. The defensive system of the Brăhășești hillfort raises significant questions, since in the area of the rampart, a significant amount of soil with traces of burning is visible. In conclusion, the communities that built the hillforts located between the Eastern Carpathians and Prut used various types of defensive systems, this diversity reflecting their different social and military needs and posibilities.

228. Tracing Mounted Nomads in Eastern Central Europe: Material Evidence for Conflict at Fortified Hallstatt Settlements in the 7th Century BC

Authors: Anja Hellmuth Kramberger (Alma Mater Europaea University)
Format: Oral

Archaeological interpretations of the so-called "Scythian invasions" in eastern Central Europe have long relied on a combination of historical sources and selected artefact categories, most prominently bronze arrowheads, elements of horse equipment, and destruction horizons documented at fortified Hallstatt-period settlements. While episodes of violence in the 7th century BC are widely acknowledged, their scale, organization, and social context can now be reassessed in greater detail through recent high-resolution documentation methods, including LiDAR and GPS-based spatial mapping. This presentation offers an evidence-based reassessment

of material indicators for conflict associated with mounted nomadic groups, focusing on the systematic analysis of arrowhead typologies, spatial distributions, and impact traces from well-documented fortified sites such as Smolenice-Molpír (south-western Slovakia) and Dédestapolcsány-Verebce-bérc (north-eastern Hungary). Large assemblages of arrowheads recovered in direct association with gates, fortification walls, and destruction layers allow for a detailed reconstruction of conflict-related processes, including firing directions, areas of concentrated activity, and structurally vulnerable zones within the fortifications. Deformation patterns and concentrations of arrowheads embedded in masonry provide direct physical evidence for organized episodes of armed confrontation rather than sporadic or incidental violence. A comparative typological analysis demonstrates that the arrowhead assemblages are not uniform. This variability suggests that the material record cannot be attributed to a single, homogeneous group, but instead reflects the involvement of multiple mounted nomadic groups with different regional backgrounds. By integrating artefact typology, spatial analysis, and contextual evidence from fortified settlements, this presentation revisits invasion models and situates them within a more nuanced and empirically grounded interpretative framework.

746. Fire, Fortresses, and Mobility: Scythian Raids in a Comparative Perspective

Authors: Nikita Kurbal (National University of Kyiv-Mohyla Academy)
Format: Oral

The phenomenon of Scythian raids in Central and Eastern Europe was, until recently, poorly studied and highly mythologised, and existing research did not allow for well-founded conclusions to be drawn. Over time, however, our understanding of this process has gradually expanded. Today, several radiocarbon analyses are available from major hillforts that were attacked by the nomads. In addition, a growing body of evidence comes from other settlements, where traces of fires and weapons associated with Early Nomads have been identified within cultural layers. Nevertheless, the renewed interest in this topic has generated as many questions as answers. At the same time, Early Nomads did not expand exclusively westwards. Ancient Greek and Assyrian written sources clearly document Scythian campaigns in Asia Minor, and this evidence is supported by a substantial archaeological record. Urartian fortresses such as Ayanis, Bastam, and several others provide clear testimony to attacks carried out by Early Nomads. The subsequent decline of the Urartian state may indicate that nomadic incursions and the devastation they caused were among the decisive factors shaping the fate of this region. A comparative analysis of these two processes, despite their chronological distance and differing regional contexts, offers significant potential for new insights. Such a comparison makes it possible to identify both shared and distinctive features, to better understand the tactics of Early Nomads, and to examine how they adapted their strategies to different conditions of warfare, particularly given the fundamentally different types of fortifications encountered in these regions. Beyond episodes of violence, other forms of interaction must also be considered, including trade and cultural exchange. Comparing the interactions between Early Nomads and sedentary populations in Central and Eastern Europe and in Asia Minor can therefore contribute substantially to a more nuanced understanding of nomadic–sedentary relations.

1400. Mirrors between hillforts and graves of the Iron Age in the Danube region

Authors: Denis Topal (National Museum of History of Moldova | Institute of Cultural Heritage of Moldova)
Format: Oral

Across the Danube region (from the Dniester basin to the eastern Alpine zone), at least 152 mirrors dating between c. 700 and 100 BC have been recorded. Most derive from funerary contexts (76%), while 21% are stray finds and only 3% come from settlements. Half originate from burial mounds and about a quarter from flat cemeteries, with marked regional differences: in Bukovina, mirrors occur exclusively in barrows, whereas in Transylvania and Pannonia, they are typical of flat cemeteries. Nearly two-thirds of all finds concentrate in the Lower Danube and Carpathian–Dniester regions, underscoring their role as key corridors of interaction. The earliest mirrors appear in the Carpathian–Dniester area in the mid-7th century BC and belong to Early Scythian types of Caucasian and Siberian origin. From the mid-6th century BC, Greek imports (especially Olbian-Borysthenite and Argive types, later Peloponnesian forms) entered the region. During the Classical and Hellenistic periods, locally produced mirrors increasingly adapted Greek prototypes, reflecting cultural entanglement between nomadic groups, Greek centres, and sedentary communities. Although predominantly funerary, mirrors are closely linked to settlement systems, particularly hillforts and fortified central places. Several stray finds cluster in the hinterlands of major settlement agglomerations, suggesting circulation within landscapes structured by fortified sites, route control, and seasonal congregation areas rather than accidental loss. The few settlement finds reinforce this interpretation, indicating that hillforts functioned as hubs where mirrors circulated as personal or prestige items before deposition in graves. Over time, mirrors shifted from gender-neutral objects in the Early Scythian period to exclusively female grave goods from the Middle Scythian period onward. Their persistence into the Late Scythian period highlights their enduring symbolic role in connecting burial practice, settlement dynamics, and gendered identities.

806. Every valley tells a story: Early Iron Age hillforts in the heart of the Western Carpathians

Authors: Joanna Markiewicz (Jagiellonian University in Cracow)
Format: Oral

The Early Iron Age around the Western Carpathians was a time of turbulent cultural transformations, associated, i.a., with the development of the Eastern Hallstatt world, nomadic invasions in the Central Europe, and the transformation of the Lusatian cultural circle. At that time, the mountains constituted a frontier of these phenomena, and simultaneously, a zone of interpenetration of

diverse influences – people and ideas flowing through the valleys in different directions. In the traditional approach, one of the manifestations of these external influences – Lusatian in the north, Hallstatt in the west, and nomadic in the east – was the emergence of defensive settlements. Available archaeological data from several intramontane regions of the Western Carpathians were subjected to comprehensive analyses, encompassing settlement patterns and dynamics, alongside the typochronological and stylistic diversity of material culture. The results suggest that, deep in this mountain range, the development of the Early Iron Age hillforts – and upland settlements in general – was more complex and largely related to local environmental and communication conditions. Significant variations can be observed in the size and internal layout of the 'defensive' settlements, as well as their position and function within local settlement networks. Particularly noteworthy are the secondary nature of the fortifications, relative to the natural defensive features of the mountain landscape, and the late appearance of Pfostenschlitz-type structures in the region. Archaeological sources from Western Carpathian hillforts also indicate that the influence of 'nomads' on local communities was diverse – not necessarily military – in nature.

1326. 'Settlement complexes' of upland sites in the NW Slovakia from the Late Bronze Age to the Hallstatt period

Authors: Barbora Lofajová Danielová (Orava museum of P. O. H. in Slovakia)
Format: Oral

A change in settlement strategies occurred in north-western Slovakia, in the Western Carpathian Mountains, during the Late Bronze Age and Early Hallstatt Period. This paper aims to highlight changes to mountain settlements in the Orava microregion (NW Slovakia), where the author is conducting archaeological excavations. The changes mainly concern the use of the mountains for everyday activities, as well as for communication and defence purposes. There is a high density of upland settlements surrounding the dominant hillforts ('settlement complexes' of upland sites'). These settlement complexe date back to the Late Bronze Age or the Early Iron age, and most of them were still in use until the end of the Early La Tène period. The paper also discusses the presence of 'eastern type' artefacts at upland sites, particularly at hillforts, which can be linked to the theory that local elites were fascinated by equestrian elites from the East (for example, we can see this in horse fittings).

1362. Mapping Complexity: Late Bronze and Early Iron Age Enclosures and Upland Landscapes in the Western Carpathians

Authors: Martin Mino (Monument Board of Slovak Republic) – Tibor Lieskovský (Slovak University of Technology in Bratislava, Faculty of Civil Engineering)
Format: Oral

Enclosed hilltop sites constitute some of the most conspicuous archaeological features within the mountainous landscape of Central Slovakia. The majority of documented sites are attributed to the Late Bronze Age (LBA), with many reaching their floruit in the Early Iron Age (EIA). The nationwide implementation of airborne laser scanning (ALS) has fundamentally transformed research on these sites, not merely by facilitating the identification of previously unknown locations, but by enabling their analysis within a broader landscape framework. As most of these sites are situated in densely forested terrain, traditional methods—such as aerial or satellite photography—have proven insufficient for reconstructing their wider spatial context. ALS provides a new analytical perspective: beyond revealing the morphology of enclosure systems, modelling intervisibility with surrounding hinterlands, or quantifying habitation terraces, it permits an integrated examination of the surrounding cultural landscape. The demographic expansion of the LBA/EIA resulted in the extension of agro-pastoral land use into higher elevations to an extent unparalleled before or after this period. Significantly, it is precisely within these upland zones that hillforts and associated landscape features have been preserved, largely protected from the destructive effects of large-scale agricultural collectivisation during the communist era. ALS data reveal a complex prehistoric landscape comprising communication routes, barrows, lynchets, and field and pasture boundaries. This evidence enables the study of landscape stratigraphy and the spatial relationships among individual features. On the basis of these results, it becomes possible to assess the potential centrality of individual sites and to model their hierarchical organisation within regional settlement systems. The paper presents initial results from selected mountain ranges within the volcanic zone of the Western Carpathians: the Štiavnické vrchy, Kremnické vrchy, and Poľana.

553. Settlements Referred to as Defensive in the Cultural Landscape: Selected Examples from the Oder and Vistula River Basins

Authors: Marcin Maciejewski (Institute of Archaeology of Maria Curie-Skłodowska University) – Kamil Nowak (Austrian Archaeological Institute Austrian Academy of Sciences Vienna)
Format: Oral

Processes of settlement transformation, including the emergence of various forms of enclosures at the transition from the Bronze Age to the Iron Age, have long been the subject of extensive scholarly debate. In our paper, we aim to shed new light on this issue through five case studies from areas generally associated with the Lusatian Urnfield cultures, yet located in markedly different regions within this broad horizon: Wicina, Grzybiany, Kamieniec (Upper Silesia), Stołężyn, and Tarławki. Rather than treating these places in isolation, we examine their spatial setting, surrounding settlement patterns, and natural landscapes to better understand the processes that led to enclosure. The region under consideration lies outside the core geographical focus of the present session.

Nevertheless, its relevance is underscored by long-standing discussions concerning interregional connections and the influence of groups described as "steppe populations" on cultural change and the increasing tendency towards enclosed settlement forms. One of the analysed sites was destroyed during an incursion by a group representing a Scythian cultural model, allowing the area to be interpreted as part of a broad frontier zone affected by interactions with the Pontic area. The paper addresses two principal questions: -whether the processes leading to the formation of enclosed sites followed similar trajectories? -whether the enclosure can, in every case, be directly linked to the militarisation of the surrounding world? These issues are explored through detailed case studies, which are also situated within wider cultural processes observable at the Bronze–Iron Age transition. The paper has been prepared within the framework of the research projects "Characteristics of Selected Metallurgical Regions in Poland" (2021/40/C/HS3/00097) and "A Biography of Late Bronze and Early Iron Ages Hoards. A Multi-Faceted Analysis of Metal Objects Related to Monumental Constructions in Poland" (2021/41/B/HS3/00038), funded by the National Science Centre, Poland.

2750. Following a blueprint – strategies for achieving population aggregation in Early Iron Age Smuszewo (Poland)

Authors: Robert Staniuk – Jan Romaniszyn (Faculty of Archaeology, Adam Mickiewicz University) – Jutta Kneisel – Johanna Brinkmann – Hendrik Raese (Institut for Ur- und Frühgeschichte, Kiel University) – Mateusz Drewicz – Oliwia Kubiak – Mateusz Jaeger – Jakub NiebieszczańSki (Faculty of Archaeology, Adam Mickiewicz University)
Format: Oral

The Early Iron Age in North-Central Poland (800-600 cal BCE) is a period of dynamic population aggregation in a previously marginal area. This process culminated in the emergence of Biskupin-type fortified settlements, which are unique examples of planned spatial organization with limited evidence of social inequality. The novelty of this settlement system relied on the successful design of settlement infrastructure (pathways and gangways, gates, ramparts, breakwaters) and living quarters, which required careful planning, and execution in a highly waterlogged environment. Last but not least, the restricted storage conditions had to be organized around surplus redistribution. In our paper we present new results from non-invasive prospection (geomagnetic and georadar), population estimations, and re-evaluation of legacy data from a Biskupin-type fortified settlement in Smuszewo to provide a first high-resolution characterization of this settlement system. The discussion of the results will explore the socio-environmental impact of this community on the landscape and how a new aggregation was designed in an area previously devoid of large populations. The results will be used to conceptualize strategies used to establish and maintain these types of settlements.

173. The Tsirkuni hillfort: three stages of formation and functioning

Authors: Kostiantyn Peliashenko (The Museum of Archaeology of V. N. Karazin Kharkiv National University)
Format: Poster

The Tsirkuni hillfort is an archaeological site located in the forest-steppe zone of the Siverskyi Donets River basin (a tributary of the Don River). The total area of the site is 3.6 hectares. Fortifications divide it into three parts, two of which contain a cultural layer, and one is an additional uninhabited fortification. The results of the long-term excavations made it possible to identify several stages of the site's development and functioning. The first stage (late 6th–5th centuries BC). The construction of the hillfort`s first fortifications is dated to the late 6th–early 5th centuries BC. This was the time of mass construction of hillforts in the forest-steppe zone between the Dnipro and Siverskyi Donets Rivers. In the early stage, the fortification area was small, covering 1.1 hectares. An early cultural layer was discovered only in the southern part of the site. The second stage (4th century BC). The old fortifications were leveled, new ones were built, and the settlement's size more than doubled. Excavations of the fortifications revealed that the settlement's inhabitants radically altered the fortress's entrance system, fortifying them with additional barriers. Another fortification was added to the existing one, and the previous wall on the northern side lost its functional significance. The residents built an additional fortification – a small rampart and a ditch on the approaches to the main defensive walls. Third stage (3rd–1st centuries BC). To date, the Tsirkuni hillfort in the Siverskyi Donets basin is the only archaeological site where traces of life from the early Sarmatian period have been recorded. At the same time, only individual artifacts are presented here, and there are no dwellings or utility buildings from this period. This suggests that the site of the previously built settlement was used as a temporary fortification.

2559. Hillforts of the Black Sea Iron Age: the case of Stânceşti

Authors: Alexandru Berzovan (Iași Institute of Archaeology) – Owen Doonan (California State University Northridge) – Nicole Rose (Northern Arizona University) – Suleyman Berk (University of Pennsylvania)
Format: Poster

The Early Iron Age (ca. 1000 -600 BCE) in the lands around the Black Sea is characterized by the appearance of larger fortified settlements (hillforts) that signal a regional scale phenomenon. Hillforts of the early Iron Age exhibit impressive evidence of community mobilization in the apparent absence of strong hierarchical organization. The introduction of Black Sea trade with colonial outsiders exposed local communities to novel political and cultural formations. By the early fourth century BCE, large political entities (kingdoms) emerged across the Black Sea zone. Hillforts of the Black Sea examines the transition from more egalitarian to more hierarchical social systems and the level of social and economic integration in and around these hillforts. The Prut drainage is an ideal space for such an investigation based on existing knowledge of major sites, extensive agricultural exposing smaller ephemeral sites, and a cluster of hillforts, small sites and cemeteries that are already partially documented. Our initial season (June 2025) of systematic archaeological survey around Stânceşti documented 15 archaeological sites in a radius of approximately 10 km around the main hillfort. Surface scatters were mapped and representative ceramic ware types were taken for further analysis. Technological and geochemical compositional analysis of a sub-sample of 30 daub and 105 ceramics labeled in the field as likely dating to the period based on consistencies with Late Hallstatt and Greek wares demonstrate primarily local-scale production of a generally shared but not homogenous tradition. Together, these are signals of traditions adopted through legitimate peripheral participation in a community of practice reflective of social networks rather than centralization A second season (June-July 2026) proposes to fill in outstanding gaps not yet surveyed and to expand geophysical and excavation programs at Stânceşti and other key sites already initiated by the Iași Institute of Archaeology.

134 THE CONTRIBUTION OF HERITAGE IMPACT ASSESSMENT TO SUSTAINABLE HERITAGE DEVELOPMENT

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Gertrudes Branco (CHAIA/Universidade de Évora) – Gábor Virágos (Independent researcher I EAA Heritage Advisory Board)
Keywords: Environmental Impact Assessment, Cultural resources, Archaeology
Format: Regular session

SESSION ABSTRACT

Through the Sustainable Development Goals, the United Nations has positioned cultural heritage at the core of human-centred and sustainable development (Goal 11.4), which frames culture as both an intrinsic value and a driver of social, environmental and economic sustainability. Yet, as daily practice demonstrates, the relationship between cultural value preservation and developmental pressures remains fraught with tension. Projects in infrastructure, energy transition, housing, tourism or urban regeneration often expose structural conflicts between safeguarding the past and constructing the future, leading to missed opportunities for inclusive and holistic development. This session focuses on how Heritage Impact Assessment (HIA) – conducted either within or independently from Environmental Impact Assessment systems – can practically address these tensions. We are particularly interested in contributions that analyse or exemplify: • Key conflict zones where cultural values are challenged by development needs (e.g. renewable energy projects, transport corridors, urban densification...). • How HIA methodologies identify, weigh and negotiate cultural values, especially where values are plural, contested or embedded in diverse stakeholder communities. • Legislative and operational gaps that hinder effective protection or balanced decision-making. • Stakeholder engagement practices that enable (or fail to enable) meaningful participation, including Indigenous, local, resident and expert communities. • Mechanisms for reconciling "preserving the past" with "building the future" through mitigation, design adaptation, alternatives analysis or long-term management frameworks. The session aims to examine how HIA can serve not only as a technical tool, but also as a dialogical and decision-support mechanism for resolving value conflicts and guiding sustainable heritage-inclusive development. The presentations will be followed by a discussion that will synthesise recurring challenges, effective practices and conceptual advances across cases. The goal is to formulate concrete recommendations to be shared with international bodies engaged in Environmental and Heritage Impact Assessment, contributing to improved standards and more culturally responsive impact governance.

CONTRIBUTION ABSTRACTS

1097. Impact Assessment – The Hidden Aspects of Decision-Making

Authors: Gábor Virágos (independent researcher)
Format: Oral

Impact Assessment (IA) has become an essential decision-support tool in heritage management and development-led archaeology, yet its practical application often remains narrowly framed. This paper critically examines the hidden and underexplored dimensions of impact assessment through the lens of the Hungarian regulatory and professional context, while drawing broader conclusions relevant at the European and global scale. The presentation first outlines the historical evolution of impact assessment practice in Hungary, from optional heritage impact studies, through formally mandatory but substantively flexible documentation, to the current system of compulsory assessments with prescribed content. Building on this trajectory, a future-oriented proposal is introduced, advocating for mandatory impact assessment combined with professionally selective, context-sensitive content requirements. The paper then addresses key structural questions embedded in IA practice: who is affected by heritage-related decisions, how "affected communities" are defined in practice, and what exactly is being assessed. Particular attention is given to the one-directional nature of current assessments, which typically examine the impact of development on archaeological sites, while neglecting the reciprocal effects of heritage constraints on development processes, including timeframes, costs, design modifications, and economic viability. Further neglected aspects include global and systemic effects, such as impacts on multinational investment ecosystems, political environments as part of the broader context, and the long-term usability of archaeological outcomes in relation to storage, data management, processing and dissemination capacities. The paper also introduces concepts from financial valuation, such as discounting and present value calculation, to explore alternative values of archaeological sites beyond mitigation logic, including tourism, wellbeing and non-market benefits. Finally, emerging connections between impact assessment and AI-based analytical

tools are briefly discussed. The paper argues that more holistic, reciprocal and multi-scalar impact assessments – linking local and global perspectives – would lead to more balanced, transparent and effective decision-making in heritage-led development contexts.

1757. The preventive assessment of archaeological impact in Italy between Cultural Heritage and Landscape Code, Public Contracts Code and Ministerial Guidelines

Authors: Maria Taloni (National Research Council of Italy - Institute of Heritage Science)
Format: Oral

The preventive assessment of archaeological impact, also known as preliminary verification of archaeological interest and abbreviated as VPIA or VIARCH, or more commonly abbreviated with the not entirely correct expression "preventive archaeology", stems from a conceptual extension of the environmental impact assessment (acronym VIA) and, starting with the 2004 Code of Cultural Heritage and Landscape (Legislative Decree no. 42/2004) and the 2006 Public Procurement Code (no. 163/2006), in compliance with the European environmental principle of "polluter pays", characterises the procedures for issuing authorisations for public works in Italy. Since 2006, the relevant legislation has been expanded and amended several times, although not in the Code on Cultural Heritage and Landscape, which should constitute its primary legal basis. The purpose of this contribution, therefore, is, on the one hand, to provide an overview of the current legislative references that span the Cultural Heritage and Landscape Code, the last Public Contracts Code (Legislative Decree no. 36/2023, which abolished and replaced the previous 50/2016) and ministerial guidelines (no. 53/2022 updated to the new Public Contracts Code with no. 32/2023) approved by decree of the President of the Council of Ministers (DPCM 14 February 2022), highlighting their peculiarities compared to other European countries. On the other hand, we will attempt to assess its actual impact on archaeological practice and analyse the reasons behind the continuous attempts to modify, or even abolish, all or part of the current legislation. Finally, we will examine the training path, which is not always linear and unambiguous, that a professional must follow in order to be able to draw up and sign the archaeological impact assessment document in light of the current regulatory framework (Ministerial Decrees no. 60/2009 e no. 244/2019) which, again, is not always consistent with itself.

697. Two Systems, One Heritage? Legal Boundaries in Luxembourg's Heritage Management

Authors: Heike Posche (Institut national de recherches archéologiques)
Format: Oral

The revision of the Luxembourg Heritage Protection Act in 2022 introduced, for the first time, two distinct procedures for the protection of architectural and archaeological heritage. While architectural heritage is subject to a detailed set of evaluation criteria and a formalised designation process, the classification of archaeological sites is regulated in a considerably less stringent manner. In practice, this legal separation has led to a range of challenges at the interface between built heritage and archaeological heritage management, requiring pragmatic, preservation-oriented solutions by the responsible authorities. Based on the current legislative framework, this paper explores approaches to a pragmatic management of heritage assets located at the intersection of architectural and archaeological heritage. It identifies key areas of tension, addresses unresolved questions arising from the dual system, and discusses potential avenues for legal and procedural adaptation. Two case studies currently under debate serve as illustrative examples: medieval and (early) modern cemeteries, where questions arise concerning the protection of entire burial grounds versus individual grave monuments; and medieval city walls that have been incorporated into later, non-listed buildings. In both cases, effective heritage management necessitates an integrated consideration of both archaeological and architectural perspectives, an approach that is not adequately reflected in the existing legal framework. The paper aims to contribute to the development of coherent, interdisciplinary management strategies and to provide a basis for discussion of comparable challenges faced by heritage authorities in other European contexts.

1855. Balancing Development and Heritage Preservation: A Case Study from South-West England

Authors: Alexandra Latham (Arcadis Consulting UK Limited)
Format: Oral

As consultants, the need to balance the client's wishes and respect for the preservation of heritage assets can often be in conflict. With each new proposed development, there will always be a risk of causing harm to heritage assets. This harm could be caused by physical change to an asset or to its setting. As part of a large development in the south-west of England, Arcadis Consultancy (UK) Ltd was tasked with undertaking three heritage impact assessments. These were for a scheduled monument, a Grade II listed building, and a non-designated asset that encompassed the whole of the new development area. It was vital that each asset's heritage value and significance was investigated, recognised, and then any proposed harm to the assets was examined. One of the reports recognised that the Grade II listed building would benefit from the development. The asset had been altered in the past and would now be put back in its original location. Elsewhere the HIAs identified potential risks that would have caused substantial harm to two of the assets. One such risk was that the development impacts had not been given sufficient priority, which would have substantially changed the historical character of the area. These risks created tensions between the community and the developers. We were able to make recommendations that address these risks which were accepted by the client and community, enabling the development to go ahead whilst preserving the integrity and character of the assets.

1966. Integrating Heritage Values into Climate-Related Impact Assessment: A Participatory Approach for Museums

Authors: Maria Shehade – Panagiotis Ntzeremes (CYENS Centre of Excellence)
Format: Oral

Climate change poses long-term risks to cultural heritage, including museums, through physical impacts and pressures arising from adaptation/mitigation measures. These climate-related consequences are often addressed through hazard-based risk assessments that inadequately capture cultural values, and socially embedded significance. Climate-related interventions prioritising environmental performance can overlook cultural, social, and institutional meanings, which constrains informed decision-making and risks reproducing tensions between safeguarding heritage and pursuing future-oriented development. While Heritage Impact Assessment (HIA) offers a value-based framework, museums remain largely absent from climate change impact assessments, which predominantly focus on heritage sites. Therefore, museums' specific vulnerabilities, roles, and values in climate crisis are often neglected. Participatory approaches to value elicitation are also rarely translated into systematic assessment criteria capable of informing governance and planning. Drawing on the ClimAid research project on museums and climate change in Cyprus, the paper addresses this gap by proposing a participatory, value-based approach to assessing climate-related consequences for museums. The approach combines focus groups with museum professionals and a survey with the general public, enabling exploration of how different stakeholder groups perceive climate-related risks, and acceptable responses. The presentation critically discusses how such participatory engagements can elicit heritage values for specific climate-related risk parameters and how these values can be analytically incorporated into the evaluation of climate-related consequences, moving beyond risk identification toward value-informed impact assessment. By involving both expert communities and the public—who are rarely included in such decision-making processes—the research illustrates how participatory approaches can support more inclusive and culturally responsive impact assessments. This approach provides an example of how impact assessments can be meaningfully applied to museum contexts, and how HIA can function as a dialogical tool for embedding heritage values into climate adaptation and mitigation planning, highlighting the relevance of such approaches for advancing sustainable, heritage-inclusive development, informing future impact assessment standards.

1510. The "Fragile Heritage" Project in the Context of Sustainable Development Policy: A Case Study of Archaeological Sites in South-Western Poland

Authors: Jedrzej Hordecki – Paweł Konczewski (Wroclaw University of Environmental and Life Sciences) – Joanna Wojnicz (State Office for Archaeology Saxony) – Anna Wierzgoń – Mateusz Krupski – Monika Ziemiańska – Cezary Kabała – Aleksander Misiurny – Gracjan Mielczarek – Barbara Kwiatkowska (Wroclaw University of Environmental and Life Sciences)
Format: Oral

Policies of sustainable development fundamentally reshape the relationship between people and archaeological heritage. This interaction becomes particularly visible in the case of archaeological sites located in areas of intensive human interest and use, where tensions between safeguarding heritage for future generations and the contemporary exploitation of space are especially pronounced. The international Polish–German research project Fragile Heritage addresses these challenges in the context of changing climatic conditions. Archaeological sites are increasingly exposed to multiple and overlapping risks, resulting both from climate change itself and from societal adaptation measures responding to these processes. Under such conditions, sustainable development policies and planning instruments become key drivers shaping heritage governance, protection priorities and decision-making frameworks. This paper focuses on the functioning of archaeological sites situated within forest landscapes, understood as a complex socio-ecological environment in which environmental protection, economic use and heritage values intersect. Case studies from south-western Poland, including the sites of Białogórze, Bielawa and Ronów, located in forested border regions, form the empirical basis of the analysis. Forests may provide a degree of physical protection for archaeological remains, but they can also generate new threats related to forestry practices, climate-induced stress and increased human activity. At the same time, forest areas are increasingly embedded in local economic strategies and promoted as spaces of tourism and recreation. Within this context, archaeological heritage operates at the intersection of three principal stakeholder groups: local communities, public administration and the scientific community. From the perspective of sustainable development policy, maintaining a balance between these interests becomes a central challenge. The paper discusses practical examples of how such balance may be negotiated, highlighting both conflicts and effective management strategies. In doing so, it contributes to broader discussions on the role of fragile archaeological heritage in sustainable development under conditions of environmental change.

1965. Enhancing Mountain Cultural Landscapes in the Eastern Pyrenees: contributions of the CulturMonts project to sustainable territorial development

Authors: Marta Flórez-Santasusana (Catalan Institut of Classical Archaeology) – Josep Maria Palet – Arnau Carbonell-Puigventós – Valentina Pescini – Jesús Martínez-Fernández (Catalan Institut of Classical Archaeology)
Format: Oral

In recent decades, archaeological research carried out in European high mountain areas has demonstrated that these territories constitute cultural landscapes shaped over time and that they preserve an important cultural legacy resulting from intensive human

activity. Despite their significance, this exceptional archaeological and cultural heritage remains poorly known and has often been undervalued as a potential driver for revitalization, innovation, and sustainable territorial development. The Cultur-Monts project, funded by FEDER funds through the Interreg Sudoe programme, aims to enhance mountain cultural landscapes and promote new development opportunities for local communities. Led by ICAC CERCA, the project brings together a consortium of nine beneficiary institutions from Spain, France, and Portugal. The establishment of an international network among southwestern European regions linked to mountain cultural landscapes represents an important milestone for the development of shared strategies to promote these landscapes as resources for sustainable development—an issue of particular relevance in a social context marked by depopulation and ageing. Through various pilot cases, the project seeks to highlight the value of these cultural landscapes as tools for social innovation and for fostering territorial development and cohesion within mountain communities. This presentation will offer a brief overview of the resources and main expected impacts of the pilot initiative located in the Eastern Pyrenees, specifically in the regions of Ripollès and Cerdanya.

2466. How much is it worth?The value of archaeological heritage in environmental impact assessments

Authors: Gertrudes Branco (CHAIA/Universidade de Évora)
Format: Oral

As a member of the European Union since the end of the last century, Portugal has signed up to, and incorporated into its legislation, a set of Community regulations, including the Environmental Impact Assessment procedure. In this context, characterisation of archaeological heritage is carried out exclusively by archaeologists authorised by the public entity responsible for protecting, enhancing and disseminating archaeological heritage to the Portuguese people and international institutions. One of the archaeologist's tasks is to identify, characterise and enhance the existing archaeological heritage in a project area, with the aim of establishing a hierarchy of its scientific and cultural importance. This hierarchy determines the minimisation measures to be implemented in the project's different phases. But how much is archaeological heritage worth? What criteria should be used to value it? Should archaeologists be responsible for proposing the valuation of identified archaeological heritage on a project-by-project and site-by-site basis? Is this a substantive action to ensure the preservation of evidence of a people's collective memory and identity in the face of the growing impact of economic development projects? In this presentation, we will share and put up for debate these reflections, considering the European scope of this matter under Community law.

1099. Between theory and practice: the importance of training in the development of good Environmental Impact Assessment practices

Authors: Leonor Maria Pereira Rocha (Évora University, CHAIA)
Format: Poster

The introduction of mandatory Environmental Impact Assessment (EIA) in the European Union imposed new rules on the implementation of public and private projects likely to have a significant impact on the environment, including in Portugal. This preventive instrument, which is fundamental to the sustainable development policy of all states, has implications for economies and has required the creation of procedural and legal management mechanisms by the entities involved. With regard to heritage, the carrying out of specific environmental impact assessments (EIA) has also led to procedural changes in the entity that oversees heritage, establishing rules and methodologies, but one essential issue has been left out of this process, namely the training of technicians (archaeologists) with skills in this field. This paper aims to address how Heritage Impact Assessment (HIA) is being carried out in terms of university education, taking into account the work carried out in this field and the scientific results obtained.

2266. TOURAL: Multidimensional model of tourism driving sustainable and balanced growth among rural and remote regions, fostering macro-regional cooperation

Authors: Angela Pencheva – Zdravko Popov (Balkan Heritage Foundation)
Format: Poster

The TOURAL project (Horizon Europe 2023) aims to support the touristic development and untapped potential of six pilot regions in Greece, Italy, Croatia, Bulgaria, Romania and Ukraine, focusing on 5 tourism niche sectors: underwater tourism, cultural & nature heritage tourism, cultural & creative tourism, cultural science tourism and silver tourism (UCCST). The UCCST framework offers substantial promise in promoting sustainable regional development by capitalizing on unique cultural, scientific, and natural assets. Strategic actions, including stakeholder capacity-building, infrastructure investment, and targeted EU policy support, are essential to maximising the benefits of niche tourism development across pilot sites. Following the guidelines set out in the EU Rural Action Plan and the EU Blue Tourism Strategy, the TOURAL project focuses on sustainable, resilient tourism that protects ecosystems, fosters innovation, and supports coastal communities, fostering policy making and cross-border cooperation. Six Living Labs were held in the TOURAL pilot regions, aiming to identify and co-design solutions to reflect the real needs and opportunities of local communities with the active involvement of public authorities and local stakeholders. The Living Labs collected data, which will be used to design a UCCST model for every pilot region. Based on the UCCST, a business model will be created with specific tourist products and offers for every pilot region. Several digital tools will also be developed to expand the TOURAL project output, e.g., tourism flows impact simulation tool; predictive Advisor tool for balancing tourism flows and areas capacity; "MedDriveInThePast" web platform; VR Tools for an enhanced tourist experience; the TOURAL Embryonic Tourism Data Spaces.

2751. Enhancing Heritage Impact Assessment in Portugal: The Role of LiDAR and Remote Sensing for Sustainable Archaeological Management

Authors: Vanessa Antunes (CGeo - Centro de Geociências | Universidade Autónoma de Lisboa | Instituto Politécnico de Tomar | Património Cultural IP | ERA Arqueologia) – Telmo Pereira (Universidade do Minho | UNIARQ—Centre for Archaeology, School of Arts and Humanities | CGeo - Centro de Geociências) – João Fonte (ERA Arqueologia | Centre for the Humanities - CHAM, Universidade NOVA de Lisboa) – João Marques (CEAACP- Centro de Estudos em Arqueologia, Artes e Ciências do Património | CHAIA – Centro de História da Arte e Investigação Artística)
Format: Poster

The safeguarding of archaeological heritage within the framework of Environmental Impact Assessments (EIA) in Portugal continues to reveal structural weaknesses, despite the legislation and scientific requirements imposed by heritage authorities. The model currently used for the heritage descriptor has proven ineffective in the early identification of archaeological remains, often leading to their detection only at advanced stages of project development, when opportunities for protection or technical adaptation are already limited. This situation highlights persistent tensions between development objectives and the preservation of cultural value. These limitations are particularly evident in forested areas, where dense vegetation cover, terrain morphology, and access restrictions hinder traditional survey methods. Operations such as soil mobilization, the opening of firebreaks, and the circulation of heavy machinery frequently expose previously unknown remains, often making their safeguarding impossible. In this context, the integration of remote sensing technologies, particularly LiDAR, represents a concrete opportunity to strengthen the effectiveness of Heritage Impact Assessment (HIA) within EIA processes. By enabling detailed mapping of microtopography beneath vegetation cover, LiDAR allows for the early identification of archaeological structures and landscapes, supporting the analysis of project alternatives, the definition of mitigation measures, and the adaptation of alignments and interventions. The systematic adoption of these approaches marks a paradigm shift in the management of archaeological heritage, bringing Portugal closer to European best practices. By strengthening the preventive capacity of both EIA and HIA, these methodologies promote a better reconciliation between "preserving the past" and "building the future," consolidating the role of impact assessment not only as a technical instrument but also as a decision-support mechanism fostering culturally responsive and sustainable territorial development.

135 JAPAN'S RESONANT PASTS: MATERIALITY, LANDSCAPES AND HERITAGE

Theme: 1. Widening perspectives in material culture studies
Organisers: Mark Hudson (Max Planck Institute of Geoanthropology) – Claudia Zancan (Ca' Foscari University of Venice)
Keywords: Japan, Material practices, Sustainability, Heritage, Resistance, Nationalism
Format: Regular session

SESSION ABSTRACT

Japanese archaeology provides a unique lens for examining how material traces of the past resonant with and shape cultural, spiritual, and environmental experiences in the present. Japanese archaeology has been closely intertwined with narratives of national identity, where ancient sites and artefacts are interpreted as expressions of cultural continuity and the nation's historical roots. From the ritual landscapes of Jōmon and Yayoi communities to the monumental kofun mounds, these sites reflect both temporal transformation and enduring influence, intersecting with contemporary discussions about heritage, sustainability, and the role of archaeology in shaping collective identity. Moving beyond these narratives, this session will explore not just how Japan's past continues to resonate in present contexts—through material, sensory, and symbolic dimensions of archaeology, as well as through heritage management, environmental engagement, and community practices—but also how the long experience of social archaeology in Japan can be inserted into contemporary debates over a rapidly-changing world. By highlighting enduring echoes of the past, the session aims to foster discussion on how Japan's archaeological record not only preserves history but actively shapes contemporary cultural and social realities, while considering those issues within a global framework. Although centred on Japan, the session engages with themes central to European archaeological debates, including nationalism and identity-building, community participation, heritage management, and environmental sustainability. By encouraging comparative perspectives, the session aims to show how insights from Japanese archaeology can enrich European discussions, opening a dialogue that contributes to broader theoretical and methodological conversations within the European archaeological community. We invite papers addressing topics including, but not limited to: Material and spiritual continuities between past and present; Ritual landscapes; Archaeologies of memory, temporality and emotion; Archaeologies of resistance (feminist, ethnic, community-based and others); Heritage management; Environmental sustainability; Nationalism and identity; Aesthetics, materiality and sensory experience; Comparative perspectives on Japanese archaeology.

663. Archaeological Heritage Management in Hokkaido: Enacting and Unsettling Settler Colonialism

Authors: Amanda Gomes (Hokkaido University)
Format: Oral

Over the past decade, "utilization" (活用) has received growing attention in cultural property management in Japan, often framed as a pragmatic response to pressing sociopolitical issues. Yet even as the Ainu have been formally recognized as Indigenous and Hokkaido acknowledged as part of their traditional homelands, academic discourse rarely asks what it means to utilize archaeology in a settler-colonial region. This paper addresses this question by examining how colonial logics are defined, reproduced, and sometimes unsettled, through the everyday work of using the past in Hokkaido. Drawing on a mixed-methods ethnographic study of municipal heritage managers across the region, it combines a broad survey with semi-structured interviews, follow-up conversations, and site visits to trace how sociohistorical context, values, and participation shape heritage practice. The analysis shows how the utilization of archaeological heritage is negotiated within municipal institutions shaped by colonial histories and contemporary national agendas, setting the terms of relevance, participation, and interpretive authority in ways that tend to prioritize the ethnic Japanese majority. Across the sites, utilization tends to privilege a nationally recognizable deep past as the most "usable" heritage, while sidelining other local histories. Meanwhile, Ainu-related materials are often treated as cultural contexts rather than as archaeological materials, which diffuses responsibility for Indigenous authority and collaboration. Placemaking operates as a guiding value, uncritically aligning archaeological heritage with narratives of belonging in Indigenous land. Participation often takes educational forms aimed at supporting attachment to place and keeping interpretive authority firmly with heritage institutions. At the same time, place-based relationships also support uneven but meaningful collaborations, suggesting that these institutional logics do not fully determine practice.

1061. The "Kofun Boom" and its Implications for Heritage Communication: How Young Women are reshaping Public Engagement with Kofun Period Archaeology

Authors: Britta Stein (Martin-Luther-University Halle-Wittenberg | State Office for Heritage Management and Archaeology Saxony-Anhalt)
Format: Oral

In the early 2010s, a movement emerged in Japan centred on popular engagement with Kofun period archaeology. Publications featuring walks to keyhole-shaped tombs and songs about burial mounds appeared alongside the initiation of an annual festival at the Imashirozuka tomb in Osaka Prefecture. The event attracted an increasing number of visitors (3,000 in 2012; 40,000 in 2022), prompting national media coverage of what was soon termed the "Kofun Boom". This paper presents an overview of the phenomenon and critically examines the interactions between the "Kofun Boom" community and institutional archaeology, discussing the implications for heritage communication and public engagement policies. Notably, the movement's participants are predominantly young women, colloquially and somewhat derogatorily referred to as "Kofun girls", and their children. Beyond site and museum visits, these people engage actively in the production and sale of Kofun-themed, often hand-made, merchandise ("Kofun goods"). This movement's enthusiasm for sites and finds highlights the enduring influence of the Kofun period and also demonstrates how these ancient tombs shape community practices and local identity. The phenomenon was subsequently picked up by commercial actors. The department store chain Tokyu Hands has hosted annual travelling exhibitions of "Kofun goods", and museums have begun to expand their merchandise. Despite the high visibility of the movement, especially on social media, systematic interaction of the "Kofun boom" community and professionals in the cultural heritage sector has remained remarkably limited. This is particularly striking in light of the challenges faced by Japanese museums, where visitor demographics skew towards older generations and lecture audiences remain predominantly male. The "Kofun Boom" thus constitutes a rare opportunity to broaden audience demographics by challenging traditional gender dynamics and to foster dialogue between heritage professionals and community-driven initiatives by reconceptualizing heritage management as participatory community practice, leading to the democratization of archaeological knowledge.

479. Murals in Motion: Archaeology, Iconography, and Conservation of the Takamatsuzuka and Kitora Tombs

Authors: Marianna Lázár (Károli Gáspár University)
Format: Oral

This paper presents the wall paintings of the Takamatsuzuka and Kitora tombs (late 7th–early 8th century) as a significant case study in heritage management of fragile archaeological sites, where art-historical value, material vulnerability, and long-term preservation policy intersect. While the murals are central evidence for the transmission and transformation of East Asian cosmological and funerary imagery in Japan, their modern histories foreground the managerial challenges posed by excavated, microclimate-sensitive heritage. The study links art-historical interpretation with conservation decision-making, institutional response, and evolving preservation frameworks. The first objective reassesses the relationship between the tombs as sequential stages in the localization of continental visual systems. Both chambers employ the iconography of the Four Gods, celestial bodies, and constellations, situating Japan within the East Asian mortuary sphere. Takamatsuzuka uniquely includes courtier figures in an elegant linear mode, whereas Kitora presents a more systematized cosmological program, including a detailed astronomical ceiling map and Twelve Zodiac figures rendered as armed, animal-headed guardians related to the Buddhist Twelve Heavenly Generals. Differences in compositional structure, orientation, and workshop practice—particularly Kitora's incised draft lines and transfer techniques—indicate a distinctly Japanese reinterpretation of imported models, paralleling developments in the Hōryūji Kondō murals and echoed in Shōsōin materials. The second objective evaluates how conservation crises have shaped heritage management strategies. Fungal outbreaks at Takamatsuzuka and plaster exfoliation at Kitora revealed the instability of sealed stone chambers after excavation, prompting high-impact interventions: dismantling of structures and removal of murals for controlled off-site treatment. These actions redefined site authenticity, risk assessment, and stewardship models. Recent approaches emphasize preventive conservation and non-invasive research; mercury detection in Kitora clarified previously obscured zodiac figures and fine iconographic details without further physical intervention.

252. The Japonization of Jōmon Space-Time: Archaeology, Art, and the Resonance of Prehistory in Modern Japan

Authors: Rafael Abad (Universidad de Sevilla)
Format: Oral

The Jōmon period is today widely perceived as a foundational and resonant past in Japan, embedded in archaeological discourse, cultural identity, and popular imagination. This presentation argues that such resonance is historically constructed and results from a long process through which prehistoric materiality was transformed into a culturally meaningful space-time. The presentation begins by outlining the formation of Jōmon space-time within archaeology. Early interpretations of Japan's "Stone Age" framed prehistoric remains as a space of alterity, understood through Western evolutionary categories. During the early twentieth century, this perspective shifted with the recognition of continuity between prehistory and protohistory, leading to the consolidation of the Jōmon–Yayoi–Kofun sequence. This temporal framework redefined the prehistoric past as an internally coherent and culturally embedded Japanese space-time. The focus then shifts to the postwar rediscovery of Jōmon pottery, when archaeological artefacts began to be reinterpreted at the intersection of archaeology, craft, and art. In this context, Okamoto Tarō's influential "Dialogue with the Fourth Dimension" played a decisive role, reframing Jōmon ceramics not as primitive survivals but as expressions of a living and dynamic tradition, and opening the way for their aesthetic and symbolic revaluation. The presentation then examines the japonization of Jōmon space-time during the second half of the twentieth century. Artists and intellectuals such as Hijikata Hisakatsu, Sō Sakon or Shimao Toshio mobilized Jōmon materiality to rethink origins, sensibility, landscape, and collective memory, transforming archaeology into a resource for cultural and philosophical reflection rather than a purely academic domain. Finally, the presentation explores how Jōmon imagery and concepts entered the popular imaginary through exhibitions, museums, manga, and contemporary visual culture. This final section highlights how archaeological pasts continue to resonate through material, sensory, and symbolic forms, actively shaping cultural experience and debates on identity and heritage in modern Japan.

761. Deconstructing the "Jomon Utopia": Survival, "Original Sin," and the Responsibility of Archaeology

Authors: Yastami Nishida (Institute of Cultural Studies, Chuo University)
Format: Oral

In recent years, the Jomon period has been increasingly used by nationalist groups in Japan to support a narrative of a "unique and peaceful" origin for the Japanese people. This paper argues that the field of archaeology is partly responsible for this situation. By using modern national borders to define prehistoric cultures and focusing on a short-term view of history, researchers have unintentionally supported these political myths. This presentation proposes a necessary correction. First, we must stop viewing "Jomon" as a single, isolated culture. Instead, we should see it as a complex collection of regional groups. Second, we must challenge the idea that the Jomon period was a simple "peaceful utopia." If we look at the reality of how our ancestors survived for over 10,000 years, we must admit that they were not always "peaceful." Survival often required what we might call "Machiavellian intelligence"—the ability to compete for resources and, perhaps, displace other groups. This is the "original sin" of our existence: our life today is built on the sacrifices of those who did not survive. By recognizing that our survival is a "debt" rather than a "national triumph," we can create a new foundation for international empathy. Archaeology should not be used to justify national pride or borders. Instead, it should remind us of the heavy price of human survival. This perspective helps us resist nationalism and find a way to cooperate in a violent world, not through the state, but through a shared responsibility for our common human history.

944. 150 years of encounters between European and Japanese archaeology

Authors: Simon Kaner (Sainsbury Institute for the Study of Japanese Arts and Culture)
Format: Oral

2027-2029 marks the 150th anniversary of what was effectively the first formal 'archaeological' excavation in Japan, undertaken by the American zoologist Edward Sylvester Morse at the Omori shell mounds in Tokyo in 1877 and its publication, the first archaeological report from Japan, which appeared in both English and Japanese in 1879. This presentation will examine the history of engagement by European archaeologists with the Japanese archipelago, and Japanese archaeologists with their European counterparts. This paper marks the start of a new project based at the Sainsbury Institute for the Study of Japanese Arts and Cultures re-visiting the transnational history of Japanese archaeology, re-assessing previous accounts which present Japanese archaeology

as essentially nationalistic (cf Diaz-Andreu, Trigger). The paper briefly considers three sets of case studies: Eduardo Chiossone, William Gowland and the creation of a kofun period (1870s and 1880s); Shōgorō Tsuboi and Kōsaku Hamada and a Japanese gaze on European archeology (1890s to 1920s); and Jiujirō Nakaya, Gerard Groot, the Archaeological Institute of Japan, and the definition of Jomon archaeology (1930s to early 1950s). These case studies are set in the context of the broader development of archaeology in Europe and East Asia.

1963. From China with love: mirrors and empire in East Asian antiquities

Authors: Goran Đurđević (University of Zadar)
Format: Oral

This paper examines mirrors as artes minores in Han Dynasty and interactions with neighboring regions, including Japan. Central to this study is the concept of reflection, understood as a multifaceted process encompassing reversed images, perception and cognition, the formation of social values, and the expression of political authority. Mirrors are approached as two-sided media of reflection: a polished surface used for grooming and visual self-recognition, and decorative reverse bearing inscriptions and iconography that conveyed moral ideals, cosmological order, and imperial ideology. Reflection is treated as meta-concept shaped by imperial structures, integrating social practice, religious and magical meanings, and perceptions of physical and moral beauty. The production and distribution of mirrors across imperial centers and peripheral regions functioned as channels for transmitting imperial ideas, a process conceptualized as imperial peri-reflection. Within this framework, paper highlights the close functional and symbolic relationship between mirrors and seals. Both objects served as instruments of identity - mirrors reflecting the physical image, seals bearing names and titles that articulated personal and political status. Archaeological evidence shows that mirrors and seals were frequently stored and worn together in pouches, a practice corroborated by textual sources from the History of the Jin and Sui Dynasties. From a sovereign perspective, mirrors and seals also functioned as emblems of state power. Produced and distributed by the imperial court, they were bestowed upon officials, vassal rulers, and foreign polities. A key example is the diplomatic mission of 57 CE, during which Emperor Guangwu of Han sent mirrors and a golden seal to Japan, including the seal inscribed Han vassal King of Na state, symbolizing political recognition and hierarchical relations. Together with comparable evidence from Dian, these materials demonstrate how mirrors and seals operated as integrated elements of Han imperial diplomacy, projecting imperial image and authority within and beyond the empire.

460. Infrastructure and Agency in Late Kofun Japan: Between Private Performance and Public Aggregation

Authors: Claudia Zancan (Ca' Foscari University of Venice) – Mark Hudson (Max Planck Institute for Geoanthropology Jena)
Format: Oral

Building on our current research on infrastructure and social power in Kofun Japan, we explore the agency of infrastructure through its capacity to direct human movement and social relations. Focusing on Late Kofun mortuary infrastructure, we analyse two types of tombs and two categories of mortuary artefacts. Yokoanashiki-sekishitsu (corridor-style stone chambers) feature a fixed path of entry that restricts access to a limited number of individuals and mandates passage through specific, confined environments. The infrastructure thus mediates the relationship between the participant and the funerary space: the architectural layout constrains human movement, dictating both the scale of participation and the physical postures required. In contrast, yokoana (rock-cut tombs) function as 'public' infrastructure. Frequently clustered in large 'cemeteries' near settlements, their facades operate as nodes of aggregation. Their agency does not lie in guiding movement inward, but in anchoring social activity outward. Much like a square or a road, these tombs serve as daily spatial references that organize village life; the infrastructure thus facilitates the production of the community. Haniwa and sekijin-sekiba are artefacts placed outside tombs that guide the external movement and experience of those who will never be able to enter the tomb. Given their imposing scale (sekijin-sekiba) and often their expressions (haniwa), their agency was to keep intruders away from the sacred area and protect the tomb. They attract the gaze (visual agency), forcing those walking outside the mound to follow a precise perimeter. This study demonstrates how Japanese archaeology enriches global debates by relocating monuments as active infrastructural agents that produce, rather than merely reflect, social relations.

340. Keyhole-Shaped Mounded Tombs as a Religious Symbol in the Early State Formation Process in Japan

Authors: Kenichi Sasaki (Meiji University) – Yoshitaka Hojo (Tokai University)
Format: Oral

In the middle third century CE, giant keyhole-shaped mounded tombs appeared in the Nara basin where the central polity was presumably located at that time. The practice of constructing keyhole-shaped tombs spread all over Japan except the northern island of Hokkaido and the southwestern Ryukyu Islands. Keyhole-shaped mounded tombs were built according to fixed sets of construction plans, and it seems that the high-ranking chiefs of the central polity distributed the construction plans to local elites as a sign of political alliance or friendship. Local elites took the meanings of constructing keyhole-shaped mounded tombs in various ways, and one was to treat mounded tombs as a religious symbol. This interpretation is based on the following lines of evidence. For example, the axis of the Sakitama-Inariyama tomb in Saitama Prefecture is in the alignment to the direction of Mt. Fuji, the tallest mountain in Japan that has been considered sacred throughout Japanese history. Although the Sakitama-Inariyama tomb is approximately 100 kilometers away from Mt. Fuji, Mt. Fuji is visible from the tomb. The axis of the Kōbōyama tomb in Nagano

Prefecture is in alignment to the direction of sunrise on the day of winter solstice. It is likely that local agriculturalists participated in the construction of large elite burial mounds because of the religious nature of mounded tombs.

660. Effect of the Symbolism of Keyhole-shaped Mounded Tombs in the Frontier Regions of Japan

Authors: Yutaka Tanaka (Ibaraki University)
Format: Oral

n the middle third century, CE, keyhole-shaped mounded tombs that required a complicated and sophisticated construction plan appeared in the Nara basin. The Nara basin and Osaka plain are considered as the region where the central polity was presumably located because keyhole-shaped mounded tombs of much larger than 200 meters in length were spatially concentrated. Within a century, keyhole-shaped mounded tombs were built in most of the regions of Japan from north to south, 1200 kilometers in distance. Keyhole-shaped mounded tombs of various regions shared several aspects such as the mound morphologies and assemblages of goods deposited with the dead. This symbolized that mortuary rituals were unified in many regions, and the differences in the sizes of mounds indicated the differences in the social ranks of local elites. It is highly noteworthy that keyhole-shaped mounded tombs of 160 to 170 meters were built in the fourth century in Ibaraki in the east, Miyagi in the northeast, and Kagoshima in the southwest. These regions are very peripheral of the spatial distribution of keyhole-shaped mounded tombs. This phenomenon is puzzling because, excluding the central polity regions of Nara and Osaka, there are few keyhole-shaped mounded tombs of this size. In this paper, the author takes the case of Ibaraki Prefecture as an example where trades took place between the indigenous people of northeastern Japan and people of the mainland Japan. The author argues that the construction of large keyhole-shaped mounded tombs as ritual was incorporated into a system that created the mutual trust between these peoples and encouraged smooth trade of goods between them.

148. Where History Is Silent, Tombs Speak in Symbols. A Comparative Archaeology of the Kofun Culture in Human History

Authors: Kazutaka Kawano (Tokyo National Museum)
Format: Oral

From the 1960s to the 1990s, Japanese archaeology accumulated empirical research, interpreting the diversity of kofun forms and scales in relation to political order and state formation. However, the question of why social structure and power are expressed not only through political institutions but through burial practices as religious and symbolic acts has remained insufficiently theorized. Since the 1980s, comparative studies of royal tombs have repositioned the kofun within a global human-historical framework, drawing on research from Egypt, Mesopotamia, China. Building on this tradition, this paper redefines royal tombs as symbolic devices that materially visualize and reconfigure social order, ritual authority, ancestorhood, and temporality. Royal tombs are understood as social technologies through which societies "display" their order and legitimacy, constituted by five elements: a monumental above-ground commemorative structure, burial facilities surpassing in scale and complexity, a planned funerary landscape with subsidiary mounds and ritual spaces, burial spaces visualizing the otherworld, and human and animal sacrifice with prestige goods. This paper proposes a seven-stage model for the emergence and transformation of royal tombs: (1) sacredness-generating ritual landscapes and communal cemeteries; (2) the personalization of sacredness through individual burials; (3) dynastic royal tombs sustained by long-distance exchange and prestige goods networks; (4) the intensification of sacred kingship through sacrifice and retainer burials; (5) the deification of kings and completion of funerary complexes; (6) the integration of royal tombs with cities and the visualization of the otherworld; (7) the transformation into urban kingship, in which cosmic order is materialized in cities and royal tombs are overcome. Applied to the kofun culture, this model shows that dynastic kingship and keyhole-shaped tombs correspond to stages (3)–(4), while full deification was never achieved. Funerary complexes remained incomplete, and in the Asuka period cities came to embody cosmic order, ultimately overcoming the age of royal tombs.

56. Technologies of the Sacred: The Emergence of Mediated Religious Practice in the Yayoi Period

Authors: Koji Mizoguchi (Kyushu University)
Format: Oral

This paper explores the technological and social development of religious communication during the Yayoi period, focusing on the Middle Yayoi in northern Kyushu. It examines a pivotal transformation in how the supernatural/metahuman was conceptualised and engaged, as reflected in the emergence and evolution of ritual imagery on burial jars. In the earlier Middle Yayoi, iconographic motifs depicting animals such as deer appear on jar surfaces. These images likely referenced supernatural forces linked to life regeneration and fertility. They are sometimes accompanied by raised-floor storage buildings, suggesting an emergent religious logic connecting death, agricultural surplus, cyclical renewal, and communal continuity through material symbolism. This agrarian-cosmological grammar can be read as an early configuration of themes that later became prominent in Japanese religious history, including the sacrality of seasonal renewal, prosperity, and protection. From the latter Middle Yayoi onward, imagery shifts toward human figures performing ritual actions with distinctive attire and implements. This signals the rise of mediated religious communication and the emergence of designated ritual specialists. Such specialisation parallels increasing social complexity and stratification, as communities required authoritative roles to manage uncertainty and symbolically stabilise developing hierarchies. By tracing these iconographic and sociopolitical changes, this paper argues that Middle Yayoi innovations in ritual media and authority formation

laid important foundations for subsequent Japanese religious systems, from elite-centred ceremonial legitimation in later prehistory to more institutionalised forms of ritual governance.

487. Foreign Images, Indigenous Beliefs: Religion in Kofun Period Japan

Authors: Doreen Thierfelder (Martin Luther University Halle-Wittenberg)
Format: Oral

The earliest written sources from the beginning of the 8th century on the Japanese archipelago refer to the existence of „80 myriads of deities". However, the origins of these deities remain shrouded in mystery. The Kofun period (mid-3rd to 6th century AD), which predates both the compilation of these myths and the advent of Buddhism, is therefore crucial for assessing which concepts of deities or divine beings existed prior to written records. By the early 3rd century AD, mirrors bearing depictions of anthropomorphic Daoist deities had reached the Japanese archipelago from China. These mirrors were rapidly copied and widely distributed, becoming important religious objects and prestige symbols in the Early Kofun period. The iconography of these mirrors derives from external religious beliefs. Consequently, they cannot be regarded as evidence for indigenous beliefs in anthropomorphic deities. Additionally, it is important to note that subsequent religious concepts, such as Shinto, are unlikely to be applicable to the Kofun period and may result in the obscuring of earlier belief systems when retrojected. The present paper provides a re-evaluation of the portrayal of deities in Kofun period Japan, with a particular focus on depictions on domestic mirrors, decorated tombs and terracotta figures (haniwa). The analysis indicates that, despite sustained exposure to Chinese religious imagery, the Kofun people did not adopt anthropomorphic deities. Instead, the material record indicates the persistence of non-anthropomorphic, conceptually different forms of religious belief. The apparent absence of anthropomorphic deities during the Kofun period is in profound contrast to the deity-centred myths that emerged in the early 8th century, thus indicating a transformation in religious concepts prior to the compilation of the earliest written sources.

282. Material Anchors of Maritime Adaptation: Onigasaki (Tsushima) and Early Holocene Coastal Innovation in Japan

Authors: Daniele Petrella (IRIAE – International Research Institute for Archaeology and Ethnology)
Format: Oral

Tsushima Island is often framed as a marginal "stepping-stone" between the Korean Peninsula and northern Kyūshū. This paper argues instead that Tsushima should be approached as a productive island world in its own right, where coastal landscapes and material practices shaped distinctive forms of innovation and resilience during the Early Holocene. We present recent results from the IRIAE investigations at the Onigasaki site, integrating excavation data with observations derived from survey and documentation conducted across multiple coastal contexts on the island. Our approach moves beyond diffusionist narratives and overly generalised assumptions about Japanese prehistory—such as the idea that obsidian was uniformly accessible because sources are widespread across the archipelago. In an island setting without local obsidian outcrops, procurement choices, raw material circulation, and technological organisation become especially informative, showing how maritime connectivity was embedded in everyday practice rather than treated as an exceptional phenomenon. We interpret the Onigasaki record as evidence for adaptation not only as a functional response to environmental constraints, but as operational maritime knowledge: a learned capacity to schedule mobility, coordinate labour, and exploit coastal resources through time. By foregrounding the interplay between landscape dynamics, material decision-making, and social practice, this contribution shows how Tsushima's coastal archaeology resonates with wider debates on materiality, temporality, and the archaeology of island worlds, offering a comparative perspective for rethinking early Neolithic trajectories in East Asia.

768. The Shape of Death and Daily Life: Geometric Morphometric and Machine Learning Analyses of Edo-Period Ogame Jars, Japan

Authors: James Loftus (Institute of Science Tokyo)
Format: Oral

Edo-period (1603–1868) ceramic production in Hizen Province, Northern Kyushu, Japan is often discussed as a case of accelerating industrial organization under global and domestic pressures. Scholars have long argued that Hizen's porcelains became increasingly standardized as production expanded to meet overseas demand, particularly during disruptions to Chinese porcelain supply during the Qing "sea ban" (1647–1684), and through later domain-level regulation. Yet the same historical claim has yet been tested for Hizen's utilitarian stonewares. Among these, "ogame" large jars are especially revealing because they moved across social worlds: they stored water, soy sauce, and fertilizer, and frequently served as mortuary burial jars. Many ogame also survive to this day continuing to appear in households and commercial settings, making them a material bridge between early modern lifeways and the present. This paper statistically evaluates whether ogame became more standardized through the Edo period, and whether vessel shape differed between kiln contexts and mortuary contexts. Outline-based geometric morphometrics was applied to 243 ogame from sites across Hizen and Chikuzen Provinces, integrating kiln assemblages with burial assemblages. A machine learning random forest classifier groups undated vessels around a small set of dated samples, producing six stages spanning the seventeenth to eighteenth centuries. Results show (1) declining within-stage dispersion toward later stages, consistent with increasing standardization, plausibly connected to the wider reorganization of Hizen's ceramic economy in the wake of export expansion and stronger domain regulation; and (2) strong context-structured form, with mortuary jars tending to be taller and more enclosed, while kiln-associated jars are broader-shouldered with more open rims, suggesting context-sensitive selection and/or production. Together, this approach offers a replicable way to bring archaeological science into early modern Japanese archaeology and speaks to "resonant pasts" by linking political economy, daily practice, funerary meaning, and living heritage.

2183. Transformations in Ancient Japanese Eating Practices: Evidence from Deep Learning-based 3D Morphological Analysis of Sue Ware

Authors: Wataru Tatsuda (Institute of Archaeology, University College London) – Ryo Hori (Graduate School of Informatics, Nagoya University) – Kimiyasu Morikawa (College of Computing, Georgia Institute of Technology | The New York Public Library) – Hayata Inoue (Research Center for Cultural Heritage and Texts, Nagoya University)
Format: Oral

This study examines transformations in ancient Japanese eating practices through a deep learning–based 3D morphological analysis of Sue ware ceramics from the Sanage kilns, dating to the 8th–mid-9th century. Sue ware has long been discussed in relation to changes in food consumption, particularly the proposed shift from hand-based eating to the use of spoons or chopsticks, reflected in the declining use of dish-type vessels and the increasing prevalence of bowls. However, previous studies based on empirical typology or 2D outline analysis have struggled to establish a robust and objective link between vessel form and eating practices. To address this limitation, we apply the Point Transformer, a state-of-the-art deep learning model optimised for 3D point cloud data, to classify 917 Sue-ware vessels into five morphological types. The model achieves high overall classification performance and successfully captures subtle shape variations that are archaeologically meaningful. Notably, bowl (B) and dish body (DB) types show overlapping morphological features in both principal component analysis and hierarchical clustering, and several borderline specimens are classified correctly by the model. These results suggest that morphological ambiguity between bowls and dishes is not merely a classificatory problem but reflects a transitional phase in eating practices, during which vessel functions were not yet strictly differentiated. The interchangeable use of bowls and dishes implied by the morphological overlap supports the hypothesis that changes in food consumption practices were gradual rather than abrupt during this period. By directly linking fine-grained morphological variation to broader discussions of eating practices, this study demonstrates how explainable deep learning approaches can move beyond typological classification to address anthropological questions. The results highlight the value of 3D morphology as evidence for behavioural change and offer a transparent, reproducible framework for exploring the relationship between material form and everyday practices in archaeology.

798. Edo to Meiji Period Stratified Memory Landscape: Archaeology and Digital Reconstruction in Tokyo's Italian Embassy Historic Garden

Authors: Ivan Varriale (International Research Institute for Archaeology and Ethnology)
Format: Oral

The Historic Garden of the Italian Embassy in Tokyo is a palimpsest of three centuries of Japanese elite domestic architecture, spanning the Edo-period Nakayashiki of the Matsudaira clan, the Meiji political residence of Matsukata Masayoshi, and its current role as a diplomatic compound, showing the evolving of the architectural forms as expression of political power. This paper reports three seasons of stratigraphic excavation (2023–2025), documentation, and digital reconstruction of key remains: the Edo-period Nakano Ō Cha ya, the Meiji-period Keirokaku pavilion, and a Tai an–type tea house. Beyond traditional archaeological documentation, the research integrates parametric 3D modeling, augmented reality, and archival research to move from excavation to musealization, turning the garden into an interpretive laboratory where digital tools reveal the contested meanings of its layered topography. This research is significant as it represents the first archaeological investigation of this garden, moving beyond archival documentation to material evidence and stratigraphic confirmation. The stratigraphic excavation was crucial, as it provided the first material evidence confirming Edo-period structures like the Nakano Ō Cha ya, previously known only from maps, and their Meiji obliteration. The discovery of a Kikuma roof tile—a hallmark product of the Iyo-Matsuyama domain—directly connects the Nakayashiki to its parent clan, illuminating networks of craft production and political loyalty The research also identified the original placement of the nine-tiered stone pagoda and the precise site where the Ako rōnin spent their final days, restoring the spatial and symbolic logic of a commemorative marker whose meaning had been obscured by changes in the site's topography. The paper argues that the Historic Garden of the Italian Embassy exemplifies how archaeological investigation, digital reconstruction, and public musealization can work together to recover and interpret layered memory landscapes, contributing to Japanese architectural history and broader debates on conservation and digital heritage.

138. Ritual Water Landscapes in the Yayoi Period:Focusing on the Karako–Kagi Site

Authors: Tetsuya Shiroishi (Yamagata University)
Format: Poster

The Yayoi period in the Japanese archipelago is generally regarded as the time when rice-based agriculture was introduced (ninth century BC). During this period, under the influence of continental interactions, a major ideological transformation occurred from the preceding Jōmon period, which had been based primarily on hunting and gathering. This transformation is thought to have been accompanied by significant changes in ritual landscapes, particularly in relation to water and agricultural practices. In this

paper, we focus on pictorial representations and well features in order to reconstruct ritual landscapes associated with water. Wells in Yayoi settlements are not only functional facilities for daily life but also appear to have played important symbolic and ritual roles, reflecting cosmological conceptions of water, fertility, and community. In addition, through pollen analysis of well sediments excavated at the Karako–Kagi site in Nara Prefecture—where the authors have been conducting recent archaeological investigations—we reconstruct the contemporary environment and examine the specific contexts in which ritual practices were carried out. By integrating archaeological interpretation with environmental data, this study contributes to broader discussions on ritual landscapes and human–environment relationships in early agricultural societies.

136 COLLECTIVE BURIAL TRADITIONS: ARCHITECTURE, MEMORY, AND THE SOCIAL LIFE OF THE DEAD

Theme: 1. Widening perspectives in material culture studies
Organisers: Katarzyna Harabasz (University of Szczecin) – Arkadiusz Marciniak (Adam Mickiewicz University) – Patrycja Filipowicz (University of Adam Mickiewicz) – Marco Milella (University of Pisa)
Keywords: Collective burials, Anatolia, Balkans, Central Europe, Neolithic, Chalcolithic, Funerary architecture, Material culture
Format: Regular session

SESSION ABSTRACT

During prehistory, collective burial traditions extending from the Near East into the Balkan and Central European regions in the Neolithic and Chalcolithic periods offer profound insights into how ancient communities conceptualized death, memory, and social belonging. These funerary practices were not merely ritual expressions but active mechanisms through which social identities, power relations, and collective histories were negotiated and maintained. This session focuses on the architectural forms, material assemblages, and embodied rituals associated with communal graves and mortuary enclosures, exploring both shared and divergent patterns that shaped social life and remembrance across these interconnected regions. It also considers their multifaceted meanings as dynamic arenas where care, violence, and remembrance intersected. We welcome interdisciplinary contributions that explore the diversity and long-term development of collective burial customs particularly those addressing shifts linked to demographic change, and socio-political transformation. Particular emphasis is placed on studies that integrate spatial analysis, bioarchaeological data (including paleopathological and isotopic analyses), and theoretical frameworks such as memory studies, personhood, and material agency. By examining how bodies were arranged, modified, and redeposited over time, the session aims to situate these practices within their specific social frameworks and link them to the lived experiences of human communities and their long—term engagement with ancestral remains. Furthermore, the session encourages critical reflection on how modern archaeological interpretations have shaped—and sometimes distorted—understandings of prehistoric deathways. How do excavation methods, preservation biases, or cultural assumptions influence our reconstructions of collective burial practices? We also invite methodological innovations, including digital reconstructions, 3D modeling, and GIS-based spatial analyses, to enhance the visibility of subtle mortuary patterns. Ultimately, this session seeks to advance a holistic understanding of how the dead and their material worlds actively structured prehistoric social life, serving as enduring anchors of identity, continuity, and transformation across generations.

CONTRIBUTION ABSTRACTS

146. Body rituals from four prehistoric millenia. Initial insights into an interdisciplinary research project on the Cherry Tree Cave, Franconia, Germany

Authors: Timo Seregély – Andreas Schäfer (Pre- and Protohistoric Archaeology, University of Bamberg) – Joachim Burger – Laura Winkelbach – Jens Blöcher (Palaeogenetics Group, University of Mainz) – Marcel Keller (Department of Environmental Sciences, University of Basel | Institute of Genomics, University of Tartu) – Nadine Carlichi-Wiltjes – Franziska Immler (AnthroArch GbR, Grafrath) – Carsten Witzel (Department of Biology, University of Hildesheim) – Valeska Becker (Pre- and Protohistoric Archaeology, University of Münster)
Format: Oral

The Cherry Tree Cave, discovered in 2011 in Franconia, is a stroke of luck for archaeological research in vertical caves in many respects. The numerous bone finds in the small cave were not displaced by laymen and can be proven to date back at least four prehistoric millennia. In addition to an unique cattle bone from the Younger Neolithic, human and animal bones from the Final Neolithic, the Early Bronze Age and the Iron Age were found. In two preliminary projects the finds were first recovered from the cave surface and from initial small test trenches and analysed. Due to the confined space in the cave, a 3D scanner was used to record the exact location of the finds. Analyses to date indicate the presence of at least 22 human individuals, as well as several animals of different species. The preservation of ancient DNA is excellent, which is why the site has incredible potential for population genetic studies, kinship analyses and analysis of pathogens. As the nature of the deposits of bone remains in the hard-to-access vertical caves is still unclear, for the time being we will refer to them as body rituals rather than burials. This more neutral term includes burials, but as a 'repeated, intentional process' it is also open to other interpretations. A research project funded by the German Research Foundation and launched in 2026 aims to complete the excavation of the Cherry Tree Cave. This offers the opportunity to use interdisciplinary collaboration to decipher processes and perhaps the original motivation behind these long-practised body deposits in a vertical cave. Another exciting question is that of continuity or discontinuity and similarities and differences between prehistoric periods. The lecture summarises the current state of knowledge and provides an overview of the research methodology and initial results.

398. Another World – Burials in the Late Copper Age in Central Europe

Authors: András Rajna (Ferenczy Museum Center)
Format: Oral

The Late Copper Age in the Carpathian Basin is one of the most researched periods in Central European prehistory. The processing of the findings of the thousands of sites dating back to this period excavated over the past decades is constantly adding tons of new data to the research. Complex researches produced a number of new results, but it is still this period, the 4th millennium BC, that raises the most questions. There is a sharp contrast between the explosion of innovation manifested in the finds and the invisibility of the housing conditions (the absence of archaeological traces of the houses) and the lack of copper finds. The representation of cemeteries and settlements is also inconsistent and disproportionate: the small number of cemeteries and burials within settlements is not proportional to the vastness of settlements and the population they presumably accomodated. In this ever-changing Late Copper Age world, we must interpret the phenomena we discover in a different way from the earlier stages of the Copper Age. The way of caring for the dead changes, the majority of the deceased departs to the afterlife without any archaeological trace. Therefore, the 'traditional' burial of individuals in cemeteries and settlements has a special significance. The act of burial itself represents the role of the individual in society. In my presentation, I would like to introduce the changes that followed the Middle Copper Age, which was characterized by large numbers of cemeteries, and rich in copper artifacts, the phenomena of the small number of burials and mass graves during the transitional period introducing the Late Copper Age, the possible social connections of the Baden complex cemeteries, and the relationship between the cemeteries and the finds excavated at the sites, based on recently published extensive research results.

789. Bioarchaeological Analysis of a Mierzanowice Culture Multiple Grave, Southeastern Poland

Authors: Anita Szczepanek (Institute of Archaeology an Ethnology Polish Academy of Sciences | Department of Anatomy Collegium Medicum Jagiellonian University) – Paweł Jarosz (Institute of Archaeology an Ethnology Polish Academy of Sciences) – Marta Korczyńska-Cappenberg (Independent Researcher) – Paulina Kowalska (Anthropos Doctoral School of the Institutes of the PAS | Institute of the History of Science, PAS) – Alicia Muriel (Centre for Palaeogenetics, Stockholm | Stockholm University, Stockholm) – Maja Krzewińska (Centre for Palaeogenetics, Stockholm | Stockholm University, Stockholm)
Format: Oral

This interdisciplinary study presents integrated isotopic and genetic analyses of an Early Bronze Age cemetery at Krzyżanowice Dolne in southeastern Poland, with particular emphasis on a multiple grave containing nine individuals, interpreted within the broader context of the burial ground. The arrangement of the skeletons and radiocarbon dating indicate simultaneous interment. This grave, exceptional within the Mierzanowice culture and enigmatic in character, comprised predominantly young individuals, several of whom exhibited osteological evidence of violent death, raising questions about social relations and funerary practices. Genetic analyses identified four females and five males and revealed greater variability in mitochondrial DNA lineages compared to Y-chromosome haplotypes, a pattern consistent with patrilocal residence systems and a possible polygynous social organization. Stable carbon and nitrogen isotope analyses were conducted to reconstruct dietary practices and to compare individuals buried in the multiple grave with those interred elsewhere in the cemetery. The results indicate a predominantly inland subsistence strategy based on C3 plants, supplemented by varying proportions of animal protein, with observable differences between individuals from the multiple grave and the remaining community. In addition, strontium isotope analyses provided insights into mobility patterns, suggesting female-biased immigration into the cemetery population, while indicating a local origin for the individuals interred in the multiple grave. Taken together, the combined bioarchaeological, isotopic, and genetic evidence contributes to explaining the distinctive character of this multiple burial, which contrasts markedly with earlier Late Eneolithic and later Bronze Age funerary traditions involving collective interments. This research was funded by the National Science Centre Poland, grant number NCN 2020/39/B/HS3/00454.

492. Collective cave burials in the Subbaetic Mountais (Córdoba, Spain) during Late Prehistory: insights from Cueva de los Mármoles

Authors: Zita Laffranchi – Rafael M. Martínez Sánchez (University of Córdoba) – Juan Carlos Vera Rodríguez (University of Huelva) – Juan Antonio Cámara Serrano (University of Granada) – María José Martínez Fernández (University of Huelva) – María Dolores Bretones García (Independent Researcher) – Marco Milella (University of Pisa)
Format: Oral

The use of natural caves as collective burial places is a long-standing and cross- regionally widespread practice. Frequently represented by secondary depositions, these finds often exhibit traces of manipulation. Such features are particularly frequent from the 4th millennium cal. BCE onward in the Subbaetic region of Córdoba (southern Iberia). Cueva de los Mármoles (CM) in Priego-Córdoba is one of the largest caves in this region and has yielded a substantial assemblage of commingled skeletal remains, suggesting

a repeated funerary use from the Neolithic to the Late Bronze Age. The aims of this study are (a) to present and discuss the archaeological, osteological, and taphonomic features of CM based on radiocarbon dates, minimum number of individuals (MNI) estimates, fragmentation patterns, and analyses of anthropogenic modifications, and (b) to contextualize these findings within the broader regional variability of similar Subbaetic assemblages. Results suggest a funerary use of CM between the 5th and 2nd millennia cal. BCE, and a MNI of 12 (seven adults and five nonadults). The underrepresentation of hand and foot bones raises the possibility that bodies were introduced into the cave in a partially decomposed state. Anthropogenic modifications, including fresh fractures and modified bone elements, point to intentional fragmentation, soft tissues removal, and selective reuse of skeletal remains. The comparison with other cave funerary contexts from the same region suggests the presence of shared cultural elements, particularly during the Neolithic period, and underscores the persistent symbolic and social significance of the human body within these communities. The development of collective deposits in this region from the mid-4th millennium cal BCE should be understood in direct conceptual and chronological relation to the megalithic and hypogeic chambered tombs of southern Iberia.

1200. The Last of Us: Chalcolithic Collective Burial and the Maintenance of Identity at La Paridera de la Dehesa (Muel, Spain)

Authors: Marina Bretos – Jesús Picazo (University of Zaragoza) – Javier Fanlo – Nerea Timoneda (Independent researcher)
Format: Oral

Recent excavations at La Paridera de la Dehesa (Muel, Zaragoza) have revealed an exceptional collective burial context that offers new insights into the mortuary practices of the Ebro Valley during the Chalcolithic (c. 2800–2300 cal BCE). Located within a natural sandstone shelter, the site has been significantly altered by post-depositional processes. However, the identification of remnants of a closing wall lined with a clay coating suggests an original intent to transform the geological formation into a defined mortuary enclosure, delineating a boundary between the living and the ancestral domain. The funerary deposit, containing a minimum of 50 individuals of varying ages and sexes, reflects a complex biography of use. This prolonged use has led to a highly fragmented and mixed record, barring some notable instances of anatomical articulation. These taphonomic signatures are not merely preservation issues but indicators of an active "social life" of the remains, where ancestors were continuously reorganized to accommodate newcomers. Moreover, preliminary bioarchaeological analysis has identified distinct paleopathologies indicative of survival with debilitating conditions, pointing to the existence of care and community resilience. This site dates to a crucial period marked by territorial mobility and emerging organizational systems in the region. In this context, the persistent use of the burial space over centuries served as an enduring anchor for the community, acting as an active mechanism through which social identities and collective histories were maintained. By integrating high-resolution spatial analysis, 3D digital modeling, and bioarchaeological data, we aim to disentangle the formative process of this collective burial. These mortuary practices provide a vital proxy to reconstruct the specific social framework of the community, shedding light on a period where the scarcity of settlement evidence has historically obscured our understanding of their lived experience.

1342. The Emergence of Collective Burial Phenomenon in Late Neolithic Çatalhöyük

Authors: Katarzyna Harabasz (University of Szczecin) – Arkadiusz Marciniak – Patrycja Filipowicz (Adam Mickiewicz University)
Format: Oral

This paper examines the emergence of collective burial traditions corresponding purpose-built funerary architecture during the Late Neolithic occupation of Çatalhöyük (ca. 6300–5950 BCE), a period characterized by pronounced demographic contraction, environmental stress, and spatial reorganization. Whereas earlier mortuary practices at the site were embedded within domestic architecture and structured around intramural burials, the final centuries of occupation witnessed a decisive shift toward spatially segregated funerary contexts. Drawing on architectural analysis, stratigraphic relationships, osteological evidence, and Bayesian chronological modelling, the paper focuses on three key funerary contexts: two burial chambers and a structure interpreted as a charnel house, located in the TP and East Areas. These funerary features document a transition from individual, household-centred interments to collective, and repeatedly reopened mortuary deposits, in which the dead were actively re-engaged through practices of manipulation, reburial, and spatial reconfiguration. Within this framework, collective funerary architecture is interpreted as a critical arena for negotiating social memory and communal belonging in the context of settlement fragmentation and post–8.2 ka event environmental instability, fundamentally reshaping the social life of the dead in the late phase of Çatalhöyük's occupation.

2317. Living with the Dead: Continuing Bonds at Late Neolithic Tell Sabi Abyad, Syria

Authors: Karina Croucher (University of Bradford) – Jo-Hannah Plug (University of Oxford)
Format: Oral

Drawing on a background of rethinking burial interpretations – moving away from traditional interpretations of status, instead exploring emotional impacts on the bereaved and the relationships between the living and the dead – this paper discusses burial practices from the Late Neolithic site of Tell Sabi Abyad, Syria. We focus on a subset of burials from the 7th and early 6th millennium BCE from Tell Sabi Abyad 1 and III, which evidence extended interaction with the dead, bodily manipulation, and keeping the dead spatially close to the living. We explore emotional relationships with the dead, and the tangible connection with the dead evidenced through the mortuary evidence. Through an analysis of burial practices which incorporates emotion, sensory experiences,

and mourning, we aim to further enhance our understanding of the significance of the dead at Tell Sabi Abyad, and what such approaches might mean for understanding the prehistory of Southwest Asia, and for funerary archaeology more broadly.

382. Fragmented bodies and renewed engagements: The mortuary dimension of social cohesion at Tepecik-Çiftlik

Authors: Ali Büyükkarakaya (Hacettepe University)
Format: Oral

Appearing as special and rare graves during the Neolithic period, Collective Burials are considered a distinct type of burial, differing from "individual" and "single" burials, as they involved long-term successive burials and accommodated numerous members of the community across different generations. Furthermore, in these types of graves, the extended communal use of a specific space is considered to have led to the intersection of different household groups in Neolithic villages. Thus, they are not merely a place where successive burials were carried out, but should also be seen as a performance area for important references to a shared past and narratives. Located in the volcanic Cappadocia subregion of Central Anatolia, Tepecik-Çiftlik is a settlement that exemplifies the extremely diverse mortuary practices of the PPN and PN, allowing for an examination of the relationships these period communities established with their dead. Material evidence of secondary interventions in graves, skull removal practices, secondary and multiple burials, and the different representations of individuals' skeletal elements in these burials reveal the continuity of interesting funeral rituals. Recently unearthed plastered skulls have also given us a better understanding of the extent of interventions performed on the dead at Tepecik-Çiftlik. Among the graves identified at the settlement, the BB collective burial dated to the first half of the 7th millennium BCE is particularly significant due to its long-term use and evidence regarding bodily manipulation and fragmentation. Many researchers have pointed out that findings regarding the handling and rearrangement of body parts belonging to the dead, especially in multiple burials, contribute to the study of social relations during that period. Given this, the present study aims to examine this burial, along with other multiple graves, from the perspective of the formation of collective memory and social cohesion through mortuary rituals.

1251. Spatial Organization and Collective Practices in Extended Supine Inhumation Cemeteries of the Northern Pontic Region

Authors: Olha Demchenko (Odesa I.I. Mechnikov National University)
Format: Oral

Extended Supine Inhumation (ESI) cemeteries of the Northern Pontic region represent one of the longest-lasting burial traditions in Eastern Europe (late 8th–mid-5th millennium BCE), comprising over 1,200 individuals from more than 50 sites. Rather than following a linear development, ESI practices display multiple forms of spatial organization, reflecting changing concepts of ancestry, social belonging, and engagement with the dead. This study focuses on collective burial practices and identifies at least two main organizational models based on cemetery layouts, grave morphology, stratigraphy, and disturbance patterns. The first model consists of sub-burial cemeteries, where graves were repeatedly reopened to inter closely related individuals, as confirmed by genetic data from Yasynuvatka (Type A). Sites such as Vovnygy I–II, Dereivka West and East, Vilnianka, and Yasynuvatka show reused burial pits with layered fills and partial disturbance of earlier skeletons while preserving grave outlines. These features indicate controlled, memory-based practices in which specific graves functioned as long-term family or lineage burial places, anchoring collective identity. The second model is characterized by large rectangular or sub-rectangular collective ossuaries with homogeneous fills, suggesting continuous access, likely via covering structures (documented at Mykilske). Prolonged use led to extensive skeletal disturbance and loss of anatomical order, pointing to repeated embodied interaction with ancestral remains. This model corresponds chronologically with the emergence of the Azov–Dnipro tradition and broader eastern Eneolithic influences. The appearance of flexed supine burials in the latest ESI contexts reflects shifting ritual systems and the gradual decline of collective traditions. Radiocarbon dates indicate partial chronological overlap between the two models, though the second persists until the onset of metallurgy. Bioarchaeological and genetic evidence demonstrates that these transformations resulted primarily from internal social processes rather than population replacement. Clear markers of social status are largely absent; only with the Eneolithic do individual burials signal emerging social differentiation.

1049. Kinship, Mobility, and Violence in a Late Eneolithic Collective Burial of the Złota Culture from Southeastern Poland

Authors: Anita Szczepanek (Institute of Archaeology an Ethnology Polish Academy of Sciences | Department of Anatomy Collegium Medicum Jagiellonian University) – Wojciech Pasterkiewicz (Institute of Archaeology, Rzeszów University) – Paweł Jarosz (Institute of Archaeology an Ethnology Polish Academy of Sciences)
Format: Poster

The study presents the results of a multidisciplinary investigation of a collective grave attributed to the Złota culture and dated to the Late Eneolithic (first half of the 3rd millennium BC), discovered at the cemetery site in Sadowie, southeastern Poland. The deliberately constructed grave chamber contained the commingled remains of six individuals representing different age groups and both sexes (five males and one female). Osteological analysis revealed clear evidence of perimortem violence: three individuals exhibited fatal cranial injuries, while flint arrowheads embedded in the postcranial skeletons of two others indicate death as

a result of interpersonal conflict. Integrated bioarchaeological, genetic, and isotopic analyses were undertaken to reconstruct the biological profiles of the individuals, their mobility, diet, and the circumstances surrounding burial formation. Ancient DNA analysis identified close biological relationships among three of the individuals, suggesting kinship ties within the group. Strontium isotope ratios demonstrated that most individuals were local to the Sadowie region, with the notable exception of one female whose isotopic signature indicates a non-local origin. Stable carbon and nitrogen isotope values obtained from bone collagen point to a broadly homogeneous diet based primarily on C3 plants, supplemented by substantial animal protein intake. Taphonomic observations, together with the spatial distribution of skeletal elements and grave goods, suggest at least two phases of burial activity, involving both primary deposition and subsequent disturbance of remains. The burial practices, combined with genetic and isotopic evidence, suggest that the victims of at least one violent event were interred by members of their own community, providing important insights into social relations and expressions of violence during a period of major cultural and genetic transformation in Late Eneolithic Europe. The research was financed by the Polish National Science Centre (grant no. 2021/05/X/HS3/01850).

1201. Collective Burial in the Neolithic Western Alps: Deliberate Choices, Ritualised Interaction, and Long-Term Engagement with Ancestral Remains

Authors: Noah Steuri (McDonald Institute for Archaeological Research, University of Cambridge | Institut für Archäologische Wissenschaften, Universität Bern) – Nikolai Goritschnig – Sandra Lösch (Institut für Archäologische Wissenschaften, Universität Bern)
Format: Poster

The first Neolithic burials of the Western Alpine region provide a valuable perspective on how prehistoric communities constructed memory and social continuity through long-term engagement with the dead. Between 4800 and 3800 BCE, so-called Chamblandes-type graves—small box-shaped structures built from stone slabs or, more rarely, wooden planks—display considerable variability in mortuary practice, ranging from single primary inhumations to successive and collective burials involving secondary deposition. This variability paired with strong similarities in grave structures suggests that collective burial was not predetermined by architectural form but emerged through deliberate choices and repeated practices. Chamblandes-type graves occur both in small clusters and in large necropolises containing hundreds of graves, with burial activity continuing over multiple centuries. Long-term engagement with ancestral remains is further indicated by repeated reopening of graves for successive burials, as well as the rearrangement and redeposition of bones. Notably, overlapping graves are rare, implying that even centuries-old ones remained visible, remembered, or otherwise accounted for in the mortuary landscape. Taken together, these patterns indicate that Chamblandes-type graves structured social life beyond the moment of burial, likely functioning as enduring anchors of identity, continuity, and community history. Drawing on modelling of nearly 200 radiocarbon dates from human remains, this paper reconstructs long-term developments in burial customs and regional variation in grave use. Ongoing bioarchaeological research—including isotopic and aDNA analyses—further enables exploration of biological relatedness and mobility within and between burial communities, providing insight into how kinship and movement were negotiated. By situating Chamblandes-type graves within broader debates on memory, personhood, and the social life of the dead, this contribution argues that Western Alpine Neolithic burial practices served as focal points for ritualized interaction with ancestral remains, materializing kinship, community, and continuity.

137 KEEP TRYING TO CONTROL YOUR TEMPER: REASSESSING POTTERY TEMPERING PRACTICES IN THE AGE OF ARCHAEOLOGICAL SCIENCE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Vasile Opris (University of Bucharest, Research Institute, ArchaeoSciences Platform | Bucharest Municipality Museum) – Miriam Cubas (University of Alcalá, Área de Prehistoria)
Keywords: ceramic technology, temper, archaeometry, interdisciplinary approach, material agency
Format: Regular session

SESSION ABSTRACT

In 1976, O. S. Rye urged archaeologists to "keep their temper under control" by investigating the material and technological choices of pottery manufacturing rather than focusing exclusively on decorative techniques or typology. Half a century later, his appeal for integrating etic and emic perspectives on tempering resonates anew within the rapidly expanding field of archaeological science. Today, the addition of organic or mineral temper is no longer regarded as a static cultural trait, but as a dynamic technological choice—one that reflects environmental knowledge, performance optimization, and social practice. This session invites discussion on how interdisciplinary analytical methods—such as petrography, SEM–EDS, XRD, isotopic and biomolecular analyses, computed tomography, and experimental replication—are transforming our understanding of tempers and tempering processes in ancient pottery. Recent studies from Europe and Western Asia have revealed complex technological systems, from calcite, chaff, or steatite for functional reasons, to the recycling of ceramic fragments as grog encoding social memory and identity. We seek to explore how the study of tempers can bridge traditional technological analyses with the pluralistic and reflexive perspectives of current approaches in Archaeology, linking potters' embodied skills with the physical and chemical behaviour of their materials. We welcome contributions from prehistoric and ancient pottery assemblages from all regions that address methodological innovations, theoretical implications, or cross-disciplinary dialogues concerning pottery tempering practices. By revisiting Rye's foundational questions

through the lens of twenty-first-century science, the session seeks to redefine temper not only as an additive in clay but as a key concept for understanding resilience, innovation, and meaning in ceramic technologies.

CONTRIBUTION ABSTRACTS

1105. More Than Porosity: Organic Temper as a Technological Choice in Neolithic Pottery from West Lithuania

Authors: Eglė Šatavičė (Vilnius Academy of Arts, Institute of Art Research)
Format: Oral

Organic temper has traditionally been interpreted primarily through its effects on fired ceramic properties, particularly porosity and thermal performance. In prehistoric pottery, it is often discussed in relation to early agrarian contexts, where vegetal additives such as chaff are well documented. In contrast, organic-tempered pottery associated with hunter–fisher–gatherer communities remains less systematically explored and appears considerably more variable in composition. This contribution examines organic temper as a technological choice in Neolithic pottery from West Lithuania, with emphasis on the diversity of organic and mineral additives used within non-agrarian ceramic traditions. Petrographic and SEM–EDS analyses reveal heterogeneous paste recipes combining organic temper with shell and other inclusions. XRD, FTIR, and CL provide complementary information on mineralogical composition, organic matter, and thermally related variability. FTIR results indicate predominantly plant-based organic matter, although the presence of animal-derived materials (e.g., hair or feathers) cannot be excluded based on microstructural observations alone. Shell-tempered fabrics exhibit variable CL responses, reflecting differences in preservation and thermal histories. Following the framework proposed by O. S. Rye (1976), organic temper is approached not solely as a functional additive affecting porosity, but as part of broader technological decision-making encompassing paste preparation, workability, and firing behaviour. In this context, the combined use of organic matter—including materials such as dung or herbivore stomach contents rich in organic acids—may have influenced clay flocculation and handling properties. While direct chemical characterisation of organic additives remains challenging, the observed fabric characteristics are consistent with intentional paste modification, which can be explored through the integration of experimental approaches and high-resolution imaging techniques. By emphasising variability rather than typology, this contribution demonstrates how interdisciplinary approaches can deepen our understanding of organic tempering practices within hunter–fisher–gatherer ceramic traditions and highlights their technological complexity.

343. Functional and Symbolic Dimensions of Ceramic Inclusions in the Early Chalcolithic Precucuteni Culture

Authors: Ana Drob (Arheoinvest Center, "A.I.Cuza" University of Iasi) – Camelia Pintilie (Faculty of History , "A.I. Cuza" University of Iasi) – George Bodi (Institute of Archaeology, Romanian Academy, Iași, Romania) – Felix Tencariu (Arheoinvest Center, "A.I.Cuza" University of Iasi)
Format: Oral

This study focuses on pottery from the Early Chalcolithic site of Isaiia–Balta Popii (Eastern Romania), a settlement attributed to the Precucuteni culture and dated to approximately 4700–4500 BC. Its primary objective is to reconstruct the ceramic chaîne opératoire through an integrated approach combining field investigations, laboratory analyses, and experimental archaeology. A total of fifty ceramic samples, along with several additional clay artefacts, were examined using portable X-ray fluorescence (pXRF), scanning electron microscopy coupled with energy-dispersive X-ray spectroscopy (SEM-EDX), and optical microscopy. These analyses were complemented by the sampling and characterisation of local clay sources in order to assess potential raw material procurement strategies. The analytical results indicate the deliberate incorporation of a diverse range of inclusions within the ceramic matrix. These include vegetal temper, as well as grog consisting of crushed and re-fired ceramic fragments intentionally added to the paste. In addition, the detection of foraminifera and other biogenic calcareous microfossils points to the use of locally available clay deposits as primary raw material sources. Particularly noteworthy is the identification of calcium- and phosphorus-rich residues consistent with bone ash in several cult-related artefacts, suggesting a non-random and potentially symbolic choice of temper. To further evaluate this hypothesis, experimental replication was conducted. Comparative SEM-EDX analyses revealed compositional and microstructural correspondences and characteristic vitrification patterns, supporting the intentional inclusion of bone ash in the original ceramic assemblage. Collectively, these findings point to a sophisticated technological repertoire characterised by selective clay procurement, intentional tempering, and recycling practices. Moreover, they underscore the technological, cultural, and social complexity inherent in the selection, processing, and combination of raw materials and additives. Overall, the study enhances current understanding of Early Chalcolithic ceramic production, revealing deliberate technological choices that reflect both functional requirements and symbolic considerations within the Precucuteni cultural framework.

1149. Does Temper Matter? Diachronic Choices in Prehistoric Pottery from Sultana

Authors: Theodor Aurelian Ignat – Vasile Opriș (University of Bucharest | Bucharest Municipality Museum) – Adrian Majuru (Bucharest Municipality Museum) – Cătălin Lazar (University of Bucharest)
Format: Oral

The prehistoric settlement of Sultana, located in southern Romania near the Danube, offers an exceptional opportunity to investigate

long-term continuities and transformations in ceramic production practices. The site was occupied for approximately 1,500 years, from around 5000 cal BC (Boian culture) to 3500 cal BC (Cernavodă III), encompassing major cultural and technological shifts throughout the Chalcolithic sequence. This paper examines the role of ceramic temper as a technological choice and cultural practice within the prehistoric communities of Sultana. Our approach combines macroscopic qualitative and quantitative analysis of pottery fabrics with targeted archaeometric investigations, including petrographic and geochemical analyses of a selected sample set. Through this multi-scalar methodology, we explore diachronic patterns in temper selection and their implications for ceramic manufacture and performance. Observed similarities and differences in tempering traditions across time raise key questions regarding production processes: who produced tempering materials, what tools and labour were required, and how did different tempers influence clay preparation, shaping, and firing behaviour? To address these issues, we integrate insights from experimental archaeology, replicating temper preparation and ceramic forming under controlled conditions. Our results suggest a marked local resilience in preferred temper types during the early and middle Chalcolithic, alongside significant changes emerging in the late Chalcolithic period. These shifts may reflect broader transformations in technological knowledge, resource management, and social practice. By reassessing temper not merely as an additive but as a meaningful component of ceramic technology, this contribution aligns with current interdisciplinary debates on material agency and innovation in prehistoric pottery production. This work was supported by a grant of the Romanian Ministry of Research, Innovation and Digitization, CNCS-UEFISCDI, project number PN-IV-P2-2.1-TE-2023-0876, within PNCDI IV.

602. Temper Your Shells: Archaeometric Analysis of Cernavodă I Shell-Tempered Chalcolithic Pottery from Southeastern Romania

Authors: Bogdan Manea (Interdisciplinary School of Doctoral Studies, University of Bucharest | ArchaeoSciences Platform, ICUB) – Valentin Radu (ArchaeoSciences Platform, ICUB | National Museum of Romanian History, Bucharest) – Ioana Poroșnicu – Adrian Sima (National Institute for Laser, Plasma and Radiation Physics, Măgurele) – Florin Vlad (Ialomița County Museum) – Ion Tiseanu (National Institute for Laser, Plasma and Radiation Physics, Măgurele) – Cătălin Lazăr (ArchaeoSciences Platform, ICUB)
Format: Oral

Pottery held a central role in the development of early societies, which is why it rapidly spread and became widely adopted during prehistory. Today, it remains equally important for archaeologists, as archaeometric analyses enable them to access new information on past technologies, social organization and relations, mobility, and human-environment interactions. One of the most intriguing aspects of pottery research is the variety of choices in temper, as they provide valuable information about technological practices and traditions within well-defined spatio-temporal frameworks. The proposed topic aims to discuss preliminary archaeometric results on Late Chalcolithic Cernavodă I pottery (4th millennium BC) from the archaeological site of Săveni-La Movile, Ialomița County, southeastern Romania. The objective of this study is to investigate in detail the main technological feature of the Cernavodă I phase, characterized by the addition of crushed shell valves to the paste recipe, a practice unlike those encountered among other Chalcolithic communities in the Muntenia region. By means of macroscopic investigation, thin-section petrography coupled with optical microscopy, and X-ray computed tomography, among other methods, various aspects of shell-tempered pottery will be discussed. The meaning of the available data on the nature of the shells (whether fossil or non-fossil), their presence in the paste (natural or deliberate), their cluster (frequency, distribution, orientation), and individual (shape, size, striations, and breakage patterns) characteristics, as well as the potential species and their provenance, will be explored from technological (including possible shell crushing practices), social, and human-environment perspectives. Temper studies are continuously developing and highlighting the untapped plethora of information that pottery still holds, ultimately allowing archaeologists, through comparison, to gain a better understanding of how life unfolded within and between prehistoric communities. This work was supported by a grant from the Romanian Ministry of Education and Research, CNCS UEFISCDI, project number PN-IV-P1-PCE-2023-1899 (BioArhSteppe).

2496. Paste, Pores, and Firing: Ceramic Production Technology and Stylistic Transformation during the Bronze Age Harappan Civilization in the Drishadvati Basin

Authors: Manjari Sharma (Indian Institute of Technology, Gandhinagar) – Prabhakar Nandagopal (Indian Institute of Technology Gandhinagar) – Krishnan Krishnan (—)
Format: Oral

The evolution and expansion of the Bronze Age Harappan Civilization (c. 2600–1900 BCE) across diverse ecological zones display high degrees of standardization along with regional stylistic and typological variations. However, the degree of regional variability in manufacturing practices and technological choices related to paste preparation and tempering, remains underexplored. This study evaluates variability in production techniques and raw material use through a scientific investigation of ceramics from the type-site Karanpura (Drishadvati basin). The site has a one-thousand-year occupation unravelled through stratigraphic excavations, divided into Early Harappan (c. 3000–2500 BCE) and Harappan (c. 2500–2000 BCE) phases. Ceramic assemblages from the Sarasvati–Drishadvati river basins have been attributed to the Sothi–Siswal ceramic tradition during the Early Harappan phase [1] and classical Harappan ceramics during the Harappan phase, based largely on typological characteristics such as vessel forms, surface treatments, and decorative schemes. The hypothesis is that variability in ceramic typologies over time may conceal shared production strategies and tempering practices. The ceramics from Karanpura were analyzed using an integrated approach combining apparent porosity analysis, thin-section petrography, and X-ray diffraction (XRD), complemented by ethnoarchaeological observations and experimental replication of ceramic production practices. Apparent porosity values helped assess changes in paste preparation, and degrees of vitrification through time. Petrographic analysis provided basic information on fabric classification, temper types, and raw material selection [2], while XRD identified mineralogical phases, allowing inferences on the overall preparation techniques. Some Ethnoarchaeological and experimental production data were used as comparative frameworks to evaluate technological choices and execution. Further, the site's location in a dynamic fluvial landscape is also investigated to understand the regional geology and availability of raw materials influencing clay and temper choice. This paper will discuss the continuity in techniques of paste preparation, tempering, and firing across the stratigraphic phases of Karanpura while disentangling technological practices from stylistic expressions.

2685. Temper or not to temper? The manufacturing of painted pottery as a sign of innovation in the Early Iron Age

Authors: Dagmara Łaciak (Institute of Archaeology, University of Wrocław) – Wojciech Bartz (Institute of Geological Science, University of Wrocław) – Paweł Szymański (Masurian Pottery School)
Format: Oral

In the territory of today's SW Poland, the phenomenon of polychromic ceramic vessels seems to become the most noticeable at the beginning of the Early Iron Age (Hallstatt period, ca. 750-450 BC), when an abundant amount of ceramics dominated in archaeological records. The collection includes a broad assemblage of shapes and ornaments that differ from other kinds of mass-scale pottery. They are considered a prestige item, and the production as one of the material signs of social changes. Our presentation aims to indicate temper as a feature influencing the manufacturing process of painted pottery. Archaeometric (petrography, XRD, thermal, SEM-EDS) and traceological research have indicated several different stages of manufacturing sequence according to raw clay, temper, shaping techniques, surface treatment, and firing. Especially one of the group differs not only in painted patterns, but also in the lack of temper or a small amount of mineral one. The question about the shaping technique has appeared. New insights were provided by traceological observations. Experimental attempts based not only on archaeometric and surface analysis, but also on handicraft skills and knowledge of recreating ceramic paste have shown the existence of a very new technique of shaping the painted vessels. In the light of social transformation at the end of the Bronze Age, temper consist a technological choice, a representation of innovative properties of the Early Iron Age manufacturing of ceramics.

1630. Black Matter: Graphite-Tempered Pottery and Its Role in Late Iron Age Society

Authors: Ábel Garczik (Eötvös Loránd University)
Format: Oral

One of the most important aspects of pottery production is tempering. The choice of temper influences the clay's workability and stability, firing conditions, and the quality and appearance of the final product, as well as its function. Graphite, which has both positive and negative physical and chemical properties, can definitely be considered a unique tempering agent. Its use flourished in Central Europe during the Late Iron Age. Graphite-tempered vessels represent one of the most distinctive, yet also most enigmatic find type of the La Tène culture, as numerous questions remain unanswered regarding their production, distribution, and function. Previous geochemical analyses have demonstrated that the graphite used in their manufacture was mined in the Bohemian–Moravian region and subsequently transported as small lithic fragments to various areas of the eastern Celtic cultural complex. Graphite-tempered vessels occur in substantial quantities at nearly every site in this region during the last centuries BC, indicating the existence of a well-organized and efficient network of connections. Through this network, not only graphite itself but also the technological knowledge required for its processing, as well as the conceptual background of its use, could circulate over distances exceeding more than a thousand kilometres. In this presentation, I will examine the chaîne opératoire of graphite-tempered pottery, their value in Celtic societies, as well as their chronological development. This study is based on a series of new petrographic material analyses (thin sections, XRD) combined with a revised approach to typo-chronological observations, with particular emphasis on finds from the Carpathian Basin.

498. End or Reorganisation? The First-Century BC Transformation in Central Europe Based on Pottery from South Bohemia

Authors: Jan Volf (Institute of Archaeology of the Czech Academy of Sciences) – Karel Slavíček – Kristýna Trnová (Department of Geological Sciences, Faculty of Science, Masaryk University)
Format: Oral

This paper examines changes in tempering practices and other stages of the ceramic chaîne opératoire in Central Europe during the first century BC, at the end of the La Tène and the beginning of the Roman periods. The transformation of material culture during this time has traditionally been explained as a result of population replacement, with La Tène pottery production assumed to have ceased entirely. However, past research has primarily focused on vessel shapes and decorations, leaving technological choices largely unexplored. The aim of this study was to obtain new data on pottery from this transitional phase using macroscopic observation, X-ray fluorescence analysis, and thin-section petrographic analysis, with an emphasis on the properties of ceramic fabrics. Pottery assemblages from the settlements of Dub-Javornice and Přešťovice in southern Bohemia were selected as a case study. The results showed that certain tempers were typical of pottery attributed to either the La Tène or the Roman period, with materials of distinct chemical composition often characteristic of pottery dated to one of the two periods. Nevertheless, overlaps in fabric preparation

were also identified, with some materials used with similar frequency in the production of pottery from both periods. This demonstrates that the detected variability in tempering practices cannot be understood simply as a chronological marker. Further differences were observed in other stages of the chaîne opératoire, although similarities were documented as well. Overall, the data suggest that differences in pottery production can be interpreted more as a reorganisation of ceramic production and changes in specific stages of the manufacturing process, including tempering practices, rather than as evidence of a complete technological discontinuity. These changes likely reflect deliberate choices made by potters in response to a combination of environmental, cultural, social, and economic factors, rather than being a direct result of large-scale migration.

922. Reading the Landscape in Pottery: Fe-Rich Concretions Between Technology and Environment

Authors: Andra Simniškyte-Strimaitiene (Lithuanian Institute of History, Department of Archaeology)
Format: Oral

The study examines the origin and significance of Fe-rich concretions in ceramic fabrics. Iron-rich concretions in ceramics are often described in general terms without detailed mineralogical characterization. As a result, their interpretation remains ambiguous, ranging from natural inclusions to intentionally added temper. In this study, using SEM–BSE imaging and EDS analysis, we examine Fe-bearing phases in two Roman Iron Age vessels from a site in Lithuania. One of the vessels was highly sensitive to a magnet, while the clay matrix of the other contained abundant spherical nodules. The results demonstrate that the Fe-rich concretions are natural inclusions rather than added temper, having originated in naturally ferruginous clays formed under fluctuating redox conditions in wetland settings and subsequently modified during firing and depositional processes. The findings contribute to broader research on how landscape processes are recorded in material culture. By situating Fe-rich inclusions within environmental and technological frameworks, the study contributes to a more nuanced understanding of temper as a dynamic and context-dependent concept rather than a priori cultural choice.

344. Cucuteni Type C Pottery in Chalcolithic Eastern Romania: An Archaeometric and Experimental Technological Study

Authors: Ana Drob (Arheoinvest Center, "A.I.Cuza" University of Iasi) – Camelia Pintilie (Faculty of History , "A.I. Cuza" University of Iasi) – George Bodi (Institute of Archaeology, Romanian Academy, Iași, Romania) – Felix Tencariu (Arheoinvest Center, "A.I.Cuza" University of Iasi)
Format: Poster

The present study examines Cucuteni pottery assemblages from eastern Romania, with a particular emphasis on technological traditions, manufacturing practices, and provenance within the Chalcolithic Cucuteni cultural framework. Conducted as part of a broader interdisciplinary research project on prehistoric pottery production and distribution, the study focuses on the experimental and archaeometric characterisation of ceramic materials, with special attention given to the so-called Cucuteni type C ceramics. These vessels are functionally associated with cooking activities and are distinguished by the use of shell or vegetal tempering agents. The main objectives of the research are to identify potential raw material sources, to assess technological choices, and to differentiate between local and regional production patterns. From a methodological perspective, the research combines macroscopic and microscopic observations with advanced analytical techniques, including scanning electron microscopy coupled with energy-dispersive X-ray spectroscopy (SEM–EDX) and micro-Fourier transform infrared spectroscopy (μFTIR), complemented by experimental replication using locally sourced clay materials. Comparative analyses of archaeological and experimentally produced samples from several recently investigated Cucuteni B sites reveal notable variability in both the type and composition of inclusions. In certain settlements, ceramics predominantly contain vegetal temper, whereas in others, shell-rich pastes prevail, pointing to technological as well as cultural differentiation among the examined sites. Preliminary results suggest that, despite the overall standardisation observed in Cucuteni B ceramic production, type C pottery exhibits a marked degree of heterogeneity. This variability likely reflects small-scale, potentially household-based production practices. While local clay sources appear to have been primarily exploited, differences in raw material selection and tempering strategies indicate the coexistence of diverse technological traditions. Overall, the study enhances current understanding of Chalcolithic ceramic production systems and highlights the complex interplay between tradition, technological choices, and local resource management.

434. The Secret Recipe by the Khitans: Potteries from Medieval Frontier Mongolia

Authors: Jingchao Chen (Hebrew University of Jerusalem) – Paula Weiman-Barak (Tel Aviv University) – Gideon Shelach-Lavi (Hebrew University of Jerusalem)
Format: Poster

This research presents the interdisciplinary analysis on pottery from the Medieval period in China and Mongolia, with a specific focus on ceramics associated with the Medieval Wall System in Mongolia. Particularly, it is to investigate ceramic technology and distribution nomadic and seminomadic societies in frontier medieval Mongolia, as opposed to sedentary societies. As a pilot study, earthenware and glazed sherds, along with local clay samples, were thin-sectioned and analyzed using polarized light microscopy, Fourier-transform infrared spectroscopy (FTIR), and scanning electron microscopy (SEM). Petrographic and microstructural analyses reveal multiple fabric groups characterized by distinct mineral inclusions, clay matrices, and tempering strategies, including variations in particle size, sorting, and temper composition. These patterns suggest intentional recipes rather than uniform or

static traditions, highlighting adaptive choices in raw material selection and paste preparation.The ceramic samples were previously subjected to isotopic and biomolecular analyses, which identified significant lipid residues linked to steppe subsistence and foodways. Integrating residue evidence with technological data provides rare insight into how tempering choices intersected with vessel use, thermal performance, and culinary practices in mobile societies.

1911. Does Temper Always Matter? Experimental Insights into Clay–Temper Recipes

Authors: Andreja Kudelic – Natali Neral (Institute of archaeology, Zagreb) – Ana Maričić (University of Zagreb, Faculty of Mining, Geology and Petroleum Engineering)
Format: Poster

Throughout prehistory, communities employed a range of tempering materials to modify ceramic pastes. These materials improve workability, reduce shrinkage, and enhance thermal shock resistance. However, tempering materials may interact differently with specific clay types, resulting in variable technological and mechanical outcomes. Examining these interactions is essential for understanding tempering practices, the function of tempering materials, and factors underlying raw material selection in pottery production. This study investigates the physical and mechanical properties of ceramics produced using different clay–temper recipes to assess how tempering materials interact with distinct clay types and influence production and ceramic strength. The research focuses on four tempering materials—calcite, grog, sand, and vegetal material—and two clay types commonly used in prehistoric Croatia: sandy clay and inclusion-poor clay. The methodology combines plasticity and shrinkage tests (Atterberg limits) with mechanical strength assessment using point load index testing on 56 experimentally produced ceramic briquettes. The results show that tempering effects are strongly conditioned by clay type, with a more pronounced impact in highly plastic, inclusion-poor clays. In these clays, mineral tempers are essential to reduce shrinkage and maintain structural integrity after firing, indicating that tempering materials are structurally necessary rather than merely performance-enhancing. Moreover, these clays produce stronger briquets, reflecting the potters' skill and understanding of raw materials. In contrast, adding tempers to moderately plastic, sandy clays does not significantly affect production or ceramic strength, suggesting that tempering can be considered independently of clay properties. Therefore, tempering materials may fulfil different technological roles depending on clay type. These findings raise questions about why potters select challenging, highly plastic clays despite the availability of sandy clays, and why tempers are used in clays already rich in mineral inclusions. These choices likely reflect specific cultural and environmental conditions, offering insight into the complexity of technological strategies and material selection.

139 CROSS-ANALYTICAL APPROACHES ON THE MATERIALITY OF CULT IN EARLY GREEK SANCTUARIES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Tamara Saggini (ESAG - Swiss school of Archaeology in Greece | Université de Lausanne) – Azzurra Scarci (LEIZA) – Samuel Verdan (ESAG - Swiss school of Archaeology in Greece | Université de Lausanne)
Keywords: interdisciplinary approaches, Early Greece, sanctuaries, analytical methods, archaeometry, materiality of cult
Format: Regular session

SESSION ABSTRACT

Research on early Greek sanctuaries increasingly benefits from methodological innovation and collaborative frameworks that move beyond traditional material studies. While archaeological investigations have significantly deepened our understanding of sacred spaces and ritual settings, interdisciplinary approaches are reshaping the way we engage with the tangible remains of cult and belief, broadening interpretative horizons and enhancing analytical precision. This session explores how the dialogue across disciplines –– including archaeometry, geology, archaeobotany, zooarchaeology, palynology, anthracology, metallurgy, geomorphology, spatial and digital modelling, and advanced data analysis –– refines our understanding of sacred spaces and ritual behavior. Integrating these approaches allows us to gain deeper insight into the complex biographies of cult implements and votives, the roles of plants and animals in ritual practices, the significance of landscape features, the shaping of sacred spaces through architectural choices, and, ultimately, the material and spatial dimensions of ritual performance within Greek sanctuaries. By fostering dialogue between field archaeology, laboratory science, and computational methods, this session assesses how data integration and analytical experimentation can deepen our understanding of early Greek cults poorly attested in written sources. We welcome contributions that present recent methodological advances, and first-hand, data-driven approaches. Ultimately, the session seeks to illustrate how interdisciplinary collaboration reshapes the study of early Greek religion, improve interpretative accuracy, and enhances reconstructions of ritual practices and social dynamics in Greek sanctuaries.

1220. The metal finds from the Greek sanctuary of S. Anna in Agrigento (Sicily): archaeometric investigation

Authors: Giovanni D'Elia (University of Augsburg)
Format: Oral

The research project originates from hundreds of metal objects recovered in numerous depositions intercepted in the area of the extra-urban shrine of S. Anna in Agrigento. These artefacts can be considered either gifts to the gods, part of the sanctuary's metal treasure found within the famous indigenous pithos, or as individual votive objects buried in the sanctuary grounds, with no possibility of recovery by worshippers. The analysis of such metal finds is based on their careful stratigraphic contextualisation within the sanctuary, their comprehensive classification, and their ethno-geographical origins (indigenous, Greek, or continental European workshops). To better define the consistent cultural, commercial, and trade relations surrounding metal in antiquity, the research, in addition to focusing on numerous comparisons with metal artefacts from across the Greek world, also drew on the valuable contributions of archaeometry. The archaeometric analyses, supervised by Dennis Braekmans, Associate Professor in Archaeological Materials Analysis at the Department of Archaeological Sciences at Leiden University (The Netherlands), have been conducted on specific categories of artefacts (ingots, aes rude, smelting slag, and miscellaneous objects). Such analyses have aimed to deepen our understanding of ancient raw materials and metallurgical processes, identify the chemical composition of the various objects, and, finally, determine the origin of the metals hoarded at S. Anna. To achieve these goals, the research project employed a combined approach that incorporated various analytical techniques (invasive and non-invasive): XRF and ICP-MS analyses to obtain a complete spectrum of the materials' chemical composition; and lead isotope analysis to trace the sources of metal supply. The results of these scientific investigations have provided new data on mineralogical and metallurgical aspects of S. Anna's metal and have enabled us to trace a broad picture of trade and exchange in the Mediterranean area.

1319. Disassembled Dedications: The Aesthetics and Use of Bronze Hydria at the Sanctuary of Zeus at Nemea

Authors: Stephanie Kimmey (Weber State University) – Jesse Obert (University of South Florida)
Format: Oral

The Sanctuary of Nemean Zeus in the northeast Peloponnese, one of the four Panhellenic "crown" sanctuaries in Greece, does not always conform to the established understanding of a panhellenic sanctuary. Too frequently, aspects at Nemea were described in relation to patterns and rituals occurring at Olympia, but the sanctuary clearly does not fit the traditional mold. One primary example is the relatively low quantity votives bronzes. Throughout the sanctuary, votive deposits are rare generally. The most prevalent exception, and the centerpiece of the Nemea Museum is an archaic bronze hydria with the inscription "ΤΟ ΔΙΟΣ ΕΙΜΙ ΤΟ ΝΕΜΕΑΙ" (BR 379). Excavated from a well in 1977, it was found ritually "killed" in three separate pieces. Excavators found four bases one hydria, but not their bodies, in the same well. At least five more disassembled bases were deposited in other wells around the sanctuary and very few bronze fragments were found in association; we are left with only part of the whole. This begs the question, what happened to the rest of the hydriai? Combining contextual and depositional analysis with pXRF spectroscopy and archaeometallurgical analysis opens the door to reconstructing the pre- and post- depositional history of these bases. It also allows us to reconstruct what these hydriai would have looked like due to variations in metallurgical composition and construction, the visual aesthetics of displaying metal objects, and the ritual practices occurring at the sanctuary. This paper examines these metal vases in their ancient context, their use and reuse, while also addressing issues of modern conservation, to demonstrate how interdisciplinary approaches can open new avenues of research on legacy material.

2253. From Use to Offering: Weapons, Tools and Vessels Dedications in the Artemision of Amarynthos

Authors: Tamara Saggini (Swiss school of archaeology in Greece | University of Lausanne) – Azzurra Scarci (Leibniz-Zentrum für Archäologie LEIZA, Mainz)
Format: Oral

This paper investigates cultic practices related to the dedication of objects that may have been used before their deposition in the sanctuary of Artemis at Amarynthos (Euboea). By situating this material within the wider framework of votive behavior in Greek sanctuaries, the study seeks to explore the processes through which functional objects were transformed into meaningful ritual offerings. The analysis focuses on a corpus of metal dedications—primarily weapons and tools—examined alongside associated assemblages of ceramic vessels. The study adopts an integrated methodology combining contextual archaeological analysis with archaeometric investigation. Elemental and metallographic analyses, X-radiography, and metalwork-wear analysis are employed to examine alloy composition, manufacturing techniques, structural features, traces of repair or modification, and patterns of use-wear. Together, these approaches provide critical insights into the object biographies, allowing an assessment of whether they were produced specifically for votive purposes or circulated within domestic, artisanal, martial or other everyday contexts prior to their dedication. The ceramic assemblage is similarly evaluated in terms of use, selection, and depositional context, enabling a comparative perspective on different categories of offerings. Particular attention is given to the spatial and stratigraphic distribution of the material within the sanctuary, as well as to chronological patterns of deposition. This approach facilitates the reconstruction

of ritual practices and depositional strategies, highlighting the role of material choice and object biography in the articulation of cultic gestures. By contextualizing metal and ceramic offerings within the broader ritual landscape of the Artemision, this paper contributes to a more nuanced understanding of the cult of Artemis at Amarynthos, emphasizing the intersections between warfare, craftsmanship, and social identity. More broadly, it demonstrates the interpretive potential of integrating archaeometric data with contextual analysis for the study of the materiality of cult in ancient Greece.

969. Crossed methodologies for the Archaic and Classical pottery from the Amyklaion of Sparta

Authors: Adrien Delahaye (Université de Montpellier Paul-Valéry)
Format: Oral

Excavations conducted at the Spartan sanctuary of Apollo Amyklaios since 2006 by the Amykles Research Project, under the auspices of the Archaeological Society of Athens, have led to the discovery of rich deposits of archaic and classical pottery in stratigraphy. These artifacts, which consists mainly of fine wares and miniature objects, offer the possibility of a comprehensive and holistic documentation, thanks in particular to the use of cross-disciplinary approaches: ceramology, typology, stylistic, diachrony, but also archaeometric analyses. Petrographic and XRF analyses are currently underway, as are analyses of organic residues. The aim of the former is to identify the fabrics and their local dimension. The aim of the latter is to determine the function of certain categories of vases as containers and then to identify the nature of the contents. These analyses of archaic and classical artifacts are being conducted in conjunction with those of the Bronze Age and Early Iron Age periods. While the data is still being processed and therefore remains unpublished for the moment, the purpose of this presentation is to provide an overview of the current state of research.

2055. Exploring the polychromy of terracotta figurines from the sanctuary of Artemis Amarysia

Authors: Alice Clinch (Max Planck Institute for the History of Science)
Format: Oral

Research into the polychromy of the ancient Mediterranean world has routinely focused on its uses in large scale formats such as architecture, wall painting, and sculpture, offering reconstructions and interpretations of how these structures and materials would have originally appeared. However, smaller scale material culture has frequently been overlooked by such studies. In ancient cult practice, smaller forms of visual and material culture dominated as the principal type of votives and thus embodied more personal forms of religious commitment and ritual. Recent excavations at the sanctuary of Artemis Amarysia in Euboea by the Swiss School of Archaeology in Greece have uncovered a remarkable number of terracotta figurines, many still bearing traces of rich, polychromatic, painted decoration. This paper presents initial results in the identification of pigments and colourants used in the decoration of the figurines, to revive the rich polychromy of votive practice, and offer insights into the craft and technology of ancient cult at the sanctuary of Artemis at Amarynthos.

2610. Textiles for Artemis: new evidence from Amarynthos, Euboia

Authors: Bela Dimova (Independent scholar)
Format: Oral

Since 2021 excavations at the temple of Artemis at Amarynthos conducted by the Swiss School of Archaeology in Greece have uncovered several hundred fragments of ancient textiles from a deposit dated to the late 6th century BC. These mostly small and fragile fragments were documented and analysed with a range of scientific tools in order to shed light on their raw materials, technology, how they were used at the sanctuary. Some were carbonised (partially burnt in situ), others are preserved through mineralisation in contact with bronze and iron weaponry and other objects, and some are partially organic. Insights from the scientific investigation will be integrated with information from written and iconographic sources on textiles at other cult sites. The study of the textile remains sheds light on cult practices, the material environment at the sanctuary, and the biography of votive offerings, which could be embellished, wrapped, and stored using cloth.

919. Timber and Technology: Anthracological Analysis of the Amarynthos Temple Structures

Authors: Panagiotis Koullouros (The Cyprus Institute, STARC)
Format: Oral

This paper investigates the materiality of cult in early Greek sanctuaries through a cross-analytical framework, utilizing the anthracological record of the Artemis Amarynthia sanctuary as its primary evidence. Rather than focusing on theological interpretations, the study prioritizes the technical and economic realities of sanctuary life, assessing the selection of wood for both ritual combustion and construction. By analysing charred macro-remains, the research assesses the interplay between environmental resource management and the structural evolution of the temple site. The transition from geometric structures to formalized stone architecture necessitated a sophisticated understanding of timber properties; consequently, the anthracological data is correlated with architectural features such as post-holes, to distinguish between fuel and structural timber. This approach treats charcoal not merely as sacrificial refuse, but as a diagnostic material that reveals the logistics of sanctuary maintenance, the exploitation of the local

Euboean maquis, and the spatial organization of the temple. By integrating archaeobotanical identification with a rigorous study of architectural stratigraphy, the paper demonstrates how the physical construction and daily operation of the Amarynthos temple were dictated by available technology and landscape management, providing a grounded, materialist perspective on the development of early Greek sacred spaces.

27. Animals and ritual practices at early Olympia - a neglected piece of evidence

Authors: András Patay-Horváth (ELTE Budapest)
Format: Oral

Based on the iconographical analysis of the EIA bronze animal figurines, the present author has already suggested that the sanctuary of Olympia was originally frequented by aristocratic hunters chasing wild or feral bovids. The sanctuary has not provided any archaeozoological/osteological evidence in order to test this hypothesis, but a skull identified as belonging to an aurochs (bos primigenius bojanus) has been found near Elis (at Staphidokampos). It has slready been examined by a archaeozoologist (G. Nobis), was mentioned in the excavation report (ArchEphem 1999) and is currently on display in the local museum. The find was made in 1993 during a rescue excavation of a classical era cemetery with cist graves containing also some circular repository pits dating from the Byzantine times. Inside the largest pit, the skull was found among the remnants of fire but not burned itself and it was carefully placed and secured all around with small stones and tiles. The skull belongs to a young animal, whose horns have probably been cut off, perhaps to be used as a domestic drinking vessel. The paper will discuss the identification of the animal and its possible implications for the interdisciplinary study of early Olympia.

2096. The Gods' Portions: Zooarchaeological Perspectives on Local Sacrificial Variability in Ancient Greece

Authors: Audrey Fourtet (Université Paris 1 - Panthéon-Sorbonne | ArScAn - UMR 7041 - Archéologies environnementales | AnHiMA - UMR 8210)
Format: Oral

In the account of the Promethean sacrifice, Hesiod places the question of division at the heart of the thusia: the gods receive the bones concealed beneath fat, while humans are allotted the consumable portions of the animal. While Hesiod clarifies the distinction between the divine and human shares, other sources allow a more precise understanding of the nature of the burned portion. Homeric epic emphasises thigh bones wrapped in fat (mēria), a motif taken up in tragedy and comedy (Aeschylus, Sophocles, Aristophanes), while other passages also refer to the caudal region (osphys), and more occasionally to other anatomical parts. Taken together, these testimonies suggest a recurrent model of the portion offered to the gods, centred on posterior segments of the animal, without constituting a homogeneous norm or accounting for the diversity of local practices. This paper proposes to examine the material translation of these sacrificial models at the scale of sanctuaries through zooarchaeological analysis of faunal remains. The identification of bones subjected to intense burning (carbonisation and calcination) provides a means of approaching materially the portions burned for the gods and of highlighting variability in anatomical selection, both between sanctuaries and over time. The study is based on a comparative analysis of three Archaic-period sacrificial contexts – the sanctuary of Apollo at Delphi, the sanctuary of Aphrodite at Miletus, and, to a lesser extent, the Amyklaion at Sparta – and on their comparison with assemblages from other Greek sacred spaces. The spatialisation of these data at the scale of Greece allows an assessment of the archaeological visibility of the "classical" sacrificial model and a discussion of its regional and chronological variations. This approach highlights the tension between shared ritual frameworks and local practices, showing that the existence of a common sacrificial reference does not necessarily entail uniformity in ritual gestures.

2420. Fire, Bone, and Ritual: Cross-Analytical Perspectives on Faunal Assemblages from the Sanctuary of Artemis at Amarynthos

Authors: Angelos Gkotsinas (Hellenic Ministry of Culture, Ephorate of Antiquities of Ilia | Swiss School of Archaeology in Greece)
Format: Oral

This presentation presents an ongoing cross-analytical study of faunal assemblages from the Sanctuary of Artemis at Amarynthos, demonstrating how integrating complementary methodologies can transcend the limits of conventional macroscopic analysis to produce data-driven reconstructions of cult activity. The assemblage, recovered from the Geometric–Archaic temple and associated spaces, exhibits intense fragmentation and pervasive burning consistent with repeated episodes of ritual processing and deposition. Preliminary analysis reveals a marked predominance of caprines, supplemented by lesser proportions of cattle, pigs, and wild taxa. Significant spatial variation in the density and burning intensity of remains across the sanctuary suggests differentiated modes of ritual behavior, potentially linked to distinct stages of sacrificial practice. While extensive thermal alteration constrains species-level and anatomical identification, integrating analytical perspectives on burning conditions — including combustion temperature, duration, and bone coloration patterns — provides a framework for interpreting how animals were processed and deposited in relation to cult installations such as altars. This case study illustrates how interdisciplinary dialogue between field archaeology and laboratory science deepens our understanding of early Greek cult practices.

2681. Offering the sea: marine animal remains in the first Greek sanctuaries

Authors: Tatiana Theodoropoulou (CNRS - Université Côte d'Azur)
Format: Poster

Marine animal remains recovered from Greek sanctuaries have often been interpreted as incidental or as decorative curiosities, not included in the official religious acts of Greek religion. Yet their repeated presence in ritual contexts points to deliberate acts of selection and deposition, that should be more valued within the overall discussion of ritual practices. This poster provides a short overview of marine invertebrates and fish in sanctuary assemblages from Greek sanctuaries of the Aegean and Greek colonies during the Early Iron Age and Archaic periods. It aims to explore inter-regional similarities and local variations, taking into account the nature of the deity involved, as well as the environmental availability of marine resources. The study examines how marine materials contributed to the articulation of individual and collective identities within the official religious experience. We argue that marine animals functioned as meaningful ritual media rather than incidental offerings, reflecting not only individual expressions but also shared religious conventions in the Early Iron and Archaic Greek religion.

141 CROSS-CULTURAL PATTERNS IN SMALL-SCALE SOCIETIES: INSIGHTS FROM COMPARATIVE ETHNOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Vaclav Hrncir (Max Planck Institute for Evolutionary Anthropology) – Petr Kvetina (Institute of Archaeology of the CAS, Prague)
Keywords: comparative ethnology, cross-cultural research, material culture, hunter-gatherers, small-scale agriculturalists, cultural evolution
Format: Regular session

SESSION ABSTRACT

Every human culture is unique. And yet there are certain commonalities shared by some, or even most, human societies. This applies both across space and across time. Archaeologists have long been aware of the potential similarities between prehistoric and recent ethnographically documented societies, which has led to the common use of ethnographic analogies and the development of the specialized subfield of ethnoarchaeology. Although both provide interesting qualitative insights into the lives of traditional hunter-gatherer, horticultural and pastoral societies, the possibility of generalizing their findings is debatable, as they are often random, fragmentary, or based on cherry-picking. In contrast, comparative ethnology provides a more systematic approach. It collects and statistically analyzes data from a global and representative sample of societies (e.g., Ethnographic Atlas, Standard Cross-Cultural Sample, HRAF Probability Sample) to describe and explain patterns of cross-cultural regularity and diversity, and to test cross-cultural hypotheses. However, this quantitative approach to ethnographic data is still relatively rare in the archaeological community. This is despite the recent resurgence in comparative ethnology stimulated by the digitization of extensive ethnographic databases (e.g., eHRAF World Cultures, D-PLACE) and the development of new analytical methods (e.g., phylogenetic analysis, Bayesian modelling and causal inference). In this session, we want to bring together researchers who conduct large cross-cultural comparisons to understand the variation of material culture, behaviors, and norms in small-scale societies. We are particularly interested in the applications of insights from comparative ethnology for answering specific archaeological questions, especially on topics of dwellings and monumentality, production and technology, exchange and trade, and rituals and religion. We also welcome critical contributions that discuss the limitations and pitfalls of this methodological approach.

CONTRIBUTION ABSTRACTS

564. Alcohol before agriculture: Insights from a cross-cultural study of recent foragers

Authors: Vaclav Hrncir (Max Planck Institute for Evolutionary Anthropology)
Format: Oral

Alcohol is the most widely used psychoactive drug that people have been consuming for millennia. However, the origins of alcohol production remain unknown. Although archaeologists have found 10,000-year-old residues of fermented beverages in stone mortars and ceramic vessels, earlier evidence is difficult to obtain because virtually no organic vessels from the Pleistocene have been preserved. There are thus two hypotheses: either alcohol production began with the dawn of agriculture (i.e., "traditional hypothesis"), or it began much earlier in hunter-gatherer societies (i.e., "Paleolithic hypothesis"). In this talk, I will demonstrate how comparative ethnology can contribute to this discussion. A cross-cultural analysis of a global sample of more than 90 foraging societies (ethnographically documented in the 19th and 20th centuries) shows that the production of fermented beverages is not very common, observed in less than 20% of the studied cases. This indicates that alcohol consumption was not a universal feature of Pleistocene societies. On the other hand, the presence of indigenous fermented beverages on several continents and the variability of raw materials used to make them (ranging from honey and fruit to tree sap and flower nectar) suggest that various forager

groups discovered alcoholic drinks independently several times throughout history.

2593. Environmental Determinism and Human Agency in Models of Upper Palaeolithic Shelter Construction

Authors: Phoebe Baker (University of Liverpool) – Tullio Abruzzese (Leiden University)
Format: Oral

The origins and early use of shelter is difficult to disentangle in the archaeological record. Whilst hints from early sites, such as worked wood found at Kalambo Falls, Zambia, are suggestive, it is not until the Late Pleistocene that traces of free-standing shelter constructions begin to appear in the human record. Much of the Pleistocene evidence remains disputed either in form or function. In high latitudes, it is likely that environmental conditions - primarily cold temperatures - had a significant influence on daily life. It is of particular interest, then, that traces of shelters, which may potentially have been key to surviving harsh environments, appear so late in the European Palaeolithic record, and remain so difficult to understand. In this paper, we will discuss the use of large-scale cross-cultural comparison of contemporary hunter-gatherer groups to inform models of early shelter construction. Whilst not directly analogous to Palaeolithic groups, analysis of foragers' shelter solutions reveal both overarching patterns and significant variability in style, function and form across different societies. This duality raises questions about how environment determines shelter construction, and whether it is possible to create a model for early shelter use that can also take individual or cultural choices into account. Ultimately, this contribution aims to provide a starting point for moving beyond environmentally deterministic explanations of early shelter construction and use, and to explore whether ethnographic data can be structured in ways that explicitly integrate cultural choices, traditions, and social practices into static, predictive models.

1515. Concealed Spaces and Restricted Knowledge: Interpreting Neolithic Enclosures through Cross-Cultural Comparison

Authors: Petr Kvetina (Institute of Archaeology of the CAS, Prague) – Petra Schindlerova (Museum of Prague)
Format: Oral

This paper applies cross-cultural research to model the interpretative context of selected Neolithic enclosures in Central Europe, focusing on Early Neolithic longhouse enclosures and Middle Neolithic rondels. Prevailing interpretations emphasize their function as communal gathering places and ritual centers, but often fail to specify the kinds of activities that would have required architecturally segregated and visually concealed spaces. Our analysis is based on two recurring characteristics: the enclosures demarcate spaces hidden from external view and occur only at selected sites within the settlement landscape. These features suggest activities restricted to limited groups and requiring deliberately screened spaces, while remaining plausible within Neolithic social systems. We propose that rites of passage and rituals associated with secret or restricted societies best fit these parameters. This hypothesis is tested through a cross-cultural analysis using the Standard Cross-Cultural Sample (SCCS) and the Ethnographic Atlas (EA). The results refine current interpretations of Neolithic enclosures and contribute to broader discussions of ritual, secrecy, and social differentiation in early farming communities.

959. Organisation of manufacture and crafts in cross-cultural data

Authors: Tomasz Oberc (Institute of Archaeology and Ethnology, Polish Academy of Sciences)
Format: Oral

Interpreting the functional division of settlements from intra-site archaeological data is one of the most challenging tasks in the field. Although some archaeological and ecological evidence aids interpretation, the specific uses and life cycles of individual structures are often unknown. This challenge is especially pronounced at older sites, where later occupations may further obscure the archaeological record. For Neolithic settlements, often only material sealed within pit and post-hole infills remains. Use-wear analysis of lithic tools can help reconstruct how tools were used before disposal. However, the locations where tools were deposited do not always match where they were used, resulting in a disconnect between recorded activities (e.g. hide cutting) and the broader production process. This study is part of the "From Waste to Workshop"[1] research project, conducted at the Institute of Archaeology and Ethnology PAS. The project investigates whether there is a relationship between use-wear evidence and the spatial organisation of activities in Neolithic Lengyel culture settlements. Historical and ethnographic data on craft organisation and procesing of different materials, visualised as networks of interconnected tasks, help bridge the gap between tool use and spatial planning. The research constructs networks for processing plant, animal, and mineral materials (such as wood, hide) using lithic tools. This presentation offers general observations on material processing, manufacture, and craft specialisation. While manufacturing specifics are often unique to particular cultures or sites, a broad cross-cultural overview of production can provide comparative models. These models help create plausible scenarios and narratives for the choices made by Neolithic societies, extending beyond purely economic considerations. 1861. Counting Herds Without Numbers: Domestication, Risk, and the Cultural Adaptation of Numerical Practices

Authors: Cheng Liu (UMR 5199 PACEA, Centre National de la Recherche Scientifique) – Francesco D'Errico (UMR 5199 PACEA, Centre National de la Recherche Scientifique | SFF Center for Early Sapiens Behaviour, University of Bergen)
Format: Oral

Human numerical cognition is often framed as progressing toward increasingly abstract and symbolic representations. However, cross-cultural evidence suggests substantial variability in how quantities are tracked and managed in practice. Here, we investigate how livestock management shapes numerical practices, focusing on herd tracking as a cognitively demanding problem involving mobile, high-value resources. Drawing on a qualitative cross-cultural survey of 36 societies using the eHRAF World Cultures database, we examine whether variation in numerical practices is predicted by (i) the duration of animal domestication, (ii) herd scale and species characteristics, and (iii) economic reliance on livestock. Using a generalized linear mixed model, we find no consistent association between these domestication-related variables and the presence of symbolic number systems. Instead, substantial between-society variation remains unexplained by livestock characteristics alone. Ethnographic evidence indicates that approximation, individuation, embodied counting, and externalized memory systems constitute adaptive alternatives to exact enumeration, shaped by cultural norms, political risk, and cognitive constraints. In many herding contexts, avoiding precise counts serves to mitigate misfortune, evade taxation or state surveillance, or prioritize qualitative herd composition over abstract totals. From a cognitive perspective, these findings highlight alternative strategies for allocating limited cognitive resources: some societies externalize computation through material or embodied tools, while others rely on memory, perception, and estimation. Overall, the results portray numerical cognition as flexible, socially embedded, and responsive to ecological and institutional conditions, rather than as a unidirectional developmental sequence.

242. Four New Guinea Societies

Authors: Christopher Buckley (Tracing Patterns Foundation)
Format: Oral

In this talk I will discuss a study of four small-scale societies in New Guinea, encompassing highland and coastal regions and two major language groupings (Papuan and Austronesian), for which unusually detailed, visual ethnographies of material culture are available. Beginning with a listing of the objects made by each culture, I have classified them according to the functional niches that they occupy, and the techniques used to make them, and used simple numerical measures to compare between cultures. Over a thousand objects are considered and classified, using photographs and descriptions of the items. The results suggest that object types are linked to functional niches, as might be expected, but that the study of techniques is more closely linked to cultural histories and connections. Fine detail emerges as a key requirement: a group of New Guinea studies on a database that lumped different artifact types such as axes and adzes together produced unclear results. I will briefly discuss the patchy state of material culture studies as compared with the impressive and systematic cross-cultural work done by linguists and suggest some directions for future archaeological and ethnographic research.

1945. Same Forms, New Meanings: Reading Cultural Motifs Through the Millennia

Authors: Petra Rajtarević – Mirna Šuljug – Mirela Hutinec (Vucedol Culture Museum)
Format: Poster

This research focuses on a comparative analysis of artifacts from the Vučedol site (Vukovar, Croatia), with an emphasis on the anthropomorphic figurines of the Eneolithic Baden and Vučedol cultures, certain motifs from the Vučedol ceramic repertoire, and their possible parallels with the traditional clothing of Baranja County (Croatia) during the 19th and 20th centuries. By comparing archaeological and ethnological material heritage, the study examines the question of continuity and transformation of specific motifs, based on the assumption that observed similarities do not indicate direct cultural continuity, but rather the universality of certain symbols, ornaments, and garments across different social and cultural contexts. The presentation discusses how universal symbols and motifs, although separated by time and space, can shape the same or similar material culture in different communities across long chronological spans and even broad geographical areas. The preservation of archaic elements in Baranja's traditional clothing has been the subject of numerous studies and discussions. Viewed in an archaeological context, the traditional Baranja costume raises the question of whether the motifs and symbolism of more recent traditional communities can contribute to a better understanding of prehistoric life.

143 SCRAPING THE BARREL: APPROACHING THE LOW-VISIBILITY PREHISTORIC PAST AND THE ARCHAEOLOGY OF THE EPHEMERAL

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Kate Britton (University of Aberdeen) – Anna Linderholm (Stockholm University)
Keywords: Palaeolithic, Mesolithic, Late Pleistocene, Interdisciplinary, Archaeological Science, Preservation
Format: Regular session
Affiliation: Palaeolithic and Mesolithic Community - PaM

SESSION ABSTRACT

In this session, we will explore how archaeologists can investigate the deeper past in areas where little conventional archaeological evidence exists and how interdisciplinary approaches can come together to help meet the challenge of low-visibility archaeological evidence. Low-visibility archaeology arises in diverse circumstances but often stems from past human activities that were fleeting or temporally punctuated in nature. However, syn- or post- depositional preservation conditions, complex taphonomic histories, archaeological palimpsests, and even biased or blinkered research traditions can further complicate the interpretation of these records. This is particularly problematic when studying the pre-Neolithic past in areas that have been exposed to significant landscape change during the Late Pleistocene and early Holocene (e.g. glaciations, sea level change), as well as in areas with extreme environmental conditions or otherwise sparse resources. These same environments may also hold reservoirs of data yet untapped and only recently accessible with advanced methods and techniques. Together we will explore the diverse methods, approaches, and techniques which can be used to ascertain information about the past from prehistoric archaeological contexts and natural archives which are traditionally considered poor quality, low-visibility or otherwise scant in their character. This may include, but is not limited to: landscape or agent-based modelling; sedaDNA/eDNA or other biomolecular approaches; palaeoenvironmental or palaeoecological proxy approaches; the utilisation/maximalisation of fragmentary or uncontextualized archaeological or palaeontological remains; methods in understanding complex taphonomic histories; effective utilisation of antiquarian collections; and the avoiding or addressing of perceptual barriers.

CONTRIBUTION ABSTRACTS

1052. The Other Loch Ness Monster: Approaching the Lost World of Scotland's Last Interglacial Megafauna

Authors: Kate Britton (University of Aberdeen)
Format: Oral

The Last Interglacial, specifically sub-stage Marine Isotope Stage (MIS) 5e (also known as the Ipswichian or Eemian), saw a global climatic amelioration that brought a curious suite of temperate mammalian species to Britain, some of which are restricted to sub-Saharan Africa today. While archaeological evidence suggests Britain was abandoned by hominins at this time, a comparatively rich palaeontological record of contemporary mammalian life has been found across sites in England and Wales. This famous "hippopotamus assemblage-zone" features megafaunal species such as straight-tusked elephant, narrow-tusked rhinoceros, and hippopotamus, alongside taxa such as spotted hyaena, lion, wolf, red fox, brown bear, wild boar, bison, red deer, fallow deer, giant deer, and mountain hare. The most northernly extent of Eemian hippopotamus documented to date is northern England. However, the extent to which this reflects the real geographical expansion and climatic tolerance of this species, or is simply a result of the destructive effects of subsequent glaciations on pre-MIS 2 palaeontological records in Scotland (and elsewhere in northern Europe), is not known. This paper will examine the intersections between the material record and the impact of glaciations, and the scant evidence for warm-phase biota in Scotland from rare deposits that pre-date the Last Glacial Maximum. Novel potential sources of information will be explored, from archives to sedaDNA, with the ultimate goal of asking how we might begin to reconstruct the Lost World of the Last Interglacial in northern Europe.

1212. Life before the Ice: Exploring the evidence for MIS 3 fauna at a high-latitude Scottish cave site

Authors: Alicia Sanz Royo (University of Aberdeen | National Museums Scotland) – Andrew C. Kitchener (National Museums Scotland) – Kate Britton (University of Aberdeen)
Format: Oral

Scotland has been shaped by complex glacial processes and has few karst landscapes. Consequently, the evidence for human or animal life in the region during Marine Isotope Stage (MIS) 3 is scarce. The Late Pleistocene faunal assemblage from Reindeer Cave (Assynt), in north-west Scotland, however, represents a rare exception. Their study offers a unique opportunity to explore the palaeoecosistems in Scotland prior to the Last Glacial Maximum (LGM). Nevertheless, following the late 19th/early 20th centuries, systematic study of the collections has been limited. In this work, we conduct a multidisciplinary analysis of the faunal remains pre-dating the LGM of Reindeer Cave and compare it with available regional data. The main objective is to improve our understanding of the impact of climatic fluctuations during MIS 3 on the local environment and mammalian communities, including humans. The taxonomic study of these materials highlights a rich Late Pleistocene sub-Arctic fauna, almost entirely dominated by reindeer and bears. While taphonomic analysis indicates that there is no evidence of anthropogenic activity on these remains, research reveals diverse activities of animals inside the cave and different depositional processes. A new programme of radiocarbon dating and isotope analysis on bones illuminates the eco-chronological framework associated with the advance and retreat of the last British-Irish Ice Sheet. Our results suggest that climatic variability and ice sheet dynamics are reflected both in the species composition at Reindeer Cave and in the processes involved in the accumulation of their remains. These data are consistent with the available chronological, faunal, and palaeoenvironmental evidence in Britain. Severe climatic conditions and associated faunal shifts may explain the limited presence of Palaeolithic groups in the region compared to areas farther south. Ongoing dating and biomolecular analyses will provide more insights into the environment–fauna–human interactions in the region during MIS 3.

575. Updating off-site archaeology: surface finds, land-use patterns and modelling pioneer settlement in southern Scandinavia

Authors: Jesper Pedersen (University of Tübingen) – Felix Riede (Aarhus University)
Format: Oral

Archaeological research on the Late Pleistocene of Southern Scandinavia has long been shaped by a paradox: despite intensive research histories, the archaeological record remains sparse, fragmented, and dominated by a small number of well-known sites. This low-visibility record has traditionally been treated as a limitation. Here we argue instead that it constitutes a key source of information about past land-use strategies, provided that surface finds and isolated artefacts are treated as primary data rather than as noise. Building on Robert Foley's concept of off-site archaeology, we propose a methodological update that integrates large-scale surface find datasets from existing heritage databases with spatial and modelling-based approaches. We explore how contrasting archaeological patterns 1) few, dense sites associated with the Hamburgian Culture contexts versus 2) numerous isolated finds linked to Federmessergruppen and Bromme Culture assemblages can be interpreted as fundamentally different land-use strategies rather than differences in archaeological visibility alone. Southern Scandinavia is presented as an ideal case study for this approach. The region combines dramatic Late Glacial environmental change, pioneer settlement dynamics, and exceptionally rich legacy datasets derived from both antiquarian and modern recording practices. By incorporating surface find distributions into climate niche modelling frameworks, it becomes possible to explore how land-use intensity, mobility, and spatial decision-making varied between cultural groups operating under comparable climatic conditions. This contribution demonstrates how the systematic use of surface finds can help transform low-visibility archaeological records into analytically powerful datasets. More broadly, it argues that integrating off-site archaeology with quantitative modelling offers a productive way forward for investigating ephemeral prehistoric land use, particularly in regions shaped by rapid environmental change and pioneer settlement.

1133. A handful of stones on the edge of the known world. Lifting the cloak of invisibility off Magdalenian northern expansion

Authors: William Mills (University of Aberdeen)
Format: Oral

Since its reassessment in 2008, Howburn Farm has been widely accepted as evidence for Late Glacial activity in Scotland based on techno-typology alone. Despite two decades of intense research, the record remains limited to a few lithic assemblages, none of which possess associated organic material or directly datable contexts. Re-evaluating regional collections has identified several "potential" Late Glacial assemblages; however, these often share attributes with the Scandinavian Fosna/Hensbacka Early Holocene, or Early Mesolithic industries bearing broad transitional Upper Palaeolithic traits. Consequently, confidently isolating these to the Late Glacial — rather than a broader Late Glacial-Early Holocene bracket — is difficult. Following a re-examination of antiquarian collections at the National Museum of Scotland (NMS), three specific artefacts from Urquhart, Moray, stood out. One exhibits distinct Upper Palaeolithic features characteristic of Magdalenian technocomplexes, which are absent in later transitional industries. Following the archival trail through successive collections, notably Elgin Museum, further evidence for Upper Palaeolithic lithic production around Loch Spynie (57°39N) has been identified. When combined with the recent re-dating of faunal remains and landscape modelling as part of the PALaEoScot project (Aberdeen), a picture of the northernmost human exploration on the edge of the European continent becomes increasingly tantalising.

1095. Fragmented Traces, Connected Landscapes: The CELL Project and Inland Mesolithic Lolland

Authors: Sandra Söderlind (Museum Lolland-Falster) – Sascha Krüger (National Museum of Denmark) – Mikkel Sørensen (University of Copenhagen) – Daniel Groß (Museum Lolland-Falster)
Format: Oral

Stone Age research on Lolland, southern Denmark, is quickly gaining momentum and preliminary results indicate long term fishing practices, as well as the presence of large-scale contact networks. The extensive excavations associated with the Femern Belt project over the last decade have significantly expanded knowledge of coastal occupation during the late Mesolithic Ertebølle period. In contrast, inland Mesolithic sites, particularly those predating the Ertebølle, remain poorly understood, resulting in a markedly low-visibility archaeological record. This paper presents ongoing research on the Godsted mose site complex, located within a former lake system in central Lolland. The complex has seen limited excavations in the early 1900s and again between 2023–2025, providing valuable insights into chronology and preservation. However, the majority of the archaeological material derives from extensive surface collections gathered over the last several decades, indicating repeated human activity from at least the early Mesolithic and possibly the Late Palaeolithic through to the Neolithic. As such, Godsted mose represents a deeply stratified palimpsest shaped by complex taphonomic processes. The site's topographic position on a minor plateau within an otherwise flat landscape is critical for understanding Mesolithic mobility and orientation. During the early Mesolithic, Lolland formed part of a land bridge between continental Europe and southern Scandinavia, before mid-Holocene sea-level rise transformed the region into an archipelago. The newly initiated CELL project (CEntral Lolland's Landscapes) aims to integrate fragmentary archaeological evidence with new archaeobotanical and palaeoenvironmental approaches to reconstruct human–landscape interactions and illuminate the understudied Mesolithic prehistory of inland Lolland.

2108. Extending the early Holocene (Mesolithic) faunal record of Scotland using ZooMS: a case study from Tarradale

Authors: Tayla Sanders (Department of Archaeology, University of Aberdeen) – Benjamin Elliot – Ingrid Mainland (UHI Archaeology Institute, UHI Orkney) – Astrid Nyland (Museum of Archaeology, University of Stavanger) – Karen Ruebens – Geoff Smith (Archaeological Proteomics Laboratory, University of Reading) – Kerry Sayle (SUERC Radiocarbon Laboratory, University of Glasgow) – Craig Pattinson – Kate Burgoyne (Aberdeen Proteomics, The Rowett Institute, University of Aberdeen) – Kate Britton (Department of Archaeology, University of Aberdeen)
Format: Oral

The early Holocene archaeological record of Scotland is characterised by pronounced low visibility, shaped by a combination of post-glacial processes, sea-level change, extreme environmental events and acidic soils that have constrained the preservation of bone (or the visibility of sites) in many contexts. This, alongside hunter-gatherer lifestyles associated with more ephemeral archaeological evidence, has meant that faunal assemblages from the few known Scottish Mesolithic sites are dominated by highly fragmented, morphologically unidentifiable faunal remains, limiting understanding of human-animal relationships and subsistence practices in this period. Biomolecular approaches have the potential to substantially extend the known palaeontological record for early Holocene Scotland. This paper presents the results of a pilot analyses of fragmentary bone samples from the Mesolithic site of Tarradale, Scotland utilising Zooarchaeology by Mass Spectrometry (ZooMS). The assemblage can be divided into two temporal phases, with contexts pre- and post-dating the Storegga tsunami (~8.2 k ya), and is mainly comprised of small, unidentifiable bone fragments, many of which show evidence of burning, offering limited insight through traditional zooarchaeological techniques. Application of ZooMS has more than doubled the number of species identified at the site, demonstrating the value of targeted biomolecular approaches for extracting information from low visibility assemblages. The results allow comparison of faunal exploitation across temporally distinct phases and identification of animal taxa otherwise absent from the visible archaeological record for the site. Combined with the results of stable isotope analyses on the same samples, the new data contribute to the broader palaeontological record for early Holocene Scotland and provide novel evidence for past ecosystems and environments.

2510. Tracing Human Activities through Sedimentary DNA at El Portalón

Authors: Anders Götherström (Dept. Archaeology and Classical Studies | Center for Palaeogenetics, Stockholm University) – Emrah Kırdök (Mersin University, Department of Biotechnology) – José Miguel Carretero Díaz – Cristina Valdiosera Morales (University of Burgos) – Anna Linderholm (Center for Palaeogenetics, Stockholm University)
Format: Oral

Cave sediments can be a useful source of information where conventional archaeological evidence is sparse, biased, or archaeologically invisible. Sedimentary ancient DNA (sedaDNA) can capture signals from plants, animals, and microorganisms that are poorly represented, fragmentary, or entirely absent from the archaeological and osteological record, offering a complementary perspective on site use and human–environment interactions. Here, we present a sedimentary DNA study from El Portalón de Cueva Mayor (Atapuerca, northern Spain), a cave site with a well-documented stratigraphic sequence spanning from the Late Pleistocene to the Roman period. Such cave contexts often exhibit strong preservation biases and complex taphonomic histories. We analysed sedaDNA from 25 stratigraphically well-defined sediment samples and integrated these data with the archaeological and faunal record from the site, allowing us to evaluate aspects of human activity that remain archaeologically underrepresented. Our results show that anthropogenic signals in the sediments closely track major cultural and economic transitions. DNA from domestic animals, including sheep and cattle, appears from the Neolithic and Chalcolithic onwards, broadly mirroring the osteological assemblage while highlighting differences in preservation relative to skeletal evidence. Importantly, sedaDNA also reveals cultivated plants that leave limited or ambiguous macrofossil evidence in cave contexts. Barley DNA is detected in Neolithic sediments, while wheat appears from the Chalcolithic onward, documenting the emergence and development of agricultural practices at the site. In parallel, we observe shifts in sedimentary microbial communities associated with sustained human occupation, reflecting changes in cave use and environmental conditions difficult to detect through artefactual evidence alone. Together, these results show that sedimentary DNA captures structured signals of human activity rather than background environmental noise. By demonstrating how domesticated animals, cultivated plants, and microbial communities co-vary with archaeological phases, this study highlights the potential of sedaDNA to illuminate how prehistoric societies organised subsistence and space across millennia.

2267. Unveiling the invisible: a methodological study for optimizing sedaDNA extraction and purification

Authors: Zara Evans – Samantha Jones – Linus Girdland Flink (University of Aberdeen)
Format: Oral

Sedimentary ancient DNA (sedaDNA) has emerged as a powerful approach for recovering ephemeral and disseminated traces of past life beyond conventional archaeological contexts, yet its wider and routine application in archaeology remains limited. This limitation reflects persistent challenges in sedimentary taphonomy and the lack of efficient standardized extraction protocols across contrasting sediment types. Here, we present preliminary results from a comparative assessment of ancient DNA recovery from organic- and mineral-rich sediments, focusing on release from organo-mineral complexes and the inhibitory effects of humic substances. We evaluate the efficiency of three extraction and purification strategies: the standard Qiagen PowerSoil kit, an adapted cold-spin method from Murchie et al. (2021), and a novel workflow combining PowerSoil extraction with oligonucleotide clean-up using the NEB Monarch DNA Clean-Up Kit. Performance is assessed in terms of DNA yield, inhibition, and recovery of ultra-short fragments, alongside amplification of established trnL P6 chloroplast metabarcodes. This preliminary research is based on two coring sites in Scotland, in Tiree and Aberdeenshire, that have been radiocarbon dated to span the late Mesolithic/early Neolithic to the late Iron Age/early Medieval period. The tested sediments include peat-rich deposits and lake sediments representing a range of taphonomic histories and environmental conditions, for which we are also analysing a corresponding pollen record. Comparing the efficacy of existing and modified sedaDNA protocols as applied to varied sediment types will enhance the ability of researchers to overcome taphonomic limitations of sedaDNA and develop routine and accessible practices for recovering the invisible and fragmentary evidence of past lives.

1835. Tracking 'invisible' migrations and behaviours of Late Pleistocene ungulates in Britain

Authors: Sarah Barakat (Department of Archaeology, University of Aberdeen) – Mael Le Corre (Department of Archaeology, University of Aberdeen | BioArch– UMR 7209, Muséum national d'Histoire naturelle) – Kate Britton (Department of Archaeology, University of Aberdeen)
Format: Poster

Reconstructing Late Pleistocene ungulate ecology is essential to understanding early hunter-gatherer lifestyles, particularly in regions where archaeological evidence is scarce but palaeoecological evidence is abundant. Reindeer (Rangifer tarandus) are common prey-species found in large numbers across northwestern European archaeological and palaeoecological sites. As a pioneer species capable of inhabiting harsh environments and undertaking long-distance seasonal migrations between summer and winter home ranges, reindeer can be a valuable proxy to reconstructing past environmental conditions and understanding ecosystem-ice sheet interactions during glacial events. This project aims to use multi-isotope analysis and computational modelling to reconstruct reindeer spatial ecology in Late Pleistocene Britain. By integrating published and unpublished isotopic datasets with find distributions, radiocarbon dates and spatial ecology models, this project seeks to identify reindeer migratory behaviours before and after the Last Glacial Maximum. Using strontium isotopic analysis, innovative isoscape modelling including now-submerged landscapes, and computational spatial assignments, this project aims to take a landscape level approach to understanding habitat suitability and predict herd routes. These results can provide new insights into Rangifer's adaptations to climate variability and provides archaeologists with a better understanding of living landscapes and the otherwise 'invisible' behaviours of archaeo-faunas.

145 RETHINKING MARKETS SITES IN ANCIENT AND MEDIEVAL MEDITERRANEAN BASIN

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Noe Conejo (University of Carlos III of Madrid) – Pedro Trapero Fernandez (University of Cadiz) – André Carneiro (University of Evora)
Keywords: Market, Rural economy, Exchanges, Mobility
Format: Discussion session

SESSION ABSTRACT

Markets were important spaces for political, social and economic life in cities and rural areas of the Mediterranean in ancient and medieval times. Dedicated to the exchange of goods and services, sources mention that these places also hosted political and even religious activities, given their public nature and capacity to draw crowds. In urban environments, markets, which could be permanent or periodic, are easily identified by archaeology, thanks to specific architectures in which it is possible to identify certain economic activities. In rural areas, identification is complex because these commercial encounters took place at intermediate points, on the outskirts of cities and/or in large rural settlements, such as the vici, pagi or villae in Roman times and/or villages in medieval times, and did not require architectural structures. In recent years, the study of market spaces has undergone new revisions and proposals, although most of them have focused on new interpretations of urban markets, so the rural world in the Greco-Roman and medieval periods remains an open question. Beyond the reference studies on permanent and periodic markets developed in Africa, Italy and Egypt, where epigraphic and papyrological evidence is abundant, this session invites researchers to reflect on different aspects of the identification of market spaces in rural areas in the classical period: a) new interpretations of rural sites favourable to commercial activities in ancient and medieval times; b) new strategies for identifying market spaces through epigraphy, legislation, numismatics, spatial archaeology and/or architecture; c) specific case studies illustrating commercial activities in the rural Mediterranean world of the classical period.

CONTRIBUTION ABSTRACTS

546. Villae as markets or Villae and markets? Searching for productive and commercial connectivities in rural Lusitania

Authors: André Carneiro (Universidade de Évora)
Format: Oral

The rural economy in Lusitania is a subject that relies heavily on acquired but unvalidated concepts. It is always assumed that traditional production – wine, olive oil and bread – served to sustain rural communities and supply cities. These products were developed within large rural units known as villae. However, new data must be introduced in order to gain a more accurate understanding of the economic system of the Lusitanian rural world. Product circulation networks were not unidirectional, but had internal relationships. Similarly, these villae could take on other functions, generating their own commercial and economic dynamics. We are aware of archaeological and epigraphic evidence that points to the exploitation of other products. Similarly, we understand the functioning of commercial networks that connect different regional areas, promoting exchange circuits that, in addition to economic benefits, may also have had social, cultural, and technological implications. This presentation considers new possibilities for the study of the rural world and the function of the various settlement units.

548. SPATIUM: A GIS Model for Spatial Mobility and Territorial Influence in Historical Landscapes

Authors: Pedro Trapero Fernández (University of Cádiz)
Format: Oral

Geographic Information Systems (GIS) are widely used in landscape archaeology and historical research to study mobility, connectivity, and spatial organisation. Most existing approaches, however, rely on mobility models originally designed for modern geography, transport planning, or environmental management. As a result, GIS-based analyses in historical contexts have predominantly focused on optimal routes, least-cost paths, and the reconstruction of road networks, often overlooking the broader spatial implications of human mobility. This paper proposes a conceptual and methodological reorientation of GIS mobility analysis for historical landscapes. Rather than modelling movement between sites, we introduce a framework that conceptualises mobility as a spatial property of places themselves. The proposed model treats mobility tools as technical constructs for understanding areas of influence, territorial centrality, and intermediate spaces within inhabited landscapes. The model is based on the generation of isochrone-based mobility surfaces that do not rely on conventional cost maps. Instead, territorial limiters such as rivers, mountain ranges, and uninhabitable zones are explicitly modelled as structural barriers that shape spatial accessibility SPATIUM ((Spatial Processing of Areas Through Integrated Mobility). Drawing on principles derived from historical agrimensory and land-surveying practices, mobility is interpreted as a measure of territorial reach rather than transport efficiency. This approach enables the delineation of functional territories for cities, villas, and secondary settlement centres, offering new analytical possibilities for studying market accessibility, transport costs, spatial hierarchies, and the effective limits of occupied and unoccupied areas. The methodology is evaluated through a set of case studies from the southwest of the Iberian Peninsula, demonstrating how GIS mobility tools, when reinterpreted in this way, can address historical questions that extend beyond the identification of paths to the understanding of territorial organisation and spatial interaction

786. Coins in Hispanic rural contexts: evidence of market activity?

Authors: Noe Conejo (University of Carlos III of Madrid)
Format: Oral

The discovery of coins in rural areas confirms that the inhabitants of the countryside in Roman times were well connected to the structures of a monetised economy. The most recent excavations have made it possible to georeference coins in different rural sites, which has helped to identify the areas of greatest daily activity in villae, vicus and other types of settlements. Sometimes, it is possible to observe a higher concentration of coins in certain areas, which is sometimes interpreted as the result of a lack of solid paving and/or the existence of rubbish dumps where coins had been discarded. However, a relationship between the coins, their respective monetary value, and their location in certain areas with respect to the daily life of these sites makes it possible to put forward new hypotheses about the economic activity of certain sites. An analysis of certain Hispanic cases suggests that this concentration of finds in certain places in villae is evidence of periodic market activities in the rural world. This interpretation supports our understanding of economic and commercial activity in the Hispanic rural world, where there is no epigraphic evidence of the existence of rural markets, whether periodic and/or permanent, but which existed regularly due to the strength of the verified exchange networks.

450. Central Places or Isolated Islands? The Formation and Hierarchy of Urban Networks in High Medieval Bohemia

Authors: Katerina Levá (Institute of Archaeology of the CAS, Prague, v. v. i.)
Format: Poster

The emergence of urban networks in 13th and 14th-century Bohemia represents a fundamental shift in the spatial and social organization of the medieval landscape. While traditional historiography and archaeology have primarily viewed the medieval town as a distinct legal and economic unit, this study seeks to place this perspective within a broader context. It interprets towns not as a collection of isolated entities, but as a complex, integrated system of interconnected nodes, exploring the structural dynamics that bound these centers—and their peripheries—together. The primary theoretical framework for this analysis is Central Place Theory (CPT), applied here not as a rigid geometric model, but as a flexible tool to investigate functional hierarchies and spatial distributions. Through case studies of selected Bohemian regions, the research demonstrates how varying levels of urban settlements—from major regional hubs to minor towns—formed a structured and interdependent network. The paper explores how these sites organized their hinterlands through market systems, administrative ties, and economic functions, creating a sophisticated spatial hierarchy. A key component of this study is the application of Geographic Information Systems (GIS) to model these complex relationships. The results indicate that medieval Bohemian towns did not exist as 'islands,' but rather as integral parts of a dense, multi-layered network where urban functions overlapped diachronically. By focusing on the diversity and hierarchical levels of these settlements, the study underscores the transformative potential of geographic modeling in archaeology. These theoretical principles remain highly relevant for interpreting settlement patterns and spatial hierarchies across diverse historical periods and geographic regions.

146 RESILIENCE, ADAPTATION, AND TRANSFORMATION: TRAJECTORIES OF CHANGE IN PAST AND PRESENT HUMAN SOCIETIES

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Sebastien Manem – Peter Tóth (Masaryk University) – Louise Gomart (CNRS) – Sara Krubeck (Pompeu Fabra University) – Morgane Blanot (Université Paris 1 Panthéon-Sorbonne)
Keywords: resilience, adaptation, social change, human-environment interactions
Format: Regular session

SESSION ABSTRACT

Throughout human history, societies have faced, multiple and interrelated forms of change: environmental, political, economic, social, demographic, ideological, and technological. Archaeological and ethnographic records reveal diverse and often non-linear responses to such changes. This session explores societal and socio-ecological trajectories—past and present—through the theoretical lens of resilience, emphasizing mitigation, adaptation, transformation or collapse. We invite papers addressing: (1) social, economic, and other dynamics in response to stressors; (2) the impact of change across different temporal scales, from abrupt crises and disturbances to gradual transformations and long-term shifts; (3) the interaction and compounding effects of multiple stressors; (4) the role of mitigating, adaptive, and transformative strategies in ensuring continuity, restructuring or renewal. With a focus on trajectories in the short and long term, we welcome analyses at diverse social and spatial scales, from small-scale communities to inter-cultural networks. We encourage reflections on specific historical contexts and the pursuit of transferable insights for the present and future regarding mechanisms, limits, and sources of resilience. For an interdisciplinary discussion, this session seeks to bring together case studies and theoretical works from all regions and periods, and multiple fields including archaeology, archaeological sciences, ethnography, palaeoenvironmental studies, historical geography and history. We welcome empirical studies integrating environmental and socio-cultural proxies, theoretical and computational modelling approaches. We encourage contributions examining contemporary forms of social resilience, from preservation of traditional knowledge and heritage to risk adaptation and sustainable development. Thematic areas may include: human-environment interaction, resource use, subsistence practices, land-use change, mobility and migration, production of goods, networks, demographic dynamics, settlement patterns, socio-political organization, ideology, ritual practice and the encounter between tradition and innovation. Ultimately, this session seeks to move beyond static notions of resilience, revealing the complex, contingent, and sometimes fragile pathways through which human societies endure, transform, or disappear.

CONTRIBUTION ABSTRACTS

1333. Trajectories of Change and Adaptation in Communities of Practice: Petrographic Analysis of Neolithic Pottery in Northeast China (6000–2000 BC)

Authors: Pauline Duval (École Pratique des Hautes Études - Université PSL | Jilin University)
Format: Oral

In Northeast China, the coexistence of hunter-gatherer societies and groups transitioning to agriculture during the Neolithic (6000-2000 BC) is well-documented. Both economies had established ceramic traditions. In this paper, I will examine the unique historical trajectories of Neolithic social groups by discussing the changes observed in the development and evolution of ceramics alongside changes in subsistence strategies, and the extent to which these pottery-making communities adapted and interacted with one another. In the Lower Nen River Valley, in a context of hunter-gatherer economy, each chronological phase yielded pottery characterized by a single fabric consistently containing shell fragments, although in varying proportions. During the sixth millennium BC, quantities of shell fragments were high enough to affect the artefacts' physical properties. After this initial phase, however, shell fragments were mixed with large amounts of sandy inclusions and did not always significantly impact the artefacts' properties. The persistence of such inclusions can thus be considered as a cultural choice, revealing perhaps an intent on the part of potters to

maintain a tradition from generation to generation. Conversely, in the Liaoxi region, where societies were gradually transitioning to agriculture around 6000 BC, two distinct communities of potters coexisted within the same area: one using grog (chamotte) and the other producing fabrics rich in metamorphic inclusions. By the late fourth millennium BC, these distinct practices were no longer in use, and a new tradition appeared where clay fabrics (fine or coarse) were selected according to the vessel's intended function. While these populations were geographically close, with their peripheral zones meeting despite core areas being 400 km apart, their fabrics marked clear social and spatial boundaries. Despite production remaining largely domestic, these communities were integrated into broader networks that facilitated the circulation of pottery, ideas (forms and styles), and likely people as well.

1172. Integrating stable isotopes, lipid residues, and pottery chaîne opératoire: Late Neolithic Lifeways and resilience at Čičarovce, Slovakia (5000-4500 cal BC)

Authors: Peter Tóth – Johana Malíšková – Sébastien Manem (Masaryk University) – Veronika Brychová (Czech Academy of Sciences) – Miriam Nývltová Fišáková (Masaryk University) – Zdeněk Tvrdý (Moravian Museum) – Peter Milo (Masaryk University) – Rastislav Hreha (Zemplín Museum) – Dalia Pokutta (University of Rzeszów | Stockholm University) – Eszter Bánffy (HUN-REN RCH Institute of Archaeology | Römisch-Germanische Kommission des Deutschen Archäologischen Instituts)
Format: Oral

During the construction of a gas pipeline at Čičarovce, Slovakia, in 1976, excavations revealed 12 Late Neolithic graves (5000-4500 cal BC), including a central burial interpreted as a shaman's grave with four consecutive burials, surrounded by five pits. While previous publications have focused on typological-chronological analysis of pottery, this study uses an integrated bioarchaeological approach to reconstruct the subsistence strategies and social organization of this community. This research addresses three central questions: (1) What was the paleoenvironmental context of the settlement? (2) How do human dietary isotopes correlate with faunal evidence and lipid residues in pottery? (3) What do pottery production techniques and dietary patterns reveal about social differentiation within the community? Human and faunal skeletal remains from museum collections underwent zooarchaeological and anthropological analysis, as well as stable isotope (δ13C, δ15N) analysis, and 14C dating to reconstruct diet and chronology. Ceramics were analyzed by lipid extraction using GC-FID, GC-MS and GC-C-IRMS to identify absorbed organic residues and determine the function of the vessels. Analysis of ceramics using the chaîne opératoire method examines the complete production sequence and identifies technical choices that reflect learned traditions and social transmission. This integrated analytical approach aims to deepen our understanding of the social structure, resilience and adaptation of Late Neolithic communities in the Upper Tisza region. This research is supported by the RES-HUM project (Ready for the Future: Understanding the Long-Term Resilience of Human Culture; CZ.02.01.01/00/22_008/0004593).

2305. Čičarovce, Slovakia (5000-4500 cal BC): an anthropological reading of ceramic technical tradition

Authors: Sebastien Manem – Peter Tóth – Johana Malíšková (Masaryk University)
Format: Oral

The twelve Late Neolithic graves and five pits (5000-4500 cal BC) from Čičarovce in Slovakia (Vizdal 1980) offer an opportunity to reconsider the perception of the site in the context of the Upper Tisza region through an anthropological interpretation of the ceramics. In this paper, we will explore the themes of resilience, transformation, and adaptation through a synchronic and diachronic reading of ceramic technical traditions—involving roughing-out, preforming, finishing and surface treatments—, the latter being inherited from one generation to another and the expression of a social group. In the synchronic axis, we will focus on the societal importance of the site and the social status of the deceased by researching the "number" (one or more) of social groups involved in the burial deposits. More broadly, this question allows us to address the sociological landscape in which the Čičarovce site is located. From a diachronic perspective, we will address the issue of cultural filiation by tracing the signal of transmission through time—generation after generation of potters—in order to determine a possible historical continuity between technical traditions at Čičarovce through detailed analysis of ceramic chaînes opératoires. This research is supported by the RES-HUM project (Ready for the Future: Understanding the Long-Term Resilience of Human Culture; CZ.02.01.01/00/22_008/0004593).

2550. Ceramic change across boundaries: resilience and techno-social trajectories in Northeast Iran (3500-1800 BCE)

Authors: Camille Abric (Paris 1 Panthéon-Sorbonne University | UMR 7041 ArScAn)
Format: Oral

Between the Late Chalcolithic and the end of the Middle Bronze Age (ca. 3500-1800 BCE), Northeast Iran underwent profound techno-social transformations associated with the development of proto-urban societies. One of the most striking material expressions of these changes is the progressive disappearance of painted ceramic traditions and the widespread adoption of burnished grey ware, which became dominant during the Bronze Age. This transition has long been interpreted as a sharp cultural rupture, often explained through invasionist models. Drawing on a multi-scalar analysis of ceramic assemblages from key sites on both sides of the Elburz Mountains, including Tureng Tepe and Tepe Hissar, this paper reconsiders these interpretations through the lens of resilience and techno-social trajectories. Combining technological analysis and typological approaches, it explores how technical choices, production practices and morpho-stylistic variability articulate local traditions with broader inter-cultural networks. At a

macro-regional scale, ceramic trajectories appear broadly comparable, marked by the emergence and dominance of grey ware. At a micro-scale, however, technological analyses reveal significant continuities with earlier painted traditions, alongside locally specific adaptations and hybridization processes. Despite the strong topographic constraints imposed by the Elburz Mountains between the two sites, ceramic techniques display both shared foundations and differentiated expressions, challenging the idea of mountains as strict technical or cultural boundaries. Rather than reflecting a uniform of abrupt transformation, the shift from painted to grey ceramics documents a process of adaptative reconfiguration, in which communities reworked existing technical knowledge while engaging with wider exchange networks, including those linked to major contemporaneous socio-political entities such as the Oxus Civilization. Resilience in pottery production thus appears as a situated and dynamic process, combining continuity, innovation and selective resistance. Through the study of seemingly ordinary artefacts, this paper highlights the potential of ceramic techniques as sensitive proxies for understanding long-term techno-social transformations in ancient Iran.

2691. Resilience and adaptation of the honorific statue habit in Late Antiquity (fourth-sixth centuries C.E.)

Authors: Esen Ogus (Utah Valley University)
Format: Oral

The honorific statue was a three-dimensional anthropomorphic 'contract' on which were played out a variety of human agency, ranging from the expression of political and economic power to social status and religious affiliation. The medium was employed from the fourth century B.C.E. onwards, for almost one thousand years, and yet dedicating new statues was abandoned by the sixth century C.E. Multivariate factors drastically upended urban life between the fourth and sixth centuries C.E., an essential habitat for the honorific statue medium. These factors include the transformation of administrative and civic politics, cultural changes such as the dissemination of Christianity, and environmental factors such as earthquakes. Despite these stressors, the statue habit showed remarkable resilience and adaptation, a phenomenon that deserves scrutiny. I adopt a theoretical framework that highlights the significance of 'things' in social network systems, promoted in A. Gell, Art and Agency (Oxford 1998); B. Latour, An Introduction to Actor-Network Theory (Oxford 2005); and I. Hodder, Entangled (Malden 2012). I argue that statues, just like other items of material culture, acted within social and cultural networks that involved multiple stakeholders, such as the honoring body, honorand, maker, and public beholder. The 'stickiness' of these networks resulted in necessary adjustments in the honorific habit to continue it. The eventual demise of statues came only when society could no longer sustain the social networks that benefited from the presence of statues. My main geographic area of focus is Asia Minor and Greece, which offer large numbers of the material amenable to qualitative and quantitative analysis. This study leads to the conclusion that human subjects attributed such significant social role, symbolic power and agency on the medium of statues that adaptation and transformation strategies were developed to sustain it so as not to suffer the social, economic and cultural consequences.

2514. Family ties and "good" pots: Hiwi ceramic production and circulation in the Middle Orinoco (16th-21st century)

Authors: Natalia Lozada-Mendieta (Universidad de Los Andes) – Sebastien Manem (Masaryk University) – Jose Oliver (University College London)
Format: Oral

Hiwi (Jivi), Sikuani or Guahibo people were highly nomadic indigenous groups located in the Middle Orinoco region between Colombia and Venezuela, in the lowlands of northern South America, who moved across the savannah and the river channel of this borderland region at the time of the Spanish contact. Since the 18th century, most Hiwi communities have adopted a more sedentary way of life, practiced agriculture and incorporating material and religious practices of the European and criollo culture. Despite the significant transformations associated to the acculturation and colonization process, some Hiwi communities have continued to produce and adapt pottery following traditional recipes and innovating in other areas to appeal to larger audiences beyond their local camps. Using archaeological, historical, and ethnographic sources we prove how certain methods and techniques of the chaîne opératoire have prevailed and which ones have been transformed according to cultural and economic pressures. Adaptation and resilience and observed specially in morphological and decorative traits, as well as in some tools and uses for different ceramic productions, still associated to family networks and reputation from particular pottery workshops. Contemporary uses of these pots are limited since there is only one potter active in the area and might translate into the disappearance of this long tradition.

772. A Tale of Two Cities Evolution and structural adaption in two LBK settlement clusters- a comparison

Authors: Franz Pieler (State Collections of Lower Austria) – Julia Längauer (Univ. for Continuing Education Krems, Centre for Museums Collections Management)
Format: Oral

The Early Neolithic settlements of Lower Austria are structured into regional clusters. Those north of the Danube seem to possess a hierarchical structure and clear regional, often fortified, centres. Presently, two of these dwelling clusters have been researched in depth as to their size, structure and evolution: the Horn Basin and the Upper Zaya Valley. Although only some 70 km apart, the regional natural and climatic properties are very different. Living on the edge of the LBK world, the inhabitants of the Horn Basin had to adapt, which resulted in notable shifts of settlement hotspots and population distribution. In the Zaya Valley, possibly due to a comparatively more fertile and milder setting, structural changes are not as prominent. However, there were stress factors in

this community too, which might have led to the "famous" massacre event in Schletz. It seems, however, that this possible demise of the central site was only a milestone in the downward spiral of the Zaya Valley dwelling cluster. In our contribution we want to point out the regional differing courses of evolution of these two communities from the first settlement to the transition to the Middle Neolithic Lengyel Culture. We will present the natural challenges of both regions and portrait the two dwelling clusters, focusing on their respective strategy in the human-natural relationship and the effects visible in site structure, selection of settlement sites and dwelling patterns .

1479. Neither "crisis" nor "end of the world". Resilience and non-linear change at the end of the Uruk early urban Mesopotamia

Authors: Johnny Baldi (CNRS, UMR 5133 Archéorient, Lyon)
Format: Oral

The profound chrono-cultural transformations marking the passage from the 4th to the 3rd millennium BCE have long been described in the archaeological literature through either imprecise chronological labels – often subsumed under the loosely defined notion of "transition" – or through overtly catastrophic frameworks that privilege the concept of "crisis." Such interpretations tend to extrapolate from a single cultural process or marker, however prominent – most notably the end of the Uruk diffusion in northern Mesopotamia and western Iran and its "retreat" in southern Mesopotamia – to characterise an entire historical phase. Several decades ago, M. Frangipane questioned the relevance of the notion of crisis for the southern Uruk world, suggesting instead that processes of economic contraction may have more directly affected northern Mesopotamian communities. More recent archaeological and environmental evidence invites a further reassessment of this perspective. While a degree of cultural discontinuity between the polities of the fourth millennium BCE and the early urban formations of the early third millennium is undeniable, data from northern regions increasingly point to a strong legacy of the Uruk phenomenon, particularly in terms of social practices identifiable through material culture. Drawing on recent results from excavated sites in the Zagros Piedmont – specifically the Chamchamal Plain – as well as from southern Mesopotamia in the Dhi Qar Governorate, this paper challenges the interpretative framework of "crisis" and proposes a non-linear reading of political and cultural transformations between the 4th and 3rd millennia BCE.

554. Mapping Resilience: Parish Networks, Land Use, and Settlement Patterns in Late Medieval Hungary

Authors: Beatrix F. Romhányi (Károli Gáspár University of the Reformed Church in Hungary)
Format: Oral

This paper explores late medieval land use and settlement patterns in the Kingdom of Hungary through large-scale spatial analysis of ecclesiastical and fiscal data. The study draws on the RD1500 database, which currently integrates nearly 15,000 settlements and over 5,000 Catholic parishes for c. 1500, complemented by c. 4,400 parishes recorded in the papal tithe register of 1332–1337 and related documents. Rather than treating ecclesiastical institutions as objects of inquiry, parish networks are used here as spatial proxies for settlement density, infrastructural reach, demographic change, and modes of subsistence. By combining distance-based modelling of parochial catchments with fiscal evidence for cereal production, the paper reconstructs the interaction between arable farming and pastoral land use across different ecological zones. The results reveal pronounced regional contrasts between areas of dense, cereal-oriented settlement and regions characterised by extensive pastoralism, seasonal mobility, and sparse institutional coverage. In marginal and mountainous areas, large distances from parish centres correlate with Orthodox chapels and monasteries, or with the absence of stable ecclesiastical infrastructure, pointing to adaptive land-use strategies rather than institutional deficiency. Comparison of the two time slices also reveals significant shifts in spatial patterns, allowing for the identification of both climatic and human-driven factors behind these changes. The Hungarian case highlights resilience as a product of land-use diversity and flexible settlement organisation, demonstrating how mixed agro-pastoral economies sustained long-term continuity under varying environmental and social constraints. Methodologically, the paper illustrates the potential of high-resolution, relational datasets for tracing adaptive socio-ecological trajectories in medieval Europe.

1053. Violent disruption of settlement continuity and trajectories of resilience: Long-term transformation of the rural landscape of Iraqi Kurdistan

Authors: Lenka Starková (University of West Bohemia in Pilsen) – Karel Nováček (Palacký University Olomouc)
Format: Oral

This paper examines processes of resilience, adaptation and transformation in rural settlement systems of Iraqi Kurdistan in the context of the violent disruption of settlement continuity during the second half of the twentieth century. Armed conflicts, and in particular the genocidal al-Anfal campaign, led to the destruction of thousands of villages, forced population displacement, and the radical reorganisation of social and spatial structures that had developed over centuries. These events represent an extreme case of abrupt socio-ecological shock whose consequences can be traced across both short- and long-term trajectories of regional development. The study draws on an interdisciplinary research (multi-temporal analysis) project combining archaeology, remote sensing analysis, architectural and building-historical survey, and oral history. The research focuses on the mountainous areas north of the city of Koya (Iraqi Kurdistan). The results demonstrate that local responses to the violent rupture of settlement continuity were neither linear not uniform. Alongside the complete abandonment of some villages, a wide spectrum of adaptive strategies can be identified, including partial reoccupation of former settlement cores, the establishment of new villages in close proximity to earlier

sites, and the transformation of traditional nucleated settlement layouts into more dispersed forms reflecting new socio-economic conditions. These processes reveal profound changes in social organisation, resource use, and the relationship between communities, landscape, and place-based memory. By situating this case study within broader debates on resilience and socio-ecological change, the paper argues that the transformation of rural landscapes in post-conflict contexts should be understood not only as a consequence of destruction but also as the outcome of active adaptive strategies. The study further highlights the urgency of documenting endangered cultural heritage and demonstrates the potential of such datasets for comparative research on resilience and long-term trajectories of human–environment interaction.

1458. Landscape archaeology and historical roots of territorial remoteness: Basilicata inner areas in the longue durée

Authors: Giovanni Lombardi – Elisa Di Giovanni (Institute for Studies on the Mediterranean CNR-ISMed)
Format: Oral

This paper will explore the landscape archaeology and the historical roots of territorial remoteness of the inner areas of Basilicata, a region in southern Italy mostly mountainous and hilly, but embraced on the east and west by two Mediterranean seas. Basilicata, also known as Lucania, houses ancient settlements alongside a rich historical palimpsest. In a longue durée view, considering landscape archaeology and long-term settlement dynamics, we will examine the correlation among the deep structures that have shaped territorial organization from the protohistoric to the contemporary era, passing through a vibrant Greek, Roman, and medieval history. Currently, Basilicata is largely associated with the so-called inner areas, facing challenges such as depopulation, marginalization, and infrastructural and socio-economic fragility. The approach aims to integrate archaeological, topographical, and environmental data, focusing on the territorial morphology, the continuity of mobility networks, and hilltop settlements from a heritage perspective. These aspects are crucial for understanding the adaptative reconfiguration of the territorial system over time. This perspective emphasizes how the 'marginality' of the Basilicata inner areas did not emerge from immutable pre-existing conditions, but by socio-economic and cultural challenges that have resemanticized material continuities, civilizations, human-environment interactions, and settlements beyond the obvious erosion by historical time. The longue durée view relativizes the centre-periphery simplifications, highlighting the role – sometimes even the protagonism – the resiliencies, and the strategies of adaptation of historical settlements, roots, and uses in shaping territories. The paper intends to emphasize archaeology as a critical tool for dialogue between past and present, providing a knowledge-based framework to inform policies for the promotion and sustainable development of inner areas. It will consider landscape archaeology and historical roots as opportunities while exploring the connections between the often-perceived inevitable condition of inner areas and the meaning of heritage, which is always correlated with social recognition.

1435. A 5,500-year record of paleohydrological variability in a northwestern Mediterranean paleolake: trajectories of human-water interactions (Cadrix, Var, France)

Authors: Mélanie Dagneaux (CEREGE | Aix-Marseille Université) – Romaric Bardet (CCJ | Aix-Marseille University) – Hélène Bruneton (CEREGE | Aix-Marseille University) – Olivier Sivan (LAMPEA | INRAP) – Christelle Claude – Doriane Delanghe (CEREGE | Aix-Marseille University) – Fréderic Guiter (IMBE | Aix-Marseille University) – Alda Flambeaux (INRAP) – Corinne Landuré (CCJ) – Tachikawa Kazuyo (CEREGE)
Format: Oral

Several surveys carried out in 2024 revealed nearly 22 metres of lake deposits. Two cores measuring 6 and 11 metres long were taken, recording the last 5.5 thousand years showing high-resolution potential for paleoenvironmental records. First results obtained, combining archaeological inventories and paleoenvironmental data from Cadrix paleolake, illustrate the resilience of rural populations regarding water resource management, with two significant turning points during Middle Neolithic and Roman period, offering a relevant case for the development of a socio-hydrosystem in the northwestern Mediterranean. The Middle Neolithic period may show a shift from a climate-dominated system ~5.5 ka to early human interactions with the environment. Paleoenvironmental proxies are consistent with a lake transgression phase associated with stable, low-energy lacustrine conditions. Simultaneously, data suggest early population settlement near the lake. Such conditions likely constituted a window of opportunity for Middle Neolithic societies, providing freshwater resources and exploitable littoral zones prior to later phases of hydrological management. Regarding the Iron Age, data suggest that the impact on water resources was limited. Settlements were characterized by fortified hilltop villages inhabited by about a hundred people. Water management was probably not left to individual initiative, suggesting that water resources were abundant enough. Around 150 AD, the paleolake appeared to be a good observatory of Roman domination, as proxies suggest the plain was artificially drained by a trench in the tufa dam to dry, settle and cultivate the lowland. Archaeological inventories and written sources show that Romans exploited land taken from indigenous people, fundamental to Rome's effective (and symbolic) control of the territory. Rome reorganized the land and constructed large-scale hydraulic engineering works to dominate the environment and supply water to large villae. Beyond the 3rd–4th century AD, the lake may have experienced several fluctuation phases linked to climatic variability and/or wetland management and water resource control.

1918. Modeling shoreline mobility and taphonomic filtering in Martinique (French West Indies): a spatio-temporal analysis of pre-Columbian settlement patterns

Authors: Morgane Blanot (University Paris 1 Panthéon-Sorbonne | Archéologie des Amériques UMR 8096 | Centre de

Recherche et d'Enseignement en Géosciences de l'Environnement UMR 7330) – Benoit Bérard (Université des Antilles | Archéologie des Amériques UMR 8096) – Christophe Morhange (University of New Caledonia) – Frédérique Leroy (Département des Recherches Archéologiques Subaquatiques et Sous-Marines | French Ministry of Culture)

Format: Oral

Coastal zones are highly attractive yet inherently unstable areas. Throughout the Holocene, marine transgression not only reshaped shoreline morphology but also reconfigured habitable areas, ecosystems, circulation routes, and sheltered environments. In the pre-Columbian Antilles (3000 BCE–16th century CE), where maritime engagement was structurally embedded, these reconfigurations likely influenced settlement and mobility choices and, consequently, the present-day preservation and visibility of coastal sites. While relative sea-level (RSL) changes are evident at geological scales, their perception at the human scale remains debated: were they experienced as abrupt crises, or as gradual processes manageable within lived time? In Martinique, new data from submerged sites and mangrove coring now enable us to locally constrain late-Holocene RSL rise. Using these indicators, we propose palaeogeographic reconstructions of shoreline positions for several pre-Columbian periods to quantify changes in available space (supralittoral, intertidal, infralittoral) and to assess the magnitude of coastal reconfigurations likely to have affected settlement dynamics. These modelling efforts provide the basis for a settlement-pattern analysis that moves beyond a deterministic interpretation of the environment. We aim to distinguish risk-mitigation strategies (erosion, submergence, coastal instability) from the exploitation of opportunities (new biotopes, resources, and changes in coastal connectivity). Finally, we discuss the taphonomic biases caused by shoreline mobility (submergence, erosion, burial), which influence our interpretation of site distributions. Beyond the Martinican context, this approach offers a transferable framework for other insular settings and directly echoes contemporary climate-change challenges, both in terms of the resilience of coastal societies and the preservation of an increasingly vulnerable archaeological heritage.

1786. The Magdalenian Hunter and His Prey: High-Resolution Isotopic Evidence for Human- Environment Adaptation in the Tatra Mountains Huciva Cave (Slovakia)

Authors: Anna Kraszewska (Institute of Archaeology, Jagiellonian University) – Dalia Pokutta (Archeological Research Laboratory University of Stockholm | Collegium Medicum University of Rzeszow) – Kerstin Lidén (Archeological Research Laboratory University of Stockholm) – Jakub Skłucki (Institute of Archaeology, Jagiellonian University) – Katarzyna Zarzecka-Szubińska (Department of Paleozoology, University of Wroclaw) – Peter Tóth (Department of Archaeology Masaryk University) – Marián Soják (Institute of Archaeology, Slovak Academy of Sciences) – Paweł Valde-Nowak (Institute of Archaeology, Jagiellonian University)

Format: Oral

Human resilience to environmental stress has often been explored through lowland settlement systems, while high-mountain landscapes have long been regarded as marginal or episodically used. This paper presents new bioarchaeological evidence from Huciva Cave (Western Carpathians, Slovakia), challenging static models of human avoidance of high-altitude environments during the Late Pleistocene. The site provides rare evidence for human activity close to the former margins of a high mountain glacier. We present an integrated multi-proxy dataset comprising 20 new AMS radiocarbon dates, stable carbon and nitrogen isotope analyses for 20 faunal individuals, 20 oxygen isotope measurements, and approximately 41,000 strontium isotope ratios ($^{87}Sr/^{86}Sr$) generated using a new high-resolution laser-based approach ("Superstrontium"). This unprecedented isotopic resolution allows the reconstruction of fine-scale mobility patterns, seasonal landscape use, and environmental variability at temporal scales previously inaccessible in Paleolithic research. The results reveal a complex adaptive strategy combining short-term mobility, targeted resource exploitation and repeated use of high-altitude environments under fluctuating climatic conditions. Rather than representing marginal or symbolic incursions, the Carpathians emerge as an integrated component of broader socio-ecological systems, reflecting resilience through flexibility and environmental knowledge. By combining chronological control with dietary, mobility and paleoenvironmental proxies, this study illustrates how human groups negotiated environmental stress not through collapse or retreat, but through adaptive transformation of land-use strategies. The presentation will be delivered by D. Pokutta, the author of the research; the project is funded by the Rector of the University of Rzeszów Programme for the Development of Humanities and Social Sciences (grant no. PWOSG.501.3.2025). The archaeological work was carried out as part of the research project no. 2021/41/B/HS3/03217 The Stone Age Man in the Caves of the Tatra Mountains, funded by the National Science Center (Poland).

1297. Millet served: A glimpse into dietary strategies at the LBA site of Čejč (CZ) tracked through organic residues in pottery

Authors: Veronika Brychová (Nuclear Physics Institute of the Czech Academy of Sciences) – Klára Šabatová (Faculty of Arts, Masaryk University) – Ivan Čižmář (The Institute for Archaeological Heritage Brno) – Vojtěch Nosek (Faculty of Arts, Masaryk University) – David Parma (The Institute for Archaeological Heritage Brno)

Format: Oral

The Čejč site (Late Bronze Age; Moravia region, Czech Republic) was excavated in 2021 during the construction of a gas pipeline. The excavation revealed more than 150 recessed features, predominantly shallow storage pits containing ceramic vessel fragments, as well as two ceramic hoards comprising complete vessels. In total, 34 ceramic fragments from both the hoards and settlement features were selected for organic residue analysis. The aim was to identify lipid residues absorbed during vessel use and to obtain an initial insight into the dietary economy of the Čejč site. Cleaned and powdered potsherd samples were subjected to acidified methanolic extraction, followed by FID, GC/MS, and GC-C-IRMS analyses to assess the concentration, composition, and original sources of lipid residues. More than 70% of the analyzed potsherds contained appreciable amounts of lipids, in some cases exceeding 1 mg per gram of extracted ceramic. The lipid extracts were rich in residues of original fats and their degradation products, including long-chain fatty acids, n-alkanes, fatty alcohols, and triterpenic alcohols. Notably, the millet biomarker miliacin was detected in approximately half of the samples. Stable carbon isotope analysis (GC-C-IRMS) of the two most abundant fatty acids indicated the presence of non-ruminant adipose fats, ruminant adipose fats, and dairy fats. Furthermore, the isotopic signatures of the animal fats were enriched in, or strongly influenced by, C_4 plant input, suggesting a significant contribution of millet to both animal and human diets. This first glimpse into the dietary practices and livestock management at Čejč through organic residue analysis of pottery raises several research questions about subsistence strategies in LBA, not only in Čejč, but also in other LBA sites in the region, to explore how millet-based subsistence at Čejč reflects broader adaptive strategies in the Bronze Age.

1156. Living in the Arctic worlds: adaptation, transformation and resilience of the past and present societies

Authors: Claire Houmard (Université Marie et Louis Pasteur)

Format: Oral

The North American Arctic lands (including Greenland) were among the last to be populated. The harsh living conditions in these regions require specific subsistence strategies and constant adaptation to environmental and/or societal changes. Any wrong decision can take a heavy toll, human and/or material. Low population density and significant seasonal variations are probably the reasons for the high mobility often assigned to these human groups. This mobility is directly linked to weather and environmental. Programming and anticipating the needs and activities can also be explained by varying degrees of resources' accessibliity. Through this communication, we wish to develop a reflection on the modes of adaptation, transformation, and resilience of Arctic societies over the last millennium. From the last human major migration (13th c. CE) to present day, the Arctic societies experienced cooling and warming episodes, as well as the contact with radically different cultures (Westerners), both factors might have influence and modify the previous traditions.

869. Long-term dynamics of flood resilience under compounding stressors: Historical insights from Southwest China (1644–1911)

Authors: Siying Chen – Liang Emlyn Yang (Ludwig-Maximilians-Universität München)

Format: Oral

Throughout history, human societies have evolved in close relationship with rivers, while floods have remained a frequent and highly disruptive natural hazard worldwide. Although resilience has emerged as a key concept in contemporary flood risk management, it has deep historical roots shaped by pre-existing resource endowments, institutional arrangements, and accumulated practices of adaptation. Yet the long-term trajectories of flood resilience under changing environmental and societal conditions remain insufficiently understood. Addressing this gap, this study draws on extensive Chinese historical documents to trace the dynamics of flood resilience in Sichuan, Southwest China during 1644-1911 A.D. (the Qing Dynasty). A composite index is calculated to capture the flood impacts across six interrelated subsystems: environment, production, infrastructure, population, economy, and social order. The reconstructed annual series reveals a non-linear resilience trajectory comprising four distinct phases, separated by three major turning points (1727, 1779, and 1856). Early phases show relatively low flood impacts despite recurring hazards, indicating a capacity to absorb disturbances. Over time, however, flood impacts increasingly intensified through cascading effects across interconnected subsystems, resulting in widespread famine, market disorder, and social unrest, with consequences extending beyond the directly affected regions. Integrating natural and socio-economic indicators, this progressive erosion of resilience is associated with continuous population growth and cropland expansion, environmental degradation, declining per capita resource availability, increasingly frequent warfare, and weakening governance capacity. Historical experience highlights the need for a holistic, systems-based approach for sustaining flood resilience under compounding stressors. It also underscores the importance of identifying thresholds and cascading processes in contemporary contexts of growing systemic and regional interdependence.

937. Discovering resilience strategies in traditional dryland agriculture: Insights from ethnoarchaeology

Authors: Sara Krubeck – Marco Madella – Carla Lancelotti (Pompeu Fabra University, CASEs research group | AGRI-DRY network) – Olaotse Thabeng – Bothepha Mosetlhi (University of Botswana | AGRI-DRY network) – Sarah Mothulatshipi (AGRI-DRY network) – Nicki Whitehouse (University of Glasgow | AGRI-DRY network)

Format: Oral

Ethnographic and archaeological evidence shows that crop production in drylands can be a sustainable and viable subsistence and land use activity under Holocene conditions. Today, agricultural systems in arid regions are disproportionately threatened by climate change, land degradation and mismatched environmental policies. Traditional farming practices may provide time-tested alternatives to unsustainable industrialised agriculture, prompting us to assess their value for sustainable development and ecological policy-making in such areas. Here, we examine which characteristics make traditional agriculture resilient to the erratic rainfall patterns in arid environments and what we may learn from past agricultural systems that persisted during periods of climate change. Applying a framework based on Resilience Theory, this study investigates resilience strategies in past and present traditional dryland

agriculture that allow farmers to cope with droughts, adapt to shifts in rainfall patterns, mitigate land degradation and sustain food security. With a focus on African contexts, the results from ethnographic interviews conducted with subsistence farmers in Botswana will be presented here. The research targets Traditional Ecological Knowledge of agricultural practices encompassing crop choices, water and soil management with their perceived costs and benefits and in relation to climatic and ecological risks. Of key interest are practices that reflect specific risk management strategies, as these are conceptualised as the sources of resilience. The ethnographic findings will be used in evaluating the trajectories of archaeologically evidenced agricultural systems. Observations on change and continuity in past farming contexts exposed to climatic disturbances provide a test for the resilience and long-term viability of agricultural practices and of the risk management strategies they display. The ethnoarchaeological approach thereby enables to assess the resilience fostering potential of non-industrial methods to sustainably address environmental stressors in smallholder dryland farms.

430. Raw material networks in Balkan Prehistory: a proxy for social interaction and sustainability

Authors: Maria Gurova (Bulgarian Academy of Sciences) – Clive Bonsall (University of Edinburgh)
Format: Oral

The paper discusses advancements in the study of flint resources in Bulgaria, particularly the analysis of Balkan flint, a key material used in toolmaking during the Early Neolithic. Over more than a decade there have been notable advances in Bulgaria in raw material studies using macro- and micropetrography combined with geochemical (LA-ICP-MS) analysis of raw material samples and flint artefacts. A systematic analysis of flint raw materials from different outcrops compared with flint artefacts from different sites leads to a better understanding of flint provenance and distribution for subsequent and variable inter-site consumption. The paper illustrates the complete chain of analyses of an important raw material (Balkan flint) with a prominent role in the Early Neolithic network in the Balkans. The findings indicate that Neolithic communities in Bulgaria often sourced flint from multiple sites, all located in Upper Cretaceous limestone formations in northern Bulgaria, and GIS modelling has suggested potential distribution routes. The concentration of Balkan flint resources in northern Bulgaria gave the region a crucial role in the spread of the Neolithic way of life through Southeastern Europe. We explore: (1) How flint procurement networks may have functioned as critical, adaptive strategies during the EN by enabling sedentary communities to secure high-quality raw materials for new agricultural technologies while fostering social, economic, and ideological connections across landscapes; (2) Whether distribution patterns changed in response to environmental or social stressors; and (3) How resource concentration contributed to community resilience during the EN.

69. Adaptation and Transformation in the Late Harappan of the Indus Valley Civilization

Authors: Heidi J. Miller (—)
Format: Oral

In the lower Indus River valley, Pakistan, from approximately 2000 to 1600 BC, significant cultural elements of the Bronze Age Harappan Civilization disappeared; however, it is believed that the culture of the Harappan continued into the late period, albeit appearing in a very different form. This new cultural expression represents a transformation from an urban-based system with extensive interregional trade reliant on shared systems of weights, writing (undeciphered), etc., to a smaller-scale, more locally situated cultural adaptation. The loss of importing of raw materials as well as the loss of an extensive array of craft products, suggest a major upheaval. Although these changes are striking, there is evidence of cultural continuity from within this loss of an overarching ideological and political identity which had governed socio-economics of the Harappan. This presentation will focus on the interregional elements that were lost, and the ways in which the new culture adapted certain aspects of the earlier material culture to the new situation by creating a more resilient fit for the socio-economic changes that were occurring.

1498. Resilience vs. Fragility in the Mediterranean Metal Trade throughout the Late Bronze-Iron Age Transition: A View from the Southern Levant

Authors: Naama Yahalom-Mack (The Hebrew University of Jerusalem)
Format: Oral

The destruction of Mediterranean palatial centers c. 1200 BCE triggered profound regional transformations, particularly within the metal trade networks central to the Late Bronze Age (LBA) economy. This study investigates these transitions in the Eastern Mediterranean by tracking shifting copper sources in the southern Levant. We synthesized a robust geochemical dataset of copper-based artifacts spanning the LBA, Iron Age I, and Iron Age II, integrating elemental composition with lead isotope analysis (LIA). When contextualized with existing lead and silver data, our results reveal a complex LBA landscape where copper procurement extended beyond Cyprus, although Cypriot intermediaries remained pivotal to regional distribution. The subsequent surge in copper production within the Arabah during the early Iron Age serves as a primary proxy for shifting geopolitical power dynamics. These shifts include a strategic repositioning of the Cypriot market toward alternative commodities and Mediterranean regions, alongside a total cessation of Aegean metal imports. By synthesizing new and archival data, this research clarifies long-standing debates regarding continuity versus disruption, illustrating how the collapse of palatial systems reorganized Mediterranean resource management.

490. The Shifting Moral and Spatial Terrain of Medieval Valencia in Times of Crisis

Authors: Ella Zeiders – Laura Jakubczak (Arizona State University)
Format: Oral

The History of Late Medieval Valencia (1300-1500 CE) was marked by major transformations to the layout of the city, both in terms of who was allowed to live within the city walls and where different religious groups were forced to reside. These changes were influenced by political and social transformations that were often linked to stressors such as the plague in the early 1300s, a violent assault of the Jewish quarter in 1391, and the great fire that happened in 1447 CE, all of which profoundly impacted the structure of the city and the make-up of its citizenry. This paper applies gender archaeology methods to gain a better understanding of how women in particular responded to these shifts in the fabric of their life. The study of the symbolic vs. actual use of spaces such as private households and public city domains allows for a picture of the medieval past that is more inclusive of all people of the city, not only those of the privileged classes that tend to be the focus of historical texts. A survey of the historical and legal documents, combined with new archaeological research, helps reveal who were enforcers of new rules and who were the people who worked subtly against the system.

2498. Salt Exploitation and Socio-Ecological Resilience in the Eastern Carpathians of Romania: A Long-Term Perspective

Authors: Mihaela Asandulesei ("Alexandru Ioan Cuza" University of Iași, DSU)
Format: Oral

The Eastern Carpathian area of Romania holds a significant and long-recognized potential in subsurface resources, among which salt represents one of the most persistent and socially impactful. Concentrated along the Carpathian chain, salt occurs in both solid deposits and liquid forms, creating a diverse and accessible resource landscape that has been exploited continuously since prehistory. Archaeological evidence documents the exploitation of saline springs as early as the Neolithic (e.g., Lunca, Poiana Slatinii) through controlled recrystallization processes. These practices, further developed during the Eneolithic through techniques commonly described as briquetage, were associated with stable settlements, collective labor organization, and emerging forms of resource management. Such early exploitation strategies indicate not only subsistence-oriented production, but also the integration of salt into systems of exchange, prestige, and social differentiation. Over time, the exploitation of solid salt deposits increased in technological complexity and scale, contributing to the development of supra-local networks and, in certain historical contexts, to political and economic control over saline resources. Throughout antiquity, the medieval period, and into modern times, salt exploitation in the Eastern Carpathians was progressively incorporated into fiscal systems and state monopolies. However, this process did not eliminate local and traditional practices of brine use, which persisted alongside organized mining and later industrial extraction. Ethnographic and ethnoarchaeological data reveal long-term continuity in the use of saline waters for food preservation, animal husbandry, and therapeutic purposes, as well as adaptive changes in exploitation strategies and in the chemical quality of brines, shaped by both natural and anthropogenic factors. Viewed through the lens of resilience, salt exploitation in the Eastern Carpathian space illustrates a dynamic trajectory of continuity, adaptation, transformation, and occasional disruption. This long-term perspective highlights how human communities negotiated environmental constraints, technological innovation, and socio-political pressures while managing a critical resource, offering transferable insights into socio-ecological resilience.

2309. Shift or Adaptation? Spatial Patterning of Middle-Upper Paleolithic Transition in Southern Iberian Peninsula.

Authors: Daniela Maio – João Cascalheira – Célia Gonçalves (ICArEHB, University of Algarve)
Format: Poster

Southern Iberian Peninsula represents the last refuge of Neanderthal populations, as modern humans advanced across Eurasia. While both Neanderthal and modern human populations relied primarily on locally available resources (Cascalheira et al. 2021), the spatial organization of their settlement systems may have differed significantly. Differences in land use and mobility may have been a key behavioral separation between Middle and Upper Paleolithic humans (Carvalho et al. 2025), likely shaped by climatic and demographic pressures that required flexible adaptive responses. These turnover periods can be explained by the emergence of new techno-complexes. For instance, the replacement of Mousterian by Aurignacian during Heinrich Event 4 was marked by a decrease of archaeological sites, suggesting that environmental deterioration and reduced resource availability drove changes in settlement logic. These shifts in both material culture and ecocultural niche are interpreted as responses to worsening ecological conditions. Although some of these topics have already been the subject of in-depth studies, very few have focused on how settlement patterns as indicators of resilience at a larger geographical scale. This poster tests whether Upper Paleolithic site locations in southern Iberia follow the same territorial logic as Middle Paleolithic ones — suggesting adaptive continuity — or whether they indicate a reorganization of occupation strategies regarding raw material sources, watercourses, and topographic prominence. This project is based on a multi-source GIS approach, integrating chronological, geographic, geomorphological, and archaeological data. The resulting models, simulation and dynamic modeling including analyses of visibility, landscape exposure, and accessibility, aim to reveal the flexibility and constraints of hunter-gatherer adaptive systems in the Southern Iberian Peninsula, offering new insights into how reorganization operated as a mechanism of resilience in the face of shifting ecological and population pressures.

2577. The Limits of Adaptation: World War II and the Demise of the Olender Settlements in the Łódź Region

Authors: Anna Olczyk (University of Lodz, Doctoral School of Humanities)
Format: Poster

Olender settlements appeared in the area of present-day Łódź and its surroundings at the end of the 18th century. The "hard-working Olendrzy" were considered experts in the economic integration of previously unused land. Since the 16th century, landowners had been signing settlement contracts with newcomers from Friesland and the Netherlands, who, thanks to their land reclamation skills, were unrivalled in the cultivation of wetlands. In exchange for rent, settlers could settle in a designated area, cultivate the land there, and enjoy a number of privileges, including personal freedom, freedom of religion, and no serfdom. This model proved effective, and Olender settlement spread from its original cradle – the Vistula Fens and the Lower Vistula Valley – to further areas, not only wetlands but also forested areas, reaching, among others, the vicinity of Łódź. Over time, the term Olender ceased to refer to an ethnically homogeneous population and became a marker of a legal and social system. The Olenders continued to be characterized by a strong sense of community. For instance, they manifested their shared responsibility towards the landowner and their form of self-government. Over the years, Olenders and their descendants faced challenges related to reforms concerning the enfranchisement of peasants (loss of the privileged position of the Olenders), World War I (war destruction), and Poland's regaining of independence (new political system). However, it was the extreme trauma of World War II that led to the collapse of the settlements, both socially and materially. Social aversion and distrust of the population perceived as German (which included the Olenders) and legal regulations led to the migration of the population that formed these settlements. Social ignorance, strong aversion, political conditions, and urbanization processes also led to the fading of the landscapes of Olender settlements in the Łódź area and their relics.

147 ECHOES OF THE STEPPE: INTERDISCIPLINARY APPROACHES TO CENTRAL ASIAN SOCIETIES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Ptolemaios Paxinos (Bavarian State Collection for Palaeoanatomy) – Júlia Olivé-Busom (University of Bonn) – Delgermaa Lkhagvadorj (Mongolian Academy of Sciencies)
Keywords: Central Asia, bioarchaeology, paleoenvironment, landscape archaeology, 3D reconstruction, remote sensing
Format: Regular session

SESSION ABSTRACT

From prehistory to the present day, Central Asia has been the birthplace of complex and influential polites, the bridge between eastern Asia and the Europe, and the home of a variety of peoples and religions, all of which were interconnected through economic, cultural and linguistic ties. Central Asia is also a hotspot of recent archaeological activities by a diverse scientific community with a background in bio- and geoarchaeological sciencies. In this session, we welcome any papers that revolve around the many nomadic societies that flourished in modern-day Kazakhstan, Kyrgyzstan, Mongolia, Tajikistan, Turkmenistan, Uzbekistan and northern China. We are interested in approaches that incorporate the bio- and geo- into archaeology, and welcome contributions that revolve around human-plant and human-animal interactions, patterns of resources consumption and management, demographic and paleopathological trends both in animals and humans, and kinship dynamics, landscape management and evolution, paleoenvironment reconstruction, and the telematic detection and reconstruction of buried landscapes.

CONTRIBUTION ABSTRACTS

1302. Approaches to Stature Estimation in Ancient Mongolian Populations

Authors: Erdene Myagmar – Ariulzul Otgonbaatar – Ulziikhishig Janchiv (National University of Mongolia) – Erdenechimeg Vanchindorj (Monsta Audit)
Format: Oral

Accurate reconstruction of human stature from skeletal remains has long been recognized as a fundamental objective in bioarchaeology. Stature estimation not only provides a proxy for understanding the biological profile of past populations but also serves as an indirect measure of health, nutrition, and social conditions. As such, it is a critical parameter for reconstructing lifeways and for comparing populations across different temporal and geographic contexts. In Mongolia, archaeological discoveries of ancient human remains present a valuable opportunity to investigate the biological characteristics of populations inhabiting the Eurasian steppe. Despite the region's significance in world history, relatively few studies have systematically examined the stature of ancient Mongolian populations. Existing approaches to stature estimation typically rely on regression formulas developed from reference populations in Europe or North America. While these formulas are widely applied, their accuracy may be limited when used for populations with distinct morphological and genetic backgrounds. To address this issue, the present study employs two complementary methods: (1) commonly used anthropometric regression formulas, and (2) anatomical reconstruction techniques based on skeletal measurements. By applying both approaches to ancient individuals recovered from Mongolian archaeological contexts, we aim to evaluate the consistency and reliability of stature estimates. Comparative analysis of these methods will highlight potential biases and limitations inherent in using non local reference formulas. Ultimately, this research seeks to develop a population specific regression formula tailored to the physical characteristics of Mongolia's ancient inhabitants. Such a formula will not only improve the accuracy of stature estimation for future studies but also contribute to a more nuanced understanding of the biological adaptations and physical diversity of populations in the Mongolian steppe. In doing so, the study advances methodological rigor in bioarchaeology while enriching our knowledge of human variation in Inner Asia.

610. Nomads or Settlers? Insights from the Andigen Barrow Necropolis in Southwestern Kyrgyzstan (3rd-4th century AD)

Authors: Klementyna Mackiewicz (Department of Archeology, University of West Bohemia in Pilsen) – Kadicha Tashbaeva (Department of Archeology, National Academy of Sciences of the Kyrgyz Republic)
Format: Oral

From 2023 to 2025, a research project including an archaeological intervention was conducted at a burial mound necropolis in the Andigen area of the Batken region in southwestern Kyrgyzstan (Central Asia). The burial ground, dating to the 3rd–4th centuries AD, is clearly visible in aerial photographs and from a nearby road. However, it had never previously been investigated. During fieldwork, 54 of the 120 burial mounds in the cemetery were excavated. Of these, 51 contained undisturbed archaeological burials. Three types of burial structures were identified within the cemetery. Although all burials contained nearly identical grave goods, significant variability in funerary practices was observed. The anthropological study revealed that the population buried at the Andigen necropolis was generally robust and presents a better osteological health status when compared to contemporaneous populations. According to historical and archaeological data, the materials obtained from the Andigen burial ground attested to the arrival of a new ethnic group with previously unknown cultural and funerary elements. Those observations and the location of the site between mountain ridges combined with noteworthy observation of high frequency of non-metric cranial traits specific for the East Asian and Mongoloid populations may support the thesis about nomadic lifestyle and community's migration into the Batken region. The paper presents the evidence of the population's origin, as well as the main elements of their cultural identity and funerary practices.

43. Reaching for paradise. The inhabitants of the Muslim cemetery of Karakorum

Authors: Julia Olive Busom – Alice Toso (University of Bonn) – Dunburee Batsukh (Institute of Archaeology, Mongolian Academy of Sciences) – Susanne Reichert – Jan Bemmann (University of Bonn)
Format: Oral

With the start of the Arab conquests in the 7th century, Islam steadily advanced towards the east, entering into contact with the Mongol Empire around the 13th century. Although this interaction is often seen as hostile, Islam became one of the many religions of the peoples of the empire. During the years 2023 and 2024 a Mongolian-German expedition excavated two different locations at the northern cemetery of Karakorum, the capital of the Mongol Empire. During these, two different burial complexes were uncovered, revealing Islamic burials. Although the burials themselves showed the key characteristics of all Muslim burials, several funerary, anthropological, palaeopathological and isotopic findings indicated that the individuals uncovered in the cemetery may have undergone a preselection process. Namely, the distribution of the graves stood out from that seen in western maqabir, with men occupying a central position, while non-adults, which were mostly under the age of 3 years, surrounded them and women were scarce and found in the periphery. More importantly, child mortality as derived from the data collected in the cemetery stood out, even in pre-industrial and pre-antibiotic societies. In conjunction, the palaeopathological analysis of the inhumated individuals revealed instances of severe, extensive and chronic diseases, and the isotopic findings may indicate a clear stratification of the population.

2522. The Prehistoric Origins and Development of Mongolia's Earliest Settled Economies

Authors: Christina Carolus – Asa Cameron (The Pennsylvania State University) – Bukhchuluun Dashzeveg (Yale University) – Jargalan Burentogtokh – Altanbayar Zoljargal – Byambatseren Batdalai (National University of Mongolia) – Isabelle Holland-Lulewicz – Jacob Holland-Lulewicz – Matthew Picarelli-Kombert (The Pennsylvania State University) – Chunag Amartuvshin (National University of Mongolia)
Format: Oral

Research into dispersals and socioeconomic impacts of major domesticated plant and animal taxa across the ancient Inner Asian steppe zone has gained significant momentum in the past decade. Improved field methods and archaeometric developments have begun to clarify the antiquity and breadth of these processes in many regions, particularly the Mongolian steppe, revealing the contours of broad changes throughout the Bronze and Iron Ages and linking them to a broader trans-Eurasian system of dynamic long-term social, economic, and biogeographic interactions with cascading effects into the present. Nevertheless, archaeologists and historians still struggle to dispel essentialist notions about "pure nomadism" in ancient steppe livelihoods and thoroughly explain the role of plant and animal economies in the region's initial major sociopolitical formation. This paper centers emerging evidence for the origins of the first settled economies known on the Mongolian steppe, which appeared in the final centuries of the first millennium BC and are often viewed as isolated and few. New cross-regional syntheses and ongoing excavations in Dornod Province allow us to explore the basis of this poorly understood phenomenon and reveal new insights into dynamics of scale, networks and

distributions, populations, and significant economic transformations directly linked to the formation of eastern Eurasia's earliest state. The sudden and poorly understood appearance of multicropping regimes, expanded herding economies, and sedentarization of highly mobile populations represented a substantial shift in livelihoods and sociopolitical organization. We suggest that ancient Mongolian communities have always practiced more diverse locally situated multiresource modes of landscape exploitation and patterns of mobility than typically recognized. These were contingent on deep long-term knowledge of ecological affordances, flexible practice, and mastery of biotic management strategies. However, we contend that this novel, dynamic mix of settled and nomadic systems provided a socioeconomic model that endured among all subsequent centralized political formations to follow.

2628. Vertical Archipelagos of Ancient Inner Asia: Investigating Long Term Socioecological Dynamics at Kyzyl Unkur-1, Kyrgyzstan

Authors: Asa Cameron – Christina Carolus (The Pennsylvania State University) – Sergei Ivanov (Kyrgyz National University) – Malike Piridinova (Kazan Federal University) – Isabelle Holland-Lulewicz – Jacob Holland-Lulewicz (The Pennsylvania State University)
Format: Oral

Often conceived of as the first true link between "East" and "West" and the premodern foundation of our globally interconnected world, the famed networks of the "Silk Road" linked distant kingdoms across Afro-Eurasia through movement, interaction, and exchange. Well known ancient oasis centers attest to this shared history and importance, yet highland regions of Central Asia with equally significant roles remain underexplored and understudied. Recent research has begun to reveal the contours of an interconnected, deep-time geography of high-altitude centers along the mountainous crossroads of Central Asia. Southern Central Asia, and particularly the area surrounding Lake Issyk-Kul in eastern Kyrgyzstan, represent critical yet poorly understood participants. This position along the vast Tien Shan Mountain range formed a vital corridor of interaction between Eurasian frontiers as early as the 3rd millennium BC, where migration routes through eastern Kyrgyzstan linked parts of western China, Mongolia, and Southern Siberia with the Hindu Kush. The following paper presents a preliminary overview of rich floral, faunal, and material cultural datasets from ongoing excavations at Kyzyl Unkur-1 (c. 2000 masl), a stratified cave site located in the Juuku Valley of eastern Kyrgyzstan with evidence of long term human and livestock occupation from the present day through to at least the Late Bronze Age (2000-800 BC). Subject to an extensive AMS dating regimen, this developing case study provides a sequence of temporal anchors to better understand late Holocene social, economic, and environmental trends throughout the greater Inner Tian Shan region and Central Asia more broadly. These trends include the development of agricultural and pastoral systems in ecologically variable and challenging highland environments, evolving landscape uses and modifications, and the changing roles of montane Central Asian societies in the movement of goods, biota, ideas, and people throughout Eurasia prior to and during the Silk Road phenomenon.

1102. Human and livestock activity in the Orkhon Valley during the Mongol Empire revealed by waste biomarkers

Authors: Ramona Mörchen – Inga Koch – Jan Bemmann – Susanne Reichert – Stefan Pätzold – Wulf Amelung (University of Bonn)
Format: Oral

During the 13th and 14th centuries CE, the Mongol Empire emerged as the largest contiguous land empire in world history. Despite its vast extent, the mechanisms that sustained an urban lifestyle in its first capital, Karakorum, located in the core of the Mongolian steppe, remain poorly understood. In particular, questions persist concerning food provisioning systems and the supply of raw materials required to support the urban population. To address these issues, we investigated the topsoil at Sarlag Tolgoi, an ancient settlement situated approximately 50 km northwest of Karakorum. Soil samples were collected along a transect crossing the settlement and complemented by reference samples from nearby locations assumed to be minimally disturbed. Phosphorus concentrations were used to detect anthropogenic waste input, followed by sterol and bile acid analyses of samples showing elevated phosphorus levels in order to reconstruct former settlement structures and their environmental imprint. Phosphorus concentrations in surrounding topsoils were up to ten times higher than those measured within the settlement itself, providing strong evidence for human-induced modification of the site. Sterol and bile acid analyses of phosphorus-enriched samples revealed distinct hotspots of ancient faecal input from grazing livestock, predominantly cattle and sheep, within the settlement area. In contrast, biomarker ratios showed no indication of horse faeces, suggesting that horses were either kept outside the settlement or played a less central role than in nomadic subsistence strategies commonly associated with Mongol populations. Only minor proportions of the human faecal biomarker coprostanol were detected, implying that facilities for human waste disposal were likely located beyond the settlement boundaries. We conclude that anthropogenic activity during the Mongol Empire left persistent and clearly detectable signatures in the soils of Sarlag Tolgoi. Soil-scientific approaches combined with targeted biomarker analyses can refine archaeological interpretations of settlement organization and human-environment interactions in the Mongolian steppe.

2546. Feeding cities, creating foodscapes: the urban animal cycle in Karakorum

Authors: Ptolemaios Paxinos (Bavarian State Collection for Palaeoanatomy) – Joris Peters (Bavarian State Collection for Palaeoanatomy | ArchaeoBioCenter, LMU Munich)
Format: Oral

Karakorum, one of the most important settlements of the Mongol Empire, was planned and erected from scratch alongside the newly emerged empire and is an example of an "implanted city", a characteristic urban development of the Mongolian plateau. The establishment of a new city in the Mongolian steppe represents in many regards a logistical challenge. Archaeozoological analysis can help us better understand the role of animals in the urban life cycle, and the resulting foodscape: which animal products were primarily consumed? Were animals imported into the city or were they kept on-site? Were people processing animal products for purposes other than food, e.g. using bones in the craft industry? Age and sex distribution analysis can answer questions related to animal management and economic practices. Differing management strategies is particularly evident when contrasting the most commonly found species at Karakorum, sheep with cattle. Sheep show a double-peaked age culling profile suggesting that young animals were slaughtered as soon as they reached maximum meat yield, whereas older animals, possibly ewes, were kept longer in order to produce milk and offspring. In contrast, cattle were being used primarily as labour animals, as suggested by the degree of labour-related pathologies. Across all species, only few remains of young animals are present in the material, suggesting that raising animals inside or nearby the city was not a common practice. Leaving the possibility of intensified animal husbandry in the Orkhon valley during the Mongol Empire aside, a dense network of herders, probably in combination with the import of goods from the eastern provinces of the Mongol Empire, was required in order to supply the city with a steady flow of meat and other animal products.

1733. Multifaceted animals: The role of livestock in Xiongnu burial rites

Authors: Simon Trixl (State Office for Cultural Heritage Management Baden-Wuerttemberg | Ludwig Maximilian University of Munich) – Eric Crubézy (Centre for Anthropobiology and Genomics of Toulouse | Institut Universitaire de France)
Format: Oral

In all pre-modern communities, animals were crucial for shaping the economic and social life. This is particularly true for Central and East Asian nomadic societies with their highly specialised subsistence strategies, which have been perfectly adapted to strong continental climate conditions. In addition to their economic significance, domestic mammals and the horse and sheep in particular were an important part of burial rites, as shown by the archaeological record from different chronological and spatial contexts in regions such as present-day Mongolia, Transbaikalia, and Kazakhstan. However, reconstructing the specific role of livestock in funerary assemblages is challenging as there are various possible interpretations regarding the deposition of meat offerings, steeds or isolated bones/associated bone groups with "magical" or symbolic functions. In addition, activities connected to the faunal remains during or after the funeral must also be taken into account. We will discuss this multifaceted role of livestock by the example of animal remains from cemeteries associated with the Xiongnu confederation (3rd/2nd century BCE to 1st/2nd century CE) on the basis of zooarchaeological and taphonomic data. A focus will be on the site of Tamir Ulán Khoshuu (Arkhangaï/Mongolia), for which abundant zooarchaeological data from 46 graves allow a detailed reconstruction of burial rites and possible animal offerings, which we will compare with results from further Xiongnu necropolises such as Gol Mod and Tsaraam. This inter-site comparison will furthermore allow to follow the question, to which extent regional, chronological or social patterns occur in the use of animals by the Xiongnu burial communities.

1401. The Tin 'Rush' in East Kazakhstan: New Evidence for the Scale of Cassiterite Mining in the Bronze Age

Authors: Evgeny Vodyasov – Olga Zaitceva (East Kazakhstan technical university)
Format: Oral

The paper focuses on the Eastern Kazakhstan Bronze Age tin-mining center. This region is characterized by numerous rich and easily accessible tin deposits, which became one of the main sources of the formation of the Eurasian metallurgical province. Between 2022 and 2025, the analysis of satellite imagery and field verification led to the identification of several thousand ancient mining features, with a total cumulative length exceeding 30 km. Based on the analysis of remote sensing data, geoarchaeological surveys, and 3D documentation of tin mines, we address the question of the enormous scale of tin extraction, which allows Eastern Kazakhstan to be regarded as one of the largest mining centers in the ancient world. We provide a cultural and chronological overview of tin mines in the region and present newly discovered mining sites for the first time. Special attention is given to the problems of reconstructing tin production volumes and to the technological characteristics of mining during the prehistoric period.

1541. Remote sensing of the landscape of the eastern Kugitang piedmonts: Archaeological potential

Authors: Nikola Mořkovská (Institute of the Classical Archaeology, Charles University)
Format: Poster

The Surkhandarya province, southern Uzbekistan, holds great importance for the understanding of history and landscape use in Northern Bactria, as proven by previous projects of the Czech-Uzbekistani Archaeological Expedition. However, agricultural activities from the Soviet era had changed the land of this region significantly, especially in fertile lowland areas. Eastern foothills of the Kugitang piedmonts, that had been notably less affected by such damage, therefore represent an area with high archaeological potential. The aim of the remote sensing survey presented in this poster is to demonstrate and quantify this potential, specifically the ability to bring new knowledge and valuable information in possible future research. To achieve this, a ratio of the number of documented objects to the extent of surveyed zones is considered, along with their nature, interpretation, and relation to the landscape.

The survey is focusing on two defined areas in the vicinity of the archaeological sites of Kulal Tepa and Panjob Tepa. For the remote sensing Soviet military maps, CORONA, HEXAGON, and modern satellite images were implemented in ArcGIS Pro program. A total of 520 terrain anomalies were documented, and both surveyed areas revealed a high number of objects interpreted as cairns, kurgans, and shelter imprints, i.e. remains of seasonal campsites used by mobile communities. Such types of objects have been only rarely documented by previous archaeological activities so far. Results of the ratio calculation show the area of Panjob Tepa having total of 12,32 objects per km2, and the area of Kulal Tepa having 8,48 objects per km2. Both areas thus prove to be rich in quantity of archaeological anomalies and having great potential. For further research following up to the survey and its results, the use of other (preferably field) methods is proposed to verify and correct the acquired data.

1687. Bioarchaeology of Xiongnu Nobility at Yamaan Us, Mongolia

Authors: Erdene Myagmar (National University of Mongolia) – Khatanbaatar Dorjpurev (Mongolian University of Science and Technology) – Munkhdelger Jigjjav (Institute of History and Ethnology, Mongolian Academy of Sciences) – Bolormaa Sakhiya (Mongolian University of Sciences and Technology) – Jacqueline Eng – Michelle Hrivnyak (Western Michigan University)
Format: Poster

Studies of Xiongnu elite burials hold particular importance in Mongolian bioarchaeology. Over the past 120+ years, 14 such sites have been discovered and investigated across Mongolia and Russia: 10 in Mongolia (over 2,380 burials total), three in Buryatia (338 burials), and one in Tuva (16 burials). Through national and international collaborative projects, Mongolian archaeologists have excavated more than 30 elite tombs and over 200 associated satellite tombs. The Yamaan Us site, located in Mongolia's western region, was discovered in 2021 and excavated over three seasons (2022–2024). These efforts uncovered two elite burials, five satellite burials, and five commoner burials—totaling 12 features—from which skeletal remains of 12 individuals were recovered. This report presents preliminary bioarchaeological and demographic analyses of the 2023–2024 human remains. Elite Burial 68 yielded the skeleton of a middle-aged male, accompanied in two satellite tombs by elderly and young adult males. Commoner burials produced exclusively male remains spanning ages 11–12 to 50+. Preliminary assessments indicate a pastoralist diet typical of nomadic herders, inferred from dietary stress markers and pathology. In contrast to prior Mongolian Xiongnu elite sites, which have yielded scarce or poorly preserved remains, Yamaan Us offers vital primary data on the health, diet, social structure, and biological affinities of elites, retainers, and commoners.

148 DWELLING IN COASTAL PLACES: POSSIBILITIES AND CHALLENGES OF ADAPTING TO A DYNAMIC AND CHANGING ENVIRONMENT

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Kelly Gibbons (University of Oslo) – Claudia Finocchiaro (University of Cantabria) – Giada Pirrone (CNRS) – Almut Schülke (University of Oslo)
Keywords: Coastal, Past-present-future, Dwelling
Format: Regular session

SESSION ABSTRACT

The coast has been significant to human societies since time immemorial for many purposes including settlement, resource exploitation, transport, leisure and for more intangible, symbolic reasons. This is evidenced by the diversity of archaeological sites attesting to human-environment interaction found along coastlines all across Europe. However, the coast is also a very vulnerable ecotone and an ever changing and dynamic environment which requires constant adaptation and resilience in the face of uncertainty and potential threat, for past present and future habitation, where the issue of sustainability plays an important role. The dual and shifting nature of the seascape, and its interplay between the marine and the terrestrial also demands a specific set of technical and experiential skills from coastal dwellers. Using a past-present-future perspective this session aims to address the following topics from a variety of methodological approaches: • Different ways of adapting to dwelling by the coast including different forms of settlement, resource exploitation and technological innovation • Coping with climatic and environmental changes over time; archaeological, historical and contemporary examples, including coastal heritage at risk • Human-animal interaction in coastal ecologies • The symbolic expressions of coastal communities such as artistic representation and ritual practices related to the sea • Moving/getting-around in coastal areas • The exceptional requirements of living on the coast We welcome papers which focus on these topics in any period or region, to explore the different areas of enquiry and a variety of applied methodologies and current research within the field of coastal studies.

CONTRIBUTION ABSTRACTS

347. Like a stone: persistent identities of coastal dwellers on Lolland, Denmark

Authors: Daniel Groß – Bjørnar Måge (Museum Lolland-Falster) – Satu Koivisto (Museum Lolland-Falster | Helsinki University)
Format: Oral

This paper examines long-term human adaptation and identity formation in dynamic coastal environments through archaeological and environmental evidence from the southern Baltic region. Focusing on the Syltholm Fjord on the island of Lolland, Denmark, our recent research highlights how coastal landscapes have served as persistent habitation places and have been subject to intense resource exploitation. Moreover, the archaeological evidence grants great insights into the use of the land- and seascapes over the course of several millennia and the populations self-understandings. Despite continuous archaeocultural change, socio-cultural practises seem to have been persistent over a significant period and highlight persistent practises of the coastal population. In our presentation we discuss the inherent meaning of the coast for dwellers from the Late Mesolithic to today and how seascapes have formed the identity of people from different periods. We argue for a nuanced understanding of coastal adaptation that supports empirical archaeological data with perspectives on intangible aspects of human-environment interaction and identity creation.

781. The islands of Atlantic Europe in the 1st millennium BCE: centres or peripheries?

Authors: Marie-Yvane Daire (CNRS | UMR 6566 CReAAH) – Hervé Duval-Gatignol (Société Jersiaise) – Jean-Paul Le Bihan (CRAF)
Format: Oral

Current research shows that, overall, Europe's Atlantic coastline has been densely populated over the millennia. The numerous islands and islets dotted along the French coastline have yielded a wealth of archaeological remains, which generally benefit from optimal taphonomic conditions but are now under threat, mainly from the effects of climate change. This has led to an intensification of research over the last few decades through dedicated projects which highlighted the roles of these islands during the 1st millennium BCE. The authors propose to present a synthetic view of the occupation of these maritories (maritime territories) during the Iron Age. The diversity of settlements forms identified raises questions about the location choice, the nature of occupation, and the relations between the islands and the mainland, within an environmental and socio-economic context undergoing profound change in the last decades before our era. The paradigm shifts invite us to consider the status of these islands, not only as spaces constrained by their geographical position, but also as strategic maritories that were part of the dynamics offered by such a specific context, with all that this implies in terms of opportunities for exploitable marine resources, sea routes and navigational knowledge essential to maritime exchange.

855. Marine Resource Exploitation during the Lower Magdalenian (ca. 19,000 cal BP) in Cantabrian Spain: Evidence from Tito Bustillo Cave (Asturias)

Authors: Alberto Marchán-Fernández (University of Salamanca | GIR PREHUSAL, University of Salamanca) – Jesus Tapia (Aranzadi Science Society, Gipuzkoa) – Marián Cueto – Esteban Álvarez-Fernández (University of Salamanca | GIR PREHUSAL, University of Salamanca)
Format: Oral

Tito Bustillo Cave is located in Ribadesella (Asturias, northern Spain), approximately 200 m from the mouth of the River Sella and 1 km from the present-day coastline. It is a karstic cavity renowned for its Upper Palaeolithic parietal art and human occupations. The most important archaeological deposit within the cave, known as Área de Estancia, is situated only a few metres from the original entrance, which is now collapsed. Since the discovery of the paintings, several archaeological interventions have been carried out, documenting occupations dated to different phases of the Magdalenian period (ca. 19,000–15,300 cal BP). This communication presents the preliminary results of the archaeomalacological analysis of remains recovered during recent archaeological interventions conducted at the Área de Estancia (2020–2024 campaigns), where occupations dated during the Lower Magdalenian have been identified. The assemblage has been analysed from taxonomic, quantitative, taphonomic and biometric perspectives. In the analysed sample, species collected for their nutritional value predominate, mainly Patella vulgata and Littorina littorea, although taxa with no apparent dietary interest have also been identified. Evidence for the selective collection of large-sized limpets and periwinkles has been documented. In addition, various anthropogenic and non-anthropogenic shell modifications (including epifauna, fragmentation and thermal alteration) have been analysed. The results are compared with existing archaeomalacological data from other Magdalenian sites in the Sella valley and the wider Cantabrian region.

1875. Subsistence in coastal-mountain ecologies. Zooarchaeology and taphonomy of vertebrate remains in Cova Rosa (Asturias, Spain) during the Late Glacial period

Authors: Marco Arones Abad – Marián Cueto Rapado (Universidad de Salamanca) – Rosana Cerezo-Fernández (Universidad de Salamanca | Université Toulouse Jean Jaurès-CNRS TRACES UMR) – Alberto Marchán-Fernández (Universidad de Salamanca) – Jesús Jordá-Pardo (Universidad Nacional de Educación a Distancia) – Esteban Álvarez-Fernández (Universidad de Salamanca)
Format: Oral

Cova Rosa is one of the main Upper Paleolithic sites in Asturias (northern Spain). The site is located approximately 4 km apart from the present coastline, in a transitional setting between coastal and mountain ecosystems. This paper presents new zooarchaeological

and taphonomic data of the assemblages belonging to the layers excavated during campaigns conducted in 1975–1979 and 2019, corresponding to Solutrean, Early and Lower Magdalenian occupations (layers dated between 22 and 18 ky cal BP). The faunal assemblage from Cova Rosa includes mammals, fish, birds, amphibians and molluscs, indicating exploitation of both inland and coastal areas. This contribution focuses on the analysis of vertebrate remains, with particular emphasis on large mammals, which represent the main exploited animal resource. Red deer is by far the dominant taxon, followed by Iberian ibex and other ungulates such as roe deer, chamois, and horse, while carnivores are only marginally represented. Through taphonomic analysis we have identified anthropogenic modifications on bone surfaces, including cut and percussion marks, and thermally altered remains, indicating systematic carcass processing and consumption by hunter-gatherer groups. These results provide insights into the ecosystem surrounding Cova Rosa during a period of climatic instability and highlight the role of a mosaic environment, where resources from the valley, mountain, and coastal zones were integrated into subsistence strategies. Furthermore, information from the study of marine invertebrates found in the site (mainly limpets and periwinkles) will also be included to provide a more complete picture of the diet of these hunter-gatherers and the coastal ecosystem near Cova Rosa. Finally, the assemblage is compared with contemporaneous sites in the Sella Valley with available data on both terrestrial and marine faunal remains, such as El Cierro or Tito Bustillo, to assess regional patterns of settlement and environmental exploitation during the Solutrean and the Magdalenian.

613. Life on the edge : Neolithic coastal occupations in the Guernsey Archipelago

Authors: Hélène Pioffet-Barracand (French Ministry of Culture | UMR 6566 - CReAAH) – Gaël Barracand (Eveha | Associate member UMR 6566 - CReAAH) – Chris Scarre (University of Durham)
Format: Oral

This presentation focuses on the study of insular occupations in the Guernsey archipelago during the Neolithic period, whether domestic or funerary. Our attention is primarily directed toward the islands of Guernsey and Herm. At this scale—and even if sea level was probably lower during the Neolithic than it is today—the coastline was omnipresent in the lives of these populations, exploited as a source of animal, plant, and mineral resources. Nevertheless, the natural barrier formed by the sea, particularly around the islets of the archipelago, raises questions about access to other resources. This is notably the case on Herm with regard to the consumption of freshwater (even today, a single spring supplies the islet). This isolation also calls into question the notion of insular identity (expressed, for example, through material culture?). Since 2024, this research program has been supported by several archaeological excavations at Neolithic coastal sites. On Guernsey, earlier excavations at the megalithic site of Les Fouaillages revealed material possibly originating from a nearby settlement. Recent excavation campaigns led by Gaël Barracand in the immediate vicinity of the monument have demonstrated the presence of later Neolithic domestic occupations. On the island of Herm, the resumption of investigations (initiated under the Island of the Dead program, directed by Prof. C. Scarre 15 years ago) has made it possible to re-examine several of the island's megalithic monuments and to highlight the establishment of domestic buildings during Middle and Late Neolithic (excavation directed by H. Pioffet-Barracand). The placement of these buildings—due to their location close to the beach, behind the present-day dune ridge—perfectly illustrates the issues of rising sea levels and access to the coastline at the heart of the daily lives of these populations.

483. Documenting Maritime Techniques of Hunter-Fisher-Gatherers: An Archaeo-Anthropological Approach

Authors: Giada Pirrone (CNRS)
Format: Oral

My PhD research focuses on the techniques of prehistoric coastal hunter-fisher-gatherer communities in Europe, specifically those inhabiting the coasts of Brittany (France), South-East Norway, and Western Latvia. The starting point is archaeological data scattered across diverse sources, including excavation reports and published literature. These data are recorded, standardized, and organized using a dedicated open-access tool, the NAUTICC relational database (Norms and Uses of Techniques in Prehistoric Coastal Communities), designed specifically to address the research questions underlying the project. Data collection follows an archaeo-anthropological approach, focusing particularly on remains linked to techniques performed within specific tasks at these sites. The project centers on key aspects of Mesolithic life, including hunting, fishing, cooking, dwelling, tool-making, and symbolic practices. Its aim is to reconstruct the taskscape and generate new archaeological insights into the social structures of coastal communities at local scales, as well as to identify patterns of cultural continuity and change across regions. In this presentation, I will provide a brief introduction to the theoretical framework of the database, describe its structure, and explore the potential applications of this tool for archaeological research.

991. Focus on continuity and repetition among Late Stone Age Fishers in North Norway gives new perspectives on coastal dwelling

Authors: Signe Terkelsen (UiT - The Arctic University of Norway)
Format: Oral

Late Stone Age fishing sinkers from North-Norway are apparently trivial objects with minimal variation. Typical sinkers are oblong stones with a pecked groove, that are near impossible to differentiate from sinkers from later periods. Though being common finds on settlement sites all along the coast, the sinkers have drawn little attention from archaeologists and have in most cases been utilised solely to infer a direct parallel between premodern jigging and LSA fishing. This one-sided view of one of the most significant aspects of LSA coastal life may however be broadened by instead analysing the sinkers and the seascape they were a part of from an everyday perspective with a focus on continuity and repetition. The apparent sameness of the sinkers through time encourages attention to the minute details and differences in the sinkers and in the seascapes, they were a part of. And to how these details and differences affected and were affected by the LSA fishers. Through paying attention to and adapting to the constituents of the seascape, the seasonal migrations and the ways different fish species behave, the actions of sea birds, the continuous mapping of the seabed and the fishing grounds, the LSA fishers created a lifeworld that still unfolds today. The analysis is based on an investigation of 1028 fishing sinkers from North-Norway. Much of the discussion is also informed by historical and ethnographic literature from the region.

1153. All at Sea: Coastal mobility and access in the Mesolithic of southeastern Norway

Authors: Kelly Gibbons (University of Oslo)
Format: Oral

In the last few decades large-scale infrastructure projects in southeastern Norway have resulted in the excavation of hundreds of Mesolithic sites dating to the period 9,300 to 3,900 BC. This growing body of evidence overwhelmingly indicates the significance of the coast for Mesolithic settlement. The majority of documented sites are located in areas that were likely very close to the shoreline at their time of use, although many are now located inland as a result of postglacial land uplift. Artefactual and environmental evidence, although sparse due to poor preservation conditions, also attest to this strong marine orientation, including the remains of marine shell, fish and marine mammals, and objects such as fishhooks. Coastal settlement appears to have become increasingly sedentary and focused around natural harbours throughout the Mesolithic, therefore we can conjecture that marine travel, both in terms of short trips and as part of larger mobility patterns, was crucial to the way of life for these hunter-fisher-gatherer communities. However, we are missing direct evidence, in the form of boats or associated artefacts and we know little about coastal access. This paper will present the approach taken to this enigmatic subject by my PhD project which is part of the HORIZON MSCA Doctoral network ArCHe. The overall project goes beyond site-specific and resource-based investigation to re-evaluate existing data with a view to better understanding human-environment interaction in the Mesolithic. This paper will specifically present results from a series of GIS-based analyses to investigate coastal mobility and access. This includes coastal reconstruction, topographic analysis, viewshed analysis and least cost analysis, which aim to shed light on how and where Mesolithic coastal communities accessed and utilised the coastal and marine environment.

2285. Ports and Prosperity: Coastal Adaptation and Trade in Central Italy

Authors: Melissa Ludke (Grand Valley State University)
Format: Oral

Traditionally, coastal trade routes were deemed more efficient and safer, bypassing available roads. However, these routes also seem to shift over time based on ecological factors (changing sea levels, silting of harbors, etc.) and demand that appear to affect the preferability of certain networks over others. This paper uses the Latin colony of Cosa and its harbor, located on the Tyrrhenian coast of Italy, as a long durée case study, which experienced eras of prosperity and decline that were dictated by a change in trade networks (from coastal to inland and vice versa), popularity of its small port, and elite families monopolizing production and export. Although originally intended for defensive purposes, the small town exhibited signs of continuous adaptation to their circumstances, often through reuse in construction, and production and consumption of desired goods, such as wine, olive oil, and garum. As the Portus Cosanus was not the first harbor in the area, and the lagoon used for its fisheries eventually silted over in late Antiquity, this paper also examines the change in the flow of goods from Cosa's port to others nearby at certain points in time, such as in Albinia and the Feniglia, dictating where the inhabitants obtained certain items. Since Cosa maintained coastal connections with Tarquinia, Populonia, and Telamon, these port cities serve as important points of comparison to determine whether Cosa reflects similar means of adaptation along the same coastal stretch, especially as the coastline changes over time.

603. From fresh- to saltwater environment – Mesolithic settlement in a coastal microregion of the western Baltic Sea

Authors: Svea Mahlstedt – Daniel A. Hepp (Lower Saxony Institute for Historical Coastal Research, NIhK) – Agata Feldens (Leibniz Institute for Baltic Sea Research, IOW)
Format: Oral

The Wismar Bay is hosting some of the most thoroughly studied Stone Age underwater sites along the German Baltic Sea coast. In the ERC project SUBNORDICA we are collecting data to model human inhabitation preferences in changing coastal landscapes of the early Holocene. A detailed landscape reconstruction around known sites in the Wismar Bay is an important prerequisite for this approach. By integrating legacy data on archaeological details and chronological input from dendrochronological and radiocarbon dating, we have set up a survey strategy targeting former lakes and shore lines in the vicinity of several Stone Age sites. Some sites are situated along a larger channel network that likely played a significant role in the context of rising sea levels other sites were found in an area so far reconstructed as a lagoonal lake. Using newly acquired sub-bottom sonar data, we identified substantial sediment infills in these depressions. By sampling these layers with a diver-operated vibrocorer we recovered a variety of organic and mineral deposits, enabling further sedimentological, geochemical and botanical analyses. Comparing on-site and off-site samples, we gain

insights into the environments chosen by Stone Age inhabitants for their stays in these dynamic landscapes and bring those together with our knowledge of human activities and land-use over several centuries from the 7th to 5th millennium BC.

916. Living in a changing landscape – The Mesolithic and Neolithic on the southern North Sea coast

Authors: Moritz Mennenga – Svea Mahlstedt – Anja Behrens – Steffen Wolters (Lower Saxony Instiute for Historical Coastal Research)
Format: Oral

The southern North Sea coast is a long-established coastal landscape shaped by continuous interaction between humans and a highly dynamic environment. During the Middle Holocene, the coastal plains of what is now north-western Germany were initially inhabited by mobile Mesolithic hunter-gatherer groups and later by settled Neolithic farming communities, as evidenced by numerous settlements, activity areas and megalithic tombs. This period was marked by climatic and environmental changes, including a shift towards more oceanic conditions and transformations in local hydrology. Processes such as paludification, terrestrialisation of shallow lakes, intermittent marine incursions into the Pleistocene mainland and the widespread development of raised bogs fundamentally altered coastal and near-coastal landscapes. These dynamics may have posed challenges for dwelling, mobility, land use and resource exploitation along the southern North Sea coast and its hinterland. This talk explores how coastal communities adapted to these changing conditions on a micro-regional scale. It addresses questions of land loss and gain, shifting settlement patterns, changing land-use strategies and the resilience of coastal dwelling practices in the face of environmental uncertainty. The contribution draws on the results of two archaeological research projects in the region between the Elbe and Weser estuaries, combining the re-evaluation of legacy data with new excavations, geophysical prospection and an extensive coring programme of nearly 1,000 boreholes integrated with detailed peat-stratigraphic analyses. By integrating archaeological and palaeoenvironmental data, time-sliced reconstructions of human–environment interaction can be achieved. The results demonstrate that, despite phases of wetland expansion, marine inundation and raised bog growth, the region remained persistently attractive for human habitation.

1199. Marine Mammal Behaviour Shaping Prehistoric Encounters

Authors: Don Sleebos (University of Latvia)
Format: Oral

The dwelling perspective in zooarchaeology emphasizes human–animal relations as emerging from everyday interactions, facilitated through overlapping individual lifepaths shaped by seasonal rhythms and environmental affordances. Around the Baltic Sea, ringed seal (Pusa hispida) remains are common in Stone Age coastal assemblages. In the present, this species is closely tied to seasonal sea ice, yet little is known about the behaviour of ancient seal populations during phases interpreted as ice-free. In the absence of phylogenetic studies of ancient Baltic populations, I examine subspecies-level variation and behavioural plasticity, drawing on ethological and ecological studies of several landlocked as well as Arctic populations. A more nuanced understanding of behavioural plasticity may help us better interpret the encounters between prehistoric humans and marine mammals and allow us to consider the tools and techniques that were used to facilitate, and made possible by the constraints of, these interactions, as well as the traces and markers they may have left behind.

681. Lost Beads from the Coast: Shell Ornaments and Symbolic Behaviour at the Late Mesolithic Site of Beg-er-Vil, Brittany

Authors: Claudia Finocchiaro (Instituto Internacional de Investigaciones Prehistóricas de Cantabria | University of Cantabria) – Catherine Dupont (CReAAH UMR 6566 - CNRS, University of Rennes)
Format: Oral

The study of prehistoric shell middens allows to explore the everyday life of coastal communities, shedding light on the exploitation of aquatic resources, subsistence strategies, and the use of specific technical practices. At the same time, marine resources hold significant potential for understanding the symbolic dimension of the sea within the ritual practices of late hunter-fisher-gatherer communities. The sea, while representing a primary source of sustenance, also became a symbolic scenario associated with death and identity construction. The widespread distribution of similar artefacts along the Atlantic coasts of Europe, together with the recurrence of specific practices—such as the selection and use of shells as personal ornaments—demonstrates how the integration of marine elements into both daily life and funerary contexts reflects shared belief systems connected to the sea. These traditions appear to have originated during the Upper Palaeolithic and continued to evolve throughout the Mesolithic. The shell midden of Beg-er-Vil, dated to the Late Mesolithic, although lacking clear evidence of burials, nonetheless confirms the existence of a symbolic relationship with the marine environment, expressed through aesthetic choices. The analysis of shell beads accidentally lost by the site's occupants suggests that wearing such ornaments was a widespread practice within the community. This pattern is consistent with evidence from other shell middens in Brittany and from contemporaneous sites along the Atlantic façade of Europe. This paper aims to further explore the symbolic significance of the sea and its aesthetic expressions within the communities who frequented Beg-er-Vil, highlighting their importance during the Mesolithic as a key period of cultural transformation.

2298. Feasting in the Margins. A unique Iron Age deposition pit in the remote coastal landscape of southwestern Netherlands

Authors: Richard Jansen – Joanne Mol – Corrie Bakels (Leiden University)
Format: Oral

It may be hard to believe, but not all parts of the Netherlands have been excavated yet. The southwestern part is a rural area that still reveals archaeological surprises, such as an impressive deposition pit dating to the Late Iron Age, that appears to be a unique find in Northwestern Europe. It was placed in a remote, coastal wetland which was considered uninhabitable, before the Romans arrived and cultivated the area. Recent research indicates more human occupation displaying that this remote region consisting of several islands was not a periphery, but rather a crucial hub in the globalised Iron Age habitation and exploitation of Northwestern Europe despite the ever changing environment. The area connects the densely populated higher parts of the southern Netherlands with their connections overseas. It also forms an important production area of salt. It is hypothesised that the content of the pit was the remaining materialisation of a feasting practice, maybe related to the sea and its dual nature. To fully understand this event, we place this remarkable find in a larger cultural landscape, emphasising the value of an interdisciplinary approach, studying the landscape at different scales by different specialists. This includes geophysical prospecting, palaeolandscape reconstruction, archaeobotanical research and archaeological excavations.

329. Skulls in the Gods' Fjord – Marine deposition of human remains during the Iron Age at Korsvik in Gullmarn, Sweden

Authors: Anton Larsson – Astrid Lennblad (Lödöse Museum)
Format: Oral

The deposition of human remains, particularly crania, in inland wetland environments (such as bogs, ponds, and lakes) was a widespread phenomenon in Iron Age Scandinavia and reflects a range of complex social practices. Comparable finds from marine environments are, however, far rarer. This pattern has been challenged by two Swedish discoveries of partially preserved human skulls, one found in the 1980s (but forgotten until the 2020s) and the other in 2018. Both finds were recovered from the small cove of Korsvik, situated at the foot of the Korsborg hill fort, which like the skulls most likely can also be dated to the Roman Iron Age (c. 1–400 AD) or Migration Period (c. 400–550 AD). In this paper, we present preliminary findings (including radiocarbon dating and aDNA analysis) relating to the Korsvik skulls, and consider their wider context within the fjord in which they were found. Gullmarn – the only sill fjord within the modern boundaries of Sweden – is noted for its distinctive visual character and unique marine biology. Its theophoric toponym derives from the Old Norse Goðmarr, which may be translated as 'the Fjord/Sea of the Gods'. Several additional archaeological finds and monuments along the fjord's shores further point to the significance of this dynamic seascape during the tumultous Iron Age.

461. The Ecology of the Dead: Living and Dying with Birds in Late Iron Age Åland

Authors: Marcus Frid (Stockholm University)
Format: Oral

Avian remains are regularly found in Late Iron Age Scandinavian cremation burials, yet discussion has often centred on a limited group of visually distinctive or culturally charged taxa, with the broader range of avian species receiving less attention. Focusing on the Ålandic archipelago, this paper examines the role of birds in Late Iron Age mortuary practice and how ecological conditions and everyday interactions shaped ritual selection. Adopting a multispecies perspective, the study explores how ecological familiarity, seasonal rhythms, and recurring human-bird encounters influenced the inclusion of birds in burial contexts. During the Late Iron Age, Åland (c. 500/550–1050 CE) formed within a maritime environment shaped by mobility, mixed subsistence practices, and the predictable seasonal arrivals of migratory species. Osteological data from three Ålandic settlements are integrated with material from two fully excavated cremation cemeteries. The results are then compared with published settlement and burial data from mainland Sweden. This approach evaluates whether birds included in graves reflect locally embedded relationships formed through everyday engagement with a fluctuating coastal ecosystem, rather than separating ecological relations from symbolic interpretation. Bird remains are interpreted as traces of lived human-bird relations through which Ålandic communities lived with seasonality, mobility, and environmental change, linking everyday ecological relations to the treatment of the dead.

149 STANDING AT THE CROSSROADS: ARE WE HEADED TOWARDS AN INFORMATION REVOLUTION OR COLLAPSE?

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: John Hanson (University of Oxford) – Kelly Mcclinton (SUNY Binghamton) – Chloe Oxborrow – Eva Hayward (University of Oxford)
Keywords: AI, Archaeological theory, Synthesis, Big data
Format: Discussion session

SESSION ABSTRACT

Is the archaeological record entering a state of plateau, and what implications does this carry for the future of archaeological evidence? With the expansion of archaeological discovery in decline (Surovell et al. 2017), archaeological literature is becoming saturated with repetitive treatments of the same objects (Noy 2010). Finding the material record and use of archaeological methods alone inconclusive, scholars have increasingly turned toward interdisciplinarity to address lacunae. Biomolecular analyses of osteological materials have enabled the scientific investigation of human mobility and diet in the deep past (Killgrove 2010), while statistical and ethnographic methodologies have been used to discuss the character of Graeco-Roman cities (Hanson 2022), and computational models have been constructed to simulate ancient economic activity (Brughmans and Poblome 2016). Yet, with neural networks and large language models developing in sophistication, AI usage represents an alternative approach to the declining utility of the archaeological record, alone. An LLM has been used by the Roman Provincial Coinage Project to recognise and recover coinage legends, whereas generative neural networks have also been applied to contextualise Latin inscriptions (Assael et al. 2025). However, many individual scholars, academic institutions, and publishers seem poised to turn their back on the technology, for fear of misleading or incorrect information produced via 'hallucination'; its implications for critical thinking; and its threats of divorcing the archaeologist from physical, experiential engagement with the material record, and with archaeological sites. Archaeology, therefore, stands at a crossroads regarding its use of AI and related tools. In this session, we invite papers exploring the implications of AI for approaches to the ancient world; interrogating the dialogue between AI usage and interdisciplinarity in archaeological research; and debating the wider moral, ethical, epistemological, and existential consequences of AI for the field. How might applications of this resource address an impending 'information collapse' in archaeology?

CONTRIBUTION ABSTRACTS

61. AI, automation, and archaeology: practices, concerns, and perspectives from the community in light of the AUTOMATA project

Authors: Ariane Menu – Amala Marx – Kai Salas Rossenbach (Inrap)
Format: Oral

Ever since Open AI's public release of ChatGPT in November 2022, the field of study known as artificial intelligence (AI) in general, and its sub-genre of general artificial intelligence in particular, have experienced a surge in attention from the media, researchers and general public alike. Archaeologists make no exception. If artificial intelligence techniques (natural language processing, computer vision, and so on) have been experimented on in the domain for many years, the current AI boom has drawn in its wake both enthusiasm and hostility from the community, which sees it as a new realm of possibilities for some, and as a threat for others. Building on the results of a survey and an interdisciplinary scientific workshop on AI and automation in archaeology, organised last year by the Horizon Europe AUTOMATA project, this presentation intends to delve into the community's practices, interests and concerns related to AI, robotics and automation, and initiate a discussion through three main focus areas: first, knowledge creation and the human role in AI and automated workflows; second, issues of governance, law and scientific ethics in the age of AI; and finally, the question of archaeologists' training and education. This communication thus aims to contribute to a constructive and critical reflection on the responsible integration of AI and automation in archaeology. Through a consortium of archaeologists and specialists in robotics and artificial intelligence coming from seven countries, the AUTOMATA "AUTOMated enriched digitisation of Archaeological liThics and cerAmics" project (2024-2029) seeks to develop an augmented digitisation process for lithic and ceramic archaeological artefacts, capable of generating 3D models enriched with archaeometric data acquired autonomously by the system. Developed with objectives of accessibility, adaptability and efficiency in mind, AUTOMATA explores concrete ways to democratise these technologies for archaeologists, and assist them in their research.

2777. Modelling Post-Vesuvian Migration: A Computational Approach to Surviving a Volcanic Event

Authors: Chloe Oxborrow (University of Oxford)
Format: Oral

Many archaeological treatments of the eruption of Mount Vesuvius in 79 CE have sought to define the event by its catastrophic mortality. Causing the destruction of person and property across interior Campania, the type and scale of the disaster were unprecedented, allowing subsequent inquiries into the survival of affected populations to be eclipsed by discourse instead resembling a 'culture of bodies' (Lazer 2009). 'Outside the city gates,' wrote Charles Pellegrino, 'ten thousand—perhaps twenty thousand and more—no matter which way they ran, were cut down by the volcanic death cloud' (Pellegrino 2004). Yet, recent contributions have sought to reframe this volcanic event as the catalyst for one of the most overlooked migration events in Roman history (Tuck, Forthcoming). While more than 1500 sets of remains have been excavated across the Vesuvian sites, archaeologists have been faced with a relative dearth of material evidence for popular survival. Scholars, in turn, have questioned the fates of contemporary individuals who chose to flee when confronted by this disaster. In response, and following principles of urban science and network dynamics, this presentation approaches the mystery of survivorship in the populations of Pompeii and Herculaneum using computational methods, and examines whether simulation could extend the declining utility of the archaeological record (Surovell et al. 2017). Drawing upon the computational modelling of population displacement in the modern humanitarian aid sector (Hoffman Pham and Luengo-Oroz 2022), this study simulates patterns of post-eruption migration from the Vesuvian cities. It provides a preliminary quantification of Pompeian and Herculanean survivors, and, following applications of settlement scaling theory to the study of ancient urban systems

(Hanson and Ortman 2017), examines a possible relationship between the acute population displacement inflicted by the eruption, and the subsequent (re)development of the built landscape of Latium and Campania across the high Roman Empire.

2783. Modern Identity Theory and Second Temple Jewish Ethnicity

Authors: Nathan Mintz (University of Oxford)
Format: Oral

How do communities sustain a coherent collective identity under conditions of dispersal, political subjugation, and existential threat? This question, urgent in the study of post-Holocaust Jewish identity, is no less central to understanding Judaism in the Roman period of the Second Temple (63 BCE – 70 CE). As the archaeological and textual record for this period approaches the limits of what established methods alone can yield, and as the field more broadly confronts the declining utility of the material record, scholarship on Second Temple Jewish identity may turn to engage with the theoretical mechanisms by which identity is actively constructed and maintained. This paper proposes that interdisciplinarity offers a productive path through this evidential impasse and engages with the question of how the field might respond to an information collapse. In examining the dialogue between new methodological resources and archaeological research, it raises broader epistemological questions about how knowledge of the ancient world is generated when the material record reaches its limits, including what role AI might productively play in that process and where its limitations lie. Drawing on ethnicity studies and social identity theory, it examines three mechanisms of identity formation (boundary marking, the use of religious practice as an ethnic signifier, and the negotiation of diaspora and homeland tension) as they operate across two historically distinct but structurally resonant contexts: Roman-period Second Temple Judaism and post-Holocaust Jewish identity. It argues that these mechanisms function in strikingly similar ways across both periods, suggesting that the pressures of minority existence and communal fragmentation generate comparable identity strategies regardless of historical context. In doing so, it moves beyond treating modern theory as merely a lens onto antiquity, proposing instead a genuinely bidirectional dialogue in which the ancient evidence illuminates, and is illuminated by the modern.

2784. The disappearing landscape: data erosion in the Roman construction industry

Authors: Eva Hayward (University of Oxford)
Format: Oral

In order to meet the demands of the early Imperial construction boom, brought on by increasing levels of urbanisation, the Romans extracted vast quantities of raw materials such as stone and clay from their local landscapes. Quantifying the extent of the subsequent landscape change provides information both on the extent and efficiency of the Roman construction industry, as well as data which can be subjected to ecocritical analysis. Recent geomorphological analysis through multidisciplinary studies has been carried out at several quarries (Carfora et al. 2016; Carfora et al. 2018) and at clay beds (Vanzani et al. 2025) in Italy. However, these projects also note a growing concern at the increasingly rapid level of data erosion occurring at the sites due to recent anthropogenic activities. Construction, agricultural expansion, deforestation and erosion from anthropogenically-induced weather phenomena such as flooding and acid rain have all contributed towards the concealment, erosion and destruction of sites that could provide valuable quantitative data on the Roman construction industry and its environmental impact, risking an 'information collapse' of sorts in this sector. There have been calls to prevent site degradation through the creation of geoarchaeological parks and other protective measures that would preserve these sites for future research. If the erosion continues, however, we face not only a collapse of information on these sites, but the destruction of physical evidence pertaining to Roman interaction with the landscape, the construction industry, and the wider Roman economy. My presentation seeks to determine the extent to which contemporary anthropogenic activity affects archaeological sites which still hold information on the Roman construction industry, examine the possibility of data erosion if the sites are left undefended, and ask whether preventative measures will prove effective in their long-term conservation.

2286. Dataset Engineering and Pattern Recognition in the Cn. Ateius Ceramic Workshop: An Interdisciplinary Approach to the Classification of Archaeological Finds

Authors: Maria Messineo (University of Florence) – Roby Stuani (University of Barcelona) – Miguel Ángel Cau Ontiveros (Catalan Institution for Research and Advanced Studies | University of Barcelona) – Andrea Barucci ("Nello Carrara" Institute of Applied Physics, IFAC-CNR) – Maria Gatto (Regional Directorate of National Museums of Tuscany) – Costanza Cucci ("Nello Carrara" Institute of Applied Physics, IFAC-CNR) – Fabrizio Argenti (University of Florence) – Juri Agresti ("Nello Carrara" Institute of Applied Physics, IFAC-CNR)
Format: Oral

In the study of ceramic artefacts, research is progressively shifting from classification based on direct autoptic observation towards integrated analytical processes, in which traditional archaeological methodologies are brought into dialogue with experimental sciences. This paper presents the preliminary results of the Arretino modo project, a research initiative developed within the framework of a Marie Skłodowska-Curie Postdoctoral Fellowship (HORIZON-MSCA-2024-PF-01). The project, hosted by the University of Barcelona in collaboration with the Institute of Applied Physics "Nello Carrara" (IFAC-CNR), focuses on the digital conversion and analysis of approximately 2,000 ceramic fragments from the Archaeological Museum of Arezzo. The core of this contribution explores the challenges of Dataset Engineering: the critical process of transforming physical fragments from the Cn. Ateius workshop (20/15–5 BC) into structured, "machine-ready" information. This requires moving beyond simple digitization to establish

rigorous criteria for image consistency and annotation, bridging the gap between traditional cataloging and the structural requirements of Computer Vision. Using a representative sample of the corpus, we evaluate a multi-scalar computational approach to identify and attribute decorative motifs. While figurative elements are generally recognizable to scholars, phytomorphic and filler motifs—though more common—pose significant attribution challenges. By comparing Unsupervised Clustering (PCA, K-means) for pattern recognition against Deep Learning architectures (CNNs, Vision Transformers) for automated feature extraction, we analyze how different algorithmic "lenses" reshape our understanding of decorative registers. Furthermore, we address how these structured datasets facilitate long-term digital curation and cross-institutional data reuse, ensuring that specialized ceramic knowledge remains findable and interoperable. This case study demonstrates that archaeological data work is a central, interdisciplinary practice. Moving beyond simple automation, this project illustrates how interdisciplinary data workflows constitute a new and essential pillar within the framework of modern archaeological knowledge production.

150 LINKING LIVES, LANDSCAPES, AND ENVIRONMENTS USING OPEN COMPARATIVE ISOTOPE DATA

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Hannah James (Vrije Universiteit Brussel) – Lisette Kootker – Maura De Coster (Vrije Universiteit Amsterdam) – Mackenzie Masters (University of York | Vrije Universiteit Brussel)
Keywords: Isotopic analysis, Open data, Bioarchaeology, FAIR and CARE, Mobility, Diet
Format: Regular session

SESSION ABSTRACT

Isotopic analysis has become one of the most powerful tools in bioarchaeology, providing insights into diet, mobility, kinship, and human-environment interactions. While isotopic analysis can be applied on a site level to examine intrapopulation differences, it has great potential when applied across time and space. Regional differences, connections between communities, and changes over time can be revealed. But these studies require large datasets, often beyond the scope of one project. Comparative data made available through open-access collaborations are essential to facilitate such multi-faceted studies. This session invites contributions that explore how open and comparative isotopic datasets (of any system, e.g., carbon, nitrogen, sulfur, oxygen, strontium) can transform our understanding of the past. We particularly welcome papers that: • demonstrate the value of inter-site or inter-regional comparisons; • examine diachronic changes using isotopic data • reflect on the challenges and opportunities of open access databases, data standards, and FAIR and CARE principles; • show how isotope studies resonate with, and enrich, other bioarchaeological, archaeological, and historical lines of evidence; • critically assess the ethical, methodological, or interpretative implications of data sharing in this field. This session aims to foster discussion on how collaborative and open practices can enhance not only the scientific robustness of isotope studies but also their broader archaeological and societal relevance.

CONTRIBUTION ABSTRACTS

778. Assessing Macro-scalar Isotopic Variation in Middle America: Implications for Isotope Bioarchaeology

Authors: Jason Laffoon – Tamara Michaelis (Leiden University | Vrije Universiteit Amsterdam) – Yadira Chinique De Armas (University of Winnipeg)
Format: Oral

Isotope analyses have a long history of contributions to archaeological research and have become exponentially popular in the last two decades. The successful application of isotope methods in bioarchaeological research is highly dependent on the nature and extent of underlying isotope variation at scales that are appropriate to archaeological research questions. Recently, several large-scale (sub-continental to continental scale) compilations of archaeological isotope data from North America South America, and Middle America have been published. In this presentation, we collate, integrate, and assess large-scale data sets of human and 'baseline' isotopic variation for Middle America (Mesoamerica, Central America, and the Caribbean). The aim is to assess the nature of spatial and chronological isotopic variation for strontium, oxygen, carbon, nitrogen, and sulfur. We reflect on how the distribution of isotopic data enables or inhibits the successful application of different types of isotope bioarchaeological research at varying scales. We additionally explore the interplay between the spatial-temporal structure in the isotopic data and the scale of our research questions, as well as the potential for large-scale data sets to address research questions beyond the scale of local cases studies.

68. Beyond the Local: Designing a Regional Strontium Baseline Map for the Baltic Sea Region

Authors: Raivo Suni (Institute of History and Archaeology, University of Tartu | Archemy Lab)
Format: Oral

Strontium isotope analysis often indicates that ancient societies were surprisingly mobile: alongside "local" individuals, we encounter a considerable number of "non-locals." There is a temptation to search for the provenance of these outsiders, using various datasets for this purpose. In some cases, researchers rely on a few elsewhere-published reference values that seem to match well with their results. In other cases, they use existing regional or global baseline maps (e.g., Hoogewerff et al.'s European soil study, 2019; Bataille et al.'s global bioavailable strontium study, 2020). A third option is to collect as much data as possible from the regions of interest and, taking into account the geological information of those areas, interpolate a hypothetical baseline map. The advantage of creating such maps is that they allow the use of continuously updated datasets. However, this approach also presents challenges: the dataset is highly heterogeneous (as baseline values for bioavailable strontium come from various sources), its overall quality is difficult to verify, and the data points are sometimes too sparsely distributed - with large areas lacking any measurements - which causes the baseline map to be biased by the interpolation methods. The aim of this presentation is to introduce the development of a bioavailable strontium baseline map for the Baltic Sea region that was generated for an Estonia-based case study. To create the map, we used previously published reference values from more than 400 locations. What did the design of such a baseline map teach us, and what are the greatest challenges in this process?

1535. At the Land–Sea Interface: Sea Spray Effects on Coastal Plant Cellulose($\delta^{13}C$, $\delta^{18}O$) and Their Link to Sea Spray DIC($\delta^{13}C$)

Authors: Henriette Brandt (Kiel University | Cluster of Excellence ROOTS) – Saskia Weitkamp (Kiel University) – Christoph Mayr (Friedrich-Alexander Universität Erlangen-Nuremberg | Ludwig-Maximilians-Universität München) – Harald Strauss (University of Münster) – Andrea Göhring (Kiel University | Cluster of Excellence ROOTS)
Format: Oral

Bioarchaeological studies of coastal regions rely on stable isotope data from terrestrial and marine food sources to reconstruct dietary and mobility patterns. However, the influence of sea spray on the isotopic composition of terrestrial plants remains poorly understood and could pose a challenge for such reconstructions. This study investigates how sea spray causes variability in δ13C and δ18O values in plant cellulose of shallow-rooted plants, including beach grass, rushes, and Poa species, collected in March, May, July, and September of 2024 and 2025 across regions near the Baltic and North Sea coasts. The sampling sites are located around the archaeological sites of Haithabu, Schleswig, Elisenhof, Ribe, and Starigard/Oldenburg in Northern Germany and Southern Denmark, dating into Viking to Medieval times, with varying distances to the sites as well as the Baltic or North Sea coast. This data is combined with δ13C measured for dissolved inorganic carbon (DIC) in surface water sampled nearby the plants to determine how this influences cellulose δ13C. As sea spray contains a high concentration of carbonate, the isotopic signature of water DIC could potentially affect the isotopic composition of the plants via sea spray aerosols. Recent research has demonstrated that sea spray causes distinct enrichment in 13C and 18O in plant cellulose. However, as terrestrial plants assimilate carbon as atmospheric CO2 rather than directly utilising carbonate species, the effect observed on the stable isotopic composition of terrestrial plants remains to be evaluated. The magnitude of this effect would vary due to differences in wind direction and strength, ion concentrations in local seawater, distance from coastline, and salinity stress in plants. By examining regional, seasonal, and species-specific variations affected by sea spray, this research provides the context for interpreting isotope fingerprints in coastal archaeological assemblages, crucial for accurately reconstructing mobility and subsistence patterns.

1720. Beyond Binary Classification: Machine Learning Detection of In-Between Instances with Mixed Isotope Signals Induced by Sea Spray

Authors: Andrea Göhring (Kiel University | Cluster of Excellence ROOTS, Kiel University) – Daniyal Kazempour – Bahne Thiel-Peters (Kiel University) – Steffen Strohm (Kiel University | Cluster of Excellence ROOTS, Kiel University) – Claudius Zelenka (Kiel University) – Matthias Renz – Peer Kröger (Kiel University | Cluster of Excellence ROOTS, Kiel University)
Format: Oral

The recently established machine learning concept of In-Between Instances (IBIs) allows a new interpretation of multi-isotope fingerprints. Going beyond a binary classification, IBIs exhibit shared characteristics of two (or more) clusters, but also additional characteristics not explained by the clusters separately. From an isotope perspective, IBIs show a mixed isotope signal of the clusters they are in-between of, with potentially additional information not explained by the clusters. In coastal regions, the so-called sea spray effect results in seemingly marine isotope signatures in terrestrial individuals although never consuming any marine food. When applying the IBI definition on isotope data from coastal regions, it becomes visible that terrestrial individuals more or less affected by the sea spray effect, with accordingly shifted isotope signatures, fall between clusters representing terrestrial and marine diet or habitat groups. Dependent on the respective sea spray magnitude, individuals show different levels of sea spray-related shifts in their isotope signatures. The identification of individuals (potentially) affected by sea spray is mandatory for a more detailed and actually correct analysis of, e.g., their diet, habitat, or provenance, since the sea spray effect leads to misleading or even incorrect isotope patterns. Without considering the bias introduced by sea spray, the interpretation of the isotope data may be misleading. However, a major task is also the identification of those individuals falling close to the (actually correct) terrestrial cluster, thus exhibiting a minor sea spray impact. They should not be grouped with those individuals actually not affected by sea spray, but still need at least some (minor) correction against the sea spray effect. The IBI approach shall, thus, enable a better approximation as well as understanding of the sea spray impact on the isotopic fingerprints of the individuals under study.

1769. Assessing the Feline Surrogacy Approach from the Bronze Age to the Medieval period using

open-access isotopic databases

Authors: Gene Shev (University of Rome Tor Vergata, Department of Biology) – Benjamin Fuller (Aarhus University, Department of Archaeology and Heritage Studies) – Bea De Cupere (Royal Belgian Institute of Natural Sciences, Brussels) – Eric Guiry (Trent University, Department of Anthropology, Peterborough | Simon Fraser University, Department of Archaeology, Burnaby) – Wim Van Neer (Royal Belgian Institute of Natural Sciences, Brussels) – Steven Bouillon (Department of Earth and Environmental Sciences, KU Leuven) – Marcello Mannino (Aarhus University, Department of Archaeology and Heritage Studies) – Claudio Ottoni (University of Rome Tor Vergata, Department of Biology)
Format: Oral

Although domestic cats (Felis catus) are among the most widespread companion animals globally, stable isotope analyses of archaeological domestic cats are somewhat limited. Understanding cat–human dietary relationships through stable isotope analysis is critical for reconstructing when and how cats became such a ubiquitous component of the human niche. Bone collagen stable isotope values of domestic cats and humans analysed by the Royal Belgian Institute of Natural Sciences, the University of Rome Tor Vergata, and Aarhus University have been compiled as part of the ERC FELIX project, spanning from Bronze Age Lebanon to Classical and Medieval period Turkey, Tunisia, Italy, Germany, and Belgium. To assess cat–human isotopic relationships, the use of large reference catalogues and open-access human and fauna isotope databases, including IsoArcH, Isotòpia, and IsoMedIta, have proven crucial for assessing this relationship at multi-regional and multi-temporal scales. We determined that there are 14 sites/periods that contain bone collagen carbon (d13C) and nitrogen (d15N) values of cats and humans. When combining our data (n=88) with online databases (n >750), cats predominantly cluster with humans, being on average only 0.3‰ higher in $\delta^{13}C$ values and 0.3‰ lower in $\delta^{15}N$ values. These results suggest long-standing commensality between domestic cats and humans, and support the potential application of an isotopic Feline Surrogacy Approach, albeit with important caveats relating to archaeological context and physiological differences between cats and humans. Moreover, this study highlights the value of open-access isotope databases for addressing key questions concerning the long-term history of human–animal interactions.

921. Investigating Millet Introduction into Bronze Age Europe: A Large-Scale Multi-Tissue and Multiple Isotope Approach

Authors: Margaux Depaermentier (Faculty of History, Vilnius University) – Christophe Snoeck (Archaeology, Environmental changes and Geo-Chemistry, Vrije Universiteit Brussel) – Michael Kempf (Department of Geography, University of Cambridge | Faculty of History, Vilnius University) – Marine Morvan – Giedrė Motuzaitė Matuzevičiūtė (Faculty of History, Vilnius University)
Format: Oral

During the second millennium BCE, a large-scale and particularly rapid change in subsistence practices has been evidenced by archaeobotanical and stable isotope studies paired with radiocarbon dates. This dietary transformation is linked with the spread of millet across Europe. However, it remains unclear how this previously unknown crop got integrated so widely and suddenly into existing agricultural traditions. To investigate this intriguing transformation, we carried out a large-scale and diachronic multi-proxy isotope study on over 500 Bronze Age individuals originating from the eastern half of present-day Europe, spanning from Latvia to Bulgaria and from Poland to Ukraine. In particular, we address the following questions: Who were the first people who ate millet during its earliest introduction in Europe? What was their socio-cultural or mobility background? Did the introduction of new crops follow a demic or a cultural diffusion model? Are there site-based or regional specificities? We use stable carbon (δ13C) and nitrogen (δ15N) isotope analyses of both dentine and bone collagen, coupled to enamel δ13C and stable strontium (δ88Sr) data to accurately identify dietary shifts related to the introduction of millet at the community and individual levels. Paired with radiocarbon dates, we further track human mobility background using dental enamel 87Sr/86Sr and δ18O data. We complete these results with existing open access isotopic datasets and information from archaeology, anthropology, and genetics. Both an opportunity and a challenge, this multi-proxy and large-scale dataset implies to consider the environmental diversity affecting local isotope baselines and to reflect on the comparability of datasets produced in various laboratories. This approach enables us to investigate millet introduction and related shifts in subsistence and mobility habits at the individual, site, regional and supra-regional scales.

628. Growing Up in the Middle Bronze Age: Diet and Population Change in the Southern Levant

Authors: Lev Cosijns (University of Oxford)
Format: Oral

The Middle Bronze Age (MB, c. 2000/1900–1600 BCE) marks a period of demographic expansion and renewed socio-political complexity in the southern Levant following the depopulation of the preceding Intermediate Bronze Age. Migration has often been proposed as a factor in this resurgence, yet direct, comparative bioarchaeological evidence from modern-day Israel and the southern Levant remains under studied. This paper presents a multi-site isotopic study of MB communities across diverse settlement types and ecological zones in Israel, drawing on funerary assemblages from sites including Ashkelon, Rishon Le Zion, Nahal Refaim and Sasa. Carbon and nitrogen collagen isotopes (δ^{13}Ccol, δ15Ncol) were employed to reconstruct dietary practices and assess inter-site variability. Teeth were preferentially sampled owing to their superior preservation and because dental tissues record

isotopic values from the period of formation. To ensure comparability and avoid weaning effects, adult teeth which are formed post weaning (canines, second premolars, and second molars with similar developmental ages) were targeted. As these teeth mineralise during childhood and adolescence, their isotopic signatures capture dietary and ecological inputs from those life stages, enabling cautious inference about whether individuals spent their formative years with different diets or in different environments. While such offsets do not on their own demonstrate migration, consistent intra-site and inter site differences, evaluated against published, open-access human and faunal baselines, can indicate population heterogeneity and patterns consistent with possible mobility. By examining isotopic variation between smaller rural sites and larger urban centres, as well as across distinct ecological regions, this study assesses whether MB dietary patterns suggest continuity or population change. The paper argues that comparative carbon and nitrogen isotope datasets provide a critical, yet underutilised, means of addressing questions of migration and social change in the MB, while also underscoring the importance of open-access data for strengthening regional and diachronic interpretations.

2706. Compilation of Stable Oxygen Isotopes from Human Sources across Medieval Scandinavia

Authors: Eve Jefferies – A. Ja'Net Baide – Alexandra Greenwald (University of Utah)
Format: Poster

Stable isotope analysis (SIA) is a scientific technique that utilizes natural ratios of chemical elements, such as 18O to 16O, to determine the signature preserved in, for example, human tissues. In archaeology, SIA of teeth and bones can offer insight into mobility, dietary habits, social and environmental interactions (Bataille et al 2021). With the growing interest in understanding human past behaviors, such as migration patterns, utilizing multiple isotopes is the most insightful method. Oxygen is one of the most commonly found isotopes since it reflects the composition of local waters and precipitation, making it strongly influenced by climatic and geographic factors (Bataille et al 2021). This project focuses on the compilation of human sources oxygen data dating to the Medieval Period (1050 -1536 CE) and from across Scandinavia, including Sweden, Norway, and Denmark (Britannica Editors 2026). The archaeological record indicates prominent human activity in association with the Medieval Warm Period (WMP) and continued population expansion following the Little Ice Age (LIA) that emerged around 1300 CE (Primeau et al 2019). Taking all of these factors into account gives a perfect baseline for a research review to deepen our understanding of mobility patterns in the past. We present a compilation of stable isotope oxygen data sourced from human enamel and bioapatite to examine regional differences and diachronic changes across this climatic shift.

151 EXTENDING OUR IMPACT: NEW CASE STUDIES IN APPLIED BIOARCHAEOLOGY

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Catriona Mckenzie (University of Exeter) – Charlotte King (University of Otago)
Keywords: Engaged research, Community Bioarchaeology, Interdisciplinary, Decolonisation
Format: Regular session

SESSION ABSTRACT

Applied Bioarchaeology is research that addresses matters of relevance today, and which actively engages people in the research process in ways that are respectful and relevant to the studied population, their communities, and their descendants. This definition of Applied Bioarchaeology encourages us to expand the type and range of research questions explored, enabling multi-vocal perspectives to enrich approaches and interpretations, to aid us in becoming more creative, imaginative, and inclusive in our approach to science, data, and the creation and dispersal of knowledge. We are seeking papers that (1) demonstrate the important insights that bioarchaeology can provide to modern-day challenges; (2) showcase rich research collaborations which involve the community or people most closely connected to the human remains; (3) explore arts-based interdisciplinary collaborations which enable community groups and/ or bioarchaeologists to tell authentic stories from human remains; (4) provide examples of bioarchaeology affecting change through advocacy and activism; and, (5) address novel approaches for decolonising bioarchaeology. We hope this session will prompt thoughtful discussion from researchers across the EAA community and inspire future research endeavours.

CONTRIBUTION ABSTRACTS

363. A Theory of Change model for community informed repatriation of African American cemetery remains from central North Carolina

Authors: Anne Marie Sohler-Snoddy (University of North Carolina Greensboro) – Kelly Hoag (Smithsonian Institution, National Museum of Natural History) – Derek Skillings – Gwen Robbins Schug (University of North Carolina Greensboro)
Format: Oral

African American cemeteries have long been targeted for exhumation in the face of municipal development in the United States. The Piedmont-Triad region of central North Carolina saw significant expansion in the early-mid 20th century with multiple African

American cemeteries exhumed. These individuals were often given to universities for teaching and research without the knowledge of their relatives. In 2021, G.R.S. was approached by a faculty member from Wake Forest University (WFU) who had used some of these individuals for teaching and was unaware of their complex history. Custody of approximately 30 individuals was transferred from WFU to the University of North Carolina Greensboro (UNCG) where they are now cared for in the Department of Biology. Some of these people will have living relatives in the Piedmont-Triad region who are unaware of their location or even that they were ever exhumed. It is imperative that we 1. Learn as much as possible about the individuals in our care 2. Identify local communities of origin, including any descendants 3. Give communities of origin agency in deciding the best outcome for these individuals and involve them as active collaborators in the project implementation. Here, we propose a Theory of Change informed model for community engagement where custody of unethically sourced legacy collections is concerned. We employ a "backwards mapping" strategy with the desired outcome of repatriation of these individuals to their origin communities and a stepwise approach to achieving this through bioarchaeological analysis, archival research, collection of oral histories, public meetings, and active collaboration with local African American community leaders. We present a framework that can be adapted for use by other researchers who are responsible for the curation of historic human remains acquired without appropriate consent via state sanctioned structural violence.

656. Community-Led Archaeology at Yakmuy 'Ooyákma-tka: Integrated Perspectives at an Ancestral Native American Cemetery

Authors: Ihuixaya Tapia – Gary Velasco (California State University, Monterey Bay) – Alan Leventhal (California State University, San Jose | Muwékma Ohlone Tribe) – Charlene Nijmeh (Muwékma Ohlone Tribe)
Format: Oral

This study highlights and exemplifies the progressive vision and goals of the California Muwékma Ohlone Tribe as it relates to their ancestral heritage sites. In situ burial documentation and laboratory examination of human remains and associated burial practices at site CA-SCL-215 Yakmuy 'Ooyákma-tka (Place of the East Ridge Site) located in San Jose, California, inform this study. The work and research efforts completed here showcase ongoing collaborative efforts with community members most closely connected to the individuals buried at Yakmuy 'Ooyákma-tka and the field of archaeology. Previous collaborative community-led archaeological analysis produced biological profiles to assess the age/sex distribution of the burial population at the site, as well as Isotopic analysis on δ13C and δ15N values to examine dietary variation. Yakmuy 'Ooyákma-tka featured 27 interment burials and 30 non-burial features, which were radiocarbon dated to A.D. 680-990. Burial and laboratory analysis recorded a variation in burial practices, including differences in body positions ranging from supine and flexed to prone. Moreover, based on skeletal positions recorded during excavation, this study suggests that some individuals may have been interred while bound. Grave inclusions and burial practices were also documented; worked shell, lithic artifacts, faunal remains, and antler were recovered and analyzed. Laboratory analysis revealed evidence of various skeletal and dental pathologies, which were interpreted within their mortuary and demographic contexts. Further, patterns observed at Yakmuy 'Ooyákma-tka are contextualized using burial and occupation data from contemporaneous sites within the region. This study constitutes a collaborative community-led archaeology and the Muwékma Ohlone Tribe's efforts to preserve their cultural heritage, inform and educate the scientific community and the public, and further their dedication and persistence toward regaining their federally recognized status.

1692. Whose bones are they anyway? Legal boundaries between person, property and specimen in New Zealand legislation governing human remains

Authors: Charlotte King – Benjamin Dudley Tombs (University of Otago) – Jamie Metzger (Experience Wellington) – Siân Halcrow (University of Otago | Durham University)
Format: Oral

The law governing conduct with anatomical remains for scientific purposes and display has developed over centuries. However, the evolution has been uneven. On one hand, explicit obligations around source donor consent are traceable throughout the 150 years of legislative development. By contrast, legalities underpinning anatomical collections, specifically 'private' collections remain legally ambiguous. As bioarchaeologists seek to further their ethical curation and sometimes repatriation of anatomical collections, they increasingly face this legal grey area between custodianship, possession and ownership. Progress requires engaging with 'property', the laws governing ownership and possession. Theoretically, human remains cannot be 'property' proper, because humans (even dead ones) cannot be 'owned'. This raises initial questions about how a collection can be 'private' in the first place. That said, deceased bodies have no agency beyond those interests articulated by a legally defined 'possessor'. Someone must be in charge. It is a delicate theoretical and practical balance. In New Zealand the topic has the added dimension of some familial tikanga Māori (culturally-correct protocol) rights and interests around the body of the deceased explicitly provided by legislation. This talk outlines the development of the legal expression and practice of bioethical considerations in legislation over time. Exploring where and how the law has navigated issues of consent, disposal, duty of care, possession and ownership. First, we provide a broad overview to the general arc of legislation concerning human tissue. We then highlight and discuss some specific statutory amendments that have demonstrably impacted the practice and curation of human anatomy. We then link the development of bioethical considerations in New Zealand legislation with the introduction of Māori cultural considerations.

1693. Hands-on history: engaging bioarchaeology to connect with our colonial past

Authors: Ruth Warren – Hallie Buckley – Nancy Longnecker – Charlotte King (University of Otago)
Format: Oral

Bioarchaeology has enormous potential to engage audiences beyond academia, bringing past lives into the present. Realising that potential requires moving our work out of laboratories and lecture halls and into communities, inviting people to investigate, interpret, and make meaning from the past themselves. To explore this, we developed Digging up Otago's Past, a multi-week school outreach programme in Aotearoa New Zealand, positioning students as bioarchaeological investigators of nineteenth-century colonial-era life. Guided by ethical protocols for working with human remains, students (ages 7–12; N>70) undertook mock excavations, bone and artefact analysis, archival research, and reflective activities to reconstruct the lives of three real individuals while exploring health, migration, labour, and domestic life in gold-mining and farming communities. Working with deliberately incomplete evidence, they experienced the realities of bioarchaeological interpretation and reflected on why some lives (particularly those of women and marginalised communities) are harder to trace in historical records, and why uncovering and sharing these stories matters. The programme culminated in students creating museum-style displays that presented the lives they had pieced together to peers, teachers, and family, allowing them to experience firsthand how bioarchaeology can bring forgotten histories back to life. Evaluation using pre- and post-participation surveys, alongside a longer-term follow-up, showed high levels of student enjoyment and engagement, alongside measurable gains in understanding bioarchaeological methods, stronger emotional and intellectual connections to people of the past, and sustained interest in archaeology and family history beyond the classroom. This presentation shares the programme's design and evaluation outcomes, offering a practical, evidence-based model for bioarchaeological research that engages communities as active participants and fosters inclusive, multi-vocal perspectives on past lives

1736. Decolonising bioanthropology: Using bioanthropological tools to re-individualize remains from colonial collections and prepare their return

Authors: Sarah Fruendt (German Lost Art Foundation | Expert Network on the Care of Human Remains)
Format: Oral

In recent years, German anthropological collections have come under close scrutiny: Many of them contain human remains collected during colonial times. They were stolen from graves against the explicit wishes of their relatives and were often used for racialized re-search. Often, the shelves of German institutions also store the remains of victims of violent colonial encounters, when they were acquired, for example, during and in the aftermath of the genocide in present-day Namibia. Anthropology as a discipline has slowly come to acknowledge its entanglement in colonial atrocities. However, while it is paramount to assume responsibility in academic and public debates or university education, anthropologists can and should do more. They need to be-come proactive and directly employ their abilities to address past wrongs. Anthropological methods for analysing individual remains can add to the reconstruction of victim's biog-raphies, create enough knowledge for identification of descendants or larger communities of care, and in general help to document past injustices that might not be written down in the (colonial) written record. In this paper, I will draw from my own experiences doing this line of anthropological work, but also offer a bird's-eye perspective on other case studies. I want to show how anthropo-logical methods have aided and prepared repatriation of ancestral remains to descendant communities, and how anthropologists themselves have profited both from the resulting dialogues as well as from the broadening of perspective on the past of their discipline. I want to argue that understanding past research conditions will make us more aware of current threats to use bioarchaeology in the service of politics that might not have the benefit of individuals and their communities at heart.

1661. More than a diagnosis: Syphilis, stigma, and constructing the osteobiographies of those affected

Authors: Kirsten Rutten – Ruth Warren – Hallie Buckley (University of Otago) – Jonny Geber (University of Edinburgh) – Charlotte King (University of Otago)
Format: Oral

Osteobiographies reconstruct individual life stories from bones, but aspects of life experience considered taboo, such as sexually transmitted infections, can complicate interpretation. The enduring stigma, moral judgment, and silence surrounding infections such as syphilis have historically led to the erasure of affected individuals, especially women and children. This study draws on consultation (surveys and interviews) with interested parties to understand how their views can shape osteobiographical narratives about 19th-century individuals affected with sexually transmitted infections. The case studies used are an individual from a frontier gold-mining settlement in Aotearoa New Zealand, and four individuals discovered within a crypt under a military barracks in Ireland. Through these two cases, we provide insight into how social, cultural, and colonial differences may influence perceptions of infection and understandings of past lives. We highlight our efforts to avoid the sensationalisation of sexually transmitted infections, framing syphilis as part of a person's life story rather than a defining characteristic. This approach fosters a more compassionate, context-aware account of past people, avoiding stigmatising and reductive narratives. Additionally, it also advances responsible bioarchaeological practice by portraying people with the nuance and humanity they deserve.

1054. Supporting Death Literacy through the Bioarchaeology of Deathways: An Ethiopian Case Study

Authors: Dil Basanti (School for International Training) – Naomi Mekonen (Independent Artist)
Format: Oral

This talk looks at how bioarchaeology and art can aid in death literacy goals through the reconstruction of deathways. This talk derives from two experiences: 1) using art to communicate archaeology in our host community of Aksum, Ethiopia; and 2) taking these ideas to teach a cross-cultural death and dying program as a bioarchaeologist and learning how students, publics, and non-specialists engage with the materiality of death. The rising study of post-mortem processing in bioarchaeology has allowed for a greater study of deathways, or the chain of practices that a departed and their living community undergo upon death. Deathways are valuable for bringing out the experiential qualities of death rite and to reorient focus from belief to practice. The study of deathways also helps move an understanding of death from grim and exotic to rites of care. This talk looks at how the bioarchaeological reconstruction of ancient Aksumite deathways (50-400 CE) in northern Ethiopia through cut-mark analysis, skeletal inventories, archived records, and histological analysis can forward public conversations in death literacy. It also takes the Ethiopianist perspective that intangible practice may be valued over material remains and how art is used to realize this valuation of heritage. A few art pieces will be shared by community and diasporic artists that demonstrate the impact of reconstructing deathways. Finally, these ideas will be recontextualized within the goals of comparative Death Studies to demonstrate the strength of bioarchaeological research in death education.

1119. Insights into dental health from an Ottoman–early modern human skeletal series discovered at "St. Athanasius" Church in Niculițel, Romania

Authors: Paul Donciu – George Merlușcă ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași) – Aurel Stănică ("Gavrilă Simion" Eco-Museum Research Institute, Tulcea) – Ozana Ciorpac-Petraru ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași) – Luminița Bejenaru ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași | "Olga Necrasov" Center of Anthropological and Biomedical Research, Iași)
Format: Poster

Teeth are a valuable source of information for bioarcheologists, providing valuable insights into age at death, diet, lifestyle, non-masticatory activities, dental morphological variations, and dental health status in past human populations. The identification and analysis of dental pathologies contributes to understanding oral hygiene, dietary practices, and the socio-economic factors that influenced the overall health of past human communities. This study focuses on odontopathies and dental abnormalities in a series of human adult skeletons discovered during the archaeological excavations at the "St. Athanasius" Church of Niculițel (Tulcea County, Romania). Preventive archaeological excavations carried out in 2022–2023, in the area surrounding and inside the church, revealed an extensive cemetery dating to the Ottoman and early modern periods (15th-19th centuries). The dental material belonging to 138 human skeletons was examined macroscopically while details were visualized using a Carl Zeiss Stemi 508 stereomicroscope equipped with an Axiocam 208 camera. Part of the material was examined using X-ray medical imaging with Siemens Multix equipment. The human skeletal remains were previously subjected to age at death and sex estimations. Dental pathologies (i.e., dental caries, periapical lesions, antemortem tooth loss-AMTL, dental calculus) are mainly described in terms of prevalence by age and sex. Dental caries with varying degrees of severity were recorded. In some cases, advanced dental caries are associated with periapical lesions. Among periapical lesions, periodontal cysts showed a higher prevalence. The AMTL occurrence was higher in the male dental series compared with the female dental series. Microdontia and impacted teeth were also reported. This study will provide a deeper understanding of how dental pathologies and abnormalities reflect dental health status, hygiene and diet of past human populations during the Ottoman and early modern periods in Southeastern Romania.

2071. Before research: pedagogical, infrastructural, and geopolitical challenges in teaching bioarchaeology at Greek Universities

Authors: Efrossini Vika (University of Thessaly | American School of Classical studies at Athens)
Format: Poster

The study of bioarchaeology in Greece occupies a unique nexus where heritage research, contemporary geopolitical realities, and evolving pedagogical paradigms intersect. While the discipline has been rapidly growing and several large research projects are being implemented in the country, Greek Universities do not offer dedicated Bioarchaeology studies as a norm. As a result, an increasing number of students is pursuing education abroad, and a two-gear trajectory is being developed between early career scholars across Europe. This study explores how national and geopolitical factors—such as heritage legislation, the tourism driven demand for rapid site assessments, and regional funding disparities—shape research and curriculum agendas at Greek Universities compared to Northern Europe. Issues that further constrain the Greek context include a fragmented governmental approach, limited laboratory infrastructure, and the need to embed ethical considerations surrounding the handling of human remains within the national legal framework. Drawing on case studies from several universities, we discuss actionable measures: 1. designing curricula that embed bioarchaeology as a critical contextualization of well-taught archaeological theory, 2. incorporating open access data repositories to mitigate resource constraints and 3. negotiating joint funding mechanisms with EU programs that earmark infrastructure upgrades for Mediterranean institutions. By addressing these intertwined challenges, the study outlines a roadmap for advancing bioarchaeological education in Greece, in order to be able to retain and train Greek students, but also create a Mediterranean learning network, integrated more fully into the course of European bioarchaeology research.

154 CLIMATE CHANGE AND HERITAGE: ADVOCACY, LOBBYING, CAMPAIGNING, AND FUNDRAISING

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Vibeke Martens (NIKU -Norwegian Institute for Cultural Heritage Research | CCH - Community on Climate Change and Heritage) – Peter Biehl (University of California Santa Cruz | CCH - Community on Climate Change and Heritage)
Keywords: Climate Change, Heritage, Advocacy, Lobbying, Campaigning, Fundraising
Format: Round table
Affiliation: Community on Climate Change and Heritage - CCH

SESSION ABSTRACT

Climate change has profoundly affected human life, material culture, and the environment in the past, and it continues to transform archaeological practice and heritage management in the present — with even greater impacts expected in the future. Although the field has made significant progress in articulating and communicating key positions and recommendations for mitigation and adaptation — such as the (2021 EAA Kiel Statement, 2021 SACC Statement, 2022 SAA Statement — implementation remains a challenge. Limited funding and a persistent lack of recognition of archaeology's relevance, both in the public sphere and within the wider scientific community, continue to hinder progress. This tenth roundtable, organized by the EAA Community on Climate Change and Heritage (CCH), builds on the success of previous meetings and will focus on Advocacy, Lobbying, Campaigning, and Fundraising at local, regional, national, and international levels. We invite representatives of major archaeological associations, as well as specialists in climate change and heritage research and policy, to serve as a sounding board for CCH's ongoing and future activities. The roundtable will also provide: • An update on the community's work since the last meeting; • A discussion of follow-up efforts from the 2025 survey; • Discussions on how to handle loss of sites; • An assessment of current opportunities and challenges; and • Suggestions for next steps to expand the CCH's network and impact. Our collective goal is to strengthen the role of archaeology and heritage in addressing the global climate crisis — identifying effective strategies for adaptation and mitigation, enhancing societal resilience, and improving communication within the professional community and with the public.

155 PROTECTING THE ARCHAEOLOGICAL HERITAGE BY LEGAL INSTRUMENTS AND PUBLIC ENGAGEMENT

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Håkon Glorstad (Community of Archaeological Legislation and Organisation) – Andris Kairiss (Community on the Illicit Trade in Cultural Material)
Speakers: John Carman (University of Birmingham | EAA Heritage Advisory Committee) – Jean-Olivier Gransard-Desmond (ArkéoTopia)
Keywords: International conventions, wars and conflict, citizen science
Format: Round table
Affiliation: Community on Archaeological Legislation and Organisation - ALO, Community on Illicit Trade in Cultural Material, Political Strategies Community - PSC, Public Archaeology Community

SESSION ABSTRACT

Social transformations and escalating crises have created a new awareness of challenges and shortcomings in heritage management and legislation in Europe. Globally, ongoing wars and conflicts have demonstrated the vulnerability of the archaeological heritage despite several international conventions developed and ratified to protect and respect the archaeological heritage. Legislation for protecting the archaeological heritage has also demonstrated shortcomings in relation to an explicit political, scientific and public interest in the archaeological heritage as means for creating a sense of belonging, social cohesion, cultural pride, as well as knowledge democratization through participation in its production. Citizen science is today a fast-growing initiative to engage with research, archaeology and the past that coincide with political visions, but generally lacks an updated juridical framework. At the EAA Belgrade conference, a discussion was initiated for how to highlight the current challenges and find answers to those concerning the juridical management of archaeological heritage. The outcome of this discussion has been to establish two coordinated working groups aimed at establishing pan-European overviews of the situation and a common platform for establishing best practice and policies that may benefit the archaeological communities and make a fruitful starting point for coordinated responses to today's challenges. The aim of this round table discussion is to present status for this work and to prepare the recommendations that have been cultivated for the EAA Board as a general recommendation for archaeological communities in Europe; and to discuss how

these recommendations can be promoted for the Council of Europe and national governments to ensure impact and implementation. The discussion will be introduced by two short key notes summing up the work and status on the ways current international legal instruments and national laws approach: • Cultural heritage in conflicts and wars • Cultural heritage, citizen science and the democratization of knowledge

156 QUANTITATIVE AND EXPERIMENTAL APPROACHES TO USE-WEAR ANALYSIS: METHODS, METRICS, AND WORKFLOWS

Theme: 1. Widening perspectives in material culture studies
Organisers: Tamar Bitchashvili (Institut Català de Paleoecologia Humana i Evolució Social, IPHES-CERCA | Universitat Rovira i Virgili, Dept. d'Història i Història de l'Art) – Julia Cabanès (Histoire Naturelle de l'Homme Préhistorique, HNHP-UMR 7194, MNHN | Institut Català de Paleoecologia Humana i Evolució Social, IPHES-CERCA) – Görkem Yeşilova (Institut Català de Paleoecologia Humana i Evolució Social, IPHES-CERCA | Universitat Rovira i Virgili, Dept. d'Història i Història de l'Art)
Keywords: use-wear, experimental archaeology, surface analysis, microscopy, quantitative analysis, workflow
Format: Regular session

SESSION ABSTRACT

The study of use-wear has advanced significantly with the development of new technologies, particularly in microscopy and quantitative analysis. However, variability in measurements across different types of microscopes and analytical workflows poses a significant challenge to the reliability of interpretations and, above all, the transferability of data. These issues highlight the need for clearer methodological frameworks that connect measurement, analysis, and interpretation in a consistent and reproducible way. This session addresses how quantitative and experimental approaches are reshaping the functional analysis and study of wear formation on stone tools. Recent advances in surface metrology, particularly confocal microscopy, optical light microscopy, 3D digital and scanning electron microscopy, and experimental replication, have made it possible to describe and compare wear traces in a quantitative way. By focusing on the methodological sequence linking surface measurement to analytical outcomes, from data acquisition and parameter extraction to statistical interpretation, the session aims to explore how each step influences our understanding of use-wear formation and variability. It encourages building a stronger bridge between archaeologists and materials scientists on integrating experimental reference data, 3D surface metrology, digital surface analysis, and quantitative modelling to improve functional interpretations. We invite contributions addressing any stage of this process, from experimental design and surface acquisition to data processing and interpretation. Topics may include, but are not limited to, parameter selection, measurement comparability, data reproducibility, and the integration of 2D and 3D image analysis approaches in the experimental context.

CONTRIBUTION ABSTRACTS

838. Effects of Micropolish Sampling Size and Shape on Measurement Reliability

Authors: Antony Borel (HNHP, Muséum national d'Histoire naturelle, CNRS, UPVD, Paris | Institute of Archeological Sciences, Eötvös Loránd University ELTE BTK, Budapest) – Raphaël Deltombe – Philippe Moreau (Université Polytechnique Hauts-de-France, LAMIH, CNRS, UMR 8201, Valenciennes) – Alice Rodriguez – Julie Marteau (UTC, Laboratoire Roberval, Centre de Recherches de Royallieu, Compiègne)
Format: Oral

Quantitative analysis of use-wear traces on stone tools aims to improve the reproducibility of the procedures of data acquisition and data treatment, but it remains highly dependent on the choices made by the analyst at each step of the workflow, from the experimental design to the interpretation of the results. A critical issue is the selection of the measured area, particularly the micropolish extent used as the basis for calculating surface roughness parameters and assigning a wear type. This article assesses the effect of the size and shape of the analyzed micropolish areas on the values of surface roughness parameters. It then examines how representative these values are with respect to the tool's overall wear and discusses potential interpretive biases linked to sampling strategies, especially when phenomena are correlated across multiple spatial scales (micro-roughness associated with gloss, and larger-scale topography influencing contact conditions). Finally, it presents contexts in which the choice of areas is constrained and specifies the conditions under which such areas can nevertheless be used reliably.

1877. New insights into identifying of ichthyofaunal treatment during the Late Mesolithic in south-east Norway through use-wear of knapped stone tools

Authors: Jorge Calvo-Gómez (University of Oslo - Museum of Cultural History) – Ivan Calandra – João Marreiros (LEIZA Leibniz-Zentrum für Archäologie, TraCEr - MONREPOS) – Inger Marie Berg-Hansen – Almut Schülke (University of Oslo - Museum of Cultural History)
Format: Oral

The role of technology in the exploitation of coastal environments by past populations has long been discussed in archaeology. In the Scandinavian Peninsula, due to its distinctive geomorphology, a substantial archaeological record of coastal hunter-gatherers has been preserved. In the contexts dated to Late Mesolithic period (6400-4500 cal. BC), lithic knapped remains represent the majority of technological data available. However, because organic preservation is rare and use-wear analyses on lithic tools are largely unexplored in this region, the role of these artifacts within the technological system remains largely unknown. The MSCA TeCh-Coast project addresses this research gap by developing lithic use-wear analyses at three late Mesolithic sites in the Oslo Fjord area and to characterize the technical choices made by coastal populations. Hence, characterizing the use of stone knapped tools in the processing of marine resources is a key objective for this research. Although previous studies have described microscopic wear associated with ichthyofauna processing, there is still no consensus on qualitative diagnostic use-wear features that reliably distinguish this activity from the processing of other animal soft tissues. This paper proposes a new methodological work to identify quantitative markers discriminating use-wear produced by marine fish processing from that generated by terrestrial animals. An experimental protocol replicating the processing of marine fish and large terrestrial mammals was conducted, and the resulting microscopic wear features were analyzed by laser confocal microscopy. Through surface texture analyses, the study aims to recognize a clear quantitative pattern that allows to distinguish both worked materials. Ultimately, the quantitative texture analyses was applied to archaeological tools showing qualitative use-wear features, interpreted as used for cutting soft animal materials. This data helps to discuss what specific technological choices were made by humans living in the coastal areas, and to understand how technical systems can reflect socially constructed technological knowledge.

2006. How does tribological knowledge impact wear analysis of archaeological materials?

Authors: Görkem Yesilova (Institut Català de Paleoecologia Humana i Evolució Social | Universitat Rovira i Virgili, Dept. d'Història i Història de l'Art)
Format: Oral

Tribology, the study of friction, wear, and surface interactions, provides valuable insights beyond engineering, extending into archaeology for understanding artifact use and production. This review study is discussing wear analysis techniques applied to archaeological materials, focusing on lithic elements, regarding the physical process of formation of wear concept. Both microscopic and macroscopic wear patterns, such as striations, polish, edge rounding etc. are discussed as indicators of material use and production, contact materials, and motion types. Methods such as optical microscopy (OM), scanning electron microscopy (SEM) and 3D profilometer, and experimental replication studies are critically reviewed for their effectiveness in interpreting traces. The synthesis of this review (in the light of experimental and bibliographic data) research highlights how tribological principles can elucidate wear mechanism of archaeological material, while also identifying limitations and challenges in standardizing wear analysis in archaeological contexts. This review highlights the interdisciplinary potential of tribology and wear studies for understanding the physics of wear rather than focusing on the archaeological story telling about the materials.

2118. Frozen in motion: A controlled in vitro experiment on freeze–thaw effects on lithic movement and use-wear patterns

Authors: Areti Leventi (Faculty of Archaeology, Leiden University) – Mickaël Baillet (School of Art and Archaeology, Zhejiang University | Faculty of Archaeology, Leiden University) – Veerle Rots (The Fund for Scientific Research F.R.S.-FNRS | TraceoLab, University of Liège) – Dries Cnuts (TraceoLab, University of Liège) – Joao Marreiros (Universidade do Algarve ICArEHB | Leibniz Zentrum für Archaeologie LEIZA, MONREPOS) – Morgan Roussel – Annelou Van Gijn (Faculty of Archaeology, Leiden University) – Vera Aldeias (Universidade do Algarve ICArEHB) – Marie Soressi (Faculty of Archaeology, Leiden University)
Format: Oral

Frost-induced displacement of artifacts is well-documented at Pleistocene archaeological sites across Eurasia, yet the magnitude of movement and the associated surface alterations produced by repeated freeze-thaw cycles remain poorly understood. Distinguishing use-wear from frost-induced wear traces is therefore difficult. Previous in vivo or in vitro experiments reported minimal displacement, contradicting archaeological evidence for freeze-thaw-driven spatial redistribution at Pleistocene sites. They also described only modest frost-related surface modifications (e.g. polish) due to short experimental durations and few cycles. In addition, many field-based studies offer limited control over key variables. We conducted a long-term in vitro freeze-thaw experiment in a climatic chamber to evaluate frost-driven artifact displacement and surface modifications after 42, 330 and 600 cycles. This controlled design allowed us to assess cumulative effects across contrasting sedimentary contexts and lithic types. Experimental sediments varied in grain size and composition, including fine-grained clay; coarse and fine sands; gravel mixed with clay; and a fine-grained silt-sand fraction sieved from sediments collected at the Pleistocene site of Quinçay cave (France). Sediment volume, water saturation, temperature fluctuations (ambient and within the sediment), and artifact deposition were controlled. The assemblage comprised unused flakes and cut flint blocks of comparable size and weight, as well as scrapers, Châtelperronian-type points, and bladelets previously used on hide, wood and bone. After 330 cycles, lithics in fine-grained sediments showed substantial uplift, commonly reorienting toward vertical positions and migrating toward the surface, whereas movement in sandy sediments remained limited. After 600 cycles, lithics exhibited net downward movement, and smaller pieces rotated more frequently. Microwear analysis indicated that polish formation was strongly sediment-dependent. These results demonstrate that prolonged freeze-thaw activity can significantly redistribute lithics and generate diagnostic surface modifications, providing a robust framework for reconstructing post-depositional processes and interpreting use-wear on Pleistocene lithic assemblages.

2224. Integrating experiments and multi-microscopy approaches to investigate wear formation on different raw materials

Authors: Julia Cabanès (Muséum National d'Histoire Naturelle - UMR7194 HNHP | Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA) – Tamar Bitchashvili (Institut Català de Paleoecologia Humana i Evolució Social - IPHES-CERCA | Dept. Història i Història de l'Art, Universitat Rovira i Virgili)
Format: Oral

Artefacts made from diverse raw materials exhibit different wear formation patterns, even under similar use conditions. Controlled experiments provide a way to observe and describe these differences to understand material-specific wear features. This study presents an approach based on experiments and various microscopic techniques to track wear formation across a variety of raw materials under controlled conditions. Flakes of various raw materials were used in identical actions and conditions, and examined sequentially (before and after use) by combining complementary microscopic techniques, such as optical, 3D digital, and confocal microscopy, to provide a multi-scale and multi-dimensional perspective on wear formation. By integrating qualitative and quantitative analyses, we explore how the combination of different microscopes can capture surface modifications in order to identify characteristic features of use-wear, especially related to the stone tool raw material. Depending on the microscopy technique employed, the data obtained may either be cross-validated or provide complementary information specific to the analytical capabilities of each microscope.

2629. From Data Acquisition to Interpretation: Analytical factors affecting reliability and comparability in quantitative use-wear analysis

Authors: Tamar Bitchashvili – Andreu Ollé (Institut Català de Paleoecologia Humana i Evolució Social, IPHES-CERCA | Universitat Rovira i Virgili, Dept. d'Història i Història de l'Art) – Antony Borel (HNHP, Muséum national d'Histoire naturelle, CNRS, UPVD, Paris | Institute of Archaeological Sciences, Eötvös Loránd University ELTE BTK)
Format: Oral

Quantitative 3D surface texture analysis has become an important tool in archaeological use-wear studies, providing objective data for the functional interpretation of stone tools. However, the analytical process involves multiple stages, from data acquisition to parameter extraction and interpretation, and each can affect research outcomes. The reliability of quantitative use-wear characterisation depends on measurement strategies and analytical workflows. Additionally, differences in data processing and parameter selection may introduce variability that influences the consistency and reproducibility of results across studies. In this study, experimental flint tool surfaces were acquired using high-resolution confocal microscopy and processed with standardised surface texture parameters. By systematically varying analytical procedures, we evaluate how methodological differences influence the recognition and differentiation of use-related surface modifications. The results underscore the value of consistent analytical approaches for strengthening and improving the comparability of quantitative use-wear research. This work contributes to improving methodological transparency and supports the integration of quantitative techniques into functional archaeological interpretations.

187. Setting Clay in Motion: Rotational Devices and Workshop Organisation in Cucuteni-Trypillia Pottery Production

Authors: Pintilie Camelia – Maria Ciobanu (Faculty of History, "Alexandru Ioan Cuza" University of Iași) – George Bodi (Arheoinvest Center, "Alexandru Ioan Cuza" University of Iași) – Adrian Tencariu (Institute of Interdisciplinary Research, "Al. I. Cuza" University of Iași)
Format: Oral

This paper brings together two complementary lines of inquiry into Chalcolithic pottery production in the Cucuteni-Trypillia world. On the one hand, it examines the technical evidence for the use of rotational devices in vessel manufacture; on the other, it places such tools within the broader evolution of pottery workshops, from small-scale and probably mobile production contexts to more structured intra-settlement environments. Recent excavations at Cucuteni-Cetățuia, together with older finds from Buznea, Costești and Brânzeni, have revealed large vessel bases bearing spiral mat impressions and internal thinning marks. These traces suggest the use of a rotational device equipped with a woven mat fixed to the moving surface, likely functioning as a precursor to the potter's wheel. To test this hypothesis, we carried out an experimental programme involving the reconstruction and use of such devices in combination with coiling techniques and surface treatment with wooden tools. The experiments showed that rotational support not only facilitated and accelerated modelling, but also reproduced the macroscopic traces observed on the archaeological material. These results are considered within a wider interdisciplinary research framework on pottery production centres in Chalcolithic eastern Romania, combining excavation, geomagnetic survey, archaeometry analyses, ethnoarchaeological analogy and experimental archaeology. Settlement expansion, increasing standardisation and the emergence of larger communities appear to have been accompanied by changes in workshop organisation, resource management and firing infrastructure. In this context, rotational devices can be understood not simply as isolated technical improvements, but as part of a broader reorganisation of ceramic production. By linking tools, gestures, workshop settings and production demands, the paper explores how innovation was embedded in technological traditions and in the social worlds of prehistoric potters. This work was supported by a grant of the Ministry of Research, Innovation, and Digitization, CNCS-UEFISCDI, project number PN-IV-P1-PCE-2023-0040.

157 SENSE & SUSTAINABILITY II: ARCHAEOLOGICAL TOURISM FOR PEOPLE, PLACES, AND PLANET

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Sofia Fonseca (ICArEHB, Algarve University | German Archaeological Institute, DAI) – Sanjin Mihelić (Museum of Arts and Crafts in Zagreb) – Ben Thomas (Society of Architectural Historians)
Keywords: Archaeological tourism, Sustainable heritage management, Community engagement, Resilience, Museums and climate adaptation
Format: Regular session
Affiliation: Community on Archaeology and Tourism

SESSION ABSTRACT

In an age increasingly defined by permacrisis—a condition of ongoing environmental, social, political, and economic instability—archaeological tourism and heritage management must reimagine their purposes and responsibilities. This session, proposed by the EAA Community on Archaeology and Tourism, explores how archaeological sites, museums, and cultural landscapes can remain agents of resilience, learning, and regeneration amid overlapping crises. Building upon the discussions leading to Sense & Sustainability II (Split, 2027)—marking the UN International Year of Sustainable and Resilient Tourism—this session invites contributions that rethink tourism as a tool for sustainability rather than strain. We welcome case studies and critical reflections that illustrate inclusive governance models, value-based management, climate-aware operations, and community participation in decision-making. Contributors are encouraged to show how archaeological tourism can support the protection of heritage while generating social and environmental benefits—ensuring that visitor engagement strengthens rather than undermines conservation goals. Emphasis will be placed on lessons learned, adaptable methodologies, and cross-sector collaborations that turn fragility into opportunity. By integrating research, practice, and policy, the session aims to outline a collective agenda for archaeological tourism that serves people, sustains places, and safeguards our shared planet—affirming the continuing relevance of heritage in a world of permanent change.

CONTRIBUTION ABSTRACTS

298. Resilient Archaeological Tourism in Styria (Austria) under Conditions of Permacrisis

Authors: Marko Mele (Universalmuseum Joanneum)
Format: Oral

The archaeological landscapes of Styria (Austria) encompass key periods of European prehistory and antiquity, from the Roman municipium of Flavia Solva to the Iron Age burial mounds and settlement remains of Großklein. Despite their high archaeological value, much of archaeological heritage remains poorly visible and insufficiently recognised—often even by local communities—as a potential resource for social, cultural, and economic development. These challenges are intensified by climate change, land-use pressure, limited resources, shifting visitor expectations, and growing competition within the tourism sector, conditions increasingly described as permacrisis. This paper explores how archaeological tourism can be repositioned from a potential source of strain into a tool for resilience and sustainability. Drawing on case studies from Flavia Solva and Großklein, and on the institutional framework of the Universalmuseum Joanneum, it examines value-based and climate-aware heritage management approaches that balance conservation priorities with public engagement. The two sites illustrate complementary challenges: the presentation of extensive but largely invisible archaeological remains and the long-term management of a sensitive archaeological landscape. Particular emphasis is placed on inclusive governance models involving museum professionals, heritage authorities, local communities, and regional tourism stakeholders. The paper argues that sustainable archaeological tourism depends on empowering local actors through dialogue, capacity-building, and shared decision-making. Initiating conversations with local stakeholders emerges as a key step in raising awareness of heritage values, strengthening local identification, and developing realistic, place-based tourism initiatives such as slow tourism and participatory interpretation.

1157. Little Did She Know. From Stone Age Life to Sustainable Tourism

Authors: Christina Toreld (Picea Kulturarv) – Pia Hansson (Inredningsarkitekt SIR) – Cia Säll (Lysekils Municipality)
Format: Oral

10000 years ago, an old woman lived on a large island where resources were plenty, both on land and in the sea. The woman died in her eighties and her dear ones buried her at the beach. Thousands of years passed, and the island eventually became mainland. The remains of the Stone Age woman were preserved in the seashells at a place we now call Österöd, situated in Lysekils municipality on the Swedish west coast. The story and the impact of the Stone Age woman have engaged a wide range of people, from heritage professionals to local citizens, municipalities and national media. From the dramatic discovery of her remains by farmers digging a post glacial shell bank to gather material for chicken feed production in the early 20th century, to her playing a significant role shaping an Experience Development project aiming to strengthen culture, tourism and places in a sustainable ecosystem. This paper will present a woman's journey in time, and how to manage a woman´s legacy in a dignified, sustainable, participatory,

educational and yet, attractive way.

1618. Community-Led Archaeological Tourism as a Strategy for Sustainability and Resilience in Nigeria and Southern Europe

Authors: Zainab Popoola (Community Integrating the Management of Archaeology and Tourism)
Format: Oral

Archaeological tourism is increasingly promoted as a pathway for heritage sustainability, education, and local economic development. However, in an era of ongoing permacrisis, characterised by climate change, economic uncertainty, governance instability, and social transformation, the long-term viability of archaeological tourism depends on more than visitor numbers or institutional management. This paper examines community-led archaeological tourism as a strategic response to sustainability and resilience, drawing on comparative reflections from Nigeria and Southern Europe. The paper explores how local communities in urban and peri-urban contexts in Nigeria shape archaeological tourism through grassroots custodianship, informal governance structures, and everyday heritage practices, often in the absence of strong institutional support. These experiences are contrasted with selected cases from Southern Europe, where archaeological tourism is typically embedded within formal heritage frameworks, professional management systems, and regulatory institutions. While European contexts benefit from policy continuity and resource investment, they frequently face challenges related to overtourism, climate vulnerability, and limited community agency in decision-making processes. By placing these contexts in dialogue, the paper argues that community-led approaches are not peripheral or supplementary but central to sustaining archaeological tourism under conditions of prolonged crisis. Grassroots participation fosters adaptability, local relevance, and environmental sensitivity, while institutional frameworks offer protection, visibility, and long-term planning, yet risk disconnect from lived heritage realities if not meaningfully inclusive. The paper contributes to debates within archaeology and tourism by reframing sustainability as a governance and value-based challenge, rather than a purely managerial one. It proposes that resilient archaeological tourism emerges through negotiated relationships between communities and institutions, offering transferable insights for archaeologists, heritage managers, and tourism practitioners seeking inclusive, climate-aware, and socially grounded approaches to archaeological tourism across diverse regional contexts.

1892. Using archaeological heritage in the city as a sustainable solution to the threat of overtourism – the example of Wrocław

Authors: Damian Werczyński (Institute of Geography and Regional Development, University of Wroclaw)
Format: Oral

Wrocław, a major city in Central Europe, is becoming an increasingly popular tourist destination year after year. This is evidenced by the record-breaking number of visitors in recent years (6 million in 2023, 6.6 million in 2024), as well as the growing number of new attractions appearing on the city's tourist map. These positive trends also bring certain consequences, including the negative effects of overtourism, which are increasingly noticeable in both summer and winter seasons. At the same time, Wrocław, a very old city with a rich and complex history, boasts a vast number of archaeological relics, only some of which have been utilised so far. Focusing on the archaeological heritage of medieval and early modern times, this article aims primarily to identify the scale and manner of its current use in the creation of tourism products. The analysis highlights both successful examples and those that ended in failure or utilised the potential of archaeological relics only to a very limited extent. A natural continuation of this presentation and the second goal of this article is to identify selected places and objects for the creation of new products, while also proposing the most appropriate ways to present and interpret them to tourists. Utilising the tourism potential of Wrocław's archaeological heritage is one of the solutions that, by proposing new products, such as urban cultural trails, attempts to disperse the excessive concentration of tourist traffic focused on a few main attractions.

2115. Who Is Archaeological Tourism For? Advocacy, Accountability, and Public Interest in Croatian Heritage Practice

Authors: Sanjin Mihelic (ICOMOS Croatia)
Format: Oral

In Croatia, archaeological tourism increasingly operates at the intersection of heritage protection, real-estate development, and destination marketing. While international instruments promoted by ICOMOS emphasise public interest, precaution, and long-term stewardship, everyday practice often reveals a widening gap between declared principles and operational realities. Archaeological sites are frequently mobilised to legitimise development projects, while decisions about their management remain only weakly transparent and insufficiently participatory. Drawing on recent case studies from coastal, urban, and insular contexts, this paper examines how archaeological research and rescue excavations are routinely followed by renewed development pressure and reduced professional influence. It documents recurring patterns in which heritage values are acknowledged rhetorically but subordinated in planning processes, and in which public presentation is treated as a compensatory gesture rather than a core responsibility. At the same time, the paper highlights situations in which archaeologists, conservation authorities, and civil society actors have successfully invoked ICOMOS principles to defend public interest and environmental limits. The paper argues that archaeological tourism must be understood primarily as a governance issue rather than a marketing sector. It advocates for stronger institutional accountability, clearer mechanisms for community participation, and the systematic application of heritage impact assessment and precautionary approaches. Drawing on Croatian examples, it demonstrates how advocacy grounded in professional ethics and international standards can counter extractive tourism models and strengthen local stewardship. Finally, the paper situates these reflections within the lead-up to Sense & Sustainability II in Split (2027), organised in the framework of the UN International Year of Sustainable and Resilient Tourism. It proposes the conference as a platform for consolidating advocacy-oriented practice and reinforcing the role of ICOMOS as an active partner in shaping socially just and environmentally responsible archaeological tourism.

2664. Bridging the Depths: Underwater Cultural Heritage Protection and Mediation at Vrak – Museum of Wrecks

Authors: Susana Vallejos (Vrak-Museum of Wrecks/Swedish National Maritime, Transport and Military Museums)
Format: Oral

Vrak – Museum of Wrecks is the newest addition to Sweden's maritime museum landscape and the first museum to present the underwater cultural heritage of the Baltic Sea as a unified whole. By adopting a transnational perspective that encompasses the entire Baltic Sea region, shared by eight countries and numerous past and present communities, Vrak moves beyond national narratives to frame the Baltic Sea as a shared space that has connected people and shaped human experience for millennia. The museum focuses on maritime archaeology and a submerged cultural heritage shaped by the Baltic Sea's unique environmental conditions: brackish, cold, dark, and oxygen-poor waters largely free from wood-degrading organisms. These conditions have preserved an estimated one-hundred thousand shipwrecks, along with countless other traces of human activity, in exceptional condition. Vrak is grounded in a central question: how can underwater cultural heritage be made accessible to diverse communities, bridging the gap between people and a cultural heritage that many are still largely unaware of, because it lies beneath the surface, including those who will never have the opportunity to dive themselves? Rather than treating this heritage as something to be salvaged, conserved, and displayed, the museum is founded on the principle of in situ preservation. By leaving wrecks where they lie, Vrak supports long-term sustainability of heritage while employing non-invasive methods for research, documentation, and public engagement. Advanced archaeological approaches, combined with innovative visualization and presentation techniques enable Vrak to investigate sites without disturbing them and to render an otherwise hidden heritage visible and meaningful to people. This presentation explores how Vrak integrates research, preservation, and technology to bridge the gap between people and the submerged cultural heritage of the Baltic Sea, while simultaneously challenging traditional museum practices centered on physical collections.

191. INHERIT – Revolutionising Heritage Conservation through Hiking and Digital Innovation

Authors: Marija Maric (University of Novi Sad, Faculty of Philosophy)
Format: Poster

The INHERIT (Hiking Heritage Trails) project, funded by the Creative Europe Programme, introduces a groundbreaking model that transforms outdoor enthusiasts into Hiking Heritage Protectors—certified guides trained to safeguard, document, and promote archaeological and historical sites in remote mountain regions. Heritage sites across Europe often suffer from neglect due to inaccessibility and limited institutional resources. INHERIT addresses this challenge with a sustainable, community-driven approach to heritage preservation. By harnessing the untapped potential of mountaineers, equipping them with cutting-edge digital tools, and fostering cross-sector collaboration, this initiative bridges the gap between adventure tourism and cultural heritage protection. The project, developed by partners from Serbia, Slovenia, Austria, and Portugal, is structured around four key pillars: 1. Education and Training – Establishing a certification program that empowers mountain guides and heritage professionals to become active stewards of cultural sites. 2. Digital Innovation – Creating a Smart Digital EU Interactive Map that connects hiking trails with heritage sites, featuring real-time data collection and a gamified mobile app to engage a broader audience. 3. Public Engagement – Elevating the visibility of neglected heritage through eco-tourism initiatives, media outreach, and community events, reaching thousands across Europe. 4. Sustainability and Policy Impact—Integrating the Hiking Heritage Protector certification into EU policy frameworks will ensure long-term institutional support and economic benefits for rural communities. By redefining the role of outdoor tourism in heritage conservation, INHERIT is setting a new standard for how Europe safeguards its cultural legacy. The project will culminate in a high-profile symposium in Portugal, bringing together policymakers, heritage experts, and outdoor professionals to scale this pioneering model across Europe and beyond. This ongoing initiative is not just setting new standards in cultural heritage preservation—it invites all EU countries to shape its future actively.

160 FEASTING AS SOCIAL IDENTITY AND THE CHANGE IN MATERIAL CULTURE CONSUMPTION IN THE LATE MEDIEVAL AND EARLY MODERN PERIODS

Theme: 1. Widening perspectives in material culture studies
Organisers: Stuart Whatley (Museum of Copenhagen) – Georg Haggren (University of Turku) – Joakim Kjellberg (Medeltidsmuseet Stockholm & Upplandsmuseet) – Tania Casamiro (University of Stirling)
Keywords: Material culture, Consumption, Social Identity, Late medieval, Early modern, Trade
Format: Regular session
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

Between the late medieval and early modern periods there was a significant transformation in material culture linked to social identity and the consumption of food. New ceramic forms and styles were complimented by new glass and metal objects and a revolving array of food and drink options. These were combined with new social practices of eating and drinking. These changes were occurring alongside the increasing effects of globalisation where drinks like cacao, coffee and tea were consumed from new porcelain cups and saucers. Recent archaeological excavations in Northern Europe have played an important role in highlighting these transformations. Excavations of households, rubbish pits, harbour bases, moat backfills, and land reclamation sites from the late medieval and early modern periods have provided evidence of evolving personal identities as reflected in material culture. Sites include an early modern landfill excavation site in Copenhagen and harbourside excavations such as Slussen, Stockholm, and the North/South metro line, Amsterdam. Here, finds assemblages are diverse, a combination of local, national, and international objects from different areas worldwide. This session aims to investigate both the causes, timing, and nature of material culture changes alongside food and drink consumption by comparing excavation datasets not only within Northern Europe but also in the Atlantic and Mediterranean zones. It also seeks to identify if there are potential patterns of transformation in material culture. It invites papers from excavations that provide interesting evidence of material culture change that examines consumption habits and the performative aspects of eating and drinking.

CONTRIBUTION ABSTRACTS

1785. Eastern Aesthetics, Changing Manners: How Eastern Ceramics Re-Scripted European Table Behaviour

Authors: Tania Casimiro (University of Stirling)
Format: Oral

Between the late medieval and early modern periods, European dining shifted from relatively stable local repertoires toward rapidly changing global regimes of display. This paper, drawing from Portuguese archaeological contexts, argues that the importation of Eastern ceramics, and the subsequent European appropriation of Chinese symbols in its own productions did more than diversify table wares. It re-scripted the social grammar of feasting. Porcelain's material qualities (whiteness, translucency, thinness) and its visual programs (landscapes, flora, auspicious motifs, pseudo-marks) became legible as cosmopolitan signals, enabling diners to stage identities that were simultaneously domestic and world-facing. I focus on how Chinese forms and iconographies were absorbed into European practices of eating and drinking, shaping the choreography of the table, such as the rise of dedicated drink wares for tea, coffee, and cacao and the multiplication of small, specialised vessels. As Chinese symbols were reinterpreted through European frameworks, first as authentic signs of distant origins and later as stylised chinoiserie, they generated new hierarchies of taste and new forms of sociability, including curated display, conversational referencing of provenance, and the moralisation of restraint and elegance at the table. By treating ceramics as active participants in feasting, the paper links globalisation to embodied conduct and aesthetic judgement, showing how material culture change was inseparable from changing ways of being seen, and seeing oneself, through food consumption.

1912. Social identity and material culture consumption from the late 1500-1750 in Copenhagen

Authors: Stuart Whatley (Museum of Copenhagen)
Format: Oral

Public practices related to eating and drinking underwent significant transformation from the late medieval period to the Early Modern era. Trade and international influences substantially altered local dining customs, fostering an increasingly integrated European approach that incorporated ceramic, glass, and a range of tablewares imported from other European countries and, subsequently, from East Asia. These changes facilitated the introduction of new foods, culinary techniques, and standards of etiquette, all of which contributed to the development of social identities and indicators of status. In this context, it is important to consider Copenhagen's position relative to other cities in Denmark and Northwest Europe: did the city reflect broader continental patterns, or did it exhibit distinctive features? A recent excavation of an early modern landfill site in Copenhagen has initiated an in-depth investigation into social identity and feasting practices of the period. The anticipated recovery of approximately 500,000 artefacts offers a valuable opportunity for comprehensive analysis of consumption patterns, incorporating evidence from local, national, and international sources throughout Scandinavia, Europe, and further afield. This paper investigates the relationship between social identity and changes in material culture related to eating and drinking practices, focusing on glass and ceramic vessels to elucidate broader consumption patterns in Copenhagen. The study incorporates new findings from the Amaliegade 44 excavation alongside data from previous excavations.

1124. "The city between the bridges" – Understanding landfills and material culture consumption in medieval and early modern Stockholm

Authors: Joakim Kjellberg (The Museum of Medieval Stockholm) – Philip Tonemar (Arkeologikonsult AB)
Format: Oral

Stockholm, like many medieval coastal towns, was largely built on landfill composed of mixed soils and household refuse. Archaeological evidence of harbour quays, piled constructions, sunken ships, and buildings erected on platforms extending into the water demonstrates how the medieval town expanded into a maritime environment. In historical sources, Stockholm was known as "the town between the bridges", reflecting how everyday life and livelihoods were closely entangled with water. Despite this close relationship, landfill deposits and submerged urban spaces have remained underexplored in archaeological research on medieval Stockholm. This is largely due to poor documentation of early dredging operations conducted in the early twentieth century. More recent excavations, notably at Helgeandsholmen in the north and Slussen in the south of the medieval urban core, have produced extensive assemblages of material culture that offer new opportunities to investigate urban life, waste practices, and waterside land use. At Helgeandsholmen, excavations conducted between 1978 and 1980 uncovered a large medieval landfill dated to the early fourteenth century, containing ceramics, leather artefacts, and animal bones, likely associated with the nearby House of the Holy Spirit. Interpreted at the time as a secondary and unintentional dumping ground, the assemblage was not prioritised for detailed analysis and has remained largely unexplored. A renewed research project at the Museum of Medieval Stockholm is now re-examining this material for future exhibitions. In parallel, archaeological monitoring of dredging during construction of the new Slussen lock has recovered tens of thousands of artefacts from shoreline contexts along Södermalm. Their volume and spatial distribution allow long-term perspectives on waste management, land use, diet, trade networks, and craft production. This paper presents initial results from ongoing research into Stockholm's medieval landfill sites and discusses their potential for comparative studies in towns around the Baltic and Northern Europe.

2394. Glass finds indicating beverages related to the dining culture in the early modern Scandinavian towns

Authors: Georg Haggren (University of Turku | University of Helsinki)
Format: Oral

Large scale urban excavations have been recently made in several late medieval and early modern Scandinavian towns like Copenhagen in Denmark, Stockholm in Sweden and Turku in Finland. They are flourishing cities still today. Another kind of example is Nya Lödöse which was a small Swedish medieval town founded in 1473 and deserted in the early 1620s. Locating on the estuary of the River Götaälv it was Sweden's gate to the west, and a lively port with close connections to Dutch, Flemish, German and Scottish towns. It was also a predecessor of the later city of Gothenburg founded in 1621. The urban history of Nya Lödöse lasted only 150 years. However, in between there was a 30 years' period when the town was transported to another site and the site was completely deserted. During this period, between 1540 and 1571 several changes related to the dining culture took place. Glass finds illustrate this era of transition, an era when medieval drinking habits turned to early modern dining culture. In the 2010s large scale excavations were made in the site of Nya Lödöse. The area is today known as a suburb of Gothenburg called Gamlestaden. During this rescue archaeological project called "Staden Nya Lödöse" dozens of plots were excavated by modern contextual methods. Analyzing these plots and urban households we can see how glass vessels became more common during the last decades before the town was deserted in the 1620s. Different types of beakers were used when drinking different beverages. Glass finds indicate drinking beer and wine, and probably enjoying stronger spirits too. Recent finds from other northern towns offer us a wider context for making comparative analyses related to changes in the dining culture.

2626. Changing town, changing tableware? The case of Tartu, Estonia from the 16th to the 18th century

Authors: Arvi Haak (Tallinn University, Archaeological Research Collection | Tartu City Museum)
Format: Oral

For Tartu, an inland town in south Estonia, the Early Modern Period clearly meant a decline in significance: a former Hanseatic town became a provincial town of only regional significance. However, the development was more nuanced, as the 17th-century university probably enhanced contacts within that sphere. In spite of the apparent decline in the town's status, the reflections of globalisation can be traced, affecting the dining sphere of the townspeople. While the abundantly excavated cesspit complexes offer a chronologically ordered overview of the changes in the dining sphere, only a few such complexes can be dated to the 17th century. Later developments can be traced from the demolition debris deposits of the Great Northern War (1700–1708 in Tartu) and the subsequent destruction of the town. In recent years, several large-scale urban excavations have provided new material to discuss the development during the Early Modern Period. The changes in ceramic consumption affected both local pottery workshops, which started producing glazed redwares, sometimes also painted, and imports. The latter concentrated on faience and especially from the 18th century onwards, also porcelain. These were symbols of conspicuous consumption which reached the wealthier households of the town. The presentation will include a comparison of the situation in Tartu with the investigated assemblages from other towns, most notably Tallinn, to establish whether there are significant differences between Estonian coastal and inland towns.

2027. European ceramics on the border of the Ottoman Empire: discoveries from the Lower Danube (XVIII – XIX century)

Authors: Niculina Dinu (Museum of Braila "Carol I" Romania)
Format: Oral

Since the conquest of Dobruja and the few points on the left bank of the river, the Ottoman Empire made its presence felt through a change in diet but especially through the fairly early adoption (16th century, most likely towards the end of it) of coffee and the

entire ceremonial for serving it. Once introduced, this custom also involves the import of new utensils and containers. Although for the 16th – 17th centuries the most archaeologically documented are Iznik plates and mugs and only from the 18th century are the coffee cups from the workshops in Kutahya, it is observed that the preference of the capital Istanbul for Chinese or European porcelain cups is also transposed in the Lower Danube area. Archaeological research undertaken in two areas that evolved almost the same way over at least two and a half centuries almost identically – Brăila, a fortress on the left bank of the Danube (1540 – 1821) and the city of Ester, a city in Dobrogea (early 16th – 19th centuries) have indicated this phenomenon. Both cities whose role was mainly commercial knew the ceramics from the Ottoman Empire but also the products of China or Western and Central Europe. For Brăila, since the early 19th century, the transition from Ottoman ceramics to European products is observed; for Ester, occasional discoveries show that the interest in Western products was at the same time as the other cities/territories that were under Ottoman influence: many fragments of Western pottery made especially for the Ottoman world – plates, cups and mugs belonging to the workshops of Sarreguemines, Meissen or those of England and Germany. The multitude of shapes and qualities of the products show that the products of Western Europe are accessible to the population of this part of the empire.

161 CITIES UNDER THREAT (ἐν κινδύνῳ): RESPONSES TO CATASTROPHES, 8TH C. BC–4TH C. AD

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Nadia Coutsinas (CReA-Patrimoine, Université Libre de Bruxelles) – Katerina Panagopoulou (Department of History & Archaeology, University of Crete) – Vassilis Evangelidis (ILSP/Athena Research Center) – Maria Xanthou (University of Bristol) – Nikos Akamatis (Academy of Athens)
Keywords: Resilience, Natural disasters, Catastrophes, Disruptions, Urban studies
Format: Regular session

SESSION ABSTRACT

This panel explores the strategies employed by cities across the Greek and Roman world to recover from natural disasters and violent disruptions of everyday life — including earthquakes, droughts, tsunamis, floods, fire, wars, and invasions. Drawing upon a broad range of case studies, we aim to examine whether, to what extent, and how ancient communities anticipated, experienced, and managed such crises, and to illuminate the social and political mechanisms that sustained urban life in times of acute peril. Key questions include: to what extent did they prepare in advance for natural phenomena or for warfare? When did systematic provisions for such contingencies emerge? Were such measures more coherent or institutionalised in the Hellenistic and Roman periods than earlier? How can we distinguish between individual agency and collective civic initiatives in responding to disruptive events? How did individuals and communities cope with the social, economic and psychological consequences of violent overturns in life (including recovering from post-traumatic stress disorder)? Particular attention will be given to the role of the embedded social and political networks that enabled the effective management of these challenges, shedding light on the diverse ways in which different urban communities fostered resilience and launched collective responses towards recovery. The panel welcomes interdisciplinary approaches and contributions that engage with archaeological, epigraphic, numismatic, literary, and papyrological evidence, in order to advance a nuanced understanding of catastrophe management in the ancient Mediterranean world.

CONTRIBUTION ABSTRACTS

579. Destructive earthquakes in antiquity; the case of Pella, Macedonia

Authors: Nikos Akamatis (Independent Researcher)
Format: Oral

Throughout the ages, natural destructions played a significant role in the evolution of human life. In some cases, their consequences were so severe that even large cities could be wiped out. One such case is ancient Pella, one of the largest and most important cities of ancient Macedonia that was destroyed, almost completely, because of a devastating earthquake in the beginning of the 1st century BCE. After the earthquake the city was only sporadically inhabited. Several years later, a new city was founded, approximately 1.5km to the west, the Roman colony of Pella. In this presentation, the archaeological data that is connected with this destruction is going to be presented. The presentation will focus on the evidence that supports the destruction of the city by an earthquake, otherwise unattested in literary sources, the chronological framework and the response of the citizens to this massive destruction. Furthermore, similar phenomena of approximately the same chronological period are going to be examined and compared.

1829. Affective Scripts: Rebuilding a Sense of Safety After the 62-63 CE Earthquake in Pompeii

Authors: Leonardo Massantini (Institut für Klassische Altertumskunde Christian-Albrechts-Universität zu Kiel)
Format: Oral

Some aspects of affectivity (i.e., emotions, moods, etc.) escape archaeological reconstruction. However, archaeologists can investigate the relations between material culture and affectivity. Bridging philosophy and archaeology, this paper advocates for the notion of

"scripts", which essentially describe how emotions unfold through time in a specific social context. This paper analyzes the affective responses to the 62-63 CE earthquake in Pompeii. In Seneca's Naturales Quaestiones (VI 1,1-8), we see that people not only feared death, but also that in the aftermath of the earthquake they felt considerable distress from losing the sense of security once provided by public and private buildings (Nat. Quaest. VI 1,5-6). In terms of social cognition, Seneca describes a script: the fear during the earthquake and the subsequent distress. However, his script is incomplete. He merely proposes philosophy as comfort, but the archaeological record goes further and testifies to the actual practices that Pompeiians performed after the earthquake for coping with distress. I analyze two of these script-candidates. The first is the Caecilio Giocondo reliefs/lararium complex, often read as a domestic device that ritualizes memory and restores safety through repeated interaction with an image of seismic disorder; this is suggestive, but it risks over-interpretation insofar as it imports modern "therapeutic" scripts into an ancient context. The second is the rebuilding practices documented across the city: the reuse and management of rubble in commercial spaces can be read not only as a building technique but as an affectively charged script of recovery. Rebuilding with rubble does not merely restore walls; it actively removes the persistent reminders of collapse from everyday perception, thereby contributing to the reconstitution of a workable sense of safety in a landscape that had been traumatically disrupted. These practices reveal rebuilding as a civic script of resilience amid acute post-seismic stress.

828. Earthquake at Tralleis: Greek Religion as Mechanism of Crisis Management

Authors: Giulia Nafissi (Scuola Normale Superiore of Pisa)
Format: Oral

The ancient city of Tralleis (modern Aydın) was affected by earthquakes which, as shown by C.P. Jones' study of the evidence relating to a first-century AD earthquake, left lasting traces in civic memory. I.Tralleis 1 preserves a Delphic oracle issued in the aftermath of a later earthquake, dating to the mid-third century AD. The inscription offers a case study of how an urban community experienced and managed a seismic disaster at social, political, psychological, and religious levels. The oracle was delivered to a priest of Zeus who had been sent to Delphi as an envoy from the city. The text is brief but dense. Apollo reassured the community that expiatory sacrifices had appeased Zeus' anger, which had caused previous calamities, thereby mitigating the psychological impact of past and present disasters. At the same time, the oracle implicitly emphasised the importance of individual agency. By bearing witness to the priest's successful negotiation with Zeus, Apollo of Delphi contributed to the consolidation of the authority of the priest and, by extension, the civic elite during the crisis. Apollo then instructs the community to appease Poseidon immediately, dismissing the query posed by the community and directing the community to the self-evident divine agent responsible for earthquakes. Rituals are prescribed under the leadership of a priest, with participation from the wider community in the form of offerings and cultic performances. These rituals serve as instruments of recovery, restoring divine protection and reactivating social and civic bonds. The oracle illustrates how religion functioned as a central mechanism of crisis management, structuring the interpretation of risk, coordinating collective action, and supporting resilience. It highlights the religious, social, and psychological strategies that underpinned urban recovery. Affiliation: Giulia Nafissi, PhD Student Scuola Normale Superiore of Pisa giulia.nafissi@sns.it

1384. Samothracian Resilience in the face of Natural Catastrophe

Authors: Bonna Wescoat (American School of Classical Studies at Athens | Emory University)
Format: Oral

The Samothracians were famously resourceful in naval combat (Herod. 8.36-97). They were equally resilient on the island, where natural phenomena, including extreme weather and seismic events, posed fundamental challenges to their primary sacred and financial asset, the Sanctuary of the Great Gods. Positioned in a cleft at the base of a mile-high mountain and framed and bisected by powerful seasonal torrents, the Sanctuary was vulnerable to the very energies that help embody its sanctity. The Samothracians made concerted efforts to control the force of these torrents and to channel them to shape and enhance the sanctuary, which reached its apex in the Hellenistic period. Earthquake and catastrophic storms caused massive destruction in the early 1st and early 2nd centuries CE. The Samothracians' strategies for repair reflect both financial capacity and hierarchies of value assigned to different areas, monuments, and passages within the sanctuary. Following the 1st century catastrophe, roofs were rebuilt and the sanctuary returned to full working order. Following the 2nd century catastrophe, however, the Samothracians were forced to reevaluate. Selective strategic repairs in the areas deemed of greatest value to the fame and function of the cult ensured its viability as a major sacred attraction in the northern Aegean for another century. As the cult lost efficacy and no longer attracted visitors to the island, the Samothracians no longer maintained the pathways and water channels in the sanctuary. The powerful torrent reclaimed the central valley, knocking over huge sections of the retaining walls as it overflowed the narrow banks. The pattern of ancient destruction looks uncannily like the destruction caused to the modern retaining walls by the catastrophic storms in 2017.

830. Natural disasters and civic responses: The epigraphical evidence of Hellenistic honorific decrees

Authors: Antiopi Argyriou (Independent Researcher)
Format: Oral

In the plethora of inscriptions dating from the Hellenistic period, there is a significant part of honorific decrees concerning benefactions related to natural disasters. These are public decrees, inscribed on stone, that were passed in honour of civic benefactors in return for their services to a community and on account of their virtues. Among the several types of benefactions, that are recorded

in the epigraphical evidence, there are numerous examples of services related to natural disasters, i.e. aid or special services offered to a polis in times of crisis, which is the consequence not of human activity (e.g. war) but of a natural catastrophe. Such cases as earthquakes, food shortage, and epidemics constitute serious threats for the lives of the poleis with social, economic, and political implications. In this paper, I shall attempt through some selected case studies to address the following questions: a) In what terms are natural disasters described in Hellenistic honorific decrees, and in what particular contexts? b) How did the affected populations experience such natural disasters? c) What particular strategies were employed by the poleis across the Greek world in the Hellenistic period to respond to such catastrophes? d) What are the social, economic, and political implications of public honours granted to civic benefactors – euergetai – for their services in times of serious natural crises?

2134. Cities at Risk: Environmental Change, Infrastructure, and Resilience in the Ancient Mediterranean

Authors: Paolo Vitti – Alessandro Pierattini (University of Notre Dame)
Format: Oral

Greek and Roman cities are often celebrated for their longevity and resilience, yet many urban communities lived persistently ἐν κινδύνῳ, exposed to environmental change, hydrological instability, and climatic extremes that repeatedly threatened urban life. This paper argues that episodes of stress, disruption, and recovery—rather than only narratives of continuity—offer a privileged lens for understanding how ancient cities anticipated, experienced, and managed catastrophic risk. Adopting an interdisciplinary perspective that combines archaeological, historical, and environmental evidence, the paper examines two contrasting but complementary case studies: the cities of the Latmic Gulf in western Asia Minor, with particular attention to Miletus and its neighbours, and the Argive Plain in the northeastern Peloponnese. In the Maeander delta, long-term alluviation—accelerated by human impact on the landscape—progressively silted harbours, transformed coastal environments, and undermined the maritime foundations of cities such as Myus, Priene, Heracleia, and eventually Miletus itself. Literary testimony, geomorphological data, and archaeological evidence together reveal both sustained investment in mitigation (dredging, canals, infrastructural adaptation) and the limits of such responses in the face of cumulative environmental change. In the Argolid, palaeoclimatic data and archaeological evidence point to recurrent droughts, flooding episodes, and water-supply crises from the Late Bronze Age through the Roman period. Here, large-scale hydraulic interventions—from the Tiryns dam to Roman aqueducts at Argos and Corinth—demonstrate how communities and imperial authorities sought to manage hydrological risk, stabilize urban life, and project political authority through infrastructure, even as such measures sometimes displaced problems or generated new vulnerabilities.

641. Abandoned cities in Roman Hispania: Revisiting the case of Colonia Victrix Iulia Lepida (Velilla de Ebro, Zaragoza)

Authors: Pepa Castillo (University of La Rioja)
Format: Oral

This contribution examines the origins, development, and eventual abandonment of Colonia Victrix Iulia Lepida, later renamed Celsa. Founded ex novo in 44 BC by Marcus Aemilius Lepidus on an elevated terrace along the left bank of the Ebro River, the colony likely received settlers from southern Gaul. Its strategic position on the Ebro transformed Celsa into a key administrative and commercial hub in the middle valley, serving as a redistribution center for riverborne goods. Its importance was further underscored when Agrippa established the imperial mint there in 19 BC. Despite these advantages, the colony entered a gradual decline and was abandoned during the reign of Nero or possibly Galba. The contribution investigates the environmental factors behind this abandonment. Archival records from the sixteenth to nineteenth centuries show that major floods of the Ebro disproportionately affected the left bank. It is plausible that similar hydrological patterns existed in the first century BC, shaping Roman decisions about settlement placement. The concentration of major Roman sites—including Caesaraugusta—on the left bank, often at points of greater river gradient, supports this interpretation. This pattern suggests a deliberate territorial strategy balancing proximity to the river for commercial purposes with the need to mitigate flood risk. To test this hypothesis, the study employs a digital elevation model to simulate flooding in the area once occupied by Celsa. Combined with archival evidence, the analysis argues that Roman authorities responded to environmental pressures by relocating the colony to a more secure yet still river-adjacent location.

1635. Resilient cities in Chalcidica peninsula: moulding criteria for measuring resilience in ancient and modern societies

Authors: Maria Xanthou (University of Bristol)
Format: Oral

Resilience as a term has been used in many ways in different disciplines. UNISDR (2009) provided a more inclusive definition of resilience as the ability of a system, community or society exposed to hazards to resist, absorb, accommodate, adapt to, transform and recover from the effects of a hazard in a timely and efficient manner, including through the preservation and restoration of its essential basic structures and functions through risk management. After a natural disaster it is typical for most efforts to focus on shelter, recovery and reconstruction without due consideration of a wider framework for building back better buildings and at the same time creating infrastructure and institutions that are resilient to different shocks and stresses. However, resilience a more nuanced term as recent ongoing research shows. My paper sets out to examine the case to two Chalcidic cities, namely Potidaia and Olynthos, with different outsets and evolving civic patterns in diachrony. Since their foundation, the urban clusters of Olynthus

and Poteidaea occupied significant geographical locations with Potidaea being located on the Isthmus of Pallene and Olynthus in the hinterland of Chalcidice peninsula with access to the gulf of Torone. Our critical analysis focuses on the resilient, at times symbiotic relation enjoyed by the two cities since the Peloponnesian war. The paper concludes with critical analysis aiming to offer at least a partial understanding of the dynamics of the city-citizen interaction especially in the 4th and 3rd c. BCE for the two cities of the peninsula. Towards this goal, we examine the interactive relation of the two resilient cities in question, aiming to introduce an integrated, multi-disciplinary approach to the crucial factors that largely defined Potidaea and Olynthus geographically, politically, and historically as two cities embracing a sustainable and resilient environment.

604. Crossing the Event Horizon: Urban Crisis and Irreversible Change in the Greek Polis

Authors: Nadia Coutsinas (CReA-Patrimoine, Université Libre de Bruxelles) – Vassilis Evangelidis (Athena RC) – Giannis Mourthos (Ephorate of Antiquities Xanthi)
Format: Oral

This presentation examines the types of crises to which ancient Greek cities were compelled to respond, the urban institutions most vulnerable to disruption, those that demonstrated the greatest adaptive capacity, and the archaeological and historical indicators that signal a threshold beyond which a city's traditional functions could no longer be sustained. Drawing on the concept of the event horizon in physics—the point beyond which escape from a black hole becomes impossible—the study conceptualizes moments of acute urban crisis as critical thresholds after which established political, economic, and social systems either collapsed or underwent irreversible transformation. Rather than treating crisis as a uniform or monolithic phenomenon, the article proposes a typology of archaeologically attested urban "event horizons," including systemic colonial failure, externally induced political collapse, environmentally triggered catastrophe, and shock-driven structural reconfiguration. Indicative case studies range from early Greek colonial settlements and Archaic poleis to urban centres of Late Antiquity. These examples are not intended as exhaustive narratives, but as analytical probes through which broader patterns of vulnerability, resilience, and transformation may be assessed. Situated within current theoretical debates on collapse, resilience, and societal transformation in antiquity, the article argues that the concept of the event horizon provides a productive analytical framework for identifying moments of irreversibility in urban history. By moving beyond binary models of decline versus survival, it offers a more differentiated understanding of crisis as a catalyst for structural change in the ancient Greek world.

805. Craft, Trade, and Urban Space in Wartime Athens (430-380 BCE): The case of the Eastern Workshops of the Athenian Agora

Authors: Aspasia Efstathiou (University of Thessaly | ASCSA)
Format: Oral

The political conditions and the economic difficulties during and immediately after the Peloponnesian War affected all categories of social and economically active groups, as is vividly recorded in the ancient sources. Yet the material evidence for how Athenians and metics (resident aliens) responded to the wartime economic implications remains less clearly understood. How were commerce and craft production organized within the city of Athens during this period? In what ways commercial activities continue during the war and in post-war Athens, and if so, to what extent? What forms of economic activity can be identified in the archaeological record? In this paper, I attempt to shed light on the commercial and craft-based activities and to provide insight into the social and political mechanisms that shaped daily life in the center of Athens during the Peloponnesian War and its aftermath. The study focuses on a complex of largely unpublished Classical-period shops and workshops on the eastern side of the Athenian Agora, dating to 430-380 BCE. A 3D video visualizes the architectural evolution and interior spaces of these buildings, while a detailed archaeological analysis of the material recovered from the fill of a well (U 13:1) in the courtyard of one structure allows the reconstruction of a wide range of production and retail activities. These include a bone- and horn-working, probably associated with a butcher's shop, a tavern, a wine shop, a coroplastic workshop, another producing and selling wedding vases and a possible establishment for weaving. Continuously evolving over some fifty years, these shop buildings at the eastern edge of the Agora tell a story of resilience and sustained productivity, demonstrating how the Athenian marketplace continued to thrive and adapt despite the realities of war.

997. Harbour Defence in The Aegean The Battle Of Ipsos: The Cases Of Ephesos, Asine and Gerakas

Authors: Firat Baranaydin (Ephesos Coordinator Excavation Project)
Format: Oral

The Battle of Ipsos, one of the major turning points in the political structure of the Diadochoi Period, led to a profound transformation of power relations in the Hellenistic world. Prior to the battle, Demetrios I Poliorketes, son of Antigonos Monophthalmos, issued a call for the Corinthian League, in response to which numerous cities crossed into western Anatolia to participate in the conflict. With the death of Antigonos Monophthalmos at Ipsos, Antigonid dominance came to an end. Demetrios Poliorketes subsequently withdrew to Ephesos with a limited force of cavalry and infantry and attempted to maintain his authority through the coastal cities of the Aegean. From this point onward, the Antigonids adopted a predominantly defensive strategy, focused on preserving control over loyal cities rather than pursuing expansionist policies. This study examines the final defensive network developed by Demetrios Poliorketes in the Aegean through the cases of Ephesos, Asine, and Gerakas. These cities respectively represent a major naval base, a regional harbour centre, and a naturally protected small bay settlement. This study also addresses the continuity and

transformation of Late Classical urban and harbour infrastructures in the early Hellenistic period. The research is based on archaeological data obtained from systematic surface surveys conducted in western Anatolia, Attica, and the Peloponnese since 2022. The analysis focuses on the declining military and economic capacity of Demetrios Poliorketes and evaluates the defensive functionality of natural topography, harbour control systems, urban layouts, and construction techniques. Overall, the study demonstrates that Aegean port cities of the Diadochoi Period developed crisis-oriented defensive models in response to the aftermath of large-scale warfare. These models reflect a forced transition from expansionist strategies to locally based, continuity-oriented, and resilience-focused defensive practices.

1472. "Moving Cities"? Cities in Exile in the Ancient Greek World

Authors: Katerina Panagopoulou – Eirini Stagkouraki (University of Crete)
Format: Oral

The present paper revisits those groups of citizens who, on account of some severe military threat or attack, or indeed because of some internal social conflict in their hometowns, were forced to relocate collectively to different cities, but eventually returned to their homelands or refounded them at a later stage. Through cases spanning from Northern Greece through to Crete, this research explores how citizens' mass relocations were inflicted and occurred from the Archaic through to the late Hellenistic period. Instances such as Ichnai (Macedonia), Athens, Sparta, Megalopolis, Lyttos, Andros, and several Thessalian cities after 198 BC will be laid out and compared, in order to grasp the underlying mechanisms that sustained these wandering civic communities during exile and which eventually enabled their return. We will address issues such as: what role did the polis's oikoi structure play in facilitating or blocking mobility? In how many cases, and in which, was there any prior preparation for citizen relocation? How, and why, did exiles maintain their initial civic identities, and respect their homeland's allies and treaties? Ought their attitude to be interpreted as lack of adaptability to the new circumstances? What was the longer-term impact of such civic destructions and exiles? In what ways were exiled communities manipulated by external players? In what ways did philanthropia and religion comfort those communities, enabling their return preference over staying in host cities?

812. Coins of Crisis: Urban Resilience in the Third-Century Roman Balkans

Authors: Evdoxia Mintzaridou (Aristotle University of Thessaloniki)
Format: Oral

Throughout the third century AD, cities of the Roman Empire faced prolonged pressures from military insecurity, political instability, economic disruption, and recurrent epidemics. Urban communities negotiated these conditions not as isolated crises but as sustained vulnerability requiring coordinated strategies for survival and continuity. Numismatic imagery offers a window into how civic authorities articulated resilience, mediated social stress, and projected urban identity during periods of uncertainty. Coinage from Thessaloniki, Perinthus, Sparta, and Nicopolis is analyzed as part of these material practices. In Thessaloniki, fortification imagery combined with the city's patron deity signaled collective protection and civic preparedness under heightened military pressure. Spartan coin types featuring Hermes and Dionysus are interpreted in relation to recurrent epidemic outbreaks and elevated mortality, emphasizing health, regeneration, and demographic continuity. In Perinthus and across the Balkan provinces, shifts in metal supply, denomination, and circulation patterns reflect localized economic adjustments to inflation, resource scarcity, and imperial demands. A comparative perspective demonstrates that coinage functioned as a civic medium, embedded in everyday economic and social practices, through which urban authorities communicated stability, reinforced institutional cohesion, and facilitated recovery. Integrating numismatic, archaeological, and historical evidence, the study shows that resilience in the third-century Roman Balkans was enacted more through negotiated, place-specific strategies than through centralized imperial intervention.

881. Antioch AD 384 to 385

Authors: Kristian Christensen (Stellenbosch University)
Format: Oral

This paper investigates the response to famine in the city of Antioch in Roman Syria in AD 384 to 385. The evidence derives from five Orations (26, 29, 27, 28, 50; their numbering is not chronological) by the city's teacher of rhetoric, Libanius. Through these we are given a highly partisan view of the Count of the East, Icarius. The changing mood of the orations (which progress from praising the Count to holding him blameless while condemning his subordinates for mistakes to denouncing the Count himself by name to the emperor Theodosius) shows the fault lines of the 4th century civic order being laid bare by the sudden outside pressure of the famine – and, in its wake, of an epidemic as well. Thus, in Libanius' condemnation of the theatre claque and their demand for caps on bread prices, one sees the Count responding to popular demands that contradict the interests of Libanius' clients among the bakers. Similar criticisms elsewhere in the orator's oeuvre indicates that the direct communication between Count and populace in the theatre was in general considered a threat to the role of the Antiochene curial class (to which Libanius belonged) in the administration of the city. Furthermore, Libanius' complaints about the company kept by Icarius and the dinner invitations he accepts reveal a second threat at the other end of the social scale: the establishment of private relations between the Count and prosperous individuals that allow the latter prestigious roles in city management. While these conflicts must have existed both before and after the famine, it is the famine that brings them into the light. Libanius' Orations thus show us an ancient community responding to a crisis, but also that crisis tearing at the seams that hold the community together.

864. Oresteion: Views on the abandonment of an Arcadian city during the foundation of the city-state of Megalopolis after 371 BC

Authors: Stamatis Fritzilas (Research Center of Antiquity, Academy of Athens)
Format: Poster

This essay examines the historical context of the abandonment of Oresteion, a town in the Maenalia district of south-western Arcadia, after the establishment of Megalopolis. Oresteion is also known as Oresthasion. According to legend, the city was founded by Orestes. The remains of the Arcadian town were uncovered between 2008 and 2014. Oresteion played a part in the creation of Megalopolis. Mainalian Oresteion was a precursor to Megalopolis. When Megalopolis was founded in 371 BC, it was the first large-scale urbanisation project in rural Arcadia and remains one of the best-known examples of classical Greek synoecism. The city was eventually abandoned, with the inhabitants removing valuables and weapons from the houses. The Mainalian city and its territory, Oresthis, probably came under Megalopolitan control. The excavated buildings date to the years before and after the Battle of Leuktra in 371 BC. Most of the artefacts found are unpainted pottery and black-glazed vases, which were used for serving food and drink, lighting, and transporting and storing solid and liquid products. The layer of the city's abandonment can also be dated using coins. Uncovering the Oresteion settlement sheds new light on the archaeology of the Peloponnese. The old city was uninhabited during the Hellenistic and Roman periods. The inhabitants of ancient Oresteion played a part in creating the famous city of Megalopolis. It is no coincidence that the entire southern part of Arcadia's federal capital was named Orestia. The last historical evidence for the city of Oresteion dates to June 362 BC. During the sudden invasion of Laconia by Epaminondas, King Agesilaus II of Sparta (c. 400–360 BC) advanced from Oresteion and caught up with the opposing troops that had set off from Tegea. New data from the fourth century corroborates ancient sources on catastrophe management in the ancient Mediterranean world.

1899. Late Antique Thessalonica after the Notorious 620's Earthquakes: Strategies, Measures and Rehabilitation Works towards Urban Recovery

Authors: Konstantinos Raptis (National and Kaposistrian University of Athens)
Format: Poster

During the third decade of the turbulent seventh century CE, and just after the fifth attempt of the Avars and Slavs to besiege the city, the urban history of Thessalonica was marked by intense seismic activity, described in the second book of St Demetrius's Miracles. These notorious 620's series of earthquakes, proven by archaeological evidence and the architectural analysis of the city's surviving structures, seem to have destroyed large part of the city, including sections of the fortification, urban infrastructure and most of the private and public, both secular and ecclesiastical buildings, shifting Late Antique Thessalonica into the Early Middle Ages. The proposed poster —acting as a chronological epilogue to the discussion of this panel on the response to natural catastrophes in Greek and Roman Antiquity— examines the extent of the seismic damage hazards and effects on the urbanscape of a continuously active urban center, as Thessalonica, by the aforementioned natural disaster. On the basis of literary sources, archaeological data and the documentation of the traces that this catastrophe and the subsequent damage rehabilitation have left on the masonries of the city's monuments, the poster also traces and discusses the subsequent response to the natural disaster, the administrative strategies, measures and restoration projects undertaken in a short period of time towards urban recovery.

162 WHAT CAN THE FUNERARY MONUMENTS REVEAL?: MATERIALS, ICONOGRAPHY AND IDENTITY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Vasiliki Anevlavi (National Hellenic Research Foundation | Austrian Archaeological Institute, Austrian Academy of Sciences) – Petya Andreeva (National Archaeological Institute With Museum, Bulgarian Academy of Sciences) – Chiara Cenati (University of Vienna)
Keywords: Funerary monuments, Graeco-Roman world, Archaeometry, Iconography, Epigraphy, Connectivity
Format: Regular session

SESSION ABSTRACT

Funerary monuments constitute one of the most enduring and informative categories of archaeological evidence for reconstructing ancient societies. This session aims to explore their diachronic importance in the Graeco-Roman world, from the Archaic to the Late Antique period, through an integrated examination of their materials, iconography, and inscriptions. By approaching funerary stelae, sarcophagi, slabs, altars, columns, mausolea, etc., as composite artefacts—products of artistic, economic, cultural, political, and social processes—the session seeks to highlight the multiple dimensions of identity they express. Particular attention will be given to the provenance and selection of materials, including marble, limestone, and other stones, as well as terracotta and mixed media. Recent archaeometric studies show that material choices were not only aesthetic or practical, but also deeply connected to trade networks, local availability, and expressions of status, community and belonging. These production and distribution patterns offer insights into regional self-sufficiency, long-distance connectivity, and workshop organisation. Equally significant is the iconographic

and epigraphic evidence: the depiction of the deceased, the divine figures or mythological motifs that accompany them, and the language, names, and dedications inscribed on the stone. Such evidence provides a refined understanding of social and familial identity, professional role, and ethnic or geographic origin. This session invites contributions combining archaeological, archaeometric, art historical, and epigraphic perspectives, encouraging comparative approaches across regions of the Mediterranean and beyond. By integrating material, visual, and textual analyses, the session seeks to reframe funerary monuments not just as commemorative objects, but as complex vehicles of memory and identity—artefacts that link personal commemoration with broader social, cultural, and economic networks.

CONTRIBUTION ABSTRACTS

2512. The Funerary Monument of Lysis and Fourth-Century Athens

Authors: Geoffrey Bakewell (Rhodes College | College Year in Athens)
Format: Oral

The funerary monument of Lysis (Piraeus Museum 3281) reveals more about fourth-century Athens than about the deceased. Literary sources contain considerable information about Lysis. The main interlocutor in an eponymous Platonic dialogue, he belonged to a hippic family whose members included victors at Delphi, Isthmia, and Nemea. He was well-educated and musical, with looks and manners that made him a sought-after eromenos. Association with Socrates eventually won him a reputation for morality (D.L. 2.29). Yet his funerary monument is unremarkable. Its upper portion is a stone loutrophoros made of white Pentelic marble; it bears a dexiosis relief in which the seated, elderly Lysis extends his hand to his adult son Timokleides. Both men wear himatia; an unidentified, younger woman stands behind Lysis' klismos. The base, made of bluish-gray Hymettian marble, is inscribed with four brief lines containing the two men's names, patronymics, and demotics. The ordinariness of the monument is however revealing about aspects of life in fourth-century Athens. Its resemblance to other contemporary funerary monuments (including Agora S 2213), along with the generic depictions of the three figures, suggests the purchase of a semi-finished loutrophoros, perhaps from stock, to which individualizing touches were then added. The surviving lead in a circular cutting atop the base indicates that the two pieces were likely joined at the grave site. The inscribed lines on the base identifying Lysis are more carefully cut than those identifying Timokleides; the father's grave site and monument may have been reused for his son. The striking color contrast between the top and bottom parts demonstrates the migration of an artistic motif from expensive public buildings to cheaper private monuments. Finally, the find spot of the gravestone at the intersection of Taxiarchon and Thessalonikis Streets in Moschato hints at yet later reuse in repairs to the Long Walls.

1398. From Fragmentation to Form: Funerary Klinai and Cultural Transfer in Hellenistic Callatis

Authors: Maria-Magdalena Stefan (National History Museum of Romania) – Dan Stefan (National Museum of the Eastern Carpathians) – Laurentiu Angheluta (Luthonium Virtual Heritage) – Valentin Stefan (Metamorfozys)
Format: Oral

We will present two newly discovered funerary stone beds from Callatis – ancient Greek polis on the western Black Sea – currently the only fully reconstructable examples of this category known in the region. The klinai were identified last year in a vaulted tomb covered by a monumental tumulus dated to the 3rd century BC. Looted in antiquity, the tomb's disturbance severely affected the structural integrity of both beds, which were preserved in a highly fragmentary state. Functionally, they were used as sarcophagi for wooden coffins with inhumed deceased. They reproduce the form of funerary couches, with close analogies in Macedonian elite contexts, pointing to the circulation of architectural models associated with high-status burial practices. Their execution, however, differs markedly: one monument displays more refined workmanship and the use of red pigments, while the second reflects a more local interpretation of the same formal prototype. This contrast offers a rare opportunity to examine workshop practices, production networks, and local adaptations of prestigious Mediterranean forms within a frontier environment. The painted funerary bed was moved from the tomb and has just been reconstructed in the permanent exhibition of the National History Museum in Bucharest. Prior to restoration, the monuments were digitally documented through high-resolution 3D scanning in situ and piece by piece after removal. Pigment and organic deposit analyses were carried out, enabling their reconstruction as composite artefacts integrating architecture, colour, and associated grave goods. The presentation aims to foreground digital documentation as a critical interpretive tool, enabling the reassessment of dispersed fragments and the formulation of multiple restoration hypotheses. Our contribution argues that elite funerary monuments from the edges of the Greek world acted as agents in negotiating identity, hierarchy, and belonging, revealing Callatis as a dynamic zone of cultural transfer rather than a passive periphery.

101. The sarcophagi of the Philippopolis gerousiastai and the construction of a group identity

Authors: Lyuba Radulova (Sofia University "Sv. Kliment Ohridski")
Format: Oral

The paper examines a group of three inscriptions (IGBulg III, 1, 992, 995, AE 2005: 1389) from Philippopolis which present striking similarities regarding both the physical characteristics of the monuments and the form and contents of the funerary inscriptions. After a brief presentation of the monuments, the study focuses firstly on the onomastic and prosopographic analysis of the persons involved, observing closely their legal and social status and ethnic background. Secondly, a textual analysis of the epitaphs aims at

individuating local and foreign linguistic and conceptual patterns, mainly related to the sphere of Greco-Roman funerary law. At last, the paper tries to find parallels of the social, linguistic and legal phenomena attested in the texts, both in the area of Philippopolis and elsewhere. The study of the selected epitaphs allows us to reconstruct a complex social and cultural reality in which the funerary monuments act as both means and visible expression of the construction of a group identity.

1801. Data on two graves of the western necropolis of Novae, Northern Bulgaria

Authors: Marin Marinov (Museum of History - Svishtov)
Format: Oral

In 2025, rescue archaeological excavation was carried out at the western necropolis of the Roman legionary fortress and a later Roman and early Byzantine town Novae, Northern Bulgaria. All the graves investigated had been previously looted. Among them, two stand out, discovered dug next to each other, at different stratigraphic levels. The earlier grave is built mostly of bricks, some of which have stamps of the First Italic Legion stationed in Novae. The only legible stamp is dated to the first quarter of the 3rd century. A bone hairpin, dated to the late 3rd - early 4th century, found among the scattered skeletal remains in the grave, provides the earliest possible date of its construction. Similar graves have been archaeologically excavated in the southern necropolis of Novae, the latest funerary monuments from which date back to the late 3rd century. Data on the eastern necropolis indicate that it ceased to exist in the early 260s due to the Gothic invasions. Possibly, the western necropolis was also affected by these invasions. It is assumed that the repair of Novae after the invasions began after 280 and before 310. No earlier than then, in, on and around the looted brick grave, was rammed loess, into which the later grave was dug. It is a cist, built with reused limestone slabs. Two of them are stelae from earlier graves: that of a Roman soldier and that of a veteran of the Claudius' Eleventh Legion. Cist graves have not been archaeologically excavated in the other necropolises of Novae; two accidental discoveries are known. The design of both graves and especially the materials chosen for the construction of the cist suggests a preference for efficiency over quality. A possible reason is a change in the socio-economic status of the population to which the necropolis belonged.

2644. The Mound of the Griffin in the Crati valley and the questions it raises

Authors: Diana Gergova (National Academy of Art Sofia) – Massimo Massimo Di Salvatore, Historian And Archaeologist, (University of Macerata) – Vincenzo Rizzo (CNR)
Format: Oral

The monumental Mound of the Griffin, near Bisignano, province of Cosenza, Italy, has raised many questions, caused by its impressive size of 22m height and by the fact that it is an "anomalous" presence in the archaeological landscape of Calabria. A complex of interdisciplinary investigations have answered to some of the questions. Lithological, geomorphological and morphogenetic studies have highlighted its natural geological composition, but its artificial shape, perfected by remodelling a natural slope. The date of the colluvium by thermoluminescence methods around the middle of the first millennium BC suggests the date of these activities. The very limited archaeological excavations at the base of the mound have revealed stone structures that are difficult to date and identify. This "anomalous" for Calabria tumulus demonstrates morphological, constructive and symbolic affinities with the tumuli of the Hellenistic Thrace and Macedonia, in the similar approaches in the modelling of the natural reliefs, in the building mounds on rock formations, etc. The dating, the symbolism and construction methods give reasons to some archaeologists and historians to raise the hypothesis that The Mound of the Griffin might be connected with some historical events that took place at that time – namely with the military campaigns and the tragic end of Alexander I of Epirus on the battlefield in Italy. Future larger-scale studies would certainly provide answers to these assumptions.

1236. Funerary Monuments and Identity in the Argolid, the Northern Peloponnese, and the Corinthian Apoikiai (7th–6th centuries BCE)

Authors: Malwina Grabowska-Zywar (University of Warsaw | The Polish Archaeological Institute at Athens)
Format: Oral

This paper examines funerary stone monuments with verse inscriptions from the Argolid, North Peloponnese, and Corinthian colonies (7–6th century BCE) as composite artefacts, showing how they encompass local identity, regional networks, and the panhellenic influences. This interdisciplinary paper analyses a range of inscribed funerary monuments, which, as the author argues, were clearly influenced by the panhellenic phenomenon of epic poetry while simultaneously rooted in local context through the selection of stone and monument form. The paper presents results from a part of the author's doctoral research, focusing on three key remarks: (A) A comparative analysis of burial markers across regions shows that in the Archaic period both inscribed and non-inscribed monuments were initially produced from locally available stone. In the case of colonies, this usage of local materials was combined with the adoption of monument forms, epichoric alphabet, and literary conventions shared with the metropolis. These results will be considered in the context of cultural mobility, highlighting how social practices and monument forms could circulate within mentioned areas. (B) Analysis of the archaeological evidence for burial customs and the content of inscriptions shows that some formulae, typically interpreted as conventional literary motifs, may in fact reflect local burial practices. (C) The emergence of a new type of funerary monument (i.e., with engraved verse inscriptions) did not lead to changes in burial forms but appears to be closely connected with the establishment of new burial sites in the late Archaic period in the Northern Peloponnese and the Argolid (e.g., Western Cemetery in Troezen). Possible implication of that phenomenon for the perception early archaic communities will be

presented. These preliminary results demonstrate how funerary monuments functioned as the product of both local identity and broader panhellenic cultural connectivity.

1387. Reflections of Local Identity through Representations of Gods in Lycian Funerary Art

Authors: Bilsen Özdemir (Nevşehir Hacı Bektaş Veli University) – Hava Keskin (Akdeniz University)
Format: Oral

The southwestern coast of Anatolia in antiquity was known as Lycia, and its inhabitants were called the Lycians. They are regarded as one of the indigenous peoples of Anatolia. In Late Bronze Age sources, the Hittites referred to them as Lukka; Homer described them as allies of Troy, while Herodotus portrayed them as a people who chose death rather than surrender to the Persians. These accounts emphasize their strong sense of independence. Modern scholarship generally agrees that Lycia possessed a distinctive cultural identity, clearly reflected in its language, belief systems, and especially its funerary practices. Tombs constitute the most significant material remains for understanding Lycian society. The diversity of tomb types—rock-cut tombs imitating wooden architecture, sarcophagi with high chests and saddle-shaped lids, pillar tombs, and monumental tombs with high podiums—demonstrates the richness of Lycian funerary architecture. In particular, the imitation of wooden architecture is crucial for interpreting Lycian beliefs about the afterlife. Reliefs and inscriptions on tombs further enhance our understanding of Lycian concepts of death and religion. However, certain Late Archaic and Classical funerary monuments display god iconographies that appear to challenge the idea of a purely local Lycian identity. A notable example is the Harpy Monument at Xanthos, where Demeter and Persephone are depicted despite their absence in local inscriptions. Similarly, the appearance of the Egyptian god Bes on the Trysa Monument reflects this cultural tension. This complexity is further highlighted by the Bellerophon rock tomb at Tlos, where the Bellerophon–Chimera relief appears in the antechamber, while the Lycian god Trqqas is depicted on the pediment. These cases raise questions about what should be considered "local" in Lycian culture. This paper examines the identities and functions of gods and goddesses in Lycian funerary art, with a focus on cultural interaction and local identity.

650. Dying as a Roman, Dying as a Barbarian: Funerary Iconography as a Marker of Cultural Identity

Authors: Martyna Marszałek (University of Wrocław)
Format: Oral

This paper examines Roman artistic representations of death in the Italian Peninsula during the 1st–3rd centuries CE, focusing on how Romans depicted both themselves and so-called "barbarian". By analyzing visual motifs in monuments, reliefs, and other material evidence, it explores how iconography communicated social, cultural, and political identities from a distinctly Roman perspective. Roman figures are typically depicted in composed, dignified postures, reflecting civic virtue, military valor, and social status. Their deaths are shown as orderly and morally sanctioned, emphasizing continuity, memory, and personal honor, and projecting a self-determined, coherent identity within Roman society. Barbarian figures, in contrast, often appear in dynamic, contorted, and sometimes violent poses, particularly in battle scenes or as defeated foes. These depictions highlight vulnerability, defeat, and the absence of individual commemoration, reinforcing alterity and social marginalization. Interestingly, suicide deaths followed a different logic. In Roman visual and literary culture, barbarian suicide was frequently interpreted as an act of courage or honor, especially in contexts of defeat or captivity. Such representations could depict the act with restraint and dignity, temporarily suspending the usual contrast between orderly Roman and chaotic barbarian death. By integrating archaeological, art historical and epigraphic perspectives, this paper shows that death imagery functioned not merely as commemoration but as a means of expressing social hierarchies, cultural identity, and notions of otherness. It also accommodated exceptional cases, such as suicide, which complicate standard ideas of honor, memory, and belonging, demonstrating the nuanced ways in which funerary and commemorative iconography reflected identity in the Roman world.

1512. Gladiatorial Tombstones in Roman Thrace: Iconography and Material Context

Authors: Petya Andreeva (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Vasiliki Anevlavi (National Hellenic Research Foundation | Austrian Archaeological Instiute, Austrian Academy of Sciences) – Walter Prochaska (Austrian Archaeological Institute, Austrian Academy of Sciences)
Format: Oral

This paper examines gladiatorial tombstones from Roman Thrace through an integrated analysis of iconography and material context. While such monuments from other eastern provinces have received considerable scholarly attention, the Thracian material remains comparatively understudied, despite offering valuable insights into provincial visual culture and commemorative practices. The study focuses on the representation of gladiators in relief sculpture, exploring recurring iconographic schemes, attributes, and compositional choices that construct the identity of the deceased. Particular attention is paid to how imagery communicates status, professional role, and memory within a provincial environment shaped by both local traditions and imperial models. Alongside visual analysis, the paper considers the material aspects of these monuments, including stone types, carving techniques, and evidence for local workshops, in order to situate the tombstones within their broader archaeological and economic context. By combining art-historical and archaeological approaches, this research seeks to reassess the relationship between image and materiality in the funerary commemoration of gladiators. The evidence from Roman Thrace suggests a dynamic interplay between standardized imperial iconography and regional adaptations, revealing how provincial communities engaged with the visual language of the arena.

Ultimately, the paper argues that gladiatorial tombstones functioned not only as markers of burial but also as powerful media of social identity, memory, and cultural interaction within the eastern provinces of the Roman Empire.

28. Dining with the Dead: Funerary Banquet Scenes and Social Identity in the Middle Strymon Valley (Roman Macedonia, Southwestern Bulgaria)

Authors: Philip Kolev (National Archaeological Institute with Museum, Bulgarian Academy of Science)
Format: Oral

Funerary monuments represent a crucial source for exploring social identity, cultural affiliation, and connectivity in the Graeco-Roman world. This paper examines funerary banquet scenes (coena funebris) on funerary stelae from the Middle Strymon Valley, a region situated within the Roman province of Macedonia in present-day southwestern Bulgaria. Located along major communication routes between Macedonia and Thrace, the Middle Strymon Valley formed a zone of sustained mobility and cultural interaction. The funerary banquet motif is approached not as a literal representation of ritual practice, but as a symbolic visual language rooted in Hellenistic traditions of heroisation and commemoration. In the Middle Strymon Valley, the motif is attested on 28 complete or fragmentary funerary stelae, suggesting that it was not among the most widely adopted iconographic themes in the region. A similar pattern can be observed in the province of Macedonia as a whole. Although the earliest monument depicting a funerary banquet dates to the Hellenistic period, this iconography achieved its widest dissemination during the Roman Imperial period. Several characteristic regional features may be identified, including the representation of more than one reclining male figure, the presence of female divinities, and the combination of the funerary banquet motif with other iconographic scenes, such as family busts and the Heros equitans. Onomastic evidence further reveals a mixed population, including individuals with names that may be interpreted as Thracian, among them the earliest attested inscription of a person of Thracian origin in the Middle Strymon Valley, as well as persons bearing Greek names. Roman citizens are likewise attested. Notably, two of the funerary stelae record individuals who served in the Roman army. Taken together, the iconographic and epigraphic evidence shows how funerary monuments were used by local communities to articulate identity, memory, and belonging within a culturally interconnected provincial landscape.

87. Sepulchral monuments with a convivium scene in the Roman province of Dalmatia

Authors: Mihajlo Džamtovski (University of Vienna) – Amra Šačić Beća (University of Sarajevo)
Format: Oral

The province of Dalmatia was one of the largest Balkan provinces of the Roman Empire, encompassing the present-day territories of the Croatian littoral, most of Bosnia and Herzegovina, western Serbia, the entirety of Montenegro, and northern Albania. As such, it has yielded a large number of monuments displaying a wide range of iconographic elements and compositional schemes. One of the most widespread motifs on sepulchral monuments throughout the Roman Empire was the convivium (banquet) scene, which evokes the festive consumption of food and drink. Although this motif has eastern origins, it spread widely into the western provinces, including the neighbouring Pannonian provinces. In the Roman province of Dalmatia, however, convivium scenes appear to have been relatively uncommon, with a proportionally small number attested in comparison to the overall corpus of sculpted sepulchral monuments. The majority of examples originate from sites near the Drina River (e.g. Užice–Srebrenica–Prijepolje triangle), but can also be found in the area of Zenica, Tomislavgrad, and Salona. The aim of this study is to analyse the monuments featuring convivium scenes within the territory of Dalmatia, examining their spatial distribution, chronology, and iconographic characteristics, and, where epigraphic evidence permits, to identify the social profiles of the individuals who commissioned them.

592. Epigraphic Evidence and Marble Provenance: A Multidisciplinary Approach

Authors: Chiara Cenati (University of Vienna)
Format: Oral

Funerary inscriptions represent a crucial source for the study of ancient societies. As they often provide precise information on the date, context of production, function, and commissioners, they allow valuable insights into social identity and cultural values. Inscriptions can also reveal variations in marble use linked to trade routes and changing funerary habits. The integration of epigraphic, historical, and archaeometric data allows these aspects to be examined within a unified interpretative framework. A multidisciplinary approach combining material analysis with the study of inscriptions and historical context makes it possible to investigate the social significance of marble selection and dedicatory choices. By systematically analysing funerary inscriptions with known provenance, this type of research can reconstruct networks of trade, patterns of consumption, and cultural meanings attached to marble use in the funerary sphere. Selected case studies will illustrate how this combined methodology can deepen our understanding of the social and cultural dimensions of Roman funerary monuments.

1296. Unpublished funerary inscriptions from the territory of Serdica, 3rd-4th c. AD

Authors: Stefani Daneva (Sofia University "St. Kliment Ohridski")
Format: Oral

The paper concerns a group of funerary monuments with Latin inscriptions from Serdica and its surroundings, which have been

discovered over the past century. The largest number of monuments has been found in the locality of the village of Tchekanchevo, east of ancient Serdica (modern Sofia). The monuments bear specific and unique features and have been dated to the end of the III c. AD and the beginning of the IV c. AD. Despite the fact that this group has been the object of scholarly research, the inscriptions on some of these monuments have not yet been published. All readings presented in the paper are based on direct examination of the monuments (ex autopsia). The author provides new and revised readings for the unpublished monuments and analyzes the texts in a broader local historical context. The inscriptions provide new insights into the prosopography and the social structure of the local community from the surroundings of Serdica.

877. The Pool of Choices: Meaning, Material, and Means in the Commissioning of Stelae at Viminacium

Authors: Ines Ferjan (University of Edinburgh)
Format: Oral

The commissioning of funerary stelae at Viminacium (modern Kostolac, Serbia), a major urban centre of the Roman province of Moesia Superior, was shaped by a complex interplay of economic, social, and practical considerations. This paper examines the factors influencing the commissioning of stelae during the Roman period, with particular emphasis on material selection, the social status of the commissioner, and the labour investment required for production. In order to assess social status, the analysis is restricted to stelae with inscriptions that are sufficiently preserved to allow identification of the commissioner's status. The dataset comprises stelae carved from marble, limestone, and travertine, enabling comparative evaluation across different materials. Following this analysis, the study briefly presents estimates of the labour investment involved in the carving of marble and limestone stelae. Labour estimates are based on Pegoretti (1843-4, Manuale practico per l'estimazione dei lavori architettonici, stradali, idraulici e di fortificazione per uso degli ingegneri ed architetti), whose work has been employed in previous studies of ancient labour and energetics in stone carving. These calculations demonstrate that carving of a one-storey architectonic marble stela at Viminacium required a substantially more labour than producing comparable limestone examples. Despite these differences, the results indicate that most commissioners, irrespective of material choice, belonged to broadly similar social strata. This suggests that factors beyond social status and production costs, such as personal preferences, material availability, and logistical feasibility, played a significant role in the decision-making process underlying the commissioning of funerary stelae in Viminacium.

1530. Apse-sarcophagus workshops in the marble quarries of Thasos during the Roman period

Authors: Manuela Wurch Kozelj – Tony Kozelj (Independent Researcher)
Format: Oral

In our study of the ancient quarries of Thasos, we have identified a few unfinished apse sarcophagi in the quarries Vathy III, Saliara 3 and Saliara 5. Due to their different states, from the first shaped volume to the hollowed-out coffin, we propose to recognize these locations as workshops for carving apse sarcophagi. As no apsidal sarcophagi have been recorded in the Thasian necropolises, consequently, this production of white marble sarcophagus coffins was intended for export; and more specifically for Rome. Some apse-shaped coffins from Saliara-Vathy have been identified in the cargo of the shipwreck San Pietro. Moreover, coffins of this type can be found in the Storage of the National Museum of Rome. Many questions arose, namely how the work could be carried out, taking in account the difference in units of measurement, Thasian or Roman foot? We have highlighted that : -the extraction, the shaping and the hollowing of the coffins within the quarry were carried out by Thasian workers, quarrymen and stonecutters, in the thasian foot, -but at the time the coffins were ready to leave the quarry, -at this state of work-, their measures were in both modules, thasian and roman foot-units. Rather than seeing this as a coincidence, we suggest interpreting it as a mark of knowledge, high level skill of work-streamlining followed by a exquisite craftsmanship. A perfect coordination of the work, so that these coffins correspond to a prepared work done by Thassian quarry-men and stone-cutters using the thasian foot, to be followed by Roman sculptors, who could executing the ornamentation without difficulties, sculpting as usual in modules of roman foot.

189. Materials, Architecture, and Identity in the Tomb of the Scipios: A Diachronic Approach

Authors: Michela Stefani (Independent researcher)
Format: Oral

The Tomb of the Scipios is one of the most important funerary monuments of ancient Rome. After nineteen years of closure, it was reopened to the public on 15 December 2011 following extensive restoration work carried out by the Soprintendenza Speciale di Roma, which respected the layout of the archaeological area designed by A. M. Colini in 1929. Located along the Via Appia, outside the Porta Capena in Rome, the site constitutes a complex funerary palimpsest spanning several centuries. In addition to the celebrated Scipio hypogeum, the area includes a series of Republican tombs, two Augustan columbaria, a large tuff foundation, and a funerary building with a small catacomb dating to the fourth century AD. Together, these monuments offer a unique opportunity to investigate a funerary landscape representing multiple social strata and commemorative strategies. This paper presents an architectural and decorative analysis of the funerary structures within the Tomb of the Scipios complex, examined in close relation to their spatial, historical, and social context. Through a diachronic approach, it explores the evolution of architectural forms, decorative programs, and ritual practices from the Republican to the Imperial period. The study also considers the materials employed—such as tuff, limestone, and other stone types—addressing issues of provenance, availability, and technical choices. By integrating architectural, decorative, and material evidence, the paper aims to demonstrate how funerary monuments functioned as markers of

identity, memory, and social positioning, closely linked to the economic resources and cultural aspirations of their commissioners within the broader funerary landscape of Rome.

1597. Revealing Ritual Landscapes: An Integrated Approach to the Roman Necropoleis of Pisidia and the Kibyratis

Authors: Tamara Dijkstra (Fryske Akademy | University of Groningen) – Caroline Van Toor (University of Groningen)
Format: Oral

The Roman necropoleis of Pisidia and the Kibyratis preserve an enormous and varied corpus of stone funerary monuments. Originating from both major urban centres and smaller settlements, these monuments range from built house tombs and relief-decorated sarcophagi to modest rock-cut niches, stelai, and ostothekai. Most have long been emptied or displaced; they survive today as de-contextualized objects, severed from the spatial and experiential settings that once shaped their meaning. Traditional scholarly divides have reinforced this fragmentation by treating archaeological aspects, iconography, and epigraphy in isolation. This paper advances a holistic approach that treats funerary monuments as composite artefacts-integrating materiality, imagery and text-and reconnects them to their spatial and temporal contexts. Such an approach yields fuller insight into local identities, modes of self-representation, and social strategies, while also illuminating patterns of production and use, regional variation, and continuity and change in commemorative expressions. It further sharpens our understanding of local eschatological expectations—visible for instance in the spatial, visual and textual emphasis on continued coherence of the oikos. Finally, it shows that communities used their tombs to communicate a sense of belonging at multiple scales: from the household, the local community, the region, to the wider Roman world. By reconstructing cemeteries as ritual landscapes, this integrated approach provides new insights into the behaviours, practices, and beliefs enacted within them—it brings into focus different forms of commemoration, networks of connectivity, and localised preferences that have thus far remained obscured.

743. The Evolution of Imagines Maiorum in Roman Funerary Culture

Authors: Martyna Marszałek (University of Wrocław)
Format: Poster

This poster examines the origin, development, and transformation of imagines maiorum — Roman ancestral death masks — as a central element in the culture of commemorating the dead from the early Republic into the Imperial period. Drawing on literary evidence and archaeological sources, it traces how these masks functioned within broader practices of funerary ritual, memory, and identity in the Roman world. The tradition of imagines maiorum likely derives from earlier Etruscan practices of honoring ancestors, with possible influences from Greek funerary customs emphasizing portraiture and commemoration. In Rome, the deceased's face was reproduced in bee-wax, creating lifelike masks that were preserved in the atrium of elite households and displayed during funeral processions. These masks functioned as visual and performative tools, communicating familial lineage, social status, and collective identity across generations. As material evolved, wax masks gradually lost prominence, replaced by more durable media such as sculpted marble portraits and funerary reliefs. Despite the change in material, the underlying Roman concern for preserving the deceased's features and sustaining memory remained central, ensuring continuity between ephemeral ritual objects and lasting monuments. By tracing the evolution of imagines maiorum and their possible Etrusco-Greek tradition this poster highlights their enduring role as vehicles of memory, identity, and social belonging in Roman funerary culture.

931. From Dokimeion to Aphrodisias: A Reassessment of Marble Provenance and Workshop Relations of Roman Period Sarcophagi from Perge (Pamphylia)

Authors: Murat Dirican (Leiden University, Faculty of Archaeology) – Vasiliki Anevlavi (Austrian Archaeological Institute, Austrian Academy of Sciences | National Archaeological Institute With Museum | Bulgarian Academy of Sciences, Sofia) – Walter Prochaska (Austrian Archaeological Institute, Austrian Academy of Sciences) – Taner Korkut (Akdeniz University, Department of Archaeology)
Format: Poster

This article presents a comprehensive re-evaluation of the marble provenance of Roman-period sarcophagi from Perge (Pamphylia), integrating the typological and archaeometric framework established by Korkut and Dirican (2020) with newly acquired multi-proxy analytical data generated at the Austrian Archaeological Institute (OeAW). While the earlier study questioned the long-standing attribution of Pamphylian sarcophagi to Dokimeion, limitations inherent in isotope-based discrimination and restricted reference datasets prevented a definitive reassignment of marble sources. The present study employs an expanded analytical strategy combining stable carbon and oxygen isotope analysis, high-precision ICP-MS trace element measurements, and multivariate statistical modelling based on a global database of over 5,700 geological marble samples. The results demonstrate a strong and statistically robust association of the Perge sarcophagus marbles with the Aphrodisias quarry district, while Prokonnesos emerges as a secondary source for a limited subset of samples. Dokimeion and Ephesian marble sources can be confidently excluded. Beyond provenance determination, these findings necessitate a fundamental reconsideration of workshop organisation, artisan mobility, and material procurement strategies in Roman Pamphylia. In particular, the dominance of Aphrodisias marble suggests sustained inter-regional connections between Caria and Pamphylia, challenging traditional models centred on Phrygian production and reinforcing the role of Aphrodisias as a major sculptural hub with far-reaching economic and artistic influence.

994. White Marble Funerary Monuments from Roman Philippopolis: Provenance and Local Supply in Thrace

Authors: Vasiliki Anevlavi (National Hellenic Research Foundation) – Petya Andreeva (National Archaeological Institute With Museum, Bulgarian Academy of Sciences) – Walter Prochaska (Austrian Archaeological Instiute, Austrian Academy of Sciences)
Format: Poster

Funerary monuments provide valuable insights into material choices and production strategies within Roman provincial societies. This paper examines white marble funerary monuments from Roman Philippopolis (present-day Plovdiv) in the province of Thrace, focusing on the role of local raw material sources during the second and third centuries AD. Although the funerary record of the city is dominated by monuments carved from locally available granite and limestone, particularly sarcophagi, the selective use of marble warrants closer investigation. The study is based on a multi-proxy archaeometric approach combining petrographic analysis, stable carbon and oxygen isotope data, and trace element analysis. A small but representative group of marble artefacts, including funerary stelae and statues, was analysed in order to assess raw material provenance and supply patterns. The analytical results consistently indicate the use of marble from the nearby Asenovgrad quarrying area, highlighting the importance of local stone resources in funerary production at Philippopolis. Equally significant is the absence of Prokonnesian marble within the analysed assemblage, despite its well-documented presence in funerary contexts elsewhere in Thrace, Macedonia, and the Upper and Middle Strymon Valley during the same period. This pattern suggests that access to high-quality local marble reduced reliance on supra-regional supply networks and shaped material selection at the urban level. The findings point to locally embedded procurement strategies, where funerary production was structured around regional resources rather than long-distance trade. By integrating archaeometric data with archaeological context, this contribution sheds light on the interplay between local availability, workshop practices, and connectivity in the funerary landscape of Roman Thrace.

2715. Grave Stelai Adorned with Ribbons on Fifth-Century BCE Attic White-Ground Lekythoi: Ritual and Commemoration

Authors: Justyna Dworniak (Piotrków Academy | University of Łódź)
Format: Poster

This poster examines the motif of grave stelai adorned with ribbons as depicted on fifth-century BCE Attic white-ground lekythoi, with particular attention to their symbolic meaning and ritual function. The presence of ribbons in funerary scenes should not be understood as merely decorative. Within the cultural framework of classical Athens, they carried a distinct semantic weight: they functioned as visible signs of remembrance, mourning, and care for the deceased while, at the same time, acting as a symbolic link between the worlds of the living and the dead. The iconographic analysis of the archaeological material makes it possible to explore the relationship between representation and lived practice. The decoration of the lekythoi is not simply a painterly convention; rather, it reflects specific gestures and actions associated with burial rites and commemorative rituals. Among the 170 representations examined, the ribbon motif appears in several configurations: in 106 cases tied directly around the stele, in 43 held or offered by figures participating in the scene, and in 21 associated with baskets placed beside the grave or carried by ritual participants. This study aims to clarify the ribbon motif's significance in funerary iconography and show how it actively communicates between the living and the dead. From this perspective, the ribbon emerges as an element that integrates ritual, memorial, and social dimensions, revealing the layered and nuanced character of the imagery found on white-ground lekythoi.

163 INVESTIGATING HUMAN PATTERNS IN EURASIA BETWEEN CA. 60-30 KA: BIOLOGICAL, CULTURAL AND ECOLOGICAL PERSPECTIVES

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Silvia Monterrosa Preziosi (University of Bologna) – Maya Oron (University of Haifa) – Juan Ochando Tomás (University of Siena)
Keywords: Palaeoecology, Subsistence strategy, MIS3, Material culture, Palaeobotany
Format: Regular session

SESSION ABSTRACT

The period between 60,000 and 30,000 years ago represents a pivotal timeframe in human ecology, characterised by significant demographic, biological, and cultural transformations across Eurasia, from the Atlantic coast to Siberia and from the Mediterranean to the northern plains. This session aims to integrate multidisciplinary perspectives to explore the complex patterns of human behaviour, adaptation, and interaction during this critical interval. Particular emphasis will be placed on reconstructing palaeoenvironmental and palaeoclimatic dynamics, subsistence strategies, and cultural sequences through multi-proxy analyses. This timespan, corresponding to Marine Isotope Stage 3 (MIS 3), is marked by pronounced climatic instability and rapid oscillations between stadial and interstadial phases. These environmental fluctuations created a dynamic backdrop for human populations, influencing dispersal routes, settlement patterns, and subsistence strategies. The period encompasses key developments including the expansion of Homo sapiens into a wide range of ecological contexts, possible interactions with Neanderthals and Denisovans, and the emergence of distinctive cultural traditions associated with the Middle-to-Upper Palaeolithic transition. The session welcomes contributions examining these phenomena through various analytical approaches, including lithic technology, zooarchaeological and archaeobotanical analyses, symbolic behaviour, ancient DNA studies, palaeoproteomic analyses (particularly ZooMS for taxonomic identification), as well as palaeoenvironmental and palaeoclimatic reconstructions and bioarchaeological research. We particularly encourage integrative, multi-proxy studies that combine diverse datasets to explore how human groups navigated and adapted to Eurasia's varied landscapes during MIS 3's unstable conditions. By fostering dialogue amongst researchers employing diverse proxies across different geographical regions, this session seeks to advance our understanding of the mechanisms that shaped human evolution, cultural development, and dispersal during this transformative period.

CONTRIBUTION ABSTRACTS

1309. Atmospheric Circulation Variability and Regional Climate in Iberia During MIS 3: Implications for Neanderthal Populations

Authors: İNci Özdoğru (ICArEHB, Universidade do Algarve) – Ozan Göktürk (NORCE Norwegian Research Centre AS | Bjerknes Centre for Climate Research) – Chuncheng Guo (Danish Meteorological Institute | NORCE Norwegian Research Centre AS | Bjerknes Centre for Climate Research) – Kerim Nisancioglu (Department of Earth Science, University of Bergen | Bjerknes Centre for Climate Research) – Richard Jennings (School of Biological & Environmental Sciences, Liverpool John Moores University) – João Cascalheira (ICArEHB, Universidade do Algarve)
Format: Oral

Marine Isotope Stage 3 (MIS 3) was characterised by pronounced millennial-scale climate variability, including Dansgaard–Oeschger and Heinrich events associated with changes in the Atlantic Meridional Overturning Circulation and Nordic Seas sea ice extent. These processes influenced atmospheric circulation and regional paleoclimate in Western Europe, affecting paleoenvironmental conditions relevant to Neanderthal populations. Neanderthal disappearance around 40 ka coincided with the Middle to Upper Palaeolithic transition and likely involved regionally variable interactions between climate-driven habitat fragmentation, reduced social connectivity, and demographic processes. Here, we investigate how large-scale atmospheric circulation changes during MIS 3 shaped regional climate patterns in Iberia, which was a potential refugia for Neanderthal populations during climatically unfavourable phases. A freshwater hosing experiment was conducted using the global Earth system model NorESM1-F under boundary conditions representative of Greenland Interstadial 8 (GI-8; 38 kyr BP), capturing the transition from Heinrich Event 4 (H4) to GI-8. Dynamical downscaling was performed using the WRF regional climate model at 9 km horizontal resolution to simulate regional circulation and associated temperature and precipitation patterns. Preliminary results indicate clear stadial–interstadial contrasts across Iberia, including a tendency toward wetter winters and drier summers during H4. These patterns are linked to shifts in the position and strength of the North Atlantic westerly jet and associated moisture transport. By linking large-scale atmospheric dynamics with high-resolution regional climate patterns, this study provides an improved assessment of Iberian climate variability during MIS 3. The results establish a climatic framework for evaluating potential impacts on landscape productivity, habitat connectivity, and resource availability. Ongoing integration with archaeological and paleoanthropological datasets will enable a direct assessment of climate–human interactions especially influences on Neanderthal settlement patterns and behaviour in Iberia.

2541. Human responses to abrupt climate and environmental change at Lapa do Picareiro (Portugal) during MIS 3

Authors: Jonathan Haws (University of Louisville | ICArEHB, Universidade do Algarve) – Milena Carvalho (ICArEHB, Universidade do Algarve) – Maria Ellis (Colorado State University | ICArEHB, Universidade do Algarve) – Michael Benedetti (University of North Carolina Wilmington | ICArEHB, Universidade do Algarve) – João Cascalheira (ICArEHB, Universidade do Algarve) – Lukas Friedl (University of West Bohemia | ICArEHB, Universidade do Algarve)
Format: Oral

During Marine Isotope Stage (MIS) 3, abrupt climate changes repeatedly impacted human and natural systems across Eurasia, leading to changes in human demographics and settlement patterns. Human responses to these abrupt climate shifts varied across the continent. Climate fluctuations created conditions for human population contractions during stadials and expansions during interstadials. This period also witnessed the replacement and assimilation of Neanderthal populations by modern humans. For western Iberia, Lapa do Picareiro, a cave site in central Portugal, provides a diachronic record of MIS 3 human occupation and environmental change. The cave contains a unique, continuous, 11 m stratified sedimentary sequence spanning over 60,000 years of the Upper Pleistocene, making it an ideal locale to track long-term human response to paleoenvironmental change. The MIS 3 sedimentary sequence of Picareiro contains Middle and Upper Paleolithic occupations, extremely rich faunal assemblages, and subtle variations in particle size and geochemistry that record changes in the climate, hydrology, and morphology of the cave environment. Age control is provided by over 100 radiocarbon dates. Sedimentological analyses including magnetic susceptibility link the cave deposits with global scale records of Late Pleistocene climate from the Greenland ice cores and regional-scale ones from deep-sea cores off Portugal and speleothems from caves. With stratified age control, we document changes in occupation intensity, raw

material acquisition, and technology. Taphonomic analyses of the faunal remains inform on local paleoenvironments and human diet choice. We use these data to synchronize abrupt climate changes and human adaptive response during MIS 3.

2341. A glimpse into MIS 3 Neanderthals in Westernmost Iberia: zooarchaeological, isotopic, and proteomic evidence from Lapa do Picareiro

Authors: Milena Carvalho (ICArEHB - Universidade do Algarve) – Jonathan Haws (University of Louisville | ICArEHB - Universidade do Algarve) – Karen Ruebens (University of Reading | Collège de France) – Geoff Smith (University of Reading) – Anna Wagner (University of Reading) – M. Grace Ellis (Colorado State University | ICArEHB - Universidade do Algarve) – João Cascalheira (ICArEHB - Universidade do Algarve)
Format: Oral

Identifying variability in Neanderthal behavior through time during the Late Pleistocene is critical for understanding the processes that ultimately culminated in the disappearance of Neanderthal populations at both local and regional scales. Portuguese Estremadura (central Portugal) represents one such region where the Middle Paleolithic archaeological record has grown substantially over the past decades. Several key sites within this region provide evidence for considerable ecological plasticity in Neanderthal hunting strategies and subsistence practices. Despite this apparent behavioral flexibility, Neanderthal populations disappear from the regional record by approximately ~42 ka cal BP, raising important questions about the nature of their responses to late climatic and environmental instability. Lapa do Picareiro is ideally suited to investigate diachronic shifts in Neanderthal subsistence behaviors and to evaluate whether these practices changed through time. The site contains extensive zooarchaeological assemblages associated with multiple Middle Paleolithic occupations, alongside a suite of paleoenvironmental proxies, well-preserved stratigraphic integrity, and robust chronological control. Together, these characteristics provide a strong framework for integrating behavioral and environmental datasets at high temporal resolution. Isotopic analyses and magnetic susceptibility data from Lapa do Picareiro suggest the presence of environmental disturbance within the sequence, potentially linked to the climatic deterioration associated with Heinrich Stadial 5. Building on this environmental context, we integrate zooarchaeological analyses, stable isotope data, and preliminary ZooMS results derived from archaeofaunal assemblages recovered from stratigraphic levels KK and JJ. Through this multi-proxy approach, we assess how Neanderthal populations responded to the changing environmental conditions of Marine Isotope Stage 3 and evaluate whether their behavioral strategies reflect resilience, resistance, and/or adaptive adjustments in the face of ecological instability.

1016. Decoding Middle Palaeolithic Mobility: A Multi-Scalar Approach to Lithic Procurement Patterns and Settlement Dynamics in Northeast Iberia

Authors: Bruno Gómez De Soler (Iphes | Universitat Rovira i Virgili) – Pablo Rodríguez-Salgado (Icrag | University College Dublin) – Julian Menuge – Maurice Brodbeck (University College Dublin) – Judit Brià (Iphes) – Amèlia Bargalló (Universitat Rovira i Virgili | Iphes) – Francesca Romagnoli (Universidad Autónoma de Madrid) – Palmira Saladié – Josep Vallverdú – Gema Chacón (Iphes | Universitat Rovira i Virgili)
Format: Oral

Understanding mobility patterns is crucial for decoding the complex dynamics of Palaeolithic human behaviour. The study of lithic resources provides a valuable means of reconstructing mobility and, by extension, settlement dynamics. While recognising the limitations of this approach, its integration with other disciplines, such as zooarchaeology, taphonomy, geoarchaeology, in a broad sense, and their spatial distribution, enhances interpretations of occupation types. Lithic raw material sourcing serves as a key marker of human movement across the territory. Variations in distance, distribution, accessibility, and mode of introduction can provide crucial evidence into territorial mobility and type of occupation. This study examines the short-term occupation at Abric Romaní Level N (c. 55 kyr BP), a well-preserved Middle Palaeolithic context, where lithic raw material procurement sheds light on the nature and duration of the occupation. Through a comprehensive multi-scalar approach that integrates macroscopic criteria, thin-section petrography, and minimal-destructive geochemical analyses (p-XRF and LA-ICP-MS), we seek to determine the range of exploited lithic raw materials and reconstruct Neanderthal procurement strategies during this brief occupation. Identifying patterns of local and non-local resource use refines interpretations of mobility and territorial organisation on a short-term scale. Our findings highlight the selective exploitation of lithic sources and their influence on site use and occupation dynamics. The integration of lithic provenance studies with zooarchaeological, taphonomic, and spatial data, including the distribution of combustion structures and wooden remains, validates the interpretation of Level N as a short-term occupation. This interdisciplinary approach provides detailed insights into how Neanderthal groups structured their activities within a short-lived settlement. This research increases our understanding of technological decision-making, mobility, and settlement organisation during the Middle Palaeolithic in Northeast Iberia.

2473. Exploitation of Environmental Resources and Subsistence Strategies in Italy during MIS 3: Insights from Zooarchaeological and Palynological Evidence

Authors: Jacopo Crezzini – Juan Ochando – Francesco Boschin (Department of Physical Science, Earth and Environment - University of Siena) – Stefano Benazzi (Department of Cultural Heritage - University of Bologna) – Omry Barzilai (School of Archaeology and Maritime Cultures - University of Haifa) – Francesco Berna (Department of Physical Science, Earth and Environment - University of Siena | Department of Archaeology, Simon Fraser University)
Format: Oral

This paper integrates zooarchaeological and palynological data to explore patterns of human behaviour and environmental adaptation during Marine Isotope Stage 3 (MIS 3) in Italy. The Italian Peninsula represents a key biogeographical region in southern Europe, having acted as a refugium for flora and fauna and favouring the persistence of human populations throughout the Late Pleistocene. Palynological analyses of coprolites, food remains, and sediments recovered from Italian archaeological contexts provide valuable information for reconstructing past vegetation and environmental conditions. At the same time, zooarchaeological analyses of several Italian sites attributed to both Mousterian and Upper Palaeolithic technocomplexes allow the identification of similarities and behavioural differences in patterns of animal exploitation between Neanderthal and modern human populations. The comparison of these proxies enables the reconstruction of the dynamics of natural resource exploitation by these two human groups, assessing whether such strategies were primarily driven by nutritional requirements and/or by specific adaptations to local environmental conditions. Given that the demise of European Neanderthals occurred at different times and followed diverse trajectories across geographical regions, a detailed regional-scale investigation of changes in environmental resource availability provides an important framework for understanding the complex processes underlying Neanderthal persistence and disappearance in Europe.

1730. New palaeoecological and tephrocronological data from the MIS3 layers of Grotta-Riparo di Uluzzo C (Apulia, southern Italy)

Authors: Juan Ochando Tomás (University of Siena) – Donatella Magri (Sapienza University of Rome) – Biagio Giaccio (Consiglio Nazionale delle Ricerche) – Omry Barzilai (University of Haifa) – Francesco Berna (University of Siena | Simon Fraser University) – Enza Spinapolice (Sapienza University of Rome) – Adriana Moroni (University of Siena | Centro Studi sul Quaternario ODV | Istituto Italiano di Paleontologia Umana) – Gabriele Terlato – Matteo Romandini – Stefano Benazzi (University of Bologna)
Format: Oral

The southern Italian Peninsula plays a crucial role as a biogeographical hotspot in Southern Europe, influenced significantly by the Mediterranean climate. This environment acted as a glacial refuge for diverse flora and fauna, humans included. This study employs pollen analysis on Mousterian and Uluzzian sediments from Grotta-Riparo di Uluzzo C in the Salento Peninsula (southern Italy) to reconstruct the vegetation landscapes encountered by the late Italian Neanderthals (thus far associated with the Mousterian) and early modern humans (linked to the Uluzzian) during the mid Marine Isotope Stage (MIS) 3. Our palynological analyses reveal a distinctive and diverse environment within the Mediterranean landscape. Tephrochronological and OSL constraints and paleoenvironmental variability consistently allow us to date the investigated interval between ~46.6 ka and 43.4 ka, encompassing the second part of the long Greenland interstadial 12 (GI-12) and the onset of the GI-11. Over these three millennia, the environment in the area of Uluzzo C is characterized by a rich flora mainly composed of evergreen elements. Additionally, heliophytes such as Amaranthaceae, Artemisia, and Poaceae are observed. The consistent presence of pollen taxa such as Juglans, and Pinus halepensis/pinea, among others, highlights the importance of this coastal area of Apulia for the long-term persistence of Mediterranean species during the Late Pleistocene. These taxa could be supported by a generally mild climate, as suggested by the occurrence of Olea, Myrtus, and Cistus. These diverse environments would undeniably have offered various opportunities for the survival of Neanderthals and early Upper Palaeolithic hominins, especially during the warm phases and, critically, the cold events of the Late Pleistocene. Our data from Uluzzo C corroborate the previous idea that the climatic and environmental setting were not the main reason for Neanderthals' abandonment of Uluzzo Bay and potentially southern Italy around 45,000 years ago.

1329. Ždrilo Cave (Croatia): New insights into Upper and Middle Palaeolithic occupations in the Eastern Adriatic through multiproxy faunal analysis

Authors: Silvia Monterrosa Preziosi (University of Bologna) – Lia Vidas (Centre for Applied Bioanthropology, Institute for Anthropological Research) – Lisa Brotons – Angelica Fiorillo – Sara Silvestrini (University of Bologna) – Gabriele Terlato (Universty of Bologna) – Omry Barzilai (University of Haifa) – Francesco Berna (University of Siena) – Mario Bodružić (University of Zadar) – Stefano Benazzi (University of Bologna)
Format: Oral

Although known for its Neolithic sequence, recent investigations at Ždrilo Cave, near Rovanjska (Croatia), have revealed significant Upper and Middle Palaeolithic occupations, filling a crucial gap in the understanding of these periods along the Eastern Adriatic coast. Extensive excavations in 2021, 2023, and 2025 exposed stratigraphically distinct UP and MP levels that are directly confirmed by radiocarbon dating, providing rare evidence for human behaviour in this region and currently representing the only site on the eastern Adriatic coast with securely dated deposits from both periods. This study presents a comprehensive zooarchaeological analysis of faunal remains, integrating taxonomic, taphonomic, and ZooMS (Zooarchaeology by Mass Spectrometry) data. The assemblages are dominated by large ungulates, primarily cervids (red deer and fallow deer), with carnivores (mainly cave bear), equids, small mammals, and birds also represented. Taphonomic analysis reveals variable evidence of anthropogenic modifications, including cut-marks, percussion-marks, and thermal alterations, alongside carnivore activity, suggesting complex and potentially different site formation processes between occupational phases. Good collagen preservation has enabled ZooMS to refine taxonomic identifications and enhance understanding of faunal diversity and palaeoecological conditions. Preliminary results suggest adaptation to mixed woodland and open environments, with exploitation of both large and small game alternating with carnivore occupation. These zooarchaeological and ZooMS data provide the first detailed faunal evidence for both Neanderthal and Homo sapiens adaptive strategies in the Eastern Adriatic, offering crucial insights into hominin adaptive responses to the environmental dynamics of MIS 3.

2409. Tool-life of Middle Palaeolithic side-scrapers in the Eastern Adriatic region – A quantitative 3D-based approach

Authors: Francesco Valletta (University of Haifa) – Ana Abrunhosa (University of Haifa | ICArEHB) – Dalma Kerekes Yaara Shafrir (University of Haifa) – Vasilije Marojević (University of Minnesota) – Nikola Borovinić (Centre for Conservation and Archaeology of Montenegro) – Mario Bodružić (University of Zadar) – Ivor Janković (Institute for Anthropological Research) – Stefano Benazzi (University of Bologna) – Francesco Berna (University of Siena | Simon Fraser University) – Omry Barzilai (University of Haifa)
Format: Oral

Side-scrapers are the most common tool type in several Balkan and Eastern Adriatic Middle Palaeolithic lithic assemblages, representing a hallmark of the regional Mousterian. The variability observed in their morphology, frequency, manufacturing process, and modification intensity is often used to extrapolate hypotheses about past hominin behaviour. Yet, when analysing these artifacts, it might be difficult to disentangle the combined effect of multiple factors on the observed features: including the cultural background of their maker, the functional and economic constraints that might have affected their manufacturing and maintenance history, and their deposition context. Additionally, the global and local morphology of side-scrapers and their manufacturing process are traditionally described based on qualitative attributes, possibly masking the variability within categories and the continuity between them and hampering the comparison between artifacts. The present project aims to develop a framework for correlating specific global and local morphological features of side-scrapers with different aspects of their life: from raw material procurement and economy, to blank manufacturing and modification, tool maintenance, discard, and taphonomic history. To test possible geographical variability patterns in different aspects of the tool life, we compare Mousterian side-scraper assemblages from different sites in the Eastern Adriatic region: including the caves of Romualdova (Istria), Ždrilo (Dalmatia), and Bioče (Montenegro). Inter-artifact comparability is addressed based on a standardized set of quantitative descriptors derived from 3D models of side-scrapers, including variables that capture overall tool geometry, the morphology and spatial distribution of retouched edges, and technological attributes related to original blank manufacture, extracted by using available software (e.g., AGMT3-D, Artifact3-D) and purposedly developed digital methods. By means of quantitative inter-site comparison we expect to identify and describe regional techno-morphological patterns and possibly correlate them with variability in local economical constraints and/or the manufacturing traditions of the groups that occupied the sites.

360. Fire use at the Upper Paleolithic site of Românești-Dumbrăvița I (Southwest Romania) inferred through the study of heated lithics

Authors: Adrian Dobos – Alexandru Ciornei (Institute of Archaeology „Vasile Pârvan", Bucharest) – Wei Chu (Leiden University)
Format: Oral

Fire as a tool is intrinsically connected to human evolution throughout the prehistory, but the knowledge on the topic, particularly in the Balkans, is still incomplete. Out presentation explores the relationship between hominins and anthropogenic fire use through the analysis of heated lithic artifacts from the Paleolithic site of Românești-Dumbrăvița I in Southwestern Romania. The aim is to investigate if heated lithics can provide information about the temperatures they were exposed to at a site that preserves no other macroscopic evidence for Pleistocene fires. We hypothesized that lithics exposed to fire show different changes contingent upon temperatures. Our approach focused on experimentally heating lithics knapped in Poieni-Pietroasa fault chert at different temperatures and durations. Changes in color, density and surface morphology were quantified and subsequently applied to the study of the archeological assemblage. Results suggest three combustion zones were present in the proto-Aurignacian level of the site. The research combines experimental pyrotechnology and archeological excavation data to provide insights into past human habitation patterns. The research was funded through the CNCS – UEFISCDI grant TE 99/2022 and ERC-Consolidator grant HOME: Palaeolithic Shelters in East-Central Europe

788. Technological Variability and Adaptive Strategies in the Zagros: Insights from Kunji Cave

Authors: Maya Oron (School of Archaeology and Maritime Cultures, University of Haifa) – John Speth (Department of Anthropology, University of Michigan) – Francesco Berna (Department of Physical Sciences, Earth and Environment, University of Siena) – Stefano Benazzi (Department of Cultural Heritage, University of Bologna) – Omry Barzilai (School of Archaeology and Maritime Cultures, University of Haifa)
Format: Oral

Located at a geographic crossroads between Europe, the Levant, and Asia, the Zagros Mountains may have played a vital role in the movement of early human populations across Eurasia. The region's evidence for long-term Neanderthal presence in the late Middle Paleolithic, as well as Upper Paleolithic cultural entities, provides a potential perspective on questions of continuity and replacement during the transition from the Middle to the Upper Paleolithic. Lithic assemblages of the Zagros Middle Paleolithic have commonly been interpreted through typological frameworks and large-scale cultural classifications (e.g. Mousterian vs. Baradostian) over the past decades. This emphasis on generalized cultural affiliation has, in some cases, obscured the behavioral processes that structured lithic assemblage composition. This paper presents a renewed typo-technological analysis of the Middle Paleolithic lithic assemblage from Kunji Cave, Iran. Kunji cave site was first reported by Henry Field in 1951 and subsequently tested by Frank Hole and Kent Flannery in 1963. John Speth returned to Kunji in 1969 and excavated a larger area of the cave. The material discussed in this paper derives largely from Speth's excavation, with an additional small sample from the initial test excavation. The assemblage is relatively large and unmixed with Upper Paleolithic or later materials, thereby providing a valuable case study for re-evaluating the Zagros Middle Paleolithic. Our analysis of reduction strategies, blank production, and retouched tool frequencies suggests that the Kunji Cave assemblage may have been significantly shaped by its specific role within a mobility-based settlement system. However, the data also reveals distinct technological attributes that may reflect broader cultural traditions. By disentangling the signatures of site function from those of cultural identity, these results provide a more nuanced understanding of technological organization and are suitable for both intra- and interregional comparisons.

879. Szeletian revisited: a combined approach to a transitional industry

Authors: Dalma Kerekes (University of Haifa) – György Lengyel (Hungarian National Museum | University of Miskolc) – Isabella Caricola (University of Bari Aldo Moro) – Francesco Valletta (University of Haifa) – Zoltán Tóth (Independent Researcher) – Michael Hitchcock (University of Haifa | Liverpool John Moores University) – Stefano Benazzi (University of Bologna) – Francesco Berna (University of Siena | Simon Fraser University) – Omry Barzilai (University of Haifa)
Format: Oral

During the Middle to Upper Palaeolithic transition, archaeological data from Eastern Central Europe reflect a complex cultural phenomenon. At this time, three archaeological cultures were present in the region, each combining Middle and Upper Palaeolithic technological and typological elements. One of these is the Szeletian, dated to between 46 and 39 kya, with sites located in Moravia, western Slovakia, northeast Hungary, and southern Poland. The industry was first identified at Szeleta Cave in northeast Hungary at the beginning of the 20th century and has since been central to debates concerning the cultural change that happened during this period. However, despite more than a century of research, its lithic technology remains poorly understood and it is only loosely described as a transitional industry based on the presence of bifacial leaf points, Middle and Upper Palaeolithic tool types, and non-hierarchical flake and blade production. Although, detailed lithic studies have been conducted to uncover the archaeological meaning of the Szeletian, the research has largely remained local, with no efforts made at cross-regional comparison that could provide a comprehensive description of the lithic record. Additionally, while hundreds of Szeletian open-air sites have been reported in Eastern Central Europe, many of them are surface surveys without excavations and are attributed to the industry solely on the basis of bifacial leaf points. Therefore, it is essential to analyse the stratified Szeletian assemblages from Hungary, Slovakia, and the Czech Republic using an integrated approach that combines traditional techno-typological analysis with 3D analysis, use-wear studies, and experimental archaeology. Besides the bifacial leaf points, the research also focuses on the toolkit and the technological aspects of the production sequence to finally provide a clear definition of the industry.

164 DECODING FAUNAL ASSEMBLAGES: SCIENTIFIC APPROACHES TO ANIMAL REMAINS IN ARCHAEOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Daniela Cabral (Universidade de Coimbra) – Beatriz Pinto (Universidade do Algarve) – Alejandro Ruiz (Universidad de Cádiz) – Ana Santos (Universidade de Lisboa) – Eva Pires (Universidade NOVA de Lisboa)
Keywords: Zooarchaeology, Faunal assemblages, Interdisciplinarity, Human–animal interactions, Environmental archaeology
Format: Regular session

SESSION ABSTRACT

This session aims to bring together researchers working on archaeological faunal assemblages to explore how animal remains contribute to our understanding of past environments, economies, and cultural practices. Scientific analysis of faunal materials has become essential for reconstructing subsistence strategies, mobility patterns, human–animal interactions, and ecological dynamics in both prehistoric and historical contexts. We invite contributions that combine traditional zooarchaeological approaches with new analytical trends such as isotopic, molecular, Zooarchaeology by Mass Spectrometry (ZooMS), geometric morphometric, and taphonomic analyses, as well as studies focusing on spatial distribution, ethnoarchaeological comparisons, or experimental archaeology. Comparative and interdisciplinary perspectives on terrestrial, aquatic, or integrated systems are especially welcome. By decoding faunal assemblages through multiple scales of analysis and integrating diverse scientific methods, this session seeks to foster dialogue between different specialists and highlight the interpretative potential of combining distinct biological proxies. We also encourage papers that address methodological challenges, sample preservation issues, and strategies for data management and sharing in zooarchaeological research.

1023. From Fragments to Behavior: A Multi-Proxy Zooarchaeological Study of Amud Cave Faunal Assemblage

Authors: Anaëlle Jallon (Hebrew University of Jerusalem | Centre de Recherche Français à Jerusalem, USR3132 CNRS) – Erella Hovers (Hebrew University of Jerusalem | Minerva Center for the Study of Population Fragmentation | Institute of Human Origins, ASU | ICArEHB, University of Algarve) – Rivka Rabinovich (Hebrew University of Jerusalem)
Format: Oral

Amud cave is a site of the utmost importance in the Levantine Middle Paleolithic framework. Dated to the very end of the Middle Paleolithic (ca. 70 to 55 Kyrs BP), a pivotal period in human evolution and population dynamics in the region, this site yielded Neanderthal remains and large amounts of archaeological materials. These findings offer exceptional insights into the technical and cultural behavior of these populations at the very end of their presence in the Levant. Among these materials, the site yielded a substantial amount of faunal remains, which are the focus of the current presentation. The assemblage exhibits some notable features, particularly the absence of carnivores and of carnivore-induced damage to the remains. Additionally, part of the bone fragments shows good cortical surface preservation, which allows the identification and study of surface modifications. However, the archaeozoological and taphonomic study of this assemblage is challenged by the very high fragmentation rate and the possible impact of post-depositional processes on the bones. To overcome these constraints, the project adopts a multi-proxy strategy and emphasizes approaches specifically designed to capture variability within the assemblage and to mitigate biases linked to differential preservation. Through the use of adapted zooarchaeological methods and high-resolution analytical approaches, including 3D microscopy, FTIR, spectrophotometry, and micro-usewear analysis, the study extracts detailed information from these highly altered faunal remains. This integrated framework provides new insights into prey selection, the acquisition and processing of animal resources, site occupation seasonality, and the processes affecting bone preservation. Ultimately, this research aims to contribute to broader discussions on the place of Amud within the Levantine Late Middle Paleolithic context, and to question cultural influences on subsistence behaviors, beyond efficiency.

2167. Integrating minimally-invasive palaeoproteomics and radiocarbon dating to the study of the Neolithic osseous industry at Svinjarička Čuka, Serbia

Authors: Anastasia Papadogianni (Department of Evolutionary Anthropology, University of Vienna | Austrian Archaeological Institute, Austrian Academy of Sciences, Vienna) – Danica Grujić (Institute of Archaeology, Belgrade) – David Blattner (Austrian Archaeological Institute, Austrian Academy of Sciences, Vienna) – Barbara Horejs (Austrian Archaeological Institute, Austrian Academy of Sciences, Vienna | Human Evolution and Archaeological Sciences Research Network, Vienna) – Katerina Douka (Department of Evolutionary Anthropology, University of Vienna | Human Evolution and Archaeological Sciences Research Network, Vienna)
Format: Oral

Post-depositional fragmentation and anthropogenic modifications often present obstacles to the study of archaeological bone artefacts, particularly within museum collections where conservation concerns limit destructive analytical approaches. As a result, taxonomic determination of the raw materials used in prehistoric osseous industries remains challenging, directly impacting our understanding of resource selection strategies. Zooarchaeology by Mass Spectrometry (ZooMS) provides an effective and quick solution for assigning robust taxonomic identifications at the family, genus, and even species level to highly fragmented or modified unidentified osseous materials and faunal assemblages. This innovative approach complements and refines the research findings of traditional zooarchaeological approaches, while remaining compatible with museum curational practices. In this study, we explore the potential of minimally-invasive ZooMS paired for the first time with minimally-destructive radiocarbon dating, conducted entirely within a museum setting, to investigate the Neolithic bone tool industry from Svinjarička Čuka in southern Serbia. Using ZooMS, we provide taxonomic identifications for a selected assemblage of Neolithic unidentifiable bone tools (n=57), including a unique figurine recovered from the Starčevo-Neolithic settlement. Radiocarbon dating establishes a secure chronological framework for the production and use of these artefacts at this key site in the Morava River valley. By integrating palaeoproteomic and chronological data with existing archaeological observations, we reconstruct patterns of raw material selection and manufacturing strategies in bone tool production at Svinjarička Čuka. On a broader level, our findings contribute to discussions on resource management and human–animal interactions during the early stages of Neolithisation in this region of the Balkans. This research demonstrates the potential of minimally-invasive, in situ sampling techniques to integrate diverse analytical proxies while maintaining ethical curational practices.

1898. Multiple animal species used in Corded Ware osseous artifacts: ZooMS evidence from Żurawica

Authors: Weronika Cieszynska (Masaryk University, Department of Archaeology and Museology) – Agnieszka Kubicka-Marek (Pracownia Badań i Usług Archeologicznych, Rzeszow) – Ondrej Šedo (Central European Institute of Technology) – Zuzana Hofmanová (Masaryk University, Department of Archaeology and Museology, Brno | Max Planck Institute for Evolutionary Anthropology)
Format: Oral

Bone artifacts are a crucial part of material culture. While traceological analysis can answer many questions about their use, it is often difficult to determine the exact species from which an artifact was made. Identifying the species can reveal patterns in resource exploitation and distinguish closely related animals, such as sheep and goat. This was the case for an assemblage of artifacts from Żurawica, a Neolithic site in southern Poland. Five bone artifacts, including grave goods, were previously identified as made of bone but lacked diagnostic features that could indicate their animal origin. To resolve this, we applied ZooMS (Zooarchaeology by Mass Spectrometry) to identify the species of each artifact. The method was successful for all samples: three artifacts were made from cattle, the needle from domestic sheep, and one artifact from pig/wild boar. These results demonstrate that multiple animal species were used to produce bone artifacts, suggesting that communities flexibly exploited available resources rather than showing strict preferences for a single species. Direct species identification through ZooMS moves beyond visual or typological assumptions, revealing aspects of Neolithic craft and subsistence that would otherwise remain hidden. The combination of domestic and wild taxa highlights resilient practices, showing how people adapted their material culture to the available resources. Many bone artifacts in archaeological collections remain unanalysed, and wider application of ZooMS promises to uncover further insights into Neolithic economies, craft strategies, and the diversity of animals integrated into both daily and symbolic life.

1039. Animal paleoeconomy of the first Neolithic communities in Dobrogea (6th–5th millennia BC)

Authors: Adrian Balasescu – Franceska Știrbu ("Vasile Pârvan" Institute of Archaeology, Romanian Academy) – Estelle Herrscher (Laboratoire Méditerranéen de Préhistoire Europe Afrique, CNRS, LAMPEA - UMR 7269) – Valentin Radu (University of Bucharest, ICUB, Bucharest | National History Museum of Romania, Bucharest)
Format: Oral

Preventive and systematic archaeological research conducted over the last 15 years in Dobrogea (southeastern Romania) has led to the discovery of new sites as well as the reevaluation of older Neolithic settlements dated to the 6th–5th millennia BC that are included in the Prehamangia culture (the site at Palazu Mare - 5700–5400 calBC) and the Hamangia culture (the sites of Techirghiol, Palazu Mare, Baia - 5400–4700 calBC). This paper reviews over 50,000 faunal remains belonging to various animal classes: molluscs, fish, reptiles, birds and mammals. Their archaeozoological study allowed us to highlight the characteristics of the animal paleoeconomy of these communities over a period of approximately 1,000 years. Within the animal breeding activity, it is observed that cattle and caprines predominante, while pigs have an extremely low share. The study of the slaughter ages of large and small horned animals suggests a differentiated use of the species depending on the economic purposes. Although 15 species of wild mammals were identified, hunting had a minor role (under 10%). The main hunted species are the hemione and the red deer. Other faunal resources, such as molluscs, fish, turtles and birds, do not seem to have contributed significantly to the communities' diet, although the interaction with freshwater environments was constant. The identified aquatic species come from rivers and deep lakes, and the exploitation of marine resources was limited. Isotopic studies (^{13}C, ^{15}N, ^{18}O) were also carried out at Palazu Mare and Cheia for mammals, allowing for the identification of differences in environmental conditions as well as the sesonality of the sheep births. This research was supported by a grant from the Romanian Ministry of Education and Research, CNCS – UEFISCDI, project PN-IV-P1-PCE-2023-1547 (ExLiDo).

1046. Feeding the herd: Reconstructing Neolithic caprine diet of El Portalón de Cueva Mayor (Atapuerca, Spain) through bone collagen isotope analysis

Authors: Juan Antonio Antolinos-Díaz – Carlota Pintado-Laguna – Amalia Pérez-Romero (Human Evolution Laboratory, University of Burgos) – Marta Francés-Negro (Department of Law and Humanities, European University of Madrid) – Cristina Valdiosera (Human Evolution Laboratory, University of Burgos | Archaeology and History Department, La Trobe University) – José Miguel Carretero (Human Evolution Laboratory, University of Burgos) – Colin Smith (Human Evolution Laboratory, University of Burgos | Archaeology and History Department, La Trobe University) – Eneko Iriarte (Human Evolution Laboratory, University of Burgos)
Format: Oral

Neolithic arrived to the Iberian Peninsula 7300 years ago approximately. During this era, groups of farmers and herders introduced new resource management dynamics. Despite the abundance of research on prehistoric human diet, the feeding practices of domestic sheep (Ovis aries) and goats (Capra hircus) in this context have received limited attention. This research aims to study these dietary patterns to better understand early pastoralism. For this purpose, caprine bone collagen from El Portalón of Cueva Mayor site (Sierra de Atapuerca, Burgos) are isotopically analyzed (^{13}C and ^{15}N). Neolithic layers of this site span nearly 2500 years of livestock management (approximately 5000-7400 cal BP). This, coupled with its geographical location, aids in understanding the cultural transfer of livestock practices across Europe, the Ebro River basin, and the Northern Meseta. In addition, modern vegetation from the surrounding of the cave was analyzed to establish a local isotopic baseline. Both isotopic signals, animal and vegetal, combined with MixSIAR software analysis may provide us approximated percentages of consumption of each type of plant. According to the results, the diet of these caprine individuals consisted primarily of shrubby vegetation, making the smallest contribution the pastures. The intake of arboreal plants and seeds varied among individuals. This implies a sophisticated management of domestic caprines during the Neolithic in the Northern Plateau, depending on seasonal changes in vegetation and plant resources throughout the year.

1231. VERA: A new 3D framework for identifying domestication related activities in animals

Authors: Christina Siali (Paleoanthropology Department, University of Tübingen | Paleoanthropology Department, University of Tübingen) – Katerina Harvati – Alexandros Karakostis (Paleoanthropology Department, University of Tübingen)
Format: Oral

Domestication studies employ various methods to identify husbandry practices, including demographic profiles and species representation. Within zooarchaeology, domestication represents the first instance where animal form becomes directly receptive to human action, thus making animal morphology, evidence for reconstructing past human behaviour. Morphological changes associated with domestication usually develop over generations. To investigate the consequences of human management during an animal's lifetime, muscle attachment sites (entheses) provide valuable insight into the animal's activity. Humans restricted animal movement through captivity for taming purposes, especially in early domestication phases, while in later stages, used animals for labour. Using the Validated Entheses-based Reconstruction of Activity (VERA) method, we investigated activity-related skeletal changes in modern reference samples of reindeer and sheep. These included zoo-kept, free-ranging, and - among reindeer - racing individuals as well. Multivariate analyses show that reindeer, a species still undergoing domestication, can be assigned to their respective activity groups with high accuracy (88–100%). In contrast, sheep, a fully domesticated species characterised by extensive breed diversity, show lower classification accuracy (~70%) when multiple breeds are analysed together. However, when comparisons are restricted to the same sheep type (free-ranging versus zoo-kept), classification accuracy exceeds 90%. We further present the first application of VERA to archaeological sheep assemblages from hunting contexts at Göbeklitepe and Gusir Höyük and husbandry contexts at Gürcütepe and Tall Munbaqa. Classification accuracy for these assemblages ranges from 89% to 92%, demonstrating the capacity of VERA to distinguish between wild and managed sheep in archaeological contexts. Based on these results, we discuss the potential of the VERA method for domestication studies, address the importance and limitations of modern reference samples, and emphasise the need to account for morphological variability across time and space, particularly in species shaped by millennia of husbandry practices.

1337. Preliminary Zooarchaeological evidence from Antartes Cave in Northern Greece

Authors: Ioanna Ermioni (LIRA Laboratory, Aristotle University of Thessaloniki) – Soultana Maria Valamoti (LIRA Laboratory, Aristotle University of Thessaloniki | CIRI-AUTH, Aristotle University of Thessaloniki) – Zoi Intze – Anastasios Siros (Ephorate of Palaeoanthropology and Speleology, Ministry of Culture) – George Konidaris (School of Geology, Aristotle University of Thessaloniki)
Format: Oral

Antartes Cave located in Northern Greece, near the village of Loutraki in the Almopia region forms part of a wider karstic cave complex known as the "Cavepark." The paleontological research in Almopia highlighted the importance of the region for the study of the Pleistocene faunas of Greece. Recently, the Ephorate of Paleoanthropology and Speleology of Northern Greece initiated systematic archaeological investigation of the caves. Despite a gradual increase in publications over recent decades, zooarchaeological research in Greece, and particularly as regards caves in the region of Macedonia, remains at an early stage of development. The application of analytical methods to faunal assemblages are still scarce and as a result, the interpretative potential of animal remains for reconstructing past human–animal relationships and subsistence strategies in northern Greece remains largely underexplored. Here we present the first results of the zooarchaeological analysis of the faunal assemblage from Antartes Cave, conducted within the framework of an ongoing master's thesis. The material analyzed is relatively limited, comprising approximately 1000 identified elements at anatomical or taxonomic level, reflecting the restricted extent and duration of previous excavation campaigns. However, the 2025 excavation season yielded a substantial quantity of new archaeological material enhancing the archaeological potential of the site. The main aim of this contribution is to present initial observations from the analysis of the available faunal material and to explore patterns of animal exploitation during the Neolithic occupation of Antartes Cave. By employing standard taphonomic and zooarchaeological methods, the study assesses which animal species were exploited by Neolithic communities and considers the role of the cave within broader subsistence and habitation practices. Although the results remain preliminary due to the small and highly fragmented nature of the assemblage, they provide an important foundation for future, more extensive zooarchaeological research at the site and in the wider region.

1506. Living by the lake - The Mesolithic site of Rothenklempenow

Authors: Natascha Kipke (LEIZA - Schleswig Location)
Format: Oral

Faunal assemblages can offer significant insights into ancient ecological systems that have since disappeared. Beyond this, they also provide a glimpse into economic processes. In addition to established analyses on topics such as methods of slaughtering and bone processing, seasonality and spatial distribution, studies of the decision-making process and its economic basis are also an important part of the analysis of subsistence strategies. With regard to this, the Rothenklempenow site, which boast favourable preservation conditions, offers particularly informative bone inventories and could be a valuable resource for further research in this matter. The bone finds from Rothenklempenow demonstrate a broad spectrum of anticipated bone remnants. Furthermore, they provide an

array of bone instruments and tools as well as artefacts whose function is predominantly presumed to be of a ritual nature. These bone assemblages also point out to an original representation of the fauna of the era, whose distribution and behaviour may have exerted an influence on the population dynamics of humans and shaped the exploitation of their ecological niche. When considered as a whole, these findings have the potential to provide a vivid representation of Mesolithic behaviour and to evaluate the underlying socio-economic trade-offs.

1925. Walls of Privilege? Spatial Zooarchaeology in the origins of the Motilla del Azuer, Spain (2200-1875 cal BCE)

Authors: Alejandro Beltrán Ruiz (University of Granada) – José Riquelme Cantal (University of Córdoba) – Trinidad Nájera Colino (University of Granada) – Nelson Almeida (University of Évora) – Fernando Molina González (University of Granada)
Format: Oral

This communication presents a spatial zooarchaeological analysis of Motilla del Azuer (Spain) and a brief of the general results, focusing on the reorganization of animal management and consumption strategies during the climatic instability of the 4.2k BP event (Phases 1 and 2). By examining the distribution of anatomical skeletal profiles and taxonomic frequencies across the site's fortification rings (Interior vs. Exterior), this study reveals a possible shift in social organization. Phase 1 (2200-1950 cal BCE) displays could be marked by spatial segregation consistent with a hierarchical model. High-value meat cuts and wild game are concentrated within the internal fortification, suggesting elite consumption by a "garrison", while the exterior settlement is characterized by lower-utility portions, likely reflecting a tributary population. In contrast, the transition to the arid Phase 2 (1950-1875 cal BCE) reveals, in part, a "reconfiguration" of these distinct consumption patterns. The analysis shows a more spatial homogenization of meat distribution, where the previous choices regarding hunted game and prime cuts diminish, including when the games are more important than the phase 1. Instead, the internal enclosure appears to shift function towards the protected storage of critical resources, evidenced by the centralized processing of pigs and the specific presence of young horses. The 4.2k BP event may have driven the site's consolidation, establishing resident families with specific functions that reshaped the social landscape. Concurrently, the lack of abundance promoted intensive processing strategies, transforming previous disposal patterns into necessary subsistence practices. Skeletal elements previously discarded were often utilized for broth preparation and grease rendering, reflecting a shift to a resilience-based economy focused on rationing and the maximization of limited resources.

1224. From bones to livestock farming: archaeozoological analysis in the Iron Age settlement of Teso de las Catedrales (Salamanca, Spain)

Authors: Rocío Pazos García – Esteban Álvarez-Fernández (Universidad de Salamanca. GIR PREHUSAL)
Format: Oral

The Teso de las Catedrales (Salamanca, Spain) is a settlement whose long sequence of occupation (from the second Iron Age to the present day) contrasts with the limited archaeological knowledge available about its evolution and internal functioning. In this context, the study of faunal remains from Late Iron Age levels (3rd–2nd centuries BC) is a fundamental way of approaching the economic practices and animal management of one of the oldest documented periods in the area. The recovered assemblage presents significant taphonomic challenges due to intense post-depositional processes, thermal alterations and a high degree of concretion, which condition taxonomic identification and functional interpretation. This paper presents the results of a recent archaeozoological analysis focused on evaluating the representativeness of the assemblage, reconstructing subsistence practices, and examining the role of animals in the daily life of the settlement. Despite preservation limitations, the study combines morphological, metric, and taphonomic approaches. The results point to a diversified livestock economy, dominated by sheep, goats and cattle, together with a significant presence of pigs and wildlife. Likewise, processing and consumption patterns in line with regional models are documented, but with local particularities that reflect the economic and social identity of the site.

2453. Legacy in Bone: The Long-Term Evolution of Animal Exploitation at the "Lužac and Jankovo" Site

Authors: Ivona Jukicic (University of Zagreb, Faculty of Humanities and Social Sciences | Geoarheo d.o.o.) – Jelena Lapic (University of Zagreb, Faculty of Humanities and Social Sciences) – Goran Skelac (Geoarheo d.o.o.)
Format: Oral

The rescue archaeological excavations conducted at the AN 3 „Lužac i Jankovo" site encompassed a total area of 39 270 m2. The primary aim of this paper is to reconstruct aspects of everyday life at the site through the analysis of bones, teeth, and horns, enabling the identification of the animal species present. By analysing the remains, the study aims to understand the human relationship with animals and how they fit into the broader social, economic, and cultural practices of the period. The comprehensive traditional archaeozoological analysis of animal remains from AN 3 site "Lužac i Jankovo" was conducted with the aim of examining changes in the use of animals across different phases of occupation. Based on the analysis of movable archaeological material, four chronological categories were identified: Prehistory, Early Iron Age – Hallstatt period, Late Iron Age – La Tène period, and Antiquity, with an additional category comprising archaeological features of unknown chronological attribution. This classification enabled a diachronic approach to the interpretation of faunal remains and their association with relevant archaeological contexts. Analysed material indicates differences in the representation of individual animal species as well as in patterns of their exploitation

between the identified periods. These differences point to changes in the use of animal resources, which can be considered within the broader framework of the development of settlement at the site. The results of the archaeozoological analysis contribute to a better understanding of the dynamics of animal use at the AN 3 site and complement the archaeological interpretation of the site across multiple chronological phases.

2315. Reading Deep Time Through Small Mammals: Taphonomic Insights from the Faro Daba and Chai Baro Beds, Afar Rift

Authors: Sema Yilmaz (University of Oulu)
Format: Oral

This paper presents a taphonomic analysis of Late Quaternary small mammal fossil assemblages from the Dawaitoli Formation in the Afar Region of Ethiopia, focusing on the Faro Daba (FD) and Chai Baro (CB) Beds of the Halibee Member. These deposits are securely dated to the Late Quaternary and are closely associated with Middle and Later Stone Age contexts and early Homo sapiens occupations in the Middle Awash. The study aims to identify the formation processes shaping these assemblages and to assess their implications for archaeological and paleoenvironmental interpretation. The assemblages comprise over 1,360 specimens, dominated by murid rodents, and provide a rare opportunity to examine microfaunal accumulation and preservation processes in a key region for human evolutionary research. Quantitative zooarchaeological analyses included NISP, MNI, and MNE, supported by a comprehensive taphonomic analysis that examined overall preservation and modification patterns. Multivariate statistical methods were applied to explore internal patterning and inter-site consistency. Both assemblages are characterized by a significant cranial bias, extensive fragmentation, and minimal evidence of digestive modification. Taxonomically, both assemblages are dominated by particularly Arvicanthis and Mastomys, with FD showing moderate diversity (MNI=286) and CB a much smaller, taxonomically restricted sample (MNI=15), a difference best explained by sample size rather than ecology. Skeletal representation and modification patterns show a strong cranial bias at both sites, with mandibles, maxillae, and isolated teeth dominating the assemblages, very low Postcranial/Cranial Index values (PCI=21.5% at FD and 0% at CB), and other taphonomic features consistent with a conservation bias. These findings highlight the need to account for strong taphonomic and recovery biases when interpreting small mammal assemblages from Late Quaternary archaeological contexts in the Afar Rift. By clarifying how formation and preservation processes structure these assemblages, the study provides a more robust framework for integrating microfaunal data into regional archaeological and paleoenvironmental reconstructions.

1037. Fourier Transform Infrared Spectroscopy as a Tool for Identifying Bone Raw Materials: Preliminary Results from Experimental Studies

Authors: Aleksandra Lisowska-Gaczorek (Cardinal Stefan Wyszynski University in Warsaw) – Grzegorz Osipowicz (Nicolaus Copernicus University, Toruń) – Krzysztof Szostek (Cardinal Stefan Wyszynski University in Warsaw)
Format: Oral

The study of prehistoric and historical bone artifacts, such as tools and personal ornaments, contributes to a deeper understanding of past human practices, expressions, and technological progress. The production and use of objects made from bone tissue results in their morphological modification and often the loss of diagnostic features that allow for the identification of the raw material used to produce them and the animal species from which they originated. One of the widely used instrumental techniques for identifying organic and inorganic materials through qualitative and quantitative analysis is Fourier Transform Infrared Spectroscopy (FTIR). In our study, we examined the usefulness of FTIR for species differentiation between samples from genetically similar animals inhabiting the same geographic region. We also experimentally attempted to identify differences between the spectra obtained for antler and bone samples from four European cervids (Cervus elaphus, Capreolus, Alces alces, Rangifer tarandus) that could be used to identify these two types of bone material using FTIR. We also assessed the effect of softening techniques for bone and antler in water, sour milk, sorrel, urine, and lyea on the FTIR spectra. The results of our pilot study indicate that FTIR spectroscopy proved to be a useful tool for distinguishing bone materials, particularly bone and antler, with the height of the amide I peak (approximately 1646 cm^{-1}) being a diagnostic indicator of the material type. Analyses also revealed that softening processes affect the chemical structure of osseous material, causing small but measurable changes in bioapatite crystallinity (CI), particularly in samples treated with sour milk, lye, or water.

2160. An Overview of Zooarchaeological Methods: Advantages and Limitations

Authors: Patrícia Aleixo – Ana Santos (School of Arts and Humanities/ UNIARQ - Centre for Archaeology)
Format: Oral

Zooarchaeology employs a range of methodological approaches to analyse animal remains from archaeological contexts, with variation depending on research questions, preservation conditions, and analytical traditions. This presentation offers an overview of the main methods used in zooarchaeology, focusing on their advantages and limitations. By comparing different approaches, it highlights how methodological choices can influence the interpretation of faunal assemblages. Each method has inherent strengths and weaknesses, making it essential to evaluate them critically and consider their limitations in any study. Some methods provide high precision and detailed information but may require specialised equipment, extensive training, or significant financial resources. Others are more accessible and easier to apply but may produce more general or less reliable results. Environmental conditions,

sample preservation, and the condition of the remains also affect the effectiveness of different approaches, as some techniques perform better with well-preserved materials, while others are more robust in fragmented or degraded contexts. Comparing multiple methods allows researchers to identify potential biases and select approaches that complement one another. By combining different techniques, it is possible to balance precision, cost, and feasibility while obtaining a more comprehensive understanding of the archaeological record. Assessing the advantages and limitations of each method also contributes to more transparent and reproducible research, ensuring that interpretations of past human behaviour are supported by solid evidence.

2373. Life in a seashell: Study of Funerary Mesolithic Shell Assemblages from Muge (Portugal) and other Atlantic European case studies

Authors: Beatriz Pinto (ICArEHB, University of Algarve) – Maria João Valente (CEAACP, University of Algarve) – Célia Gonçalves (ICArEHB, University of Algarve)
Format: Oral

The Mesolithic shell middens of Atlantic Europe often incorporate human burials within dense accumulations of mollusc remains, as exemplified by the sites in the Tagus and Sado valleys. However, the comparative role of shells in funerary contexts remains insufficiently explored — whether they were intentionally placed or incidentally deposited. Drawing on a detailed malacological study of the burials at Cabeço da Amoreira (Muge, Portugal), this paper compares the shell assemblages associated with burials from Muge to those documented in other Portuguese and European Mesolithic shell middens. Through taxonomic, taphonomic, and biometric analyses of shells directly associated with individual burials, combined with spatial and contextual data, the study investigates patterns of shell selection, treatment, and deposition across sites. Particular attention is given to surface alterations, fragmentation, and modifications that distinguish dietary refuse from ornamental items and deliberate offerings, highlighting both convergences and contrasts in funerary practices. This comparative approach helps assess how age, identity, and possibly social status influenced the curation and placement of malacological materials in mortuary contexts, situating the Muge record within a broader Atlantic framework of Mesolithic symbolic behaviour. By addressing burial-specific shell assemblages across multiple sites, the study contributes to ongoing debates on social differentiation, ritual practice, and the role of coastal resources in shaping Mesolithic identities in Atlantic Europe.

791. Chthonic Sacrifices: Canine Offerings in the Punic Ritual Wells of Gadir (Cádiz, Spain)

Authors: Rodrigo Portero Hernández (Universidad de La Rioja) – Ana María Niveau De Villedary Y Mariñas – Carolina Pérez Infantes (Universidad de Cádiz)
Format: Poster

This paper presents the zooarchaeological and taphonomic analysis of canid remains recovered from the Punic ritual wells of the Gadir necropolis in Cadiz, dated between the 5th and 3rd centuries BC. The research focuses on the contexts of Abarzuza, Palacio de Justicia and San Severiano. These wells were originally constructed for water collection but were later transformed into ritual structures and filled through successive episodes that included libations, offerings and sacrifices. Each of these actions was sealed with deposits of clean sand or stones, creating a well-documented chthonic and funerary setting characteristic of Punic ritual practices in the city. The assemblage comprises 1,545 bone fragments belonging to more than 20 individual canids. Anatomical and taxonomic analysis has revealed a deliberate selection of small sized animals and of particularly vulnerable individuals, including juveniles, elderly canids and specimens with previous injuries. Many of these animals display pathological alterations and poorly healed fractures that reflect both a lack of care during life. The presence of several individuals in anatomical connection, together with their placement within clean and undisturbed layers, points to intentional and carefully planned deposition. Taphonomic evidence confirms that these animals were killed as part of the ritual. Cutmarks recorded at the base of the skull and around the foramen magnum in some individuals indicate specific slaughtering practices associated with chthonic ceremonies. Overall, the results contribute to a deeper understanding of the symbolic role of canids within Punic ritual behaviour and the shaping of sacred spaces in ancient Gadir.

1294. Animal and Plant Resources in Early Iron Age: Bioarchaeological Evidence from Babadag Settlement (Tulcea County, Romania)

Authors: Eliza Cretu – Mihaela Danu (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Sorin Ailincăi (“Gavrilă Simion” Eco-Museum Research Institute | University of Bucharest, Faculty of History) – Margareta Stanc (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology) – Luminita Bejenaru (“Alexandru Ioan Cuza” University of Iași, Faculty of Biology | ”Olga Necrasov” Center for Anthropological and Biomedical Research)
Format: Poster

The Babadag culture represents a prominent Early Iron Age civilization in the Lower Danube region. This paper presents preliminary bioarchaeological results from the eponymous settlement of Babadag (Tulcea County, Romania), based on combined study of faunal remains and phytoliths in order to reconstruct subsistence practices and land use. The settlement is located on an elevated promontory overlooking Lake Babadag and was inhabited between the Late 11th and the beginning of the 8th centuries BCE. During the same period, on a surface of approximately 200 km2 were identified no less than nine settlements characterised by Babadag type pottery indicating a possible early system of land exploitation. The archaeozoological analysis involved anatomical

and taxonomic identification, taphonomic evaluation, quantifications, age-at-death and sex estimations, while phytolith analysis mainly consisted in sediment sampling, laboratory processing, and microscopic examination. The faunal assemblage is dominated by domestic mammals; the most important species are cattle, sheep/goat, and pig, indicating that animal husbandry formed the basis of subsistence. Wild mammals are represented predominantly by red deer and roe deer. Fish remains, quantified separately by mammals, indicate that fishing, together with hunting, played a supplementary role in the local economy. Phytolith evidence documents a wide range of plant resources associated with an economy combining crop-related activities and animal husbandry. Cereal-derived phytoliths, including Elongate dendritic forms, indicate frequent handling and processing of cereal plants, which were likely used both for human consumption and as animal fodder. Grass phytoliths typical of open environments point to the exploitation of pasture areas, while the presence of wild grasses and woody dicotyledonous forms suggests the use of natural vegetation for supplementary fodder, bedding, and fuel. Together, the archaeozoological and phytolith results indicate a mixed subsistence system well adapted to local environmental conditions in the Lower Danube region during Early Iron Age.

165 PREVENTIVE ARCHAEOLOGY IN EUROPE IN THE WAKE OF THE MALTA CONVENTION: FINDING NEW COMMON PRINCIPLES

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Amala Marx – Kai Salas Rossenbach (Inrap) – Håkon Glørstad (University of Oslo)
Keywords: Preventive archaeology, Developement-led archaeology, Malta convention, working condition, research
Format: Regular session
Affiliation: Community on Archaeological Legislation and Organisation - ALO

SESSION ABSTRACT

More than 30 years after the adoption of the Malta Convention and the development of the concept of preventive archaeology, most of the knowledge produced by archaeology in Europe comes from archaeological excavations carried out in advance of development work. The main principles promoted by the convention are the involvement of archaeology in development plans, funding through budgets for development projects and the dissemination of the results to as wide an audience as possible. The convention, which was ratified by some countries a long time ago and by others only recently, has been applied in very different ways in European countries, and often only partially in accordance with its principles. The application of the Malta Convention signalise a state's commitment to protect the archaeological heritage. The national implementation, however, is strongly defined by the countries' legislation, institutional and bureaucratic history as well as economic traditions. Political will, often driven by public demands and political strives, is nevertheless the main lever for the application of the convention. Such initiatives are also versatile and may cause abrupt or significant changes in course and practice. Finding a perfect system that protects archaeological remains and allows for good acquisition and exchange of scientific knowledge is probably impossible, but we believe it is important to compare and discuss the various existing systems and try to define new common principles for preventive archaeology. This session will therefore feature presentations on the various systems of preventive archaeology in Europe and beyond, highlighting their positive and negative aspects as well as expectations for the future. These presentations may address the working conditions of archaeologists, collaboration and connections to university research, or the vulnerability of organisations in the face of governmental changes.

CONTRIBUTION ABSTRACTS

45. A patchwork of opportunities and risks – Germany's federal structure and the implementation of the convention

Authors: Jana Fries (Niedersächsisches Landesamt für Denkmalpflege)
Format: Oral

The legal situation regarding cultural heritage management in Germany as well as its structures are unusual in European comparison due to the country's strongly federal organisation. There are no laws or institutions at the national level in the field of heritage management. Responsibility for the material evidence of the past lies solely with the federal states. This has a significant impact on the implementation of the Malta Convention and the daily work in archaeological heritage management. The respective laws and structures are inconsistent, which presents both opportunities and risks. In my paper, I will explain how the Convention has been understood and implemented in Germany since the 1990s. I will highlight the connections between heritage management and recent German history. Surprisingly, German reunification offered great opportunities for the (partial) implementation of the convention and triggered the gradual adaptation of the federal states' heritagelaws in this direction. I will also discuss the influence of some overarching political and economic changes on heritage management in Germany in recent decades. Finally, I will point out current trends towards change. With reference to tasks currently considered very important, such as the energy transition, defence, housing construction and infrastructure renovation, heritage concerns are likely to be restricted in various federal states and there are fears of setbacks in the implementation of the convention.

119. Preventive Archaeology in Luxembourg

Authors: Mei Duong (Institut national de recherches archéologiques, Luxembourg)
Format: Oral

Luxembourg was one of the last European countries to ratify the Valletta Convention (in 2016). However, as soon as the Convention was ratified, the government immediately began working on its implementation into national law, creating the Law of 25 February 2022 on Cultural Heritage. The 2022 law mandates that all construction projects in designated archaeological observation zones undergo archaeological impact assessments before permits are granted. Applications for assessments must be submitted by the developers, and the Ministry of Culture can prescribe necessary measures, such as surveys or excavations. These operations are conducted by archaeologists from private accredited firms, based on scientific specifications prepared by the National Institute of Archaeological Research (INRA). The costs of surveys are paid my developers, whereas the state fully covers the costs of preventive excavations. While the 2022 law certainly marks a significant step forward in the protection and management of the Luxembourg's archaeological resources, particularly through the introduction of preventive archaeology, there are many challenges to address. These challenges range from the types of assessment exemptions, to procedures to apply in case of legal violations, as well as public benefits. One of the biggest challenges is the time limits stipulated by the 2022 law: all operations must be completed within six months. While this is doable for surveys, it is complicated to carry out a preventive excavation within six months, and this issue usually leads to a lack of quality in archaeological excavations, and to complicated working conditions for both state and private archaeologists in Luxembourg. Both the benefits and the negative aspects of the Luxembourgish system of preventive archaeology will be highlighted in my presentation, which hopefully through discussions and comparisons with archaeologists and heritage managers from other European countries, can help to define new common principles for preventive archaeology.

2621. Preventive archaeology in the Czech Republic in times of stasis and times of change

Authors: Milan Kucharik (Labrys o.p.s.) – Jaroslav Peška (Archeologické centrum Olomouc p.o.)
Format: Oral

Last year, we celebrated 25 years since the adoption of the Malta Convention in the Czech Republic. Archaeological legislation in the Czech Republic has undergone rather minor cosmetic changes over the past 10 years. Disputes resolved by general or administrative courts, which clarify its interpretation, have a greater influence on shaping the interpretation of the Monuments Act, the basis of which dates back to 1986. Last year, the amendment to the Act clarified the obligations and relationships between certain types of archaeological organizations and owners of movable finds. However, it can be said that only some. Unfortunately, we still suffer from a number of unresolved fundamental problems. The first is the secondary nature of the monument protection of archaeological sites, where the protection of archaeological sites, if they do not contain wall structures, is difficult to enforce. The second is the absence of standards of archaeological excavations and the unification of documentation and the handling of finds. The third is the fragmented ownership of archaeological finds, where the owner of the finds can be the state, the region or the municipality, but it depends on who is conducting the excavation. Basically, every museum that is the administrator of the finds has its own system of evidence and documenting the finds, which makes the whole process even more unclear. Fourth, preventive archaeology in particular would benefit from professionalization, which is currently relatively low. Fifth, we can perceive the involvement of the public in the research process and popularization efforts as a positive trend. Sixth, a significant negative phenomenon is detectoring, which is an effort to catch them in the form of collaborators, but the looting of archaeological sites is at an unprecedented level. Seventh, a positive phenomenon is the improvement of the sector's information infrastructure.

711. Law in practice. Performance of the archaeological heritage protection system in Poland in the light of statistical data

Authors: Jakub Artemiuk (University of Warsaw, Faculty of Archaeology)
Format: Oral

Poland ratified the Malta Convention in 1995 during a period of profound and rapid political, economic, and legal change following the collapse of communism. At that time, large development investments, private archaeological companies and an amateur metal-detecting movement emerged in Poland, changing the face of Polish archaeology. A new heritage protection law was passed in 2003. This was intended to align the legal framework with the new reality. The first part of this paper will provide an overview of selected aspects of the current Polish archaeological heritage protection system. The focus will be on entities authorised to conduct preventive archaeological excavations, ownership and storage of archaeological finds, and authorisation of the use of metal-detecting devices by amateurs. The second part will present the results of research carried out on the effectiveness of archaeological conservation services in Poland. Their performance was evaluated mostly on the basis of the national record of archaeological sites, statistical data gathered on the number of various decisions relating to archaeology issued by regional conservation offices and answers to enquiries sent to them. The following aspects were taken into consideration: the number and distribution of known archaeological sites; permits given for archaeological field research; the transfer and storage of archaeological finds from excavations; and permits given for amateur metal detecting. I will attempt to identify regional differences and highlight the pros and cons of the current Polish system.

1471. Beyond the 'Polluter Pays' Principle: Lessons from Salona for the Future of European Preventive Archaeology

Authors: Ivica Pleština (Ministry of Culture and Media of the Republic of Croatia)
Format: Oral

Thirty years after the Valletta Convention, the "developer-funded" model has become the backbone of European archaeology. However, in complex, multi-layered urban environments, the practical application of these principles reveals a growing gap between legal theory and sustainable heritage management. Salona serves as a microcosm of Mediterranean urbanism, where European regulatory frameworks collide with intensive local development. Salona, the capital of the Roman province of Dalmatia, is currently facing unprecedented development pressure. This paper analyzes recent preventive excavations to test the efficiency of the current "Malta model." While the principle of "preservation by record" has exponentially increased our topographical data, it has also led to the fragmentation of archaeological landscapes and a "site-by-site" approach that often misses the broader urban context. By examining the challenges of Salona—ranging from the legal struggles of enforcing in situ preservation in private construction to the difficulties of synthesizing vast amounts of rescue data—this presentation proposes new common principles for the wake of the Convention: 1.From Rescue to Research: Moving beyond mere documentation toward mandatory synthesis and integration of rescue data into regional research frameworks. 2.Standardization of Quality: Establishing common European criteria for "scientific minimums" in developer-funded contexts to prevent the commercialization of archaeology from eroding academic standards. 3. Public Value as a Metric: Shifting the focus from administrative compliance to the social "return on investment," ensuring that preventive archaeology serves the local community, not just the planning process. Through the experience of Salona, this contribution seeks to join the debate on a "New Malta," advocating for a more holistic, quality-driven, and socially engaged preventive archaeology in Europe.

2354. Management of Transforming Coastal Stone Age Landscapes in Southeastern Norway

Authors: Amanda Sky (Museum of Cultural History, University of Oslo)
Format: Oral

This talk presents comparative observations on the management of coastal Stone Age development-led archaeological sites within select European countries. This talk further presents the interplay of archaeological heritage management, governmental policy, and municipal planning. Working on the comparison of the management of different coastal areas across Europe, Ås Municipality, Norway, which now lies in the hinterlands far from the contemporary coastline, is chosen for this presentation as a foundational case study for comparison. Due to dramatic isostatic land uplift and changes in sea levels, this region has endured significant landscape transformations over millennia. Contemporarily, landscape transformations continue, manifesting as infrastructure and housing projects permeating the region. Two coastal Stone Age sites in Ås Municipality, Nøstvet and Vinterbro, have mixed levels of protection and permitted development, exemplifying how the landscape has co-constructed regional identity, settlement, and use patterns with its inhabitants. This talk further shares the both physically and digitally embodied processes experienced by archaeologists carrying out the management of development-led archaeology. This talk will explore varying procedures, policies, and stakeholders involved in municipal development and subsequent archaeological knowledge production, preservation, and dissemination. Heritage protections created in the late 19th century in Norway continue to shape the lived environment, representing the agency of the past and the landscapes that hold it. Norwegian heritage management policy, in turn, shapes the way residents live and build around the past and projections of the future. This work is part of my PhD project within the HORIZON Europe MSCA Doctoral Network Archaeological Coastal Heritage: Past, present and future of a hidden prehistoric legacy (ArCHe). This project will compare archaeological heritage management practices in France, Latvia, Norway and Spain.

401. Societas Archaeologica Upsaliensis - a business created to try to bridge the gap between contract archaeology and research

Authors: Lars Sundström (Societas Archaeologica Upsaliensis)
Format: Oral

Societas Archaeologica Upsaliensis (SAU) was created by researchers from the Department of Archaeology, Uppsala University with the ambition to do rescue archaeology with a research agenda. This was made possible when the Swedish rescue archaeological system changed from a state monopoly to a competitive market driven system in the end of the 1990ies. They chose that SAU should be a profit driven foundation. When and if SAU made profit it would go to investments, an archaeological price and a scholarship fund. SAU has a board consisting of researchers mainly from Uppsala University. The Swedish system involves many different participants with different perspectives and ambitions. Due to lacking regulating standards, the competing companies have a rather big freedom to form not only their excavations (including methodology) but also the reporting. The talk will touch upon our experience of working with this ambition in a competitive system including tender with examples of how a scientific approach collides with the antiquarian perspective.

769. Towards a new culture heritage act in Norway. Possible implications for future culture heritage and management of archaeological material

Authors: Nils Anfinset (University Museum, University of Bergen)
Format: Oral

In the spring of 2025, a White Paper was submitted to the Norwegian Ministry of Climate and Environment, suggesting a totally new and comprehensive culture heritage act. The proposed Cultural Environment act takes into consideration a much wider concept of culture heritage, both in terms of landscape and regulations, and suggest protecting culture heritage from more recent historical periods as well. This includes moving the limit for monuments and sites automatically protected from AD 1537 to AD1650 or AD1850. Currently the new proposed law still awaits proposition from the Ministry to the Norwegian Parliament in order to be effective. In this paper the consequences of these proposed new regulations will be discussed with specific focus on the excavation and management of archaeological material with the Malta Convention as a backdrop. The paper will especially focus on the Norwegian organizational aspects from documentation and excavation to research and collaboration between universities and other governmental bodies, as well as national minorities and planners. The question is to what degree will this proposed new Culture Environment act will protect culture heritage at a time when cultural and natural heritage at large is under pressure.

2547. From the Reactive to the Proactive: improving knowledge infrastructure and commercial risk assessment through wide scale survey archaeology

Authors: Dain Swenson (Independent researcher)
Format: Oral

As a signatory to the Valletta Treaty, the Federal States of Germany have taken a localized approach to their implementation, adapting to differing regional requirements. Bavaria and Baden-Württemberg have developed a robust commercial archaeology industry to respond to local requirements, with state preservation offices (Landesamt für Denkmalpflege) managing permits, archiving, and coordinating with commercial firms on development-led excavations. Bavaria has mature digital infrastructure and information system guidelines (FIS), guiding the execution of field projects. However, fieldwork is largely reactionary to development projects. While not a signatory of the Valletta Treaty, The United States through a similar federal system and national scale commercial archaeology industry has achieved many of the same goals set out in the Malta Accords, though through different legal frameworks and methodologies. In contrast to an exclusively preventative and developer-led model, states such as Minnesota, Arizona, and Pennsylvania place emphasis on proactive, regular, large scale archaeological survey required by a legal and regulatory framework. Acting as the primary client, state agencies contract commercial firms for large scale projects on a regular schedule. This allows for statewide landscape level coverage of archaeological activity accomplished through a combination of developer led and state commissioned projects. Through this hybrid model of responsibility, projects are largely carried out by commercial companies, creating a permanent demand for archaeologists despite economic downturns which affect private developments. This paper seeks to highlight successes in the Bavarian model, while reviewing the merits of a proactive, hybrid, shared-responsibility approach utilized by states such as Arizona, Minnesota, and Utah. Through a comparison of regulatory and legal frameworks and the execution on both sides of the Atlantic, potential mechanisms for improved implementation of the Valetta Treaty in Germany will be proposed.

260. From Valletta to Local Practice: The Multi-Scalar Dynamics of Archaeological Heritage Protection in Europe

Authors: Carl L. Thunberg (Västernorrlands museum)
Format: Oral

This study examines the multi-scalar dynamics of archaeological heritage protection in Europe, focusing on how supranational norms are translated into national legislation and local practice. Drawing upon theoretical frameworks of policy translation and governance across scales, it analyses the interaction between the Malta (Valletta) Convention, the Faro Convention, and relevant European Union policies with ten selected national case studies: Sweden, the United Kingdom, Norway, Denmark, France, Germany, Italy, Austria, Poland, and Greece. These countries illustrate varying approaches to heritage governance, ranging from highly centralised systems, where state authorities exercise significant control over the protection and management of archaeological sites, to decentralised models that delegate substantial responsibility to regional or local bodies. The study addresses three interrelated research questions. First, it examines how centralisation and decentralisation influence the effectiveness of heritage protection, particularly in integrating archaeological knowledge into decision-making processes. Second, it explores the extent to which systematic archaeological research, including preventive excavations and inventories, is incorporated into protective measures, highlighting differences in institutional structures and procedural mechanisms across national contexts. Third, it investigates the impact of supranational norms on national policies and local practices, identifying instances of "policy translation gaps" where international standards are only partially implemented or adapted. By adopting a comparative and theoretically grounded approach, this study reveals patterns and divergences in the governance of archaeological heritage across Europe. The findings emphasise the significance of multi-scalar coordination for effective protection, the value of integrating scientific research into policy-making, and the challenges of ensuring that supranational frameworks produce tangible outcomes on the ground. Ultimately, the study contributes to ongoing debates within archaeology and heritage studies regarding the interplay between international conventions, national legislation, and local practice, offering insights for scholars, policymakers, and heritage managers seeking to enhance the protection of archaeological

remains in a complex, multi-level regulatory environment.

167 COMMUNICATION AND SELF-REPRESENTATION IN THE PUBLIC/PRIVATE SPHERES IN ANTIQUITY: THE ARCHAEOLOGICAL AND EPIGRAPHIC PERSPECTIVES

Theme: 1. Widening perspectives in material culture studies
Organisers: Clara Ramos-Taboada (Foundation for Research and Technology Hellas) – Anna Miączewska (Maria Curie-Skłodowska University) – Rachael Lane (University of Sydney)
Keywords: Antiquity, Epigraphy, Material Culture, Communication, Sef-representation, Identity
Format: Regular session

SESSION ABSTRACT

In the study of epigraphy, with a particular concentration on Ancient Greece and Rome, public communication (honorific, votive and funerary) has been the primary focus of academic research. The study of private epigraphy has recently been explored in greater depth (Benefiel and Keegan, 2016), but remains in the background. Rather than focusing solely on stone-curved texts, this panel will explore the landscape of communication and self-representation of individuals in the public and private spheres. The aim is to promote comparative historic and archaeological studies in these two areas. Are the same population sectors depicted in private selfportrayal as in public self-representation? Were the privileged classes interested in such communication in the private sphere? What is the level of access that members of the lower classes have to "second-class" forms of communication? We can propose a range of suitable approaches: a) Individuals' access to public/private communication b) Interaction and synergies between both types of communication c) Study of the population groups that access the different types of communication d) What is emphasised in private archaeological scenarios… identity, shared identities, status, property? e) Who was the audience for this communication? f) The study of the different archaeological materials themselves as communication tools (instrumenta, graffiti, votive offerings, mosaics and frescoes, etc.) g) Further study of forms of private self-representation among lower classes and marginalised groups as a possible form of agency. We will prioritise comparative analysis between both spheres and between societies of Antiquity, providing a broad chronological framework from the emergence of societies in Western Eurasia to Late Antiquity. To this end, we will implement an interdisciplinary approach based on archaeology, epigraphy, history, and art.

CONTRIBUTION ABSTRACTS

1013. Reading the Slave for Sale: Communication, Labels, and Legal Meaning in Roman Markets

Authors: Anna Tarwacka (Cardinal Stefan Wyszynski University in Warsaw)
Format: Oral

This paper explores slave sales in Roman marketplaces as a structured form of communication between seller and buyer, in which legal information was conveyed not only verbally or contractually, but also through material and visual means. Focusing on the pilleus, the corona, and the titulus servorum, the paper analyses these objects as communicative instruments (instrumenta) operating at the intersection of law, market practice, and public self-representation. Drawing on literary sources, juristic texts, and documentary evidence, the study argues that these markers constituted a semi-formal language of the slave market. The pilleus indicated the absence of a seller's warranty, transferring risk to the buyer; the corona, associated with prisoners of war sold sub corona, signalled both the origin of the slave and the exclusion of the seller's liability; the titulus servorum, displayed on tablets hung from the slave's neck, provided standardized information on origin, health, behavioural defects, and noxal liability, in accordance with the curule aediles' edict de mancipiis emundis vendundis. These visual and epigraphic forms of communication functioned in the public sphere of the marketplace, addressing an anonymous and heterogeneous audience, while simultaneously shaping the private legal relationship between the contracting parties. The paper further examines how such material disclosures interacted with written warranties recorded on wax tablets, revealing a multilayered system in which symbols, inscriptions, and contractual stipulations jointly constructed trust, allocated responsibility, and limited dispute.

1690. Epigraphic self-representation of the seviri Augustales in Nemausus

Authors: Alberto Barron Ruiz De La Cuesta (Universidad Nacional de Educación a Distancia)
Format: Oral

The seviratus Augustalis is usually related to the social promotion of freedmen. This urban institution of semi-official nature appeared at the end of the 1st century BC in several towns from Italy. It spread through the Latin-speaking area of the Roman Empire and lasted till the 3rd century AD. Its specific functions are not stated in the preserved testimonies but the seviri Augustales were frequently involved in acts of civic munificence. They were overwhelmingly freedmen despite the presence of some ingenui among them. Therefore, the seviratus Augustalis channelled the aspirations of social promotion and recognition that many prosperous freedmen could not get due to their status libertinus, which excluded them from the local magistracies and priesthoods. The aim of the present study is to analyse the ways of epigraphic representation of the seviri Augustales in the Narbonese town of Nemausus. Considering the large number of inscriptions that this location has preserved about the seviratus Augustalis (around 80), this epigraphic evidence may contain illustrative information for the understanding of the self-representation strategies adopted by wealthy freedmen. Nemausus had a dynamic community of liberti dedicated to trade and craft activities. It may explain the importance of the local seviri Augustales, which developed some internal ranks and tried to assimilate their group to the ordo decurionum as a second local elite. The occasional mention of their profession may assert freedmen's pride among the seviri Augustales in Nemausus, as does their frequent habit of recording their position preceding their name in inscriptions (a practice quite uncommon in comparison with that of seviri Augustales in other towns).

1320. Speaking without the Forum: Hermae and domestic epigraphy as social communication in Roman Baetica

Authors: Clara Ramos-Taboada (Institute for Mediterranean Studies IMS – FORTH)
Format: Oral

Hermae were among the most common sculptural supports employed in the decoration of Roman domestic space in the western provinces. In Baetica, recent studies have highlighted their frequent appearance in private contexts and their role within the material culture of elite households (Rodríguez Oliva 1996; Loza Azuaga 2016). A limited but significant number of these hermae bear inscriptions, offering valuable evidence for the study of domestic epigraphy beyond monumental and civic contexts. This paper places the epigraphic content of Baetican hermae at the centre of analysis, approaching these texts as deliberate practices of self-representation articulated within spaces of restricted access. It argues that domestic inscriptions on hermae were not neutral labels nor marginal expressions of literacy, but meaningful interventions in the negotiation of social identity, group belonging, and legal status within the household and its extended social environment. Focusing on names, formulae, and modes of textual presentation, the paper explores how these inscriptions reflect distinctions between social classes and juridical groups, including freeborn individuals, freedpersons, and members of local elites. Rather than promoting individualized commemoration, epigraphic hermae articulated relational and collective identities, embedding claims of Romanitas, cultural capital, and legal legitimacy within the everyday experience of the domestic sphere. Particular attention is devoted to questions of access and audience: who was able to read and interpret these inscriptions, how epigraphic knowledge circulated within the household, and how meaning was produced through interaction among family members, dependants, clients, and visitors. In this sense, domestic epigraphy on hermae functioned as a medium of social communication that reinforced hierarchies, group cohesion, and shared values. By foregrounding the intersections of epigraphy, legal status, and social groups, this paper contributes to current debates on identity and communication in the Roman world and challenges rigid distinctions between public and private epigraphic practices in the western provinces.

1894. Writing at Work, Writing at Leisure? Graffiti on the Peristyle Columns in the Pompeian Houses

Authors: Anna Miaczewska (Maria Curie-Skłodowska University)
Format: Oral

This paper examines the practice of writing on peristyle columns in Pompeian houses, focusing on a series of case studies that illustrate how the small surfaces of indoor columns in local houses functioned as loci of one of the everyday communication methods. While graffiti in domestic contexts have been widely acknowledged as a key source for reconstructing social interaction and literacy in Roman urban life, the specific choice of columns as writing supports has received far less systematic attention. By analysing the spatial distribution, content, and material characteristics of graffiti preserved on peristyle colonnades, this study explores whether distinct patterns of use can be identified and whether these surfaces encouraged particular modes of writing. The paper investigates the extent to which column graffiti can be associated with moments of work, leisure, or transitional movement within the household, and considers how the "physicality" of the column - its height, curvature, visibility, and accessibility - shaped in some way the act of inscribing specific content. Special attention is given to the question of authorship: can we meaningfully distinguish between writings produced by household members, visitors, dependents, or workers operating within the domestic sphere? By integrating epigraphic analysis with architectural context, the paper argues that peristyle columns constituted dynamic communicative spaces, revealing nuanced practices of informal writing embedded in the rhythms of Pompeian domestic life.

770. Peristyles and Beyond: Agency, Social Binaries, and the Language of Greek and Roman Gardens

Authors: Rachael Lane (The university of Sydney)
Format: Oral

This paper investigates the multifaceted forms of communication embedded within Greek and Roman gardens, questioning the perceived rigidity of binary oppositions such as public versus private and elite versus non-elite. By examining how these boundaries were either reinforced or unraveled within the garden space, this study identifies the specific features, layouts, and aesthetics that tended to facilitate both overt and tacit modes of interaction, behaviour and communication. Through an analysis of material choices—identifying which elements were embraced or discarded by the inhabitants of the Greek and Roman worlds—the discussion explores the motivations behind these shifts and their role in redefining cultural communication. Ultimately, this paper addresses how garden environments served as arenas for agency, reflecting broader societal standards regarding acceptable and unacceptable

behaviour in the negotiation of public and private display. Integrating current evidence, this study will employ a comparative analysis of archaeological data, ancient literary sources, and iconographic representations.

719. Off with the King's Head: A Unique Bust of the Nabataean King Obodas on Delos

Authors: Anna Accettola (Hamilton College)
Format: Oral

Were we to believe Greco-Roman sources, the Nabataean Kingdom would scarcely exist before the mid-first century BCE. Apart from occasional skirmishes with the surrounding empires, the kingdom made little impact on the authors of preserved texts. However, archaeological and inscriptional evidence shows that people from Nabataea moved around the Mediterranean and made an impact where they landed as early as the late third century BCE. In this talk, I present a reexamination of a marble bust and a first century BCE bilingual Greek-Nabataean Aramaic inscription found on Delos. I argue that Nabataean interactions in the Mediterranean have often been overlooked, by ancient and modern scholars, due to the Nabataean ability to subsume their expressions of identity into broader Greco-Roman standards. The bust is a curious piece of history, as its curly locks and youthful features, once misidentified as a Greek youth, depict a male figure almost identical in style to the Nabataeans kings in their numismatic portraiture. However, the marble medium could not have been locally sourced in Arabia and the block was too small to finish the details on the back of the head, indicating a mismatch between resource availability and artistic execution. As such, we must reanalyze the place of this bust within the socio-religious and political contexts of Delian dedicatory offerings. The accompanying Aramaic-Greek inscription affirms the Nabataean practice of honoring the king during trips abroad, but in an aniconic society, why was a portrait bust be created? This "immigrant object," dedicated by a Nabataean politician to a deity of Nabataean-Greek amalgamation, in the foreigner's sector of Mount Kynthos, highlights the complex interplay of foreign identity and local expectations in the predominant multi-cultural nexus of the Hellenistic Mediterranean.

2150. Luxury and Political Communication between Private and Public Spheres: Portraits of Mithridates VI in Glyptic Art and Precious Metals

Authors: Fermín Castillo Arcas (University of Zaragoza)
Format: Oral

The self-representation of Mithridates VI Eupator has been studied primarily through numismatic evidence and the limited corpus of surviving marble statuary (Højte 2009). Nevertheless, the image of the king was also articulated— and with considerable effectiveness—through luxury objects that circulated between the private and the public spheres. Ancient testimony concerning his dactyliotheca (Plin. HN 37.11), together with the well-known episode of an Athenian ally who wore a gold ring bearing the king's effigy (Ath. 5.212d), underscores the importance of glyptic art as a vehicle for political propaganda. Building on these indications, this paper examines engraved gems and cameos attributable to Mithridates VI (the so-called "Mithridatic type"), objects that are frequently miscatalogued in museum collections as Alexander the Great, Dionysos, or simply as a generic "Hellenistic ruler". Formal comparison with numismatic portraits, combined with dialogue with the historiography on Hellenistic glyptic art (Richter 1968; Plantzos 1999), allows for the proposal of criteria to identify the seriality of the king's portrait in glyptic media and to interpret its function as a form of close-range propaganda. Seal rings, gift objects, and markers of political allegiance—now preserved in various museum collections—demonstrate the role of these portable images as instruments of intimate political communication, addressed to restricted yet socially significant audiences. The study is completed by two extreme and overtly public manifestations of the same material language: the colossal gold statue of Mithridates displayed in Lucullus' triumph (Plut. Luc. 37.4–6) and the life-size silver statue exhibited in Pompey's triumph (Plin. HN 33.154). Considered together, this evidence reveals how luxury articulated authority, belonging, and political communication across different scales and contexts, positioned between the intimacy of the portable object and the public display of power (Lapatin 2015).

168 BURIAL CULTURE AND PRACTICE (16TH-19TH CENTURIES): INNOVATION AND EVOCATIONS OF THE PAST

Theme: 1. Widening perspectives in material culture studies
Organisers: Harold Mytum (University of Liverpool) – Sanna Lipkin (University of Oulu) – Richard Veit (Monmouth University)
Keywords: mortuary behaviour, burial, memorials, tradition, innovation
Format: Regular session
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

In the post-medieval period changes in religion, increased industrial production, and the development of specialist trades such as undertakers and memorial carvers, altered burial practice. Other forces also affected attitudes and behaviour: changing opinions on status, increased population led to many more deaths per year, and higher levels of disposable income and literacy affected opinions on increased consumption. In this period of rapid change, some aspects of tradition were valued and retained, families and individuals attempted to differentiate themselves within mass production, and styles and themes from the past were used in new and innovative ways, such as through neo-Classical and Gothic revival styles. This session, sponsored by the Society for Post-Medieval Archaeology, explores how the past was used within a trend for innovative change within burial practice. This may be from the level of an individual wearing burial clothes that reinforced their own biography and identity through the choice of a memorial with echoes of antiquity to larger trends in coffin and memorial production that tapped into wider cultural changes in taste.

CONTRIBUTION ABSTRACTS

1146. Grave without a name, name without a grave. Social burials in the 19th and 20th centuries

Authors: Martin Cechura (Museum of Prague)
Format: Oral

Part of the rapid transformation of cultural traditions and social ties during the 19th and 20th centuries was a fundamental transformation of the funeral rite and the methods of handling the dead body. A specific phenomenon, which has its roots in the Middle Ages, is burial in common graves. Leaving aside war graves and victims of epidemics, the most common type of common graves were the burials of people without relatives or people from lower levels of society, whose burial was provided by the public administration or the city. In connection with the search and exhumation of the remains of victims of political trials from 1948 to 1968, several common so-called social graves were investigated. In addition to the remains of political prisoners, which represent a very specific topic, these included the burials of adults and children without relatives who could arrange a funeral, people whose remains were used for teaching at medical schools, or victims of crimes. The combination of careful archaeological research and extensive research of written sources, which made it possible to link written records with specific remains uncovered by archaeological research, provides a unique insight into the process of social burial at the turn of the modern era and the present.

520. Animitas as religious and historical testimonies of popular piety: Death and memory in Concepción Cemetery, Chile (19th–21st centuries)

Authors: María Benavente – Catalina Pinilla M. – Rodrigo Bruna (Núcleo Interdisciplinario Ars Moriendi | Universidad de Chile)
Format: Oral

Animitas are mortuary works dedicated to the deceased, whose function relates to memory and the symbolic permanence of lives interrupted tragically. Their construction marks a beginning —the moment of the event— but they lack a precise historical end, as they remain in place, transforming recurrently into sites of memory. From this perspective, animitas operate as religious and historical testimonies of popular piety, in which objects, images, and devotional gestures are organised around the figure of the dead and the narratives that sustain them. This paper focuses on a group of animitas located within Concepción Cemetery, Chile, mostly associated with young women and girls who died under violent or unexpected circumstances. Unlike roadside animitas, these constructions are situated within an institutional funerary space, configuring a particular field in which forms of popular commemoration engage in dialogue with formal practices of death. The study spans the nineteenth to the twenty-first century, a period marked by the consolidation of new forms of death's individualisation and the material production of memory. Within this framework, animitas are approached as living works whose persistence, modification, and maintenance enable the examination of continuities and changes in urban mortuary practices. This paper thus proposes an archaeological reading of cemetery animitas as material indicators of historical transformations in the commemoration of death in urban contexts.

16. The Material Culture of Commemoration in Colonial Philadelphia: Local Perspectives and the Global Marketplace

Authors: Richard Veit (Monmouth University) – George Leader (The College of New Jersey)
Format: Oral

Archaeological salvage excavations at the burial ground of the First Baptist Church in Philadelphia, Pennsylvania (1722-1859), resulted in the recovery of an extraordinary collection of well-preserved humans remains as well as associated coffins and coffin furniture. What made these discoveries even more surprising is that the burial ground had officially been relocated after it closed in the mid-19th century. This relocation, however imperfect, resulted in the removal of a small number of gravemarkers to Mount Moriah Cemetery in West Philadelphia. Although disassociated from the remains in the cemetery, the markers, generally undecorated marble headstones, provide a stark contrast with the richly ornamented coffin furniture recovered from the archaeological excavations. The headstones and the coffin furniture provide material evidence for how colonial Philadelphia, an important provincial city in the Delaware Valley, developed its own aesthetic style which contrasted with new aesthetic movements, most notably the rococo, that were developing in English metropolitan centers such as London. Taken together they reveal how 18th-century Philadelphians participated in international trends while retaining a distinctive local identity, thereby engaging in a form of material code switching.

1426. Echoes of Antiquity: The transience of life in the 19th-century memorials at Ståhleborg Cemetery,

Oulu

Authors: Sanna Lipkin (University of Oulu)
Format: Oral

Ståhleborg, a cemetery in Oulu, was established in 1781 just outside the town walls. At the time, burials under the church floor and in the old churchyard ceased. Today, the oldest preserved grave marker dates to 1804. This simple gravestone, erected for Circuit Judge Johan Polviander and his wife Ebba Charlotta Fougt, was made from imported sandstone and represents the neo-Classical style that, along with the Gothic style, was prevalent in the cemetery of this northern Finnish town. This paper reviews the 19th-century memorials influenced by international ideals and symbolism, yet produced locally from local materials such as granite. In these predominantly modest memorials, local ideas about social status, the transience of life, and the inevitability of death become evident through symbolism drawn from antiquity. Examples include obelisks, broken pillars, and volute-krater urns atop monuments, as well as symbols such as the butterfly (psyché), torches, and depictions of Greek deities – Nyx, Hypnos, and Thanatos.

1522. Roman and all'antica style rings in burials of late medieval and early modern Transylvania

Authors: Peter Levente Szocs (County Museum Satu Mare)
Format: Oral

A considerable number of roman rings or other jewels were discovered in late medieval and early modern funeral context across the province. They were reused as cloth accessories in rather high status burials. Along the reused roman items, an even larger number of objects were found in burials, which were made in all'antica style in the spirit of the cult of Antiquity of the Renaissance. The use of such objects can be detected starting with the end of the fifteenth century and continued until modern times, though the height of their popularity was during the early modern period. Due to its Roman past, Transylvania was rich in Roman artifacts, due to its historical heritage, and some elements of it – stone carvings, simple marble slabs or bricks – were widely reused as spolia during the Middle Ages; smaller artifacts, however, became popular with the Renaissance only, in accordance with its concepts of Antique revival. The paper will discuss several cases where roman or all'antica style rings were discovered in late medieval and early modern burials of Transylvania. Furthermore, the context of the discoveries will be analyzed in comparison of the burial practices of the region in the period, which might permit to formulate several conclusions on the significance of this fashion.

2049. The Coffin as a Hybrid Cultural Artifact

Authors: Magdalena Majorek-Lipowicz (University of Lodz; Institute of Archaeology)
Format: Oral

Post-medieval and modern Polish coffins (16th–19th century) function as a distinctive cultural artistic medium, where the need for individualization intersects with broader traditions. Studying these objects engages art history, the archaeology of death, and the anthropology of funerary practices. Over the centuries, coffins in Poland evolved from simple wooden boxes into highly personalized works of art, often drawing on Greco-Roman and Egyptian models. This speech presents results of analyses conducted across several interconnected dimensions. First, it examines instances in which broadly conceived classical dignity merges with post-medieval and moder demands for personalization in burial practices. Second, it considers coffin shape and form, highlighting archaeological examples in which rectangular or tapered coffins and lids echo ancient sarcophagi, integrating symbolic meaning with spatial design. Third, it addresses the use of unusual or luxurious materials, evoking the splendor of the ancient world, alongside craft and decorative techniques—such as metalwork, woodcarving, and textile coverings—in which classical motifs are identifiable. Finally, the paper explores processes of personalization, including the uniquely Polish phenomenon of coffin portraits that visually memorialize the deceased. The integrated analysis demonstrates that part of Polish coffins constitute a hybrid cultural artifact, in which classical models, local practices, and symbolic imagination coexist. These objects offer significant insight into the reception of antiquity in material culture and into performative memory strategies — practices that not only recall the deceased but actively construct their image in the eyes of mourners through ritual and material forms of commemoration.

1528. How to recognize a priest: Analysis of the burials in the Roman Catholic Church of St Martin at Prozorje (Croatia)

Authors: Juraj Belaj – Sebastijan Stingl (Institute of Archaeology, Zagreb)
Format: Oral

In 1614, at the peak of the Counter-Reformation, Pope Paul V published the Roman Ritual. According to the Ritual, special attention was to be paid to the orientation of the deceased buried in the interior of sacral buildings. Until then, a more or less traditional orientation with the head laid in the west and the feet in the east was now replaced with the orientation towards the altar. A layman was to be buried with their feet towards the altar, while priests were buried the opposite way, so they could, according to the belief, lead the prayer on the Judgement Day facing the faithful. In the vicinity of Zagreb, at the site called Prozorje, there are ruinous remains of the Roman Catholic Church of St Martin. Out of 280 graves that were explored at the site so far, predominantly in the interior and in the narrow strip outside the church walls, 56 graves are dated to the 17th and 18th centuries. Two deceased males were buried with their heads towards the altar, one at the most prominent position in the church, on the main axis in the sanctuary in front of the altar, and the other in the nave. This paper deals with those two burials, questioning whether they can really be attributed to priests, based on all available archaeological and bioarchaeological data.

2176. "Until the end of time" – results from a 19th century churchyard in northwestern Denmark

Authors: Gitte Lambertsen Hjortlund – Mette Arenfeldt Christensen (Museum Thy)
Format: Oral

In 2024 and 2025 Museum Thy excavated parts of the original churchyard in Thisted. This has resulted in the uncovering of more than 700 graves from the 12th to the 19th century. A notable population increase led to the rapid expansion of the churchyard in the early 19th century followed by its abandonment in 1893, providing an almost unique burial record of well-preserved inhumation graves from the Early Modern Era. The large number of graves give a rare insight into changes of burial practices in a peripheral provincial town and how these practises reflect broader societal transformations, religious beliefs and folklore. This paper will focus on this expansion and how the graves vary from the original part of the churchyard as shown by the demography of the population and the organisation of the graves. How the inhabitants of Thisted materialised memory through grave markers and grave goods and how their burial practises align with normative Christian burial traditions of 16th – 19th century Denmark.

1889. Stele-type grave markers in Rural Areas of the Polish–Lithuanian Commonwealth (16th–18th Centuries)

Authors: Hubert Lepionka (Faculty of Archaeology Adam Mickiewicz University in Poznań | Podlaskie Museum in Bialystok)
Format: Poster

This paper analyses stele-type grave markers from rural areas of the Polish–Lithuanian Commonwealth, dated from the beginning of the 16th to the end of the 18th centuries, drawing on archaeological and historical evidence from present-day Poland and Belarus. The term "stele-type grave markers" is used to describe vertically set stone stelae functioning as grave markers; in later periods, some of these monuments may also be interpreted as "stele gravestones" due to their increasing formal and functional standardisation. The study focuses on the chronological and typological development of these markers, examining changes in form, dimensions, material selection, surface treatment, and spatial arrangement within rural cemeteries. Particular attention is paid to long-term continuities in local burial traditions alongside gradual transformations influenced by funerary practices and broader cultural processes operating within the Polish–Lithuanian Commonwealth. The results indicate that stele-type grave markers constituted a durable and regionally distinctive element of the rural funerary landscape. Their evolution reflects both the persistence of local commemorative practices and the gradual adoption of more standardised forms of grave marking. The paper also addresses methodological challenges related to dating, especially in contexts where chronology has relied primarily on historical records and numismatic evidence.

169 THE SACRED AND MARINE INVERTEBRATES FROM EAST TO WEST: CULTIC AND FUNERARY PRACTICES (7TH CENTURY BCE TO 7TH CENTURY CE)

Theme: 1. Widening perspectives in material culture studies
Organisers: Tatiana Theodoropoulou (CNRS) – Caroline Mougne (MNHN) – Nicolas Morand (Éveha International) – Vicky Vlachou (Aristotle University of Thessaloniki) – Jutta Stroszeck (DAI Athen)
Keywords: marine invertebrates (molluscs, crustaceans, echinoderms, coral), funerary and ritual practices, circulation of marine raw materials, symbolisms, East-West
Format: Regular session

SESSION ABSTRACT

Marine invertebrates (shells, crabs, sea urchins, corals) often held a highly symbolic place in religious and funerary practices of the ancient world. Their presence as votive offerings, grave deposits, protective amulets, ritual ornaments, decorative elements, or banquet remains, prompts a re-evaluation of the boundaries between nature, economy, and the sacred. From the Near East to North Africa, from Asia to Europe, these items are often attested in cultic and funerary contexts from the 7th century BCE to the 7th century CE. This is notably the period when the first Greek sanctuaries were established, commercial roads and cultural exchanges intensified between regions of the ancient world. However, uses of marine invertebrates vary across cultures. This encourages a deeper examination of the continuities between cults dedicated to the living and offerings to the dead and the gods within a large geographical frame. This session will examine the plurality of these practices and offer a comprehensive overview of the uses, circulation, and symbolism of marine invertebrates through diverse approaches, such as archaeozoology, archaeology, iconography, and textual sources. It will explore their function in cultic and funerary rituals by examining their typology, associations, and role within collective and individual gestures. The session will also focus on trade networks of these items connecting oceans and continents, questioning their symbolic value, exotic dimension, and transfers between cultures. Ultimately it will illuminate the marine world

in the imaginaries and representations of the sacred and the afterlife, and connections between nature, societies and the intangible. Finally, the session may consider the transformations observed at the beginning of the Middle Ages, particularly with the rise of Christian and Islamic cults. The goal is to understand how the uses and meanings attributed to marine invertebrates, inherited from ancient traditions, were integrated, reinvested, or transformed within new religious and cultural frameworks.

CONTRIBUTION ABSTRACTS

2231. Breaking the shell: Marine invertebrates in cultic and funeral contexts of the Late Bronze Age Eastern Mediterranean

Authors: Janine Fries-Knoblach (Ludwig-Maximilians-Universität München)
Format: Oral

While invertebrates have long been acknowledged as an important resource in Stone Age research, researchers of the Metal Ages tend to overlook these inconspicuous creatures amongst their rich textual and archaeological evidence. If they are considered, the focus is usually laid on practical uses and consumption habits. In the context of Philipp W. Stockhammer's ERC Starting Grant "FoodTransforms", I had the chance to systematically collect archaeological evidence for any use of aquatic resources in the Late Bronze Age Eastern Mediterranean, including invertebrates. Based on this data set, I will give an overview of cultic and funeral contexts with invertebrates prior to the defined period of this session, which will provide useful background information for the appreciation of later practices. In Egypt, the Temple of Hatshepsut features pictures of squid and lobster, while snails and bivalves, representations thereof or artefacts made from them were deposited in graves. In Mesopotamia, bivalves are also occasionally found in graves. For the Aegean, the role of argonauts in ritual, cult and funeral is as significant as the use of bivalves as offerings and requisites in shrines, for which both originals and representations in painting, stone, pottery etc. were employed.

2645. Shells for the deceased: shell remains from burial contexts in the Early Iron age and Archaic Aegean

Authors: Tatiana Theodoropoulou (CNRS - Université Côte d'Azur) – Vicky Vlachou (Aristotle University of Thessaloniki)
Format: Oral

Shell remains from burial contexts have long been treated as marginal or purely ornamental finds. Although discrete, their presence in funerary assemblages of the Early Iron Age and Archaic periods from mainland Greece and the Aegean islands suggests a more complex social and symbolic role. This paper will offer a short overview of shell funerary assemblages that might highlight inter-regional patterns and local divergences within the same period. Environmental availability is also considered, addressing how access to marine resource shaped choices in funerary deposits. A focus on a selection of well-studied case studies aims at providing an insight into funerary practices related to the use of marine invertebrates, and at exploring how these materials participated in commemorative acts for the deceased. The analysis focuses on specific criteria directly or indirectly evidenced in the archaeological record, such as age, gender, or markers of social identity, assessing whether shell deposits correlate with particular categories of the deceased or stages in the life cycle. Through this contextual approach, shells are studied as meaningful elements embedded in social practices, reflecting both shared cultural frameworks and regionally specific expressions of status and community affiliation during the Early Iron and Archaic periods.

1796. Small humble offerings or much more: Exploring the significance of Molluscan remains from protohistoric burial context in the Indian subcontinent

Authors: Arati Deshpande-Mukherjee (Deccan College PGRI, Pune)
Format: Oral

In the Indian subcontinent both molluscan shells and shell objects made from them are frequently found at many sites belonging to the protohistoric and historical cultural period. While the earliest ones have been recorded in the seventh millennium BC. neolithic site of Mehrgarh their particular presence at some of the burial sites dating to the Mesolithic, Harappan, Neolithic/ Chalcolithic and Iron age periods makes them significant. These range from humble, small, unworked shells to larger, intricate, handcrafted ornaments, like beads, bangles, etc. As they are mostly found to be associated with adult burials their occurrence with those of children in certain chalcolithic burials further enhances their role as burial offerings. The taxonomic Identification of the shell finds indicates the use of molluscan resources of both marine and freshwater origins during the protohistoric times. Most intriguing is the use of specific marine shells at settlements located far inland which reflects the long-distance interactions with the coast. This paper therefore attempts to determine the source, shell preferences, role, manufacturing techniques and socioreligious significance of shell finds from protohistoric burial context.

289. Marine invertebrates in funerary contexts: food, ritual and symbolic practices in the Three Gauls

Authors: Caroline Mougne (UMR 7209 BioArch MNHN Paris)
Format: Oral

Marine invertebrates are most often studied as food resources, ecological indicators or economic commodities. This paper explores another dimension of human–marine invertebrate relationships by focusing on their symbolic, ritual and alimentary roles in funerary practices during the Roman period in the Three Gauls (Gallia Aquitania, Gallia Lugdunensis and Gallia Belgica). Based on archaeological data ranging from the Late Iron Age to the Early Middle Ages (2nd century BC – 7th century AD), this study examines the presence of marine invertebrates, mainly molluscs and echinoderms, in funerary contexts. Some species, such as buccins, are deposited intact in inhumations, while others, such as sea urchins, are occasionally placed on cremation pyres and intentionally burned. Other assemblages correspond to consumption remains, interpreted as evidence of funerary meals or practices of ritual commensality associated with burial ceremonies. This paper combines fieldwork data, bibliographic research, zooarchaeological identification, taphonomic analyses, and contextual comparisons with Mediterranean funerary assemblages, particularly from southern Gaul and Italy. The results highlight both the persistence of local traditions inherited from Gaulish societies and the incorporation of Mediterranean ritual practices during the Roman period, followed by their gradual disappearance with the transformation of funerary norms in the Early Middle Ages, within a context of Christianization.

1776. Shells in a domestic context: material evidence from a house in Akragas dating back to the classical age

Authors: Maria Parello (Parco archeologico me paesaggistico della Valle dei Templi di Agrigento)
Format: Oral

The contribution presents the study of malacological remains recovered from House VII B, located in the residential area north of the Via Sacra at Akragas, investigated since 2019. The excavation of Insula VII has significantly improved our understanding of the urban development of this sector of the Greek city, from its foundation in the mid-sixth century BC to its abandonment following the destruction of Akragas at the end of the fifth century BC. House VII B, partially excavated to date, is organized around an L-shaped courtyard and preserves clear evidence of a sudden destruction caused by fire, which resulted in the exceptional preservation of primary deposits. The malacological assemblage derives from rooms A, B, C, and Z, from the courtyard, and from a votive deposit associated with the ritual closure of the house. A sample of approximately 490 shell remains was analyzed, allowing for a contextual and functional interpretation. The assemblage is dominated by Glycymeris, followed by Donax trunculus, with smaller quantities of Patella and other species. Spatial distribution shows a marked concentration of shells in rooms A and B and in the courtyard. These spaces are interpreted as a multifunctional room and a small kitchen area, suggesting that the majority of the shells represent food waste. Evidence also points to non-alimentary uses of shells. Approximately 10% of the assemblage displays marine erosion, indicating collection for purposes other than consumption. Glycymeris valves used as pigment containers, exotic shells such as Monetaria annulus and Luria lurida with symbolic and apotropaic meanings, and perforated shells from the votive deposit highlight the ritual, symbolic, and ornamental roles of malacofauna within the domestic sphere. Overall, the evidence underscores the multifunctional significance of shells in the daily life and ritual practices of late Classical Akragas.

721. Marine Invertebrates in Pompeii: From Daily Life to Ritual Acts

Authors: Rivière Julie (BioArch UMR 7209 MNHN-Paris | Direction de l'Archéologie de Chartres métropole) – Franck Decanter (INRAP | AOROC UMR 8546 CNRS ENS-Paris)
Format: Oral

This presentation aims to examine the role of marine invertebrates in ritual and funerary practices in Pompeii through a bioarchaeological study of peri-urban dumps, funerary enclosures and ritual hearths at Porta Stabiae and Porta Nocera. Moving beyond a strict opposition between everyday refuse and symbolic spaces, the research considers both contexts as interconnected arenas of consumption, social practice and material gesture. Urban dumps produce highly heterogeneous assemblages in which food remains merge with domestic and craft waste, obscuring individual acts of consumption. In contrast, funerary and ritual contexts display a highly selective faunal spectrum dominated by pigs and caprines, alongside rare but recurrent marine invertebrates, particularly sea urchins and Spondylus shells, frequently affected by burning. Their regular presence indicates intentional and standardised preparation, ritualised deposition, and possibly secondary functional uses. These contrasting treatments reflect distinct regimes of archaeological visibility: urban accumulation dissolves social practices, whereas ritual selection and transformation actively shape intentional gestures embedded within local traditions. Marine invertebrates thus emerge as symbolically charged materials within commemorative performances, highlighting how consumption mediates relationships between the living, the dead and the divine.

442. Oysters, Environment, and Lived Religion in Roman Britain

Authors: Avner Goldstein (Boston College)
Format: Oral

This paper follows previous theoretical contributions that have emphasised the potential of oysters as mediators between religion and the marine environment, and more generally between ritual and ecology, and illustrates the agency of the non-human in archaeologies of empire and its cultural milieu. Oysters, notably absent from Iron Age sites while overwhelmingly represented in many assemblages from Roman Britain, played a key role in the creation of provincial religion in the province, a phenomenon unparalleled in Mediterranean regions of the empire. In addition to being discovered in contexts associated with everyday economic and social life, oysters are frequently recovered from sites and features that are associated with ritual activity, including temples, shrines, wells, ritual shafts, pits, and cellars. They are especially common in subterranean features at non-urban sites and sacred precincts, as well

as in rural structured deposits in backyard pits and shafts, a practice of deposition that intensified throughout the Roman period. This paper therefore introduces some of the data from these various sites across Britain in order to make sense of how oysters helped create society and culture and shed light on human-environment relationships in a Roman province. Differences between inland and coastal, urban and rural, military and civilian, and high-status and low-status contexts are especially noted.

170 AT THE CROSSROADS OF EPOCHS: THE NEOLITHIC OF CENTRAL ASIA IN THE LIGHT OF NEW RESEARCH

Theme: 7. Interaction, connectivity and mobility
Organisers: Saule Rakhimzhanova (Margulan Institute of Archaeology) – Svetlana Shnaider (APSACA Laboratory, National Center of Archaeology | IRL ZooStan - CNRS – Al-Farabi Kazakh National University)
Keywords: Central Asia, Neolithic, Neolithisation, Environmental adaptation, Animal domestication, Cultural interaction
Format: Discussion session

SESSION ABSTRACT

Central Asia remains one of the least explored regions in the context of the Neolithic period, despite its key position between the ancient civilizations of the East and West. In recent years, the region has seen a growing number of archaeological projects, the application of advanced scientific methods (archaeobotany, bioarchaeology, radiocarbon dating, isotopic analysis, genetic study etc.), and the development of interdisciplinary approaches. These advances offer new insights into the processes of neolithization, the transition to sedentary life, animal domestication, and the development of agriculture. This session aims to bring together researchers working across various parts of Central Asia (Kazakhstan, Uzbekistan, Turkmenistan, Kyrgyzstan, Tajikistan, north-western China, southern Siberia, and beyond) to discuss new discoveries, interpretations, and theoretical frameworks. Particular attention will be given to issues of mobility, adaptation to diverse natural landscapes, cultural interactions, and transformations in socio-economic structures. We invite papers presenting fieldwork results as well as interdisciplinary projects that contribute to rethinking the Neolithic in Central Asia and its place in global narratives of ancient history.

CONTRIBUTION ABSTRACTS

2192. Processes of Cultural Formation in Northeastern Kazakhstan during the Final Mesolithic

Authors: Victor Merts (Toraygyrov University)
Format: Oral

The Mesolithic era is one of the least-studied periods of the Stone Age in Kazakhstan. The origin of Mesolithic complexes remains problematic, among which the Shiderty culture stands out for preserving traits indicative of influence from the southeastern Caspian region and the Near East. This influence is evident in the lithic technology and in examples of prehistoric art, represented by pebble and flint sculptures discovered at the multilayer site of Shiderty 3 (Layer 4) and at the Kostomar settlement. These are anthropomorphic and zoomorphic specimens characteristic of Near Eastern cultural traditions. Their origin may be associated with the process of Neolithization that began in the southern regions of Eurasia at the Pleistocene–Holocene boundary, followed by the colonization of peripheral areas by populations from the Near East. On the eastern flank, these processes resulted in the migration of pastoral groups into the steppe zone, gradually reaching the territories of Northeastern Kazakhstan and the South of Western Siberia by the turn of the 8th–7th millennia BC. Here, under the influence of environmental conditions and the challenges of adaptation, they reverted to foraging subsistence strategies, while retaining their lithic technological practices - without parallels in other assemblages of the region, as well as their ideological concepts.

2271. Vavilino 1: An Early Neolithic Site in Western Kazakhstan

Authors: Talgat Mamirov (Margulan Institute of Archaeology)
Format: Oral

Stratified Neolithic sites are extremely rare in Kazakhstan. One of the few known examples in Western Kazakhstan is Vavilino 1. The site was discovered by N.M. Malov in 1988 and subsequently briefly studied by N.L. Morgunova in 1991. Rescue archaeological investigations were carried out at the site by the Margulan Institute of Archaeology in 2018–2020. The investigations demonstrated that the site dates to the Early Neolithic (second half of the 7th millennium BC), with a minor admixture of later material. The soil profile of the excavation, the homogeneous assemblage of stone artefacts, and archaeozoological data (after P.A. Kosintsev) indicate the synchronicity of the complex. Typologically, the assemblage is characterized by end-scrapers made on blades and blade-like flakes, blade fragments with retouch, and few fragments of burins, borers, and other tool types. These artefacts show close similarities to Neolithic sites of the Steppe Volga region, such as Algay and Oroschaemoe 1. The obtained radiocarbon date (cal 6355–6335 BC) places Vavilino 1 within the circle of Early Neolithic sites of the Volga–Ural interfluve. The site opens new perspectives for further research on Neolithic sites in the steppe zone of Western Kazakhstan and contributes to addressing questions concerning the origin and cultural characteristics of the Early Neolithic in the region.

2345. Neolithisation in the Mountains: New Evidence for Early Pastoralism in Central Asia

Authors: Svetlana Shnaider (IRL ZooStan – CNRS – Al-Farabi KazNU) – Percy Hei Chun Ho (Harvard University) – Alexey Kasparov (Independent Researcher) – Saltanat Alisher Kyzy (Osh State University) – Choongwon Jeong (Seoul National University) – Christina Warinner (Harvard University | Department of Archaeogenetics, MPI-EVA) – William Rendu (IRL ZooStan – CNRS – Al-Farabi KazNU)
Format: Oral

The emergence of food-producing economies based on agriculture and pastoralism became one of the key processes transforming social structures, subsistence strategies, and landscape use during the Early Holocene. Despite the extensive research on Neolithisation in the Fertile Crescent and East Asia, the earliest stages of the development of food production in Central Asia remain insufficiently studied. At present, two early centres are identified in the region — the Kopet Dag foothills (Jeytun culture) and southern Fergana (Obishir-5, Surungur); however, their interconnections and their role in the spread of food-producing economies require further investigation. In recent years, our research team has conducted integrated bioarchaeological studies of Early Holocene sites in Central Asia, primarily Obishir-5 and Surungur. The application of ZooMS, cementum analysis, radiocarbon dating, and ancient DNA analysis revealed the predominance of sheep and goat remains, some of which belong to domestic forms, and provided evidence for seasonal patterns of their exploitation and specific subsistence practices. These results indicate the spread of pastoralism in the Fergana Valley during the Middle Holocene, significantly earlier than previously assumed. A comparative analysis of materials from Jeytun, Obishir-5, and Surungur has allowed us to propose a model for the formation of the Neolithic in the mountainous regions of Central Asia. These data refine our understanding of the pathways of the spread of food production and demonstrate the active role of mountain regions in the transformation of subsistence systems during the Early Holocene. The work founded by RSF #24-78-10127 and ANR PaleoCALM (ANR-23-CE27-0019).

2365. Neolithic ceramics of the North-Eastern Aral Sea region

Authors: Saule Rakhimzhanova (Margulan Institute of Archaeology)
Format: Oral

Ceramics are one of the most important sources for studying the ethnocultural development of ancient populations. Studying ceramics within a historical-cultural approach provides an opportunity to draw new data for research into the history of the region's population. The ceramic collections under study were obtained through exploration in 2021-2022 and 2024-2025. Ceramics from the sites of Saksaulskaya I, Kosaman, Akespe, Shili 7, Sholkum 6, 17, and 18, Tapa and Sazdy 2, and Kulandy, located in the Aral and Kazaly districts of the Kyzylorda region of the Republic of Kazakhstan, were analyzed. The studied materials predominantly contain pottery-shaped vessels, rarely jar-shaped ones. Round-bottomed and flat-bottomed vessels are also present. Comb and pricked ornamentation were most frequently used to decorate vessels, while pitted patterns were less common. Patterns such as stepping, stepping and rolling, zigzag, and wave have been recorded. In the Aral region, pottery was made of clay, with sand and wool being the most common additives. In the Aral Karakum Desert of the Kazalinsky region, this recipe accounts for a significantly smaller proportion, but the use of both silt and clay is observed. Admixtures include sand, chamotte, and shell, combined with organic solution (separately in different vessels). In terms of the features of form, ornamentation, and composition of the molding masses, Neolithic ceramics find analogies with the Makhandzhar and Atbasar cultures of Northern Kazakhstan (Shevnina 2014, Zaibert 2012), with the Oyuklin culture on the Mangyshlak Peninsula (Astafyev 2014) and in the Balkhan region (Markov 1962), the Caspian culture in the Northern Caspian region and Western Kazakhstan (Vybornov et al. 2021, Rakhimzhanova et al. 2023), and with the Kelteminar culture in Uzbekistan and Karakalpakstan (Vinogradov 1981). Analysis of data on ceramic production traditions reveals a multi-component composition of the population, but some features also indicate contact between them.

2374. High-Altitude Archaeobotany in Pamirs: Phytolith and Charcoal Evidence from Late Pleistocene-Holocene levels from Istykskaya cave (Murgob district, Tadjikistan)

Authors: Svetlana Shnaider (IRL ZooStan – CNRS – Al-Farabi KazNU) – Mihaela Danu (Alexandru Ioan Cuza University of Iași, Faculty of Biology, Iași) – Marie-Amandine Chautard – Auréade Henry – Julian Gentile – Barbara Mas (CEPAM UMR 7264 CNRS, Université Côte d'Azur)
Format: Poster

Central Asia remains a key yet understudied region in discussions of Neolithic transformations, particularly regarding plant-related practices in environmentally constrained settings. This contribution presents results from a combined phytolith and charcoal study carried out at the multi-stratified site of Istiskaya, located on the Pamir Plateau at over 4000 m asl, and addresses human–plant interactions from the Late Epipaleolithic to the Middle Holocene. The research is conducted within the framework of the project "Archaeology and Paleoecology of high-altitude ecosystems in Central Asia's Landlocked Mountains from the Late Glacial to the Middle Holocene" (PaleoCALM). Phytolith samples from archaeological sediments were collected from exposed stratigraphic profiles of Istiskaya Cave (near Chesh Tebe) across multiple occupation layers. In parallel, phytolith samples were obtained from modern soils, as well as dried feces of yak and sheep, collected from the ground, animal enclosures, and dried dung cakes traditionally used as fuel. These modern samples form part of a developing reference collection designed to improve the interpretation of archaeological microbotanical assemblages in high-altitude Pamir contexts. Within the archaeological framework of repeated site

occupations, phytolith assemblages are used to reconstruct local grassland composition, assess variations in herbaceous plant inputs, and evaluate patterns of site use, while charcoal remains provide complementary evidence for woody vegetation availability and fuel practices. Variations observed between stratigraphic units indicate changes in occupation intensity and flexible land-use strategies consistent with mobile lifeways. By integrating archaeological context with micro- and macro-botanical proxies and modern reference material, this study feeds into ongoing discussions on mobility, adaptation, and Neolithic trajectories in Central Asia.

171 VITICULTURE AND WINE IN THE ROMAN WORLD

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Theoni Baniou (Landscape Archaeology Research Group, Catalan Institute of Classical Archaeology) – Patricia Vandorpe (IPAS, Universität Basel) – Laurent Bouby (Institute of Evolutionary Science of Montpellier, University of Montpellier) – Remi Noraz (Centre for Anthropobiology and Genomics of Toulouse, University of Toulouse)
Keywords: Grape, Viticulture, Agrobiodiversity, Wine consumption, Trade, Roman period
Format: Regular session

SESSION ABSTRACT

Viticulture and wine consumption were fundamental to the agricultural economy and social life of the Roman period. Although the grapevine can adapt to various environmental conditions, producing high-quality commercial wine requires favourable environmental and cultivation parameters-a fact well known in Roman period. Wine's significant role in Roman society explains why the grapevine was among the most common cultivated species and popular commercial products. Thanks to locally produced, in some areas of the Empire, and imported wines of varying quality, wine consumption was widespread across all social groups. The quantity and quality of wine available to a person was closely tied to social and economic status. Recent morphometric and paleogenomic research illuminates the history, diversity, and spread of European viticulture, connecting ancient cultivation methods to the genetics of modern grape varieties and revealing new insights into the biological and cultural legacy of Roman winemaking. This session focuses new research directions enabled by advanced analytical techniques, emphasizing the identification of cultivated grape varieties and characterization of wine properties. It also explores how these methods reveal less intensive or alternative forms of viticulture-practices often invisible in traditional approaches. We invite contributions that explore the diverse dimensions of viticulture and wine exchange in the Roman world, drawing on different scientific perspectives and methodologies. Submissions combining typological and analytical approaches or examining the social, economic, and environmental contexts of Roman wine production and consumption are especially welcome. Topics include: •Viticulture and wine production centres during the Roman period, examined through archaeobotanical and archaeological evidence, including case studies on local cultivation, production, and trade. •Morphological and ancient DNA analyses on grape remains. •Organic residue analyses confirming the presence of wine. •Networks involved in wine transport. •Vessel types associated with the storage, transport, and consumption of wine. •Textual, epigraphic, and iconographic sources on wine production and consumption.

CONTRIBUTION ABSTRACTS

248. Developments in chemical analysis methods for identifying grapes and wine in archaeological objects. An overview of the current situation

Authors: Nicolas Garnier (Laboratoire N. Garnier)
Format: Oral

Since the excavation of shipwrecks in the 1970s, various indicators have been proposed for identifying archaeological wine (Condamin and Formenti, 1978). Developments in biomolecular archaeology, particularly the use of mass spectrometry since the 1990s, have enabled accurate molecular identification. However, the reliability of the results depends on many factors: sampling, methods of organic matter extraction, mass spectrometry analysis, and the identification and interpretation of molecular markers. Recently, using new, particularly sensitive methods, we have detected traces of grapes/wine in numerous containers (ceramics, basin coatings, metal, stone or glass vases, wooden barrels) and in many contexts (Pecci et al., 2013; Garnier and Valamoti, 2016). This frequency of identification has led to doubts about the methods used (Drieu et al., 2020). A return to the basics of chemistry was necessary, thus countering the unfounded and chemically incorrect criticisms of British laboratories (Whelton et al., 2021). Based on the chemical interactions between grape molecules and alcoholic fermentation with clay, we will justify the choice of samples, the effective preservation of markers over time regardless of the burial environment, and the choice of extraction methods (Garnier, 2022). Ethnoarchaeology, experimental archaeology, the integration of data with botany, and the study of other fruits have also enabled us to refine the criteria for identifying grapes and their derivatives, as well as other fruits. The analysis of duplicate sample series, using different methods and laboratories, has once again justified the results, if justification were still needed (Pecci et al., 2020a and 2020b; Bernal-Casasola et al., 2024). Today, metabolomic analysis is a reliable and particularly sensitive approach to addressing the issue of grapes and wines.

54. A new class of biomarkers for the characterization of ancient wine residues in archaeological pottery

Authors: Gazmend Elezi (University of California) – Kym Faull (University of Southern California) – Jacques Connan (Universite de Strasbourg) – Hans Barnard – Julian Whitelegge (University of California)
Format: Oral

Organic mass spectrometric applications constitute a fundamental set of tools for detecting wine residues in archaeological materials and addressing anthropological questions related to ancient trade, interregional interaction, and economy. Despite the development of high-throughput techniques and advanced instrumentation, the results of chemical analyses of ancient wine residues are often ambiguous and context-dependent. This study introduces a novel LC–MS/MS methodological framework optimized for the detection of pyranoanthocyanins, namely Vitisin A and Vitisin B, as specific biomarkers of grape wine fermentation. Authentic Vitisins standards were synthesized from malvidin-3-O-glucoside and yeast-derived metabolites, purified by preparative high-pressure liquid chromatography (HPLC), and characterized through tandem mass spectrometry. Validation with modern red and white wines confirmed their exclusive presence in fermented red wines and high recovery from ceramic matrices. Analysis of archaeological ceramic samples revealed molecular traces of pyranoanthocyanins across different regions and time periods. These findings provide the first identification of fermentation-specific pigments in archaeological materials, offering an analytical tool to distinguish between red and white wine and to confirm fermentation processes.

392. Diachronic View on Maritime Foodways and Agriculture: Carpological and Morphometric Analyses from the Roman Forum of Butrint

Authors: Riccardo Tomasini – Claudia Moricca (Sapienza University of Rome) – David Hernandez (University of Notre Dame) – Nevilla Molla (Albanian Institute of Archaeology) – Richard Hodges (University of East Anglia) – Laurent Bouby – Sarah Ivorra (ISEM, University of Montpellier, CNRS, IRD, EPHE) – Laura Sadori (Sapienza University of Rome)
Format: Oral

Butrint (Albania), a UNESCO World Heritage site, served as a strategic maritime node connecting the Adriatic and Ionian seas throughout antiquity. This study presents the analysis of waterlogged plant macro-remains and wood charcoals recovered from the Roman Forum, specifically from a well fill and foundation fills dating from the Hellenistic to the Late Antique period (4th c. BC – 6th c. AD). The excellent preservation conditions revealed a rich assemblage dominated by edible fruit and nut taxa, including Ficus carica (fig), Sambucus nigra (elderberry), and Rubus ulmifolius (blackberry). A relevant discovery is the first example of Prunus persica (peach) at Butrint, and in Albania in general. The data derived from this assemblage are helpful to deepen the knowledge of the dietary habits of a dynamic port community. An important component of this research involves geometric morphometric analyses performed on numerous Vitis vinifera (grape) pips recovered in the aforementioned contexts. By examining morphological differences among grape seeds, this study aims to distinguish between wild (Vitis vinifera subsp. sylvestris) and domesticated morphotypes. This diachronic approach provides insights into the typology of grapes consumed and the commercial exchanges that characterized the site over time. The integration of traditional carpological analyses with morphometric data make it possible to better frame the role of Butrint role in the Hellenistic and Roman economic systems, showcasing a landscape where local resource exploitation coexisted with complex agricultural management and long-distance trade networks

619. Paleogenomic perspectives on grapevine diversity and population structure during the Roman period

Authors: Remi Noraz (ISEM)
Format: Oral

The Roman period represents a key phase in the expansion and intensification of viticulture across Western Europe and the Mediterranean. While archaeological evidence documents the widespread cultivation of grapevine and the circulation of wine, the genetic structure and diversity of grapevines cultivated during this period remain poorly understood. This presentation introduces a paleogenomic investigation of Roman-period grapevine remains from Western Europe. Using genome-wide ancient DNA data and population genetic approaches, we explore patterns of genetic diversity, population structure, and biological relatedness among ancient grapevine samples. The presentation will focus on three main aspects: (i) the extent of genetic diversity observed among Roman-period grapevines, (ii) their population affinities with modern cultivated and wild grapevine groups across the Mediterranean, and (iii) patterns of genetic relatedness that provide insights into propagation practices and the circulation of plant material. These results highlight the heterogeneous genetic composition of grapevines during the Roman period and point to the coexistence of multiple genetic lineages, shaped by regional Mediterranean affinities and local management practices. By emphasizing population genetic and genetic relatedness evidence, this contribution demonstrates how paleogenomics can directly inform discussions on grapevine diffusion, agrobiodiversity, and cultivation practices in the Roman world, complementing archaeological and bioarcheobotanical approaches.

1009. Modelling the landscape of Roman viticulture in continental Italy: an integrated approach

Authors: Roberto Ragno (University of Cambridge) – Maria Castiello (University of Lausanne)
Format: Oral

The production and commercialisation of wine held an important place in the Roman agricultural economy. However, research in this area has been relatively limited and has focused mainly on micro-regional approaches and data (e.g. amphorae) that are closely associated with distribution and consumption rather than production. This research project utilises machine learning techniques to examine potential wine production regions in continental Italy from the late Republican period through the Late Imperial period (1st century BCE-5th century CE). The research examines the various environmental and infrastructural conditions that affected Roman viticulture. The research combines archaeological data from over 125 sites that include winemaking infrastructure such as wine presses, wine vats, treading floors, and wine cellars alongside stratigraphically dated occurrences of the domesticated grape-vine (Vitis vinifera) in the archaeobotanical record. By focusing exclusively on production-related proxies, we attempt to isolate the relationship between viticulture and its environmental and topographical contexts. The research utilises Maximum Entropy and Random Forest algorithms to evaluate the effect of climatic, topographical, and infrastructural variables (temperature, precipitation, altitude, proximity to water courses, roads, and urban centres) on the geographic distribution of Roman viticulture. The resulting predictive models identify regions of high and low suitability for grape cultivation, highlighting intensive viticulture productive regions near Roman villas (which have been the primary foci of archaeological research to date) and other less visible forms of viticulture. This integrative research project attempts to develop a scalable model for winemaking production and systematically quantifies the role played by various factors in past agricultural decision-making.

1789. Revealing Roman Arboriculture: investigating vine-, olive- and fruit tree-growing in southern Adriatic Italy through Google Earth Pro satellite images

Authors: Dimitri Van Limbergen (LEIZA - Leibniz-Zentrum für Archäologie)
Format: Oral

This paper offers a discussion of the numerous, buried traces of ancient vineyards, olive groves and orchards in the Tavoliere delle Puglie in southern Adriatic Italy. This area offers unique circumstances for the non-invasive investigation of Roman arboriculture traces, as it contains many, unusually preserved traces of ancient tree fields that allow to detect, study, visualize and reconstruct past arboriculture with remarkable detail and confidence. In my talk, I will focus on the use of satellite data from Google Earth Pro, and their potential to investigate how Roman arboriculture fields were set, designed and structured, and how their cultivation fitted within wider rural landscapes. To this end, I will concentrate on the territory around Roman Luceria (Lucera), where soil conditions ensure optimal visibility and past research had identified many traces of ancient land division (Roman centuriation) and rural habitation. I will also discuss how to move forward by integrating other kinds of non-invasive approaches, including geophysics and manual coring.

83. Not so new after all: orange wines in the Roman World

Authors: Paulina Komar (University of Warsaw) – Dimitri Van Limbergen (Leiza)
Format: Oral

Orange wines—white wines produced through prolonged skin-contact fermentation—have gained increasing popularity in recent decades, being often associated with natural and traditional winemaking practices. They are commonly perceived as a recent innovation confined to specific regions such as northeastern Italy and Slovenia, and most often discussed without any reference to ancient agricultural knowledge or Roman viticultural practice.This presentation shows that the technique has much deeper roots reaching back to the Mediterranean during antiquity. Drawing on textual, archaeological, anthropological, and oenological evidence, we demonstrate that skin-contact vinification was widespread in the Roman world and likely predates it, with origins potentially traceable to Neolithic cultures of the Caucasus. By situating this practice within the broader framework of Roman viticulture and wine consumption, the study highlights the long-term continuity of macerated white wine production across millennia, repositioning orange wine not as a modern novelty but as the revival of one of the oldest vinification traditions in human history.

199. Women and Roman wine-making: An interdisciplinary view

Authors: Tamara Lewit (University of Melbourne)
Format: Oral

Perhaps our most detailed textual source for Roman wine-making practices is the description contained in Book 12 of Columella's first-century CE De Re Rustica. While scholars frequently refer to this text, what has gone unnoticed is that Columella designates these activities as the responsibility of the female farm manager, the vilica. According to this agronomist's account, she was responsible for the entire process of wine-making from preparation of the vessels to fermentation of the must, including supervision of the workers and rituals for its success. An interdisciplinary examination of this in the light of both iconographic sources and archaeological investigations into the organization of spaces, work, and ritual activities at Roman villas challenges the accepted scholarly

assumption that wine-making was a male activity. The previously unrecognized part that the female farm manager played is of significance to our understanding of women's economic and religious roles in relation to Roman wine.

195. Partners in Wine: The Vintners, Merchants, and Drinkers Who Made Cretan Wine Desirable in the Roman Imperial Period

Authors: Erica Venturo (University of Michigan)
Format: Oral

For a century prior to Vesuvius' eruption in 79 CE, Cretan wine was the most prolific extra-regional wine variety distributed to and consumed in Campania. Combining archaeological, literary, and epigraphic evidence from Pompeii, I will demonstrate why and how Cretan wine, specifically passum, became so favourable for Campanian wine drinkers. This interdisciplinary evidence will also highlight how Cretan wine amphoras became a valuable part of the local Pompeiian wine industry for their sweet wine, Surrentinum. When discussing the 'value' of Cretan and Campanian wine, I analyse this through both an economic and social lens. Amphoras—especially those associated with the production and distribution of wine—have been fundamental to debates on the nature of the Roman economy. Unlike those earlier discussions, I aim to shift the conversation away from defining the nature of the Roman economy on a global scale, and instead, pursue a multiscalar analysis to reveal the irrational and personal factors that influenced the actions of those who shaped the trajectory of Central Cretan amphoras within the Roman economy—aka the producers, distributors, consumers. As such, the value of Central Cretan wine amphoras goes beyond their role as a proxy for network ties between Crete and Campania, and sheds light on the people behind the amphoras, and the decisions they made daily surrounding the Cretan and Pompeiian wine industries.

2566. Uncovering Ancient Viticulture in the Sinti Valley: a Preliminary Report from the Excavations of a Roman-Era Vineyard in Southwestern Bulgaria

Authors: Mariya Avramova (Antiquity of Southeastern Europe Research Centre, University of Warsaw) – Zdravko Dimitrov (National Archaeological Institute and Museum)
Format: Oral

Site 12, located in proximity to the village of Valkovo in Southwestern Bulgaria, underwent excavation during the spring and summer of 2025. This site is situated approximately 7 kilometers from the town of Sandanski, on the western banks of the Struma River, at the initial slopes of the Malashevska Mountain. In relation to the ancient topography of the region, it is positioned 15 kilometers from the significant urban center of Heraclea Sintica. The rescue excavations conducted at this site unveiled an intriguing complex. The site comprises two primary sectors: the southern sector features a structure dating from the Roman period (2nd-4th century), while the northern sector contains 104 rock-cut rectangular niches, systematically arranged in rows alongside an ancient stream. These rock-cut niches, located on a gentle slope with a northeast orientation, represent a notable discovery and are the first of their kind in the area. Subsequent analyses revealed that these niches were integral to local viticultural practices associated with vine cultivation on the slopes of the Struma Valley. The distinctive characteristics of the niches, including toolmarks and their stratigraphic context, suggest a Roman-period date rather than a modern origin. This paper aims to elucidate the prominent features of Site 12, alongside relevant analogies that support its interpretation as a small vineyard. This will enhance understanding of the lesser-known aspects of small-scale wine production catering to local, and potentially private, needs.

2020. Wine Residues in M·PORC-Stamped Pascual 1 Amphorae from Roman Baetulo

Authors: Francisco Javier Marín Marín – Simona Mileto – Verónica Martínez Ferreras (ERAAUB, IAUB, Departament d'Història i Arqueologia, Universitat de Barcelona) – Clara Forn Perramon – Esther Gurri Costa (Museu de Badalona) – Paul Reynolds (ERAAUB, IAUB, Departament d'Història i Arqueologia, Universitat de Barcelona | ICREA) – Alessandra Pecci (ERAAUB, IAUB, Departament d'Història i Arqueologia, Universitat de Barcelona | INSAUB)
Format: Poster

Between the mid-1st century BC and the 1st century AD, Pascual 1 amphorae were widely produced in the north-eastern Iberian Peninsula and are traditionally associated with the maritime export of regional wine. Despite this, direct evidence for their contents remains limited. Previous interdisciplinary research has highlighted the key role of the Layetanian region in wine production and trade, particularly with Gallia Narbonensis. Archaeometric studies of ceramic pastes have identified Baetulo (modern Badalona) as a major production centre for Pascual 1 amphorae. Combined archaeometric and epigraphic evidence indicates that amphorae bearing the widespread stamp M·PORC were produced in Baetulo and are well documented across the western Roman world. Eleven M·PORC-stamped Pascual 1 amphorae recovered from archaeological contexts in Baetulo were selected for organic residue analysis (ORA). All samples were attributed to the local figlinae based on chemical (WD-XRF), mineralogical (XRD), and petrographic (TS-OM) analyses of the ceramic fabrics. The primary aim of the study was to determine whether these amphorae contained wine, while a secondary objective was to identify the waterproofing materials used on their inner surfaces. Organic residues were extracted using total lipid extraction and targeted methods for wine markers, followed by derivatisation and GC-MS analysis. The results reveal the presence of compounds consistent with grape derivatives, confirming the use of M·PORC-stamped Pascual 1 amphorae for wine transport. In addition, the analyses identified Pinaceae pitch as the material used for the internal coating.

172 WOMEN AND MATERIAL CULTURE IN THE ROMAN REPUBLIC AND EMPIRE

Theme: 1. Widening perspectives in material culture studies
Organisers: Tais Pagoto Bélo (University of São Paulo) – Brian Gordon Lutalo Kibuuka (University of Coimbra) – Sarah Lino De Azevedo – Marina Regis Cavicchioli (Federal University of Bahia)
Discussant: Fábio Vergara Cerqueira (Federal University of Pelotas)
Keywords: Roman women, women agencies, Gender Archaeology, intersectionality, Feminist Theory, Power and gender relations
Format: Regular session
Affiliation: Archaeology and Gender in Europe - AGE

SESSION ABSTRACT

This session invites papers on women in the material culture of Rome, with particular emphasis on the Republican and Imperial periods, taking archaeological evidence as analytically central rather than merely illustrative. We are interested in the plurality of women's agencies and experiences as they are materially inscribed in domestic and urban spaces, rural villas and military zones, sanctuaries and imperial cult complexes, as well as in funerary and provincial contexts, where gender, status, legal condition (free, freed, enslaved), ethnicity and age are negotiated and contested. Over the past decade, work on women in Roman studies has increasingly drawn on intersectionality, feminist and queer theory, studies of embodiment and lived religion, and decolonial critiques of empire. Hence, new archaeological methods and theory have reopened key questions about labour, mobility, care work, motherhood, sexuality, religious authority, and economic participation. We welcome contributions that re-read women from the perspective of their presence, absence, and symbolic construction; that analyse artefacts related to adornment, domestic management, medicine, or cult as indices of women's agency; that explore funerary assemblages as arenas for materializing ideals of femininity, family memory, and civic identity; that interrogate the interplay of iconography and epigraphy in representing female bodies, virtues, and roles; and that critically reflect on the methodological and epistemological limits of identifying gender in the archaeological record. Considering the fundamental material traces of women to understand their place in the past, it is interesting to contemplate some questions: How has Gender Archaeology helped to rewrite the history of women of the Roman Republic and Empire? How could female agency demonstrate power through materiality? How can Archaeology demonstrate the transformations that women underwent between the Republic and the Empire? How can the material culture of this period reveal women in their plurality?

CONTRIBUTION ABSTRACTS

1438. The Public Projection of Roman Women in the transition from the Republic to the Empire

Authors: Sarah Azevedo (Federal University of Bahia) – Tais Pagoto Bélo (University of São Paulo)
Format: Oral

This presentation aims to analyze the materiality of the public projections of women of the Roman aristocracy during the period of the end of the Republic and the beginning of the Empire. We will examine coins, statues, and reliefs that demonstrate representations of women associated with Roman politics. These documents have been studied by historiography and archaeology in recent decades, always being revisited mainly to point out the participation of women in politics and in war affairs. More recently, feminist studies and gender studies have contributed to deeper analyses, creating their own epistemology to account for the complexity of the theme of women's participation in politics. Expressions like "Livian Revolution" have recently emerged in historiography and archaeology to analyze Livia's leading role, contrasting with the notion of "Augustan Revolution." Through the concept of "Livian Revolution," one studies, for example, the architectural reforms undertaken by Livia in the city of Rome, and how these represented a spatialization of female power in the city. Studies on the activity of female patronage have also grown, demonstrating the role of women in the economy, leading to them having more public visibility through benefits such as plaques or statues honoring them for the donations made. The contribution of an imperial woman in donations to the city ended up promoting the imperial family, which led to such women also being minted on coins. It will be demonstrated the epistemological changes in the analyses of material culture concerning the public projection of women, exploring themes such as female patronage, the role of women in politics and in war affairs, pointing to the protagonism and agency of women in that period.

1343. The female agency in Roman cities

Authors: Marina Cavicchioli (Ufba)
Format: Oral

Women played a significant role in the dynamics of Roman cities. However, economic "entrepreneurship," certain professions, political influence, and euergetism have traditionally been interpreted by historiography as almost exclusively male activities. Traditional historiography, in general, has privileged normative discourses that relegated women to the private sphere. In this sense, archaeological sources have played a fundamental role in changing perspectives on the role of women in Roman public life. It is worth noting that the archaeological discoveries in Pompeii were very important in highlighting the presence of women in the city's public spaces and their active participation in daily life in Pompeii; however, this fact has not received due attention in studies of the Roman world. Gender studies in recent decades have been necessary to deconstruct stereotypes related to the roles of men and women in societies and to offer a new perspective on the sources, highlighting female agency. Thus, we seek to demonstrate, through material culture, this female protagonism in the Roman world.

2739. Beyond labor matronalis: Women and amphorae in Greece and Rome

Authors: Manel García Sánchez (University of Barcelona)
Format: Oral

The presence of women in amphoric epigraphy cannot, admittedly, be generalised across all regions and periods of the ancient world. It is also true that Rhodes accounts for the vast majority of such evidence in the Greek world, while Dressel 20 amphorae from Baetica dominate the Roman record. Nevertheless, the corpus is sufficiently substantial to warrant serious consideration. It is therefore essential to subject the literary sources of antiquity to critical scrutiny and to avoid the mistake of neglecting archaeological and epigraphic evidence, which significantly nuances the androcentric and misogynistic discourse that permeates most literary genres in ancient Greece and Rome. The involvement of numerous Greek and Roman women in the manufacture of amphorae and other categories of opus doliare is well attested. This participation, which took a variety of forms, also facilitated connections with other key economic sectors, such as the production of wine and oil and the exploitation of natural resources. The documentation generated by these productive processes—primarily epigraphic in nature—is of fundamental importance. On the one hand, it challenges the notion that women in ancient Greece and Rome were confined to the ἔργα γυναικῶν or excluded from the virilia officia; on the other, it calls into question the taboos found in literary sources that restrict women's relationship with wine, commerce, or economic activities conducted outside the oîkos or the domus. The combined contribution of epigraphy and archaeology thus makes it possible to render women visible as economic agents, identifying their specific roles within activities that are crucial for understanding the dynamics of interaction and interdependence that developed on a Mediterranean scale between the third century BC and the third century AD.

559. Reflections of expected womanhood: relief mirrors from Viminacium

Authors: Ilija Dankovic (Institute of Archaeology, Belgrade)
Format: Oral

In the Roman world, women's identities were shaped through a complex interplay of social norms, domestic roles, and material practices. While literary and epigraphic sources emphasize ideals of female virtue centred on marriage, household management, and moral conduct, material culture offers an important perspective on how such expectations were materialized and communicated in everyday life. This paper focuses on a group of Roman relief mirrors from ancient Viminacium, luxury items probably acquired as part of a dowry and used in marriage ceremonies. The mythological scenes represented on their backs have traditionally led to interpretations of these objects as carriers of religious, ideological, or moral messages. Previous studies have considered their iconography as expressions of imperial propaganda, religious concepts, or as moral exempla addressed to brides. Reassessing and further developing these interpretations, this contribution approaches relief mirrors as material agents involved in the construction and reinforcement of female identity. By situating the mirrors within their social and gendered contexts, the paper explores how these objects participated in shaping expectations of womanhood, particularly in relation to marriage, household roles, and feminine virtue. Rather than viewing their iconography solely as decoration or religious symbolism, the analysis considers relief mirrors as active components within moralising discourses surrounding young women and newly married wives. Drawing on specimens from Viminacium, the paper argues that relief mirrors functioned as a material connection between ideology and everyday practice, reflecting not only who women were expected to be, but also how such expectations were materially manifested.

927. The Portrait Statue Epidauros Museum inv. no. 1: A Reappraisal

Authors: Panagiotis Konstantinidis (Institute of Historical Research - National Hellenic Research Foundation)
Format: Oral

The paper reexamines a nineteenth-century find from the sanctuary of Apollo Maleatas and Asklepios at Epidauros: the first-century CE female portrait statue Epidauros Museum inv. no. 1. On the basis of the statue's rare iconography—used almost exclusively for representations of empresses and female members of the imperial family—it is argued that a comparable identification should be proposed for the figure. Building on this suggestion, the paper explores a more specific identification by considering the history, topography, and broader cultural landscape of the sanctuary in the first century CE. Particular emphasis is placed on archaeological, literary, and epigraphic evidence for honors bestowed on women—both members of the imperial family and private individuals—within the sanctuary and the city of Epidauros during this period. Of particular importance are the members of the eminent Epidaurian family of the Statilii, particularly honoured in the Asklepieion, and related to the prominent Memmii and Voluseni families of Sparta.

1031. Deliberate Choice or Dernier Cri: Moving Beyond Fashion in Evaluating the Design of Roman Female Hairstyles

Authors: Elizabeth Wolfram Thill (Indiana University - Indianapolis)
Format: Oral

The elaborate hairstyles depicted in portraits of imperial women are some of the most famous aspects of Roman art. Yet traditional scholarship has focused on a limited range of questions for these artifacts: the who, and therefore when, the portraits represent. Investigations of why the portraits were created typically focus broadly on their role as images of females / femininity within the (assumed) male-dominated sphere of regime presentation. An excellent case study can be found in Julia Domna, wife of the emperor Septimius Severus (reign 193 - 211 CE). Her distinctive style of wig, set above curled locks of her own hair, is represented in hundreds of extant portraits: across sculpture, coins, and even painting, as well as in portraits of her relatives and unidentified women outside of the imperial family. Nevertheless, the question of why she, and so many other women, chose that particular coiffure remains underexplored. Vague academic gestures towards Julia Domna's familial connections to the Eastern cult of Elagabalus are unsupported and reduce other women's adoption of the coiffure to bland fashion adherence. In this paper I propose that the style derives from Julia Domna's consistent public presentation as actively involved in travel across the empire. A wig—particularly one compact and flat along the back, to facilitate packing or riding in a litter—would be a practical choice for a woman constantly on the road. More importantly, it would be a more believable choice than earlier elaborate imperial styles (regardless of what Julia Domna actually wore day-to-day). Given contemporary emphasis on long-distance travel and cross-empire connections for elite families, other cosmopolitan women may have had similar needs or public personas. Julia Domna's wig thus serves as a case study for exploring more complex factors than pure fashion behind the design of hairstyles for Roman women.

571. Presence, Absence, and Symbolic Construction: Women, Funerary Assemblages, and Material Agency in Imperial Rome

Authors: Clara Durand (Scuola Normale Superiore Pisa)
Format: Oral

Recent approaches in Gender Archaeology have emphasized the need to reassess women's roles in Roman society through material evidence, foregrounding questions of presence, absence, and symbolic construction. This paper adopts a funerary perspective to explore how female identities were materially articulated through monuments, portraits, and inscriptions, treating archaeological assemblages not as illustrative complements but as primary sources for women's agency. Focusing on elite and non-elite funerary contexts in Rome and its suburban landscape, the study examines how ideals of femininity, family memory, and civic belonging were negotiated through commemorative practices. Particular attention is given to the interplay between architecture, iconography and epigraphy, and to the ways in which female bodies, virtues, and social roles were constructed across different media. One of the case studies is the Licinian tomb on the Via Salaria, where the dense concentration of female names on altars and the selective deployment of portraiture reveal women as structurally central to genealogical memory and dynastic representation. Rather than passive figures within a male-centered lineage, these women emerge as active agents in the materialization of family identity. This aristocratic context is set alongside evidence from non-elite funerary commemoration, notably the tomb of Claudia Semne, where epigraphic self-representation offers insight into alternative strategies of visibility and social positioning. These case studies (Caecilia Metella, Priscilla, the Servilii Tomb, the Ottavii Hypogeum, etc.) enable both the reinterpretation of certain well-known monuments and a comparative approach across funerary contexts, highlighting women's agency in Imperial Rome and the cross-social scope of an ongoing research project. By reading funerary assemblages as arenas in which gender, memory, and identity were materially negotiated, this paper argued for a contextual, object-centered approach to female agency. It ultimately proposes funerary material culture as a key lens through which to reassess the plurality of women's experiences in Imperial Rome.

676. Elite Women in Death: High-status female burials in Roman Salona (Dalmatia)

Authors: Ivana Banovac (Archaeological museum in Split) – Ivana Jadrić-Kučan (University of Zadar)
Format: Oral

Salona, once the capital of the Roman province of Dalmatia, represents an exceptional archaeological and historical context for the study of ancient Roman society. Systematic archaeological excavations began in the early nineteenth century, focusing largely on the city's necropolises, which have since remained the subject of continuous excavations and scholarly analyses. More than two centuries of research have yielded a substantial and diverse corpus of archaeological material, including funerary monuments, inscriptions, sculpture, and associated grave goods. The specific aim of this research is to identify female burials in Salona based on preserved grave goods and associated grave architecture and sculpture, which constitute key indicators of high-status internments from the 1st until the 4th century. Particular attention is dedicated to burials containing luxurious every day and symbolical objects, such as jewellery, finely crafted personal items, and imported goods, as well as monumental or architecturally elaborate tomb structures. These elements are examined not only as markers of wealth, but also as expressions of social identity, familial representation, and gendered status within the funerary sphere. By situating the evidence from Salona within the broader framework of Roman funerary practices, this study seeks to illuminate the ways in which elite and affluent women articulated their social standing and cultural roles in death, thereby contributing to a more comprehensive understanding of female visibility and agency in the Roman world.

1110. Adornment, Identity, and Status: Female jewellery from the Smiljanovac necropolis in Roman Salona

Authors: Ana Marinović – Ivana Banovac (Archaeological museum in Split)
Format: Oral

Salona was the capital of the Roman province of Dalmatia and one of the most significant urban centers on the eastern Adriatic coast. At its peak, the city accommodated tens of thousands of inhabitants, underscoring its importance as a major administrative, economic, and cultural hub within the Roman world. Its extensive necropolises constitute a crucial source for the study of Roman population, offering insight into everyday life, social organization, and cultural practices, as reflected in burial customs and associated grave goods. The southeastern necropolis of Smiljanovac is situated on the eastern side of the Adriatic Highway, south of the river Jadro, in present-day Solin. Preventive archaeological excavations were conducted at the site in 2010 and 2011, encompassing an area of 10,132 m^2. A total of 974 graves dated from the 1st to the 6th century AD were documented. The artefacts recovered from the necropolis reflect material culture typical of Roman funerary contexts, including ceramic vessels and lamps, glassware, tools, weapons, sepulchral monuments, jewellery, and coinage. This research focuses on the analysis of grave goods, with particular attention to gender-related materials used to identify female burials. Items of female personal adornment, including jewellery as well as hair and costume elements, are considered key indicators for the interpretation of women's graves. By examining material and architectural markers of gender, social status, and differentiation, this research aims to contextualize the roles of women as active and integral members of the community of Salona and, more broadly, of Roman provincial society. Through an interdisciplinary approach integrating archaeological evidence, comparative analogies, and historical analysis, the study contributes to a more nuanced understanding of gender, identity, and social structure within an urban context of the Roman Empire.

982. Remembering and Being Remembered: Wives and Funerary Commemoration of Upper Moesia

Authors: Milica Marjanovic (Institute of Archaeology, Belgrade)
Format: Oral

Funerary commemoration played a crucial role in the construction and public display of identity in the Roman world. The widespread practice of remembering the dead through inscribed and often decorated tombstones, attested across the provinces, offers a glance into the lives of individuals from different strata of Roman society. Such monuments constitute particularly valuable archaeological evidence in provinces where literary sources provide only limited information about local populations. This paper focuses on a relatively small fraction of the provincial population of Upper Moesia: married women, including women in marriage-like unions. It examines tombstones of wives, both as the deceased being commemorated and as active commemorators of others. Although analyzed monuments largely conform to the broader visual language of Roman funerary art and to widespread epigraphic conventions, they also display distinct regional characteristics. The analysis includes inscriptions, as well as iconography, with particular attention paid to elements such as clothing, jewelry, attributes held by the deceased, and specific bodily gestures. The paper explores how socially expected roles were emphasized through these iconographic and epigraphic choices, and how the identity of a wife was constructed and materialized within this provincial population. Obtained data suggest that female identity as a wife was a particularly significant and socially meaningful category in Upper Moesia.

1161. Enkratic Memory Underground: Saint Thecla's Catacomb on the Via Ostiense and the Materialization of Female Asceticism in Late Antique Rome

Authors: Brian Kibuuka (University of Coimbra)
Format: Oral

This paper examines the Catacomb of Saint Thecla along the Via Ostiense, near the Basilica of Saint Paul Outside the Walls, as a compact case study to explore how female enkrateia (ascetic self-control, particularly sexual renunciation and the refusal of marriage) was materialized in late antique Rome. Reused from a pre-existing necropolis and monumentalized in the fourth century in connection with a now-lost surface basilica, the complex's hypogea, its shrine with a sarcophagus, and its restrained decorative program of frescoes and mosaics collectively construct a carefully choreographed environment of female sanctity. Notably, fourth-century portraits of apostles frame the burial of an elegant Roman matron and a young girl, placing them in direct proximity to apostolic authority. By placing archaeological data in dialogue with the Acts of Paul and Thecla and late antique receptions of Thecla as an enkratic heroine, this study asks how narratives of broken engagement, repudiated marriage, and itinerant virginity were translated into commemorative practice. Rather than treating "encratites" as a purely textual or heresiological construct, this paper argues that the spatial and iconographic choices within the Catacomb of Saint Thecla register a specifically Roman reception of enkratic ideals. Ultimately, the site functions as a subterranean memoryscape in which women of different ranks could inscribe themselves and their kin into a Christian tradition of radical female asceticism.

624. "One untimely born" (1 Cor 15:8): Reproductive Loss, Ritual Responses, and Women's Space in the Corinthian Ekklēsia

Authors: Eunyung Lim (Middlebury College)
Format: Oral

This paper reexamines Paul's self-depreciation in 1 Corinthians 15:8 as ektrōma (ἔκτρωμα; "one untimely born") by situating the term within ancient women's reproductive experiences and related rituals. Since this rare biblical term (ektrōma) literally means "miscarriage," "abortion," or "stillbirth," scholars have long explored its literary and theological meanings, often reading it as Paul's rhetorical defense of apostolic authority. However, little attention has been paid to the implications of this expression for Corinthian women—especially those who had endured ektrōma—within the community of Christ (ekklēsia). Bringing biblical interpretation

into conversation with Mediterranean archaeology, this paper foregrounds the gendered ritual dimensions of ektrōma, illuminating Corinthian women as authentic bearers of child loss and as religious actors in the making of sacred space across domestic and communal settings. Challenging interpretive tendencies that neglect women's embodied agency and overgeneralize elite male intellectuals' devaluation of infants, the study explores rituals and religious beliefs surrounding pregnancy and premature death. It draws on evidence from Greco-Roman uterine amulets, archaeological data on miscarriages, and perinatal infant burials in Hellenistic Athens and Roman Corinth. In addition, it highlights first-century CE Corinth as a colonized and rapidly urbanizing landscape marked by migration, where the majority of women were formerly enslaved Greeks and lived amid high rates of infant mortality. In turn, the paper suggests that pregnancy and reproductive loss in Roman Corinth generated recognizable ritual and religious responses—protective amulets, mortuary ritual, and devotional practice—that shaped how Corinthian women could mobilize bodies, objects, and affective memory in their new life in Christ. It argues that their lived experiences were critical to characterizing the Corinthian ekklēsia, a sacred space they helped create through eschatological hope, ecstatic speech, and baptism on behalf of the dead (1 Cor 14–15).

305. Pregnant stones and birthing women. A cultural history of the aetites in the Greek and Roman world

Authors: Mario Lentano (University of Siena) – Anna Maria Urso (University of Messina)
Format: Oral

From the Hellenistic age up to late antiquity, several ancient sources, both Greek and Roman, provide information on aetites or eagle stone, so called because it was believed to be present in the nests of these birds and indispensable for the hatching of their eggs. This kind of stone has a cavity inside containing another small stone or grains of dust and when shaken it produces a sound similar to that of a rattle; because of this characteristic, the aetites was likened to the maternal womb and used in Greek and Roman world of the Hellenistic and imperial age in a series of folk medicine practices related to pregnancy and childbirth. In particular, it was widely believed that applying it to the body of a pregnant woman, tied with a string or wrapped in animal skin, made labour easier and quicker, provided that the stone was promptly removed just before delivery. This contribution aims to examine in detail the sources of this belief and to explore the cultural logic behind its development, from both an anthropological and a medical history perspective.

173 "ACROSS THE BORDER": INTERACTION AND MOBILITY IN THE MEDIEVAL WESTERN MEDITERRANEAN

Theme: 7. Interaction, connectivity and mobility
Organisers: Ramón Gijón (Universidade de Évora) – Bilal Sarr-Marroco (Universidad de Granada) – María Gracia Roca (Universidad de Deusto) – Ana Luisa Santos (Universidade de Coimbra) – Sylvia Jiménez-Brobeil (Universidad de Granada)
Keywords: Landscapes transformation, Social and economic networks, Cultural interactions, Population dynamics
Format: Regular session

SESSION ABSTRACT

Throughout the Middle Ages, the history of the Western Mediterranean was shaped by the arrival of the Arabs and the spread of Islam, as well as by military campaigns in which Christian polities advanced southwards. Across these territories, shifting frontiers fluctuated in size and location, gradually moving through the landscape and creating extensive transitional zones. While traditional studies have focused on military and repopulation strategies, archaeology has increasingly filled important gaps left by documentary sources. These frontier regions have a complex history of conflict, as evidenced by the construction of fortifications and the remains of military encounters. However, during periods of relative stability, these regions also became spaces of intense interaction, acculturation and assimilation, fostering the development of dynamic, multifaceted societies. Thus, these territories were characterised by substantial social mobility, including migration, colonisation processes, commercial exchange, the circulation of technical and scientific knowledge, and the transformation of agricultural landscapes. This session welcomes archaeological research on defensive structures, battles and settlements, as well as bioarchaeological studies addressing paleodemography, genetics, health and diet across these interconnected southern European frontiers. Likewise welcomed are any types of studies related to materiality that allow for the documentation of cross-border movements of people, objects or species.

CONTRIBUTION ABSTRACTS

156. Variations in the prevalence of intestinal parasites among medieval Islamic populations in the Iberian Peninsula and North Africa

Authors: Ramón Gijón (Universidad de Santiago de Compostela) – Bilal Sarr-Marroco – Sylvia Jiménez-Brobeil (Universidad de Granada) – José Pérez Rivera (Independent researcher)
Format: Oral

The discovery of parasites from archaeological contexts allows us to learn about the socio-economic conditions and dietary habits of past populations. In addition, palaeoparasitological study of sediment associated with individuals allows us to individualise the parasitosis. This advantage makes it possible to carry out multiple studies, such as the prevalence of parasitosis in a population group. Al-Andalus and the Maghreb are two territories in constant contact throughout history; the medieval period is perhaps one of those in which the greatest number of exchanges of all kinds took place. Spaces such as Ceuta, Tangier, and Melilla became integrated into the political formations of the Iberian Peninsula, accelerating the transfer of people. This paper presents the paleoparasitogical results obtained from the analysis of sediment samples taken in situ following paleoparasitological protocols from two islamic medieval necropolises found in the south of the Iberian Peninsula (Ronda and Baza), as well as one found in Northern Africa (Madînat Sabta, Ceuta), with a sample consisting of more than eighty individuals, including all age groups and both sexes. The evidence found through optical microscopy allows for a comparison between parasites in the Iberian Peninsula and North Africa, taking into account existing mobility and its possible variations.

630. Trepanation, a bioarchaeological marker of cultural interaction and mobility in the medieval Mediterranean

Authors: Maria Roca (Universidad de Deusto) – Rosa Maroto Benavides (Universidad de Granada) – Ramon López-Gijón (Universidad de Santiago de Compostela) – Olga Lopez Guarnido – Sylvia Jimenez-Brobeil (Universidad de Granada)
Format: Oral

Cranial trepanation is one of the oldest surgical interventions and, during the Middle Ages, was primarily associated with the treatment of traumatic injuries, in many cases resulting from armed conflicts. This study examines archaeological and textual evidence of trepanation in the medieval western Mediterranean, exploring how warfare and cultural mobility facilitated the transmission of medical knowledge. The study is based on a comparative review of published cases of cranial trepanation from medieval sites in the Iberian Peninsula, southern France, and Italy, such as Gormaz (Soria), San Baudelio de Berlanga (Soria), Poggibonsi (Toscana), Prieuré Saint-Cosme or Leopoli-Cencelle (Lazio). Osteological descriptions available in the specialized literature were analyzed along with translations of medieval medical treatises as the ones by Abu al-Qasim al-Zahrawi, Guy de Chauliac or Roger de Parma. Documented cases show both the presence and absence of postoperative survival, as well as a variety of techniques, indicating the existence of specialized practitioners and systematized surgical practices. Comparison with medical texts from the Greco-Roman and Arabic traditions reveals cross-border circulation of knowledge. It is concluded that trepanation functioned not only as a therapeutic response to traumatic injuries, but also as a bioarchaeological marker of cultural interaction and mobility in the medieval Mediterranean.Taken together, these patterns reflect interconnected medical landscapes shaped by movement, contact, and shared practices across diverse communities of the medieval western Mediterranean.

636. Presence of lead in populations of al-Andalus linked to the use of glazed ceramics

Authors: Sylvia A. Jiménez-Brobeil – Rosa M. Maroto Benavides (University of Granada) – María Gracia Roca Rodríguez (University of Deusto) – Olga López Guarnido (University of Granada) – Ramón López-Gijón (Universidad de Santiago de Compostela)
Format: Oral

Although the technique of glazing ceramics is very ancient, its use became widespread in the Iberian Peninsula with the arrival of the Arabs, who used lead glazing on pieces for cooking or storing food. Lead glazing was also used as an interior coating for drinking water distribution pipes. The main objective of this study is to verify whether this use of lead in ceramics left traces in bones and whether there are differences between inhabitants of urban areas, where in addition to glazed tableware, pipes were used to carry water to cisterns or private homes, and rural areas, where in principle there was no running water, but the same type of ceramics was used for food purposes. Compact bone samples were taken from 43 individuals from a rural farmstead (La Torrecilla, Arenas del Rey, Granada) and 49 from skeletons found in archaeological excavations of urban cemeteries in Baza and Granada, along with 10 control samples from Bronze Age sites Castellón Alto (Galera, Granada) and Motilla del Azuer (Daimiel, Ciudad Real). All samples coming from adults, and the type of soil has been taken into account. The ratio of lead to calcium in ppm was analyzed using atomic absorption spectroscopy. The results confirm the initial hypothesis in that statistically significant differences were found between the control sample and the medieval sample (0.001 ppm vs 0.27 ppm), and between urban and rural inhabitants (0.42 ppm vs 0.10 ppm). There are not differences between sexes.

884. The Lower Southern Mondego territory: studying medieval populations through two funerary spaces – (11th-16th centuries AD)

Authors: Flávio Simões (CIAS | Museum of the Roman Villae of Rabaçal)
Format: Oral

Following the establishment of Coimbra as the realm's first capital, Afonso Henriques fortified the southern border through a defence' strategy by repopulation. These Christian settlements were anchored by defensive structures that provide shelter during Islamic incursions. However, as the military frontier shifted south of Tagus' River, Mondego defensive line lost strategic primacy, and its castles transitioned largely into symbolic roles. Despite their gradual physical decline, the presence of citadel churches and

their corresponding cemeteries ensured these sites retained a persistent sacred function. Archaeological interventions such as at the Castle of Miranda-do-Corvo reveal this historical continuity, highlighting a transition from a military stronghold to an exclusively religious and funerary space, with burials spanning from the 12th century to the present, with seventy five burials – six masonry-built graves (11th-12th centuries); 24 rock-cut graves (12th-14th centuries), and eight rock-cut graves (15th-16th centuries); nine pit graves (15th-16th centuries). Concomitant with the political-military struggle, a concurrent religious drive developed towards south, seeking the evangelization of Islamized populations. At São Simão (Penela) – a site originally occupied by a Roman villa, later reused by Suevo-Visigoths – documentary and material evidence point to the evolution of a hermitage likely established during this movement. This site evolved throughout the medieval period, culminating in a late medieval parish necropolis, that counts with one hundred and fifty-three burials (15th-16th century). Collectively, these sites illustrate the process of "place sacralization" and offer distinct clues regarding the cultural shift in burial rituals and cultural drift, marking the transition from an era of Islamic influence to the reassertion of Christian funerary traditions. Furthermore, these two sites provide a unique opportunity to study biocultural evolution from a paleoanthropological perspective, here firstly first focusing on physiological stress markers, across these distinct historical eras.

889. The Archaeology of Spolia in the Medieval Western Mediterranean (10th–12th Centuries): Reuse, Mobility, and Transculturality

Authors: Jorge Elices Ocón (Spanish National Research Council, Institute of History)
Format: Oral

Scholarship on spolia has traditionally privileged static and ideological interpretations of reuse. Far less attention has been paid to the dynamic social, economic, and cultural processes that underpinned reuse. This paper proposes an alternative perspective, shifting the focus from what spolia meant to how they functioned. Spolia circulated between cities and regions alongside people, skills, and practices, as prestigious commodities that functioned in/between political, cultural, and religious boundaries. This paper argues that between the tenth and twelfth centuries there was a significant turning point in the Western Mediterranean marked by a systematic reuse of both local ancient vestiges and historical artefacts originating in other cultural realms. Transcultural reuse preceded and goes beyond the idea of triumph and booty and it is embedded in practices of appropriation and display of material culture prompted by the Umayyad and Fatimid caliphates and by the rediscovery of the ancient ruins of Rome and Carthage. The study employs spolia as both a key indicator and an analytical tool for tracing mobility, interaction, and material entanglement, focusing on cases study where both ancient/Islamic material were reused in a Christian context: the cathedral of Tarragona (Roman sarcophagi and a small marble arch from Madinat al-Zahra); Montpellier and Nimes (Arabic inscriptions reused in churches); Genoa (ancient roman architectural pieces were reused together with Arabic inscriptions and bacini from al-Andalus and Ifriqiya, as in Santa Maria in Castello) and Pisa (an Umayyad capital and a Griffin metal sculpture with an Arabic inscription were reused in the Duomo; bacini and an Andalusi epitaph were reused in the church of San Sisto together with Roman capitals and columns). Through this lens, medieval western societies emerge in the tenth-twelfth centuries as dynamic and multicultural realities.

2198. Living on the Edge: Vera and the Eastern Frontier of the Nasrid Kingdom of Granada

Authors: Rocío Núñez Alarcón (Universitá degli Studi di Ferrara)
Format: Oral

The eastern frontier of the Nasrid Kingdom of Granada, particularly the area of Vera, constitutes a key enclave for analysing frontier dynamics between the Nasrid state and the Crown of Castile. This study examines the Nasrid frontier in the Vera region from a historiographical and territorial perspective, reassessing the evolution of the concept of frontier and moving beyond traditional views of it as a rigid military boundary towards interpretations that emphasise its dynamic character as a space of interaction, conflict, and negotiation. The historiographical review reveals a gradual shift from interpretations focused on the frontier as a linear defensive boundary to more nuanced models that emphasise its role as a socially, politically and economically active space. Within this framework, Vera emerges as a key frontier stronghold, strategically integrated into the eastern defensive system of the Nasrid Kingdom through a network of fortifications, rural settlements and communication routes. The analysis of available archaeological evidence suggests a sustained occupation of the territory and a significant transformation of the landscape in response to defensive, administrative, and productive needs typical of frontier zones. Moreover, material and spatial indicators point to processes of cross-frontier interaction, including conflict, territorial control, and potential mechanisms of exchange, reinforcing the interpretation of the frontier as a permeable and evolving space rather than a fixed line. Consequently, future research would benefit from interdisciplinary approaches combining historical analysis, archaeology, and landscape studies, which are essential for addressing existing historiographical gaps of the Eastern frontier of the Nasrid Kingdom.

611. Across the Nasrid Frontier: Urban–Rural Contrasts in Upper Limb Cross-Sectional Geometry (13th–15th c.)

Authors: Giulia Uccheddu (Instituto de Productos Naturales y Agrobiología IPNA-CSIC | Universidad de Granada) – Drosia Charisi – Sylvia Brobeil (Universidad de Granada)
Format: Poster

Borderlands in the medieval Western Mediterranean were shaped by shifting frontiers, trade connectivity, and intermittent warfare. Within the Nasrid Kingdom of Granada (13th–15th centuries CE), the frontier city of Baza and the rural community of La Torrecilla provide a valuable context for exploring how socio-economic settings relate to habitual upper limb loading. The sample comprises right and left humeri and ulnae from 126 adults: 55 from Baza (24 females, 31 males) and 71 from La Torrecilla (33 females, 38 males). Bones were digitized using a structured light scanner, and cross-sectional geometric properties based on external diaphyseal contour were calculated from the 3D models with the open-source Long-bone-diaphyseal-CSG-Toolkit software (GNU Octave). Because the toolkit requires complete bones, damaged epiphyses were virtually reconstructed in MeshLab when the preservation of the shaft allowed for their inclusion. Recorded variables include total area (TA), maximum and minimum second moments of area (Imax, Imin), the polar second moment of area (J), and the Imax/Imin ratio, taken at 35% and 50% of maximum length from the distal end and appropriately standardized. TA was standardized by body mass, J by body mass × bone length^2, and Imax/Imin is dimensionless. Baza males showed significantly higher left humeral TA and J than La Torrecilla males, as well as higher right and left ulnar TA and J. Among females, inter-population differences were limited, with a significant contrast only in left ulnar J. Sexual dimorphism was more pronounced in Baza, whereas humeral bilateral asymmetry tended to be greater in La Torrecilla. These patterns indicate greater upper limb robusticity in urban Baza and comparatively more asymmetric loading in La Torrecilla, suggesting different habitual activity patterns rather than a simple difference in overall workload intensity.

175 LEAVING IMPRESSIONS: A DIACHRONIC AND SUPRA-REGIONAL VIEW ON A SPECIFIC POTTERY DECORATION

Theme: 1. Widening perspectives in material culture studies
Organisers: Lily Bonga (Institute for Aegean Prehistory Study Center for East Crete) – Lea Hüntemann (Freie Universität Berlin) – Goce Naumov (Center for Prehistoric Research, Skopje) – Agathe Reingruber (Freie Universität Berlin)
Keywords: impresso pottery, radiocarbon dating, Neolithic, ceramic styles, chronology
Format: Session with keynote presentation
Affiliation: Early Career Archaeologists Community - ECA

SESSION ABSTRACT

Since pottery was first used, its initial decoration was negative: there is evidence of pottery decorated with impressions in the Far East around 20,000 years ago. This type of decoration, executed with fingernails or implements, was also applied early on in the northern Pontus, the Balkans and the Aegean region – often in combination with other decorative styles. For the Impresso and Impressa ceramic styles of the Central and Western Mediterranean world, the edges of shells were often utilized. It was assumed that such ceramics with Cardium decoration also occurred in the Eastern Mediterranean. In Greece, for example, the expectation was that their appearance could be dated precisely to a specific period: the latter part of the Early Neolithic (just around 6000 calBC). The aim of our session is to question these assumptions and discuss the occurrence of impressed pottery in a diachronic overview focusing on South-Eastern Europe, Western Anatolia and the Northern Pontic region, although contributions from neighboring areas are also welcome. We would particularly encourage studies presenting impressed pottery from well-dated contexts, using radiocarbon dating where possible.

CONTRIBUTION ABSTRACTS

1536. Keynote: Interactions between Northern Greece and the Southern Balkans during the 6th millennium BCE: The Case of Impresso Pottery

Authors: Anastasia Dimoula (Aristotle University of Thessaloniki)
Format: Oral

The Neolithic of the Aegean and the Balkans was a period of communication and interactions as demonstrated by material evidence, and particularly ceramics. Pottery wares appear to have been distributed over large areas, while scientific analyses have verified the circulation of vessels and/or the transmission of techniques and styles. Among these wares, one of the most emblematic is the so called impresso pottery, characterized by the creation of negative motifs on the vessel surface by pressing fingers or tools while the clay is still wet, prior to firing. Its significance lies both in its early chronological appearance, during the Early Neolithic, and its broad geographical distribution across Mediterranean archaeological contexts, including the Aegean and the Balkans. For these reasons, impresso pottery has frequently been used to develop models on the diffusion of the Neolithic way of life or the interactions among early farming communities. In the scope of exploring this complex web of Neolithic ceramic connections across space and time, the methodology of this study combines the investigation of the distributional, stylistic and technological, patterns of impresso pottery across broad areas. Extensive bibliographical research enabled the comparison and synthesis of the published data from over 80 sites dated to the 6th millennium BCE in areas of northern Greece, Albania and North Macedonia. The results of this research confirm the existence of extended ceramic networks among these areas, whose scale and form varied across the Neolithic phases, and suggest different communication routes through diverse landscapes established by Neolithic people.

1750. Early Neolithic Impressed, Incised, and Finger-pinched Pottery from Pontokomi-Vrysi and

Mavorpigi-Filotsairi, Western Macedonia, Greece

Authors: Lily Bonga (Instap SCEC)
Format: Oral

This presentation discusses the impressed, incised, and finger-pinched pottery from two Early Neolithic sites around the Kitrini Limni basin in Western Macedonia, Greece. The primary focus is on Pontokomi-Vrysi. For a fuller contextual understanding, other sites are touched upon, namely the nearby reference site of Mavropigi-Filotsairi, just a few kilometers to the north. Some of the finger-pinches, tool and nail impressions from these two sites are similar to one another, yet other aspects of their decoration, such as the manner of execution, the organization of the impressions, along with other details of vessel morphology and fabric appear closer to early Middle Neolithic types from both Macedonia and Thessaly. An absolute date from the Early Neolithic levels of Pontokomi-Vrysi falls at 6,200 to 6,030 cal BC, precisely spanning the transitional period of the Early to Middle Neolithic and confirming the difficulty in defining this transition in Northern Greece as based on cultural material as there are both seemingly earlier and later impressed pieces. Due to the lack of a robust radiocarbon sequence from the Pontokomi-Vrysi or elsewhere in the region for the Early-Middle Neolithic transition at a single site, the entire assemblage is also considered as other types of diagnostic pottery help to define (or refine) the impressed category. It is suggested that decoration in the negative should be considered along with painted types, and some suggestions are made on how to categorize, date, and discuss the Early and Middle Neolithic impressed pottery types found in Northern Greece.

2290. The importance of impressed pottery from newly discovered Neolithic flat sites in north-eastern Thessaly

Authors: Agathe Reingruber (Freie Universität Berlin)
Format: Oral

During systematic and intensive survey investigations in NE-Thessaly we discovered several flat sites that were inhabited for only a short period of time. They contribute significantly to our understanding of settlement dynamics in the Neolithic period. Previously, it was assumed that multi-layered settlements (tells or magoules) had formed in this region in Neolithic times. Such artificial mounds with layers of the Early and Middle Neolithic were excavated 70 years ago (the magoules Argissa, Otzaki, Nessonis or Gediki) – mostly in very small trenches or by simply extending and cleaning an existing profile. Ceramic styles were therefore classified based on limited information derived from a small number of sherds. It was presumed that impressed pottery represented a separate phase, the early Neolithic III, and this assumption has not been contested since. The materials from our investigations reflect short-lived activities lasting from a few decades to a maximum of two centuries, as shown by radiocarbon dating. Therefore, we can cross-check the earliest occurrence and latest use of impressed decorations using information from various flat sites from different phases of the Neolithic period. However, it is not only the individual basic style that is of chronological significance: at certain times, impressions were combined with painted, plastic or incised ornaments, either on the same sherd or on different sherds from the same archaeological context. By adding new information to already established research we aim to develop a more refined relative chronology scheme for this region.

2344. Beyond the Early Neolithic: Impressed Pottery from Agia Sophia Magoula in Thessaly, Greece

Authors: Lea Hüntemann (Freie Universität Berlin)
Format: Oral

There is no doubt that impressed pottery is a common feature in material assemblages all over the Aegean and the Balkans, and therefore also at many sites in Neolithic Thessaly. In this region, the style is generally expected to be found in Late Early and Middle Neolithic contexts, usually differentiated by various application methods and styles that have been researched since the beginning of the 20th century. However, the analyses of pottery from younger sites and younger stratigraphical layers reveals that the practice of decorating a vessel with impressions was not only restricted to the older phases of the Neolithic. A detailed analysis of pottery from the 1966 excavation of Agia Sophia magoula uncovered a substantial amount of impressed pottery. There was one excavation campaign, as well as a publication of a preliminary excavation report by Vladimir Milojčić detailing some of the findings regarding the uncovered material and stratigraphy; however, renewed engagement with the material as part of a PhD project revealed that a lot of information is yet to be gained from it. This paper aims to present the different styles of impressed pottery found in the Late Neolithic and Early Chalcolithic layers of this site. There are several distinct styles found within the assemblages, both coarse and fine ware, which can be categorised both according to their general aesthetic appearance and form as well as their technical aspects. The presentation will focus on the careful analysis of the stratigraphic position of these impressed decorations within the layers to allow for a nuanced differentiation between the various styles and to suggest their position within the relative chronology of the Late Neolithic and Early Chalcolithic of Thessaly.

1076. Keynote: Between the Adriatic and the Balkans: Impressed Neolithic Pottery in Albania

Authors: Edlira Andoni (Institute of Archaeology, Albania)
Format: Oral

Impressed decoration represents one of the most distinctive pottery traditions of the Early Neolithic in Albania and plays a key role in discussions of cultural interaction, identity, chronology, and the spread of Neolithic lifeways. This paper offers a comprehensive overview of Neolithic impressed pottery in Albania, focusing on its technological and decorative characteristics, chronological framework, and regional connections. The study draws on material from several Neolithic sites - Early and Middle Neolithic sites - across present-day Albania where impressed decoration is attested, examining vessel forms, manufacturing techniques, and the range of impressed motifs employed. Particular attention will be paid to the earliest sites yielding impressed pottery, with an emphasis on radiocarbon-dated contexts that allow for a more precise chronological placement of this ceramic tradition within the Early Neolithic sequence. The emergence and development of impressed pottery in Albania are discussed in relation to broader Neolithic processes in the Balkans. The Albanian evidence is further compared with contemporaneous assemblages from sites in Macedonia and North Macedonia, highlighting both shared features and regional variations in decorative practices and ceramic traditions. These comparisons contribute to a better understanding of cultural contacts, the transmission of ideas, and possible interaction networks during the Early Neolithic. By bringing together previously published data and new observations, this study seeks to clarify the role of Albania within the wider framework of Neolithic impressed pottery traditions in the Balkans.

1345. A critical approach to field data for the study of impressed ceramics between the Aegean and Adriatic seas

Authors: Dimitra-Anta Tsami (University of Toulouse - UT2J | TRACES laboratory)
Format: Oral

From the 7th millennium BCE, impressed-decorated pottery appeared in specific regions of north-western Greece and along the eastern Adriatic coast. Although initially marginal in these areas, this ceramic tradition rapidly gained prominence as it spread westward, becoming a major cultural marker of the Neolithisation of the western Mediterranean (Guilaine et al., 2019). However, the precise mechanisms and origins of this large-scale Neolithic phenomenon remain poorly understood. Recent research (Binder et al., 2022) suggests that the roots of impressed decorative traditions may lie in regions bordering the Aegean and Adriatic seas. This hypothesis calls for a renewed and critical re-examination of the archaeological record, not only to better understand the emergence and diffusion of impressed pottery, but also to refine our understanding of Mediterranean Neolithisation and east-west interaction. How, then, can we investigate this complex phenomenon when confronted with a documentation that is heterogeneous not only from one site to another, but often within a single site itself? This presentation addresses this question by introducing the methodological framework developed during my first year of Master's research, structured as a multi-criteria evaluation system. Inspired by the works of T. Perrin and C. Manen (2021), and D. Binder (2022), it argues that adopting a holistic perspective is essential. Therefore, in order to meaningfully study the origin and the diffusion of impressed pottery technology, it is first necessary to critically evaluate the capacity of any given site to contribute reliably to the "bigger picture."

2770. Human Population Genomics and the Cardial-Impresso phenomenon

Authors: Robert George (University of Notre Dame, Sydney)
Format: Oral

The expansion of a productive economy across the north Mediterranean is associated with the Impresso-Cardial Complex (ICC) and its regional variants. Until recently, the population dynamics of this phenomenon remained hypothetical and contentious. Recent ancient DNA or paleogenomic (PG) research has since demonstrated an intricate interplay of 'Pioneer Farmers' and local hunter-gatherers. The 'received wisdom' envisages Pioneer Farmers from the eastern Mediterranean as the primary vector of expansion, whilst hunter-gatherers of the Mediterranean and Atlantic regions were relegated to a passive role, at best surviving and to a modest degree being incorporated into a Neolithic 'wave of advance'. Moreover, available genomic data derives from various publications employing somewhat diverse methodologies. To develop a more nuanced 'macro-scale' understanding of the ICP, this contribution will collate published data, analyse via standardised methodological pipeline, and integrate it with emerging archaeological perspectives. We will then discuss the implications via a 'Thematic framework', beginning with an exploration of the social networks which facilitated the diffusion of the Impressa style between Mesopotamia and the Adriatic ~ 6000 BCE. The second section will analyse early Neolithic groups from Italy and southern France. We will then analyse the Cardial and post-Cardial groups in western Europe. Overall, we find that although sharing genetic ancestry, the earlier Impressa groups from Italy and the Adriatic are distinctive to the Cardial groups of Western Europe.

1753. Keynote: Impressed pottery as expression of pottery traditions in pre- and protohistoric Greece and Eastern Balkans

Authors: Zoi Tsirtsoni (CNRS - UMR 7041-Archéologies et Sciences de l'Antiquité)
Format: Oral

Based on evidence from Greece and Bulgaria, and to a lesser degree from Western Turkey, my talk should focus on the following two points: 1° The extremely long history of impressed potteries in those areas, not only during the Neolithic and Chalcolithic periods (late 7th-5th millennium BC), but also later, during the FCh/Transitional period (end of 5th-4th mill.) and the various phases of the Bronze Age (end of 4th-2nd mill. BC). These later productions are usually very simple in their execution (rows of finger, nail

or pointed tool impressions, combined or not with elements in relief) and could easily be confused with the simpler Neolithic and Chalcolithic ones, especially on coarse fragments. But similarities exist also between some more sophisticated combinations on finer potteries from different periods. 2° The great variety and "flexibility" of the attested impressed decorations, which can stand alone or combine with various decorative techniques (incision, grooving, painting), in dense, more-or-less organized arrangements. At the same time, one could note a sort of conservatism, since the employed "tools" are almost always single-end and used also in single or discontinuous gestures (i.e. one finger/tool printing each time, even when the result is a row). With the exception of some pseudo-"cardium" decorations found in Early/Middle Neolithic Thessaly and West Northern Greece, we have no evidence of the use of combs, stamps or roulettes (all widely known in other parts of the word) – at least not until the first pseudo-"corded" (or "caterpillar") decorations of the early 4th millennium, considered by some as sign of a new, foreign pottery tradition (Cernavoda I). By such examples, I wish to draw attention to the possible existence of more-or-less long-living pottery traditions in the area, which could be detected by means of a thorough technological study of the different productions.

1158. Two Traditions of Impressed Pottery at Palazu Mare (Western Pontic Coast): Prehamangia and Early Hamangia in a Supra-Regional Perspective

Authors: Vasile Opris (University of Bucharest, Research Institute, ArchaeoSciences Platform | Bucharest Municipality Museum) – Valentina Voinea (National Museum of History and Archaeology Constanța) – Adrian Irimia (Doctoral School of Economics and Humanities, "Valahia" University | National Museum of History and Archaeology Constanța) – Marta Petruneac (Horia Hulubei National Institute for Physics and Nuclear Engineering) – Dragos Mirea (Horia Hulubei National Institute for Physics and Nuclear Engineering | Bucharest Municipality Museum)
Format: Oral

The site of Palazu Mare – `Malul Alb` (Dobrogea, Romania) offers a rare sequence documenting the use of impressed pottery across two distinct Neolithic traditions, associated with the Prehamangia and early Hamangia phases. The presence of impressed decoration on ceramic from both periods provides a valuable case study for assessing the diachronic variability and supra-regional significance of this ceramic practice along the Western Pontic Coast. In Prehamangia contexts (Middle Neolithic), impressed decoration occurs in association with burnished and barbotined surfaces (often in combination) and is executed as continuous horizontal bands formed by impressions of various shapes and dimensions. Other impressed motifs were identified only on a small number of sherds. The overall technological and stylistic profile suggests affiliations with broader Mediterranean ceramic traditions rather than with contemporaneous continental Balkan groups. By contrast, impressed pottery from early Hamangia contexts at Palazu Mare displays markedly different decorative practices, including finer, more controlled impressions, more complex patterns, and occasional combinations with white inlays, embedded within a technological tradition characterised by grog tempering, distinct clay sources, and different firing regimes. Although impressed decoration remains quantitatively limited, its formal execution and technological embedding indicate a separate ceramic logic, reflecting broader transformations in cultural orientation during the Late Neolithic. The coexistence, at a single site, of two technologically and stylistically distinct impressed pottery traditions underscores the ambiguous nature of impressed decoration, which cannot be reduced to a single cultural or chronological marker. Instead, the Palazu Mare evidence suggests that impressed pottery functioned as a flexible decorative strategy, selectively adopted within different ceramic traditions that participated, at different moments and in different ways, in wider networks linking the Pontic Basin to the Eastern Mediterranean world. This work was supported by a grant of the Romanian Ministry of Education and Research, CNCS – UEFISCDI, project number PN-IV-P1-PCE-2023-1547 (ExLiDo).

512. Bug-Dniester and Criş-Starčevo-Körös culture resemblance

Authors: Manko Valery (Institute of Archaeology of the NAS of Ukraine) – Husak Martin (Taras Shevchenko National University of Kyiv, Department of Archaeology)
Format: Oral

The appearance of ceramics with impression decoration in Europe was undoubtedly linked to their primary center of origin in northern Syria at the turn of the 8th–7th millennium BC. As it can be traced in the rapid spread of such ceramics throughout Asia Minor, Southeastern Europe, and the steppe zone of Eastern Europe. The oldest archaeological culture to feature such decoration was the Bug-Dniester culture (third quarter of the 7th - third quarter of the 6th millennium BC). Bug-Dniester pottery is decorated with impressions from fingernails, combs, and other tools, as well as scratched winding lines that form vertical and horizontal compositions. Fingernails seem to have been the earliest form of ornamentation. Similarities between pottery with such decorations and pottery from the Criş, Starčevo, and Körös cultures led to the idea that the Bug-Dniester culture originated in Southeastern Europe. However, the emergence of new complexes and new radiocarbon dates has significantly altered our understanding of the emergence of both the Bug-Dniester culture and impression decoration. It has since appeared that the the oldest complexes date back to the third quarter of the 7th millennium BC, indicating that the spread of impression decoration occurred simultaneously in Asia Minor, the Balkan Peninsula, and South of Eastern Europe. However, the connection between the steppe zone between the Dniester and the Southern Bug rivers, and the Balkan Peninsula during the Neolithic period remains unclear. We assume that the spread of similar ornamentation motifs emerged independently of each other and was caused by a common basis associated with the Neolithic sites of Asia Minor.

652. Impression decorated pottery from the Luka-Mohylky Neolithic site in Central Ukraine

Authors: Martin Husak – Pavlo Shydlovskyi (Taras Shevchenko National University of Kyiv) – Valery Manko (Institute of Archaeology of the NAS of Ukraine)
Format: Oral

Impression-decorated pottery is well known among the different archaeological cultures of the Neolithic period and is often used as an indicator of cultural attribution or connection. The recently discovered Luka-Mohylky site on the River Ros in the Cherkasy region of Central Ukraine features a series of fragments with impression decorations as part of a complex belonging to the Kyiv-Cherkasy culture of the Dnipro-Donets cultural and historical community. One of the prominent ornamentation motifs in this case is the so-called "comb" stamps with two, three, or four tines on the fragments, with a high content of plant inclusions in the clay. However, some ceramic fragments exhibit an ornamentation style attributed to the Bug-Dniester culture, including impressions, dotted stamps, fingernail impressions, and incised decorations. The Ros River likely served as a corridor for the movement of people in two directions from the Middle Dnieper and Southern Bug basins. This resulted in the fusion or co-existence of ceramic ornamentation traditions and the emergence of a new cultural phenomenon. Further study of the Luka-Mohylky site may reveal how the Kyiv-Cherkasy group and Bug-Dniester culture, both associated with impression decoration, interacted. Based on the presence of these types of ceramic ornamentation, the site may be preliminarily dated to the 6th millennium BCE, a chronology that will be further tested by radiocarbon dating. Within the investigated area of the preserved anthropogenic deposits of the site, in addition to ceramic and lithic assemblages, faunal remains and concentrations of freshwater mollusc shells were recorded, enabling the application of a comprehensive suite of laboratory analyses and advanced interpretative approaches.

563. The first comb ornamentation on pottery in the North Pontic region

Authors: Nadezhda Kotova (Institute of Arcaheology Ukrainian Academy of Sciences)
Format: Oral

Comb decoration of ceramics was most popular in the area North of the Black Sea from the middle Neolithic to the late Bronze Age. The radiocarbon dates obtained in various laboratories allow for the reconstruction of the emergence and spread of the earliest comb ornamentation in present-day Ukraine and neighbouring territories. The first comb impressions were recorded in the Sea of Azov area and the steppe Dnieper valley. Their presence has been documented in sites belonging to the Rakushechny Yar (layers 22-17 of Rakushechny Yar) and the Surska (Semenivka 1) cultures. Ceramics with strokes and linear decoration dominated at these settlements. Comb impressions were combined with the referred decorative elements and rarely served as the primary motif. Short comb imprints (2-4 teeth) made with bone stamps were typical of these localities. Smooth "walking" impressions of stamps, made from shell or bone, are also known. Above-mentioned sites are dated to the first half of the 6th millennium calBC. Later comb ornamentation was the main decorative element in the pottery of the cultures of the Mariupol cultural-historical community (the Lower Don and early Azov-Dnieper cultures, as well as the Kalmius variant), the majority of whose sites are dated to the second half of the 6th millennium BCE. However, the beginning of their existence in the steppe region presumably can be dated to the second quarter of the 6th millennium calBC. At that time, impressions from long comb stamps became popular. Comb ornamentation also spread widely in the Neolithic settlements of the Southern Bug basin. Cardium shell imprints have been identified in the southernmost of these sites.

758. The Neolithization of Balkans and the Introduction of Pottery Identities in Pelagonia

Authors: Goce Naumov (Center for Prehistoric Research)
Format: Poster

Pelagonia is an elongated valley in the Balkans surrounded by mountains which creates an enclosed perspective of the environment. Due to that a so-called Neolithic cultural group of Velušina-Porodin was defined by the scholars which considered the natural boundaries and implied them to the first agricultural communities inhabiting this region. As a result of such archaeological perception these farmers were regarded as an isolated society framed by the surrounding landscape which constructed its remarkable identity. This was supported by the unique impressive artistry manifested onto pottery decoration, house models and figural representations. But the question remains whether such economic, social and symbolic outreach was indeed a result of isolation or rather based on an intensive interregional interaction? The chronological sequences provided for several Neolithic sites in Pelagonia, as well as the revision of their material culture, indicates a dynamic communication with the surrounding regions at least. In these terms the painted and impresso pottery could be emphasized as one of the most distinct visual transmitters that bears patterns common for even more distant areas. One remarkable example is the Early Neolithic site of Vlaho that was settled between 6400 and 6000 CalBC and which predates the tell sites of Veluška Tumba and Vrbjanska Čuka established around 6000 CalBC in the wetlands of Pelagonia. The painted and impresso pottery produced in these site has remarkable similarities with the sites Kozani region and Thessaly. As these sites were not observed together in detail, this paper will accentuate their likeness in terms of natural setting, architecture and material culture. The emphasis will be on the painted and impresso pottery and particularly in a relationship with the ones common for the neighboring regions of Lake Ohrid and Korça valley.

176 CELTS, GREEKS AND BALKAN POPULATIONS IN SOUTH-EASTERN EUROPE (4TH–1ST CENTURIES BC): ARCHAEOLOGICAL APPROACHES TO MULTICULTURAL CONTEXTS

Theme: 7. Interaction, connectivity and mobility
Organisers: Kevin Parachaud (UMR TRACES - Toulouse) – Aurel Rustoiu (Romanian Academy, Cluj-Napoca Branch Institut of Archaeology and Arts History)
Keywords: Iron Age, Celtic Migrations, Multiethnicity, Cultural interactions, Interdisciplinary approach, Methodology
Format: Regular session

SESSION ABSTRACT

During the European Iron Age, South-Eastern Europe, defined here as the area extending from modern Slovenia and Romania down to Greece, was divided between two main cultural spheres. In the south lay the Greek world, including the cities of mainland Greece, Macedonia, and the Greek settlements along the coast of the Propontis. In the north were the protohistoric peoples of the Balkans, whose names are known to us through ancient authors, such as the Dacians, Thracians, and Illyrians. From the 4th century BC onwards, this region also experienced an intensification of Celtic migrations, with new groups settling among the local Balkan populations. A century later, some of these Celts invaded Greece before partially integrating into the Hellenistic world. This framework provides an effective basis for examining the archaeological issues related to interactions and contacts within multicultural and multiethnic contexts. To explore this theme, this session proposes to question how multiculturalism can be approached through archaeological data, in particular by considering whether the close analysis of specific archaeological contexts, the traces and uses of artefacts, or the combination of different types of evidence can help us identify distinctive cultures or identities. We also aim to discuss whether it is possible to identify, within these contexts, new practices or productions that resulted from the interactions between different cultural groups. Through relevant case studies, we especially welcome papers that highlight a methodological process, an interdisciplinary approach, or a conceptual tool enabling us to address archaeological remains within multicultural contexts.

CONTRIBUTION ABSTRACTS

918. Celts, Dacians and Greeks: The role of human mobility in shaping multicultural interactions in Transylvania in the 4th-1st centuries BC

Authors: Aurel Rustoiu (Romanian Academy, Cluj-Napoca branch. Institute of Archeology and Arts History)
Format: Oral

The Late Iron Age in Transylvania was defined by two cultural and chronological horizons: the "Celtic horizon" (between ca. 350 and 190/175 BC) and the "Dacian horizon" (between ca. 190/175 BC and AD 106). The first chronological interval was characterized by the arrival of some Celtic groups from Central-Western Europe. These groups cohabited with the indigenous populations and their interactions contributed to the hybridization of material culture and practices, so typical Central European La Tène elements were often combined with the indigenous ones, contributing to the emergence of new communities. The social organization of this rural society was largely heterarchic. The second chronological interval was characterized by the appearance of Dacian communities in this region and the subsequent emergence of the Dacian Kingdom. The corresponding material culture and practices were different from those of the previous period, being primarily oriented towards the Lower Danube region. The emergence of hilltop fortresses surrounded by a dependent rural hinterland suggests that the social organization was also different, being largely hierarchic. Based on these social and cultural particularities, the paper examines the role played by human (individual or collective) mobility in shaping the multicultural interactions between the "Celts", the indigenous populations from the northern Balkans and Transylvania, and the Greeks from the eastern Mediterranean and the Black Sea coast. The analysis is taking into consideration a range of mobility-related practices and actors (migrations, raiding groups, mercenaries, craftspeople, exogamy etc), and their impact on the societies belonging to the two mentioned chronological and cultural horizons. This work is supported by a grant of the Ministry of Education and Research, CCCDI - UEFISCDI, project number PN-IV-P6-6.1-CoEx-2024-0206, within PNCDI IV.

928. Celtic attacks in Greece (280-279 a.C.), rupture or continuity in the relations between Celts and Greeks in South-Eastern Europe?

Authors: Kevin Parachaud (UMR TRACES - Toulouse)
Format: Oral

In 280 BC, three Celtic armies attacked Thrace, the Macedonian kingdom, and northern Greece; the Macedonian king himself was killed in battle. The climax of these events occurred the following year, with the incursion of the Celtic army led by Brennos, which overcame the Greek troops assembled at Thermopylae before attempting to plunder the Panhellenic sanctuary of Delphi. The death of an heir of Alexander, together with the threat posed to the sacred site of Delphi, rendered these attacks traumatic for the Greeks. Moreover, the Aetolian League, which sought to establish itself as a hegemonic regional power, emphasised the importance of these events in order to magnify its own role in the final victory, through artistic and political propaganda. For all these reasons late antique literature, and through it a large part of modern historiography, has viewed the Celtic expeditions of 280-279 BC as a moment of

rupture in the relations between the Greek and the Celtic worlds. However, a multidisciplinary approach combining epigraphic, archaeological, and iconographic data reveals a long-term pattern of interactions between Celts and Greeks in south-eastern Europe. Furthermore, these relations do not appear to have been systematically interpreted through the classical topos of violent confrontation between civilisation and barbarism, as evidence of peaceful exchange and intercultural influence can also be suggested. From this perspective, this paper aims to reintegrate the events of 280-279 BC into a long-term framework in which no clear "moment of rupture" emerges, and in which the famous episode of Brennos' attack appears as a local epiphenomenon, whose later overemphasis has obscured the depth and diversity of Greek-Celtic relations.

1595. Life on the Edge – "Celtic" Communities in the SE Pannonia Between Global and Local Pressures in 2nd-1st Centuries BC

Authors: Marko Dizdar (Institute of Archaeology, Zagreb)
Format: Oral

The communities that were inhabited the south-eastern part of the Pannonian Plain in the Late Iron Age shared an affiliation to the material legacy of the Central European La Tène culture, along with some local recognizable characteristics. On the one side, European researchers were observed these communities during the 2nd-1st centuries BC (Late La Tène) outside of the oppidum phenomenon spreading, while local researchers often highlighted certain peculiarities in their material legacy and settlement organization. More recent research, in addition to previously known data, shows that the settlement network and material legacy of these communities was indeed very complex and points to their specific identity. In addition to numerous objects that confirm the affiliation to the Central European La Tène culture and their involvement in networks of contacts, some objects, especially costumes and jewellery, can be seen as influences of local communities, both those that developed there in the Late Hallstatt phase, and neighbouring communities that were never more intensively touched by the legacy of the La Tène culture. This life on the edge of various cultural phenomena of the Late Iron Age depicts the south-eastern Pannonia as a multicultural melting pot, from which a unique and hybrid material legacy was developed, as most clearly recognized so far by the analysis of the archaeological data.

1491. The changing sacred landscape of Late Iron Age Transylvania

Authors: Mariana Egri (Institute of Archaeology and Art History, Romanian Academy Cluj-Napoca)
Format: Oral

In Transylvania, the so-called "Dacian-horizon" of the Late Iron Age witnessed the gradual disappearance of properly set up burials, starting with those of the commoners and ending with those of the elites. By the late 1st century BC, the corpses of most members of the local communities were disposed of in ways that left very few archaeological traces, aside from some disarticulated body parts occasionally found in various non-funerary contexts inside and outside settlements. During the same period, some members of the elites, mostly male, were still cremated and buried in flat or tumulus graves, located close to their hilltop fortresses, together with weaponry and other distinct markers of status. In the case of some high-ranking masters of the sacred, all female, only their specific silver-made costume assemblages were buried in isolated places outside but not far from the hilltop fortresses, together with libations vessels and other markers of status, while their bodies were disposed of in ways that left no archaeological traces. This gradual disappearance of burials from the local sacred landscape coincided with the monumentalization of power and authority, particularly in south-western Transylvania. The latter process, which started around the middle of the 1st century BC, was defined by major changes in both the profane and the sacred architecture, including the emergence of large stone-built sanctuaries which borrowed many architectural elements and masonry techniques of Mediterranean origin. Moreover, the presence of construction specialists that came from the Greek-speaking world has been attested archaeologically. Based on these observations, the paper is going to identify and discuss the factors which contributed to these changes in the local sacred landscape, and the role of long-distance connections in the local dynamics of power and their and evolution over time.

1371. Bayesian Modelling and Radiocarbon Dating of Cremated Remains: Toward an Absolute Chronology of Late pre-Roman Iron Age Interactions

Authors: Piotr Łuczkiewicz (Maria Curie-Sklodowska University of Lublin) – Sven Brummack (Freie Universität Berlin) – Aneta Kuzioła (Adam Mickiewicz University of Poznan)
Format: Oral

A common problem in research on issues related to interactions and contacts within multicultural and multiethnic contexts is determining the actual duration of these interactions. Whether it concerns intercultural contacts and migrations in South-Eastern Europe or the influence of this region on the populations and archaeological cultures of Central Europe, the problem remains largely the same. Although archaeology in the so-called 'Celtic', 'Balkan' and 'Germanic' zones uses the same terms (naming phases of relative chronology) to name phases of relative chronology, it speaks different languages about their respective temporalities while referring to the same or very similar types of artefacts. Are objects such as the Nauheim- or later Jezerine- brooches, used in different regions really simultaneous in different cultural areas because, in theory, they are distinctive for the same phases of relative (iso-phenomenal-) chronology? Or perhaps how long is the difference in the timespan of these artefacts and in the reception of new cultural patterns in the North? Conceptual tools for solving this problem (at least from the perspective of Central Europe) may be provided by the results of the currently being research project "Development dynamics in the 3rd – 1st century BC on the Polish Lowland

and their synchronization with the Celtic world and Mediterranean - the problem of absolute dating". The project aims to provide a large number (in total 280) of new absolute 14C-dates from cremated bones for burial assemblages of the Polish late pre-Roman Iron Age. Bayesian inference derived from correspondence analysis of these assemblages in the workflow will help to crosscheck and to specify the 14C data more precisely. With this framework a reliable absolute chronology for Poland and, among other things, a well-grounded chronology of imports (including those from the south) to Central Europe can be established.

2660. Notes on the Geschweifte Fibulae and the End of the Late Iron Age in the Carpathian-Dnieper Forest-Steppe

Authors: Nicolai Batog – Vasile Iarmulschi (Freie Universität Berlin)
Format: Oral

The so-called Geschweifte fibulae are generally regarded as one of the latest brooch types documented at La Tène sites in the Carpathian-Dnieper forest-steppe. In regional chronological frameworks, they are commonly associated with the LT D2 horizon and the Augustan period (c. 80 BC-AD 20), and are therefore relevant to discussions of the closing stages of Late Iron Age material culture in this area. Although the finds are relatively limited in number, they may contribute to dating questions concerning the late development of the Poienești-Lucașeuca culture and the classical phase of the Zarubintsy culture, particularly when recovered in well-documented contexts and evaluated alongside other chronological indicators. This contribution offers an updated overview of the currently known Geschweifte fibulae from the region, based on a systematic reassessment of published evidence and accessible unpublished documentation. Emphasis is placed on typological variability, the reliability of find circumstances, and the composition of associated assemblages, with the aim of refining chronological and cultural attribution where possible. By standardising descriptive criteria and critically reviewing contextual information, the paper seeks to clarify the evidential value and limitations of these fibulae, and to situate them more cautiously within broader debates on cultural change and chronological transition at the end of the Late Iron Age in the Carpathian-Dnieper forest-steppe.

178 CAVE SEDIMENTS AS ARCHIVES OF HUMAN-ENVIRONMENT DYNAMICS: CROSS-DISCIPLINARY PERSPECTIVES ON GEOARCHAEOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Ioannis Oikonomou (The Hebrew University of Jerusalem) – Thomas Beard (University of Vienna) – Diana Marcazzan (University of Tübingen)
Keywords: Geoarchaeology, Cave Sediments, Micro-archaeology, Biomolecules
Format: Session with keynote presentation

SESSION ABSTRACT

Cave settings are focal points for investigating past human and animal interactions, as well as environmental change. Understanding context and site formation processes is a fundamental prerequisite for exploring these important themes. The need to disentangle depositional mechanisms, evaluate contextual integrity, and examine preservation dynamics has prompted the incorporation of geoarchaeology as a core component of broader archaeological research. The application of cross-disciplinary, multi-proxy micro-geoarchaeological approaches to the study of cave sediments has become increasingly essential for answering questions related to these topics. In this session, we explore the integration of diverse analytical techniques within a geoarchaeological framework, while highlighting the rapidly emerging role of micro-archaeological, geochemical, and, in particular, biomolecular analyses. We invite contributions focused on the study of cave deposits – diverse in both geographic and temporal extent – engaging with the following themes: a) reconstruction of cave-site formation processes through geoarchaeological research, b) palaeoenvironmental and palaeoclimatic reconstructions through the analyses of cave sediments, c) decipherment of occupational patterns and human activities, such as the use of fire, through a micro-archaeological analytical framework, and d) methodological advancements in cross-disciplinary micro-contextual and micro-analytical research. We particularly encourage contributions investigating these themes through combined sampling strategies that integrate biomolecular and micro-geoarchaeological research, for example through the study of impregnated block samples used in micromorphological analysis. This meeting offers a window into the future of a highly interdisciplinary and promising field, welcoming participants from diverse academic backgrounds and career stages - especially encouraging early-career researchers. Together, we aim to foster an inclusive and engaging session that promotes the development and application of innovative micro-archaeological tools for the study of cave sediments as proxies for human history and palaeoenvironment.

CONTRIBUTION ABSTRACTS

766. Keynote: Diagenetic Pathways from Eastern Mediterranean Karstic Caves and Their Implications for the Study of the Human Past

Authors: David Friesem (School of Archaeology and Maritime Cultures, University of Haifa | Department of Archaeology, University of Cambridge)
Format: Oral

Karstic caves in the Eastern Mediterranean, particularly across the Southern Levant, preserve some of the richest archives of early human occupation. Yet, these records are not static repositories – they are dynamic interfaces shaped by complex interactions between natural, biological, and anthropogenic processes. This talk explores how advances in micro-geoarchaeological methods provide novel insights into cave site formation processes and, in turn, refine our interpretations of the Palaeolithic archaeological record. Drawing on high-resolution case studies from the Southern Levant, I examine how anthropogenic and biogenic activities (e.g., fire use, carnivore dens, guano deposition), alongside natural processes (e.g., decalcification, cementation, guano decomposition, formation of authigenic mineral), govern the visibility and integrity of archaeological remains. These insights allow us to decode the sedimentary palimpsest of caves and trace behavioural and environmental rhythms at fine scales but with broader archaeological implications. Importantly, the talk highlights how understanding diagenetic pathways and preservation dynamics provides an essential framework for future research, particularly for studies employing micro-contextual, geochemical, and biomolecular approaches. By identifying zones of preservation or degradation, this work lays the groundwork for more targeted and effective applications of advanced analytical techniques, including high-resolution geochemistry and biomolecular analysis. Finally, I consider the post-excavation impact of archaeological practices on cave sites, underscoring the need for integrated, preservation-aware excavation strategies in future interdisciplinary cave research.

2033. New Perspectives on the Chemical and Mechanical Alterations of the Early Middle Paleolithic Layer in Hayonim Cave

Authors: Avia Hamami (Institute of Archaeology, Hebrew University of Jerusalem) – David Friesem (School of Archaeology and Maritime Cultures, Haifa University) – Erella Hovers (Institute of Archaeology, Hebrew University of Jerusalem)
Format: Oral

The Early Middle Paleolithic layer (Layer F) at Hayonim Cave, Israel, is a striking example of the effect chemical and mechanical post-depositional alterations can have on archaeological artifacts and sediments, as already observed in studies conducted following the previous excavation in the 1990's. The aim of this study was to investigate these alterations in parts of Layer F that were only recently excavated, to determine the geochemical conditions associated with them, and evaluate their impact. The results, obtained through the combined use of FTIR spectroscopy and micromorphology, show that this layer was severely altered by chemical diagenesis as it is dominated by phosphatic minerals – carbonated hydroxylapatite, leucophosphite, taranakite and montgomeryite, in addition to altered clay and siliceous aggregates. Bones are rare and calcite is nearly absent, attesting to acidic conditions resulting in dissolution of carbonates. Guano remains (most probably of an animal with a vegetal diet), partly dissolved bones and signs of water action were found in thin sections to be associated with the phosphatization process. Extensive bioturbation has homogenized the sediments, erasing almost any signs of bedding. Several diagenetically altered combustion features were recognized. A detailed understanding of chemical and mechanical diagenesis has made it possible to discern the anthropogenic characteristics of Layer F, despite the extensive post-depositional alterations. The processes responsible for these alterations are inherently common in Paleolithic caves, and the refined understanding of their sources and impact can contribute to a more informed research of archaeological cave sites in general.

2038. Targeted sampling of biomolecules at the Upper Palaeolithic site Satsurblia Cave, Georgia

Authors: Thomas Beard – Larissa Bartsch – Susanna Sawyer – Omaima Zaki (University of Vienna) – Susan Mentzer (University of Tübingen) – Ron Pinhasi – Mareike Stahlschmidt (University of Vienna)
Format: Oral

The extraction of ancient DNA (aDNA) and bone collagen from resin impregnated blocks adds an unprecedented depth of biological information to archaeological investigations. These impregnated blocks provide archaeologists with an alternative resource for biomolecules, furthermore, the off-cuts of these blocks do not have an immediate use and are normally archived. Hence, using these blocks removes the need for acquiring separate dedicated samples and we can microcontextualise the biomolecules with parallel archaeological soil micromorphology thin section analysis. Using a targeted micro-sampling approach on the impregnated blocks we investigated the preservation and integrity of biomolecules at the Upper Palaeolithic karstic cave site of Satsurblia Cave in Georgia. We targeted microcontextualised areas to investigate which processes preserve, translocate and degrade sedimentary ancient DNA (sedaDNA), along with the potential sources of aDNA at the site. We identified these areas through thin section analysis, µXRF mapping and mFTIR to investigate heating of the microscopic bone fragments in the sediments. After drilling we conducted Zooarchaeology by Mass Spectrometry (ZooMS) and sedaDNA analysis on the bone and sediment samples respectively. We identified ancient bovid, canid, and ovis in both ZooMS and sedaDNA samples, and additionally human in only sedaDNA samples, ranging from ~20,000 to ~30,000 years old, which conforms with the macro faunal assemblage. Our results further suggest that micro-bone fragments are the predominant source of aDNA in the sediments and that biomolecules are well preserved at Satsurblia. Our results confirmed that DNA degrades in contexts associated with heat and that the translocation of DNA with clay and soil aggregates is not a factor at the site. Our investigation demonstrates the vast potential of recovering microcontextualised biomolecules from impregnated blocks, which in turn can elucidate upon past human behaviour in cave sites at an outstanding resolution.

1385. Formation processes of the prehistoric human occupation at Coves Llongues rockshelter (Sorita,

Eastern Iberia): a micromorphological, biomolecular and microarchaeological perspective.

Authors: Jacopo Armellini (Departament d'Història, Geografia i Art, Universitat Jaume I | Departament d'Història i Arqueologia, Universitat de Barcelona) – M. Mercè Bergadà (Departament d'Història i Arqueologia, Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona - IAUB) – Dídac Roman (Departament d'Història, Geografia i Art, Universitat Jaume I) – Helen Mackay (Department of Geography, Durham University) – Rosa M. Albert (Catalan Institution for Research and Advanced Studies - ICREA | Department of Prehistory, Universitat Autonoma de Barcelona) – Inés Domingo (Catalan Institution for Research and Advanced Studies - ICREA | Departament d'Història i Arqueologia, Universitat de Barcelona)
Format: Oral

Cave and rockshelter sedimentary infillings represent a valuable source of information on past human occupation and environmental conditions. In the last few decades, soil micromorphology has become a fundamental tool for reconstructing site formation processes, with important implications for multiple research topics such as ancient pyrotechnology, site use and livestock stabling activities. The combination of soil micromorphology with other techniques significantly expands the range of information that can be extracted from cave sediment, especially regarding paleoenvironmental conditions and site use. This contribution analyses the stratigraphic sequence of the Coves Llongues rockshelter (Mediterranean Iberia), spanning from the Mesolithic to the Final Neolithic, using a multidisciplinary approach. The deposit has been analysed combining soil micromorphology, faecal biomarkers (steroids and bile acids), n-alkane distribution and their δ13C isotopic ratio, and phytolith analysis. The results allowed a) reconstructing the site formation history, b) characterising the Neolithic sequence of the site as a dumping area, connected to the domestic exploitation of the rockshelter, and c) formulating some considerations regarding the Neolithization process of Mediterranean Iberia in caves and rockshelters, from a geoarchaeological perspective. Hence, our contribution highlights the great potential of a multidisciplinary approach to the study of cave and rockshelter sedimentary infillings for reconstructing site formation processes and paleoenvironmental conditions.

1475. Multi-Scalar, Multi-Proxy Geoarchaeological Investigations in Lower Palaeolithic Dalarik-1 Cave, Armenia: Assessing Site Formation Processes

Authors: Ioannis Oikonomou (Human-Environment Dynamics Laboratory, The Hebrew University of Jerusalem | Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA) – Theodoros Karampaglidis (Department of Geological & Mining Engineering, University of Castilla-La Mancha) – Hripsime Gevorgyan (Institut für Geologie, Technische Universität Bergakademie Freiberg) – Ariel Malinsky-Buller (Human-Environment Dynamics Laboratory, The Hebrew University of Jerusalem)
Format: Oral

Disentangling formation processes at Dalarik-1 Cave is crucial for two main reasons. First, the site represents a unique example of stratified archaeological deposits, rarely found in the Lower Palaeolithic record of the Armenian Highlands and the Southern Caucasus. The study of its material culture suggests that Dalarik-1 is temporally exceptional (MIS7-6), as it post-dates regional and supra-regional archives by tens of thousands of years and, therefore, understanding its depositional context and integrity is highly essential. Second, in contrast to typical karstic limestone caves, the depositional mechanisms of the infillings of caves formed in igneous settings remain relatively unexplored. The study of Dalarik-1 provides a rigorous depositional model for volcanic caves, highlighting the importance of multi-proxy, multi-scalar geoarchaeological approaches for such settings. The opening of Dalarik-1 Cave is the result of chemical and mechanical weathering of the volcanic bedrock, during a phase of incision of the Mastaraheghegheghat River. The site is divided into three main areas, the cave exterior and slope areas, the cave entrance, and the cave interior. Seven sedimentological units (SU) have been macroscopically identified for the external and entrance parts, while the interior consists of four SUs. The deposits of the Dalarik-1 sequence are formed through several processes, mainly involving the weathering of the cave ceiling and subsequent incorporation of roofspall through mass movement, and the accumulation of allochthonous sediments through aeolian processes, human and animal activities. The post-depositional regime is primarily associated with the presence of calcium carbonate and calcium sulphate (gypsum) precipitates. Stratigraphic, mineralogical, chemical, and micromorphological analyses indicate a spatially differentiated diagenetic milieu inside and outside of the cave. The decipherment of the nature of human occupations is conditioned by syn- and post-depositional agents; yet, the use of fire might have been part of the repertoire of human activities in the Lower Palaeolithic Dalarik-1 Cave.

540. A Millennium of Coastside Occupation. Micromorphological insights from the indigenous site of Las Estacas Cave, Tenerife

Authors: Pedro García-Villa (AMBILAB research group, University of La Laguna) – Cristo Hernández (PAST research group, University of La Laguna) – Carolina Mallol (AMBILAB research group, University of La Laguna)
Format: Oral

This study presents a geoarchaeological reconstruction of site formation processes and human activities at Las Estacas Cave, an indigenous site located in north-western Tenerife (Canary Islands, Spain) with evidence of human occupation dating back to the 2nd century CE. Soil micromorphology was applied to twelve thin sections from nine stratigraphic units, covering most of the archaeological sequence. The analysis identifies the main depositional and post-depositional processes shaping the cave sediments. The archaeosedimentary sequence is dominated by clay and rounded volcanic gravels derived from upslope inputs, basaltic clasts produced by cave wall disintegration, and abundant quartz grains introduced by recurrent sandstorm events. Coastal proximity and high salinity impart sodic characteristics to the sediments, resulting in a porous, vughy microstructure. Together with the elastic behavior of the clay-rich matrix, these conditions promoted water stagnation and the translocation of clays and micro-remains. Micromorphological evidence indicates phases of increased aridity in Units IV–II, expressed by the absence of stagnant water features, preservation of evaporites, and reduced clay illuviation. A clear contrast is observed between stratigraphic units with limited anthropogenic input and those reflecting more intensive human occupation. Units X, IX, VI, V, and III show predominantly natural sedimentation, with sodic clayey matrices, rounded gravels, and sparse ceramic and malacological remains. In contrast, Units VIII, VII, IV, and II are associated with higher occupation intensity, as indicated by combustion structures in varying states of preservation and sediments affected by trampling. Overall, the study demonstrates the value of high-resolution micromorphological analysis for understanding both environmental dynamics and human activities in coastal indigenous contexts, providing a detailed reconstruction of site formation processes at Las Estacas Cave.

480. Reading cave sediments: geogenic processes and human activities at San Bernardino Cave, a subalpine Pleistocene deposit

Authors: Diana Marcazzan (University of Tübingen) – Marco Peresani (University of Ferrara)
Format: Oral

The Pleistocene deposit of Grotta Maggiore di San Bernardino (northeastern Italy) offers an opportunity to examine cave sedimentation in a subalpine setting under various climate fluctuations and significant human presence. Our study focused on characterizing depositional and post-depositional processes through an integrated geoarchaeological approach combining field stratigraphy, sedimentology, micromorphology, mineralogical analyses, and single-grain optically stimulated luminescence (OSL) dating. The stratigraphic record reflects a dynamic depositional system dominated by slope-derived inputs and cold-climate processes, including frost-related disaggregation, solifluction, and aeolian input. Alongside dominant geogenic processes, the deposits also incorporate anthropogenic evidence of variable intensity. Units VIII, VI, and II display the clearest evidence of human input, whereas the other units are largely shaped by natural sedimentary dynamics. Micromorphological data reveal localized combustion residues, most clearly expressed in Unit VI, where ash-rich deposits, charcoal, and burnt bone fragments indicate in situ fire use. In contrast, units V and IV are characterized by limited anthropogenic remains and abundant coprolites, indicating a predominantly non-anthropogenic accumulation and only sporadic human visits. Environmental information derived from sedimentological proxies, supported by malacological assemblages in Unit VI, suggests shifts between more humid and more arid conditions throughout the sequence. Periods of increased human activity appear to coincide with phases of enhanced moisture availability. New single-grain OSL ages place the formation of Units VII to IV within Marine Isotope Stages 8 to 6, improving previous chronological constraints based on ESR-US and incomplete radiocarbon dating of the upper deposits. The refined chronology provides a framework for linking local cave sedimentation to broader Middle Pleistocene climatic variability and for reassessing patterns of Neanderthal site use in subalpine environments.

179 GLASS CONNECTING PEOPLE: GLASSWORKING AND DISTRIBUTION IN IRON AGE SOCIAL NETWORKS

Theme: 7. Interaction, connectivity and mobility
Organisers: Anzhelika Kolesnychenko (The Cyprus Institute | Institute of Archaeology of the National Academy of Sciences of Ukraine) – Kateryna D'Ayala (Department of Chemistry, University of Turin) – Anastasia Cholakova (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences | Institute of General and Inorganic Chemistry, Bulgarian Academy of Sciences)
Keywords: Glass technology, Social network analysis, Trade routes, Imports, Archaeometry, Typological studies
Format: Session with keynote presentation

SESSION ABSTRACT

The production of glass represents one of the earliest and most striking examples of an international division of labor. For much of the Iron Age, glass was manufactured primarily in a limited area encompassing Egypt and the Syro-Palestinian region, from where it was exported across the Mediterranean world and beyond for further working and refinement. Within this broader picture, however, lie numerous stories of social connectivity that glass both reflected and reinforced. As a raw material, glass was frequently reworked locally, supporting the operation of diverse communities of practice. Bright glass ornaments and precious vessels circulated through social networks, often revealing interactions that are otherwise invisible—or only faintly visible—through less exotic materials. Unlike metal objects, which could be reproduced, or pottery, which was often subject to local fashions, glass in most Iron Age contexts was clearly an imported material. It, thus, serves as a powerful indicator of social interaction across long distances and cultural boundaries. Many case studies align with this overarching pattern: the spread of colourful core-formed glass vessels outside Greek world; the distribution of glass beads in indigeneous contexts of Iron Age, the spread of Celtic bracelets beyond the known Celtic world, the spatial patterns of Roman glass finds across the Roman limes; or the richly furnished burials of Thracian

kings or Steppe nomads containing exclusive and luxurious glass vessels. We invite contributions from researchers interested in the social interpretation of glass production, working, and distribution patterns, as well as the cultural significance of glass imports in various societies.

CONTRIBUTION ABSTRACTS

706. Polychrome Glass Perfume Containers from Spina: Trade Dynamics and Ritual Significance in the Valle Trebba Necropolis

Authors: Laura Sofia Di Giorno (Sapienza University of Rome) – Mckinley Knoop (University of Bologna)
Format: Oral

Spina (Ferrara, Italy), a prominent Etruscan city-port on the Adriatic Sea, has yielded a significant corpus of core-formed polychrome glass perfume containers, recovered from both the settlement and the necropolis. The northern funerary sector of Valle Trebba—under investigation by the University of Bologna—produced approximately one hundred specimens. These finds span the city's occupation (late 6th- late 3rd century BCE) and are distributed across 61 of the 1,215 tombs within the sector, in addition to several specimens lacking a specific funerary context. Most of these perfume containers belong to the so-called Mediterranean Group 1 (MG 1) according to D.B. Harden's typological classification, while a smaller group is attributed to MG 2. MG 3 perfume containers are absent, consistent with the fact that the latest burials date only to the mid-3rd century BCE. For a few MG 1 specimens, archaeometric analyses have confirmed a Greek origin, possibly Rhodes, a primary production centre of the period. Formal and stylistic comparisons suggest a Greek/Eastern Mediterranean provenance for various other specimens within the same group as well, whereas at least some of the MG 2 perfume containers suggest an origin in Italy. The diachronic shift in these potential provenances point to interesting production and distribution patterns in Iron Age social networks, which could be clarified by possible new archaeometric analyses. At Valle Trebba, these vessels were predominantly recovered from female inhumation burials, both adults and sub-adults, with a particular concentration in the 5th century BCE. They were frequently placed in emphatic positions relative to the body—most notably near the hands—and were occasionally found in significant association with aes rude or items belonging to the personal sphere. The study of these artefacts within the context of Spina offers a multifaceted research perspective, integrating technological, commercial, and socio-cultural dimensions alongside funerary practices.

894. Core-formed glass vessels from the "suburbs" of Olbia Pontica: ritual or daily use, Olbian citizen or barbarians?

Authors: Oleksandr Kuzmishchev (Institute of Archeology NAS of Ukraine) – Anzhelika Kolesnychenko (The Cyprus Institute | Institute of Archeology NAS of Ukraine) – Andrew Ivchenko (Institute of Archeology NAS of Ukraine)
Format: Oral

Recent archaeological and geomagnetic studies in ancient Olbia have changed our understanding of the structure of this city. The city have been expanded to include part of the necropolis. The overlap of residential and burial areas makes it difficult to interpret the complexes. But who lived in the "suburbs" of Olbia? Was it suburb or western district of city? Were they full citizens with an Olbian lifestyle, or barbarians following their own traditions? These questions can be considered through the prism of glass artefacts, namely core-formed vessels, in comparison with the inner part of Olbia and other cities. Seventeen fragments of core vessels of various shapes were found in the non-burial complexes of the suburbs. Of these, there are 5 amphorae, 5 alabasters, 1 aryballos, 1 oinochoe, and 5 of unknown shape. The chronology of the vessels and complexes covers the 5th–4th centuries BC. Most of the fragments were found in pits or houses. Two vessels were recorded in sacred areas. The practice of using core-formed vessels is well known in the Black Sea region as well as in the Mediterranean. Thus, the distribution and potential function of the core-formed vessel reflect the spatial distribution of vessels in the central part of the city, supporting recent hypotheses that the city's territory were considerably broader during its early development.

728. Classical and Hellenistic glass vessels from West Pontic coast: a project overview

Authors: Mila Chacheva (National Archaeological Institute, Bulgarian Academy of Sciences)
Format: Oral

Glass vessels, which constitute undisputed luxury items of the Classical and Hellenistic periods, are relatively rare in archaeological contexts and are most frequently associated with the necropoleis of the ancient West Pontic apoikiai. More broadly, studies of ancient glass for this period provide an important foundation for reconstructing trade routes and economic interactions within the Mediterranean and Black Sea regions. In order to integrate the West Pontic coast more accurately into the broader distribution patterns of glass vessels during the Classical and Hellenistic periods, it is essential first to establish a comprehensive understanding of the glass material preserved from this area. Accordingly, the primary aim of the present project is to compile and analyze all glass vessels dating from the 5th to the 1st century BC that have been discovered within the territory of the Greek poleis along the present-day Bulgarian Black Sea coast, including both previously published finds and material that has remained unpublished to date. As a substantial proportion of these vessels derive from necropoleis, they can be examined within a secure archaeological context, allowing for an additional objective of the study: analysis and an attempt at more precise dating based on the associated finds. The initial phase of collecting and processing the available material has now been completed, enabling a preliminary presentation of

the project's results.

1344. Signs of change: glass artefacts in socio-economic upheavals in the Lower Dniester region during the Hellenistic period

Authors: Anzhelika Kolesnychenko (The Cyprus Institute | Institute of Archaeology of the National Academy of Sciences of Ukraine) – Thilo Rehren (The Cyprus Institute)
Format: Oral

The Hellenistic period was marked by profound transformation in the Greek poleis of the Lower Dniester region. Inflation and climatic aridization, and barbarian invasions coincided with reshaping local power relations in a distinctly Hellenistic direction toward more authoritarian forms of rule. Imported glass artefacts were embedded in these processes, and their patterns of distribution reflect ongoing interactions. This study focuses on the interdisciplinary analysis of glass items from the region. The use of various research methods, including the study of the chemical composition of glass by SEM-EDS, makes it possible to consider glass in various, often overlapping fields of research on a broader scale. Core-formed vessels continued to be imported into Niconion until the city's partial abandonment. Subsequently, such vessels reappear on the opposite bank of the Dniester estuary in the city of Tyras, reflecting a regional shift in political and economic power. At the same time, luxury glassware, particularly transparent bowls associated with elite drinking social display, became relatively numerous in the region. These vessels appear both in nomadic contexts and in burials within Greek poleis. Their distribution suggests a mode of political authority concentrated within a ruler's immediate circle, authoritarian in character and socially detached from the broader population. Other glass finds point to episodes of invasion, including Celtic glass bracelets, mask beads, rectangular, and other beads. Compositional analyses of glass artefacts reveal diverse supply routes and production centers, indicating an expansion of trade connections and a restructuring of socio-economic networks following Alexander's conquest of the East. Glass artefacts serve as a powerful proxy for reconstructing the social connections of a small Greek enclave on the northeastern periphery of the Greek world.

1821. Small Objects, Wide Networks: Chevron Glass Beads in the Early Iron Age Eurasian Steppe

Authors: Dmytro Nykonenko (University of Turin, Department of Chemistry | currently at University of Pavia, Department of Musicology and Cultural Heritage) – Monica Gulmini – Oleh Yatsuk (University of Turin, Department of Chemistry)
Format: Oral

Glass beads are among the most informative categories of archaeological glass artefacts, offering valuable insights into technological practices, exchange systems, and cultural interaction. Small and easily transportable items of personal adornment, they readily crossed ethnic and geographic boundaries. Their production required specialised knowledge of raw materials, colourants, and manufacturing techniques, and their distribution often reflects complex patterns of mobility and communication. The author focuses on a distinctive group of cubic glass beads decorated with chevron motifs that became widely distributed across the Eurasian Steppe during the 4th century BCE. Although their period of use was relatively short, these beads spread over an exceptionally large area, from the Danube Basin to the Ural Mountains, covering approximately two million square kilometres. Their occurrence in both funerary and settlement contexts among diverse nomadic and semi-nomadic communities makes them a sensitive indicator of interregional contacts. Based on typological analysis, spatial mapping, and the comparison of archaeological contexts, the study considers a dataset of 114 known beads from 37 archaeological sites and examines their circulation routes within steppe interaction networks as evidence of mobility and exchange. The beads are regarded as material evidence of sustained contacts between distant communities, providing an effective proxy for reconstructing social connectivity and intercultural communication in the Early Iron Age Eurasian world.

1292. Polychrome Glass Beads as Chronological Markers of the Late Scythian Culture

Authors: Olena Dzneladze (Institite of Archaeology of the National Academy of Science of Ukraine)
Format: Oral

Various types of polychrome glass beads were discovered among the grave goods of the Late Scythian burials. Chervonyi Mayak is the largest known Late Scythian necropolis of the Lower Dnieper Region. The Late Scythian Archaeological Expedition of the Institute of Archaeology of the National Academy of Sciences of Ukraine excavated the necropolis Chervonyi Mayak from 2011 to 2021. The research results are well documented: two monographs and numerous articles have been published. The beads from the burials were described and accompanied by color photographs, unlike artifacts found during excavations in previous decades. All these factors facilitate the study of polychrome beads. In total the Late Scythian Archaeological Expedition excavated 69 burial structures (no. 109-177), there are deep crypts, niche graves, pits and cenotaphs. Most types of the beads under study were in use in the 1st — the first half of the 2nd centuries AD and permit to date the graves, where they have been found to this time. In the most of graves under study the beads have been found. Among them the monochrome and polychrome glass beads, the beads made of semiprecious stones, metal, amber, jet and Egyptian faience beads. The correlation of the beads with other elements of clothing, especially fibulae and buckles, demonstrates that the beads of various types should be chronological markers. The date could be specified by the dating of polychrome beads with compound decoration, the faience beads, and items of semiprecious stones and figured pendants. Sometimes the beads are the only objects for the dating of a burial, so it is possible to use them as chronological markers.

1575. Keynote: From Numbers to Knowledge: The Role of Archaeometry in Interpreting Iron Age Glass as a Proxy for Social Interactions

Authors: Monica Gulmini (Chemistry Department - University of Turin)
Format: Oral

It is often noted that, within archaeological studies, glass artefacts have received limited attention, or at least less attention than artefacts made from other materials, such as ceramics and metalwork. In recent years, however, a growing body of archaeometric data on glass has been published and discussed in dedicated events and thematic conference sessions. As a result, even more traditional archaeological approaches are acknowledging the potential of the information conveyed by glass artefacts for the study of archaeological contexts, as well as of connections and interactions between cultures. The archaeological community now benefits from exceptionally advanced tools for chemical analysis and data processing, which promote the development of methods and interpretations through genuinely transdisciplinary approaches. Glass artefacts are currently being "rediscovered" through broader perspectives that integrate materials science and chemical analysis into their archaeological interpretation. Nevertheless, progress also requires awareness. Understanding the limitations of instrumental investigations of glass is essential in order to make full use of their potential. This contribution examines a series of exemplary case studies on Iron Age glass, drawn from research carried out at the Department of Chemistry of the University of Turin, focusing on key aspects that the archaeological community should consider in order to guide the establishment of robust foundations for interpretative frameworks currently being developed to use glass in tracing Iron Age networks and highligh cultural contacts and influences. The topic falls within the framework of the ongoing research project "Compatibility of Measurement Results for New Protocols in Archaeometry (COMAr)", funded by the Italian Ministry of University and Research under the Italian PRIN 2022 programme (Projects of National Relevance).

2329. Echoes of glass change: alkali variation and technology differentiation in post-palatial Mycenaean Greece

Authors: Kalliopi Nikita (Ephorate of Antiquities of East Attica, Hellenic Ministry of Culture)
Format: Oral

Distinctive blue glass jewellery, mass-produced in the Mycenaean palaces, was widely distributed across the Aegean and in Cyprus during Late Helladic IIIA-B (14th-13th centuries BC). The destruction of palaces and the collapse of Linear B administration system lead to the decline of the Mycenaean glass industry. In post-palatial contexts, namely in the LHIIIC period (12th-11th centuries BC) glass beads either rarely occur or they are unevenly distributed whilst the main bulk of glass seems to have been imported from an alien glass-producing centre. The paper focuses on glass beads from burials in the cemetery of Elateia-Alonaki, Phthiotis, dating to the post-palatial Mycenaean period and towards the transition to the Early Iron Age. Electron microprobe analysis in combination with trace element characterisation by Laser Ablation Inductively Plasma Mass Spectrometry has cast light on the raw materials employed in their making, more specifically on the alkali source as well as on the copper and cobalt blue mineral sources used as colourants. Special emphasis is placed on the mixed-alkali glass compositional type. Despite their uneven distribution within Elateia-Alonaki mixed-alkali glass beads are a unique and most significant occurrence in the broader Aegean of the Late Bronze Age and the transition towards the Early Iron Age. Mixed-alkali glasses have been distinctive compositions of Bronze Age Central Europe and Italy whereas their farther eastern occurrences on the basis of solid analytical evidence have been only in mainland Greece so far, in Elateia-Alonaki and on the island of Thasos in the northern Aegean. Similarities with Italian and Central European mixed-alkali glasses in conjunction with archaeological evidence for the mobility of luxury goods raise a hypothesis about their importation to Greece. The paper aims to interpret the echoes of change in the use of the newly-emerged mixed-alkali glass technology within the social context of post-palatial Mycenaean Greece.

1440. From Core to Colour: Archaeometric Insights into Mediterranean Glass Reaching Olbia Pontica (Mykolaiv Oblast, Ukraine)

Authors: Kateryna D'Ayala (University of Turin) – Anzhelika Kolesnychenko (Cyprus Inst. | Inst. of Arch. of the NAS of Ukraine) – Patrizia Davit (University of Turin) – Annarosa Mangone (University of Bari) – Alessandro Re – Alessandro Lo Giudice – Monica Gulmini (University of Turin)
Format: Oral

This study presents the first comprehensive archaeometric analysis of core-formed glass vessels from the ancient Greek colony of Olbia Pontica (northern Black Sea region), dating from the late 6th century BC to the early 1st century AD. The assemblage, predominantly blue and consisting of amphoriskoi, oinochoai, and alabastra – characteristic perfume and unguent containers – is curated in two Ukrainian institutions: the National Historical and Archaeological Reserve "Olbia" (Mykolaiv Oblast) and the Institute of Archaeology in Kyiv. Typologically classified within Mediterranean groups (MG), these artefacts are associated with workshops in the Mediterranean that are unknown in terms of archaeological evidence. A multi-instrumental approach, encompassing Optical Microscopy, SEM-EDS for major and minor element profiling, and FORS for non-destructive chromophore identification, reveals the compositional and technological foundations of their vivid coloration. The glasses are soda-lime produced via natron flux and quartz-rich sands, with intentional additions of colouring agents, predominantly Co^{2+} ions yielding intense blue hues, opacifiers and minor colorants like Cu and Mn. Micromorphological features, such as bubble distribution and inclusions, reveal core-forming techniques, firing temperatures, and raw material processing. These findings fill a critical gap in the chemical dataset for core-formed glasses from Ukrainian Black Sea sites, highlighting the role of chromophores in tracing production technologies, raw material sourcing, and Mediterranean trade networks.

849. The Analysis of Glass from the Roman Villa, Warkton, Kettering

Authors: Emily Harris-Taylor (Independent)
Format: Oral

This study examines Roman glass artefacts unearthed from Warkton Villa, Kettering, with the aim of elucidating their manufacturing techniques, raw material provenance, and the circulation patterns of glass during Late Antique Roman Britain. Central to the research are questions concerning the transmission of technological knowledge, the dynamics of material economy, and the emergence of cultural hybridity in rural elite contexts. Employing Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICP-MS) in conjunction with meticulous microscopic analysis, the investigation delivers both quantitative and qualitative insights into elemental compositions, trace element fluctuations, and microstructural characteristics of the glass samples. The collection is predominantly comprised of natron-fluxed silicate glass, consistent with classic Roman formulations from the Eastern Mediterranean. Nonetheless, marked variability in trace elements and the presence of microscopic inclusions indicate episodes of recycling and secondary production, most likely occurring within provincial workshops. Supplementary findings, such as traces of colourants, evidence of surface weathering, and distinctive textural features, further suggest post-depositional changes and small-scale craft modifications, pointing towards technological adaptation at the local level within the expansive framework of imperial exchange networks. Ultimately, the results reveal that the glass artefacts from Warkton Villa are testament to the ways in which rural elite sites in Roman Britain not only engaged with imported materials but also actively adapted and transformed them locally. This case study underscores the fluidity of trade boundaries and highlights the proactive involvement of local craftsmen in negotiating and reshaping Roman material traditions, thereby broadening our comprehension of cultural hybridity and technological interchange within the province.

274. New insights into the recycling and restoration of glass in antiquity

Authors: Šime Perovic (Museum of Ancient Glass in Zadar)
Format: Oral

The article reconstructs possible forms of recycling or restoration of damaged glass objects in antiquity, based on archaeological findings, instructions from ancient writers Martial, Statius and Pliny the Elder, as well as the results of physical and chemical analyses. This was sometimes achieved by changing the original function of the object, as witnessed by several examples from the Jader necropolis, and sometimes by attempts at actual restoration. The descriptions of the preparation of glues provided by Pliny the Elder in his work Naturalis Historia, one based on sulfur and the other on quicklime and egg white, are a vivid example of such Roman-era restoration practice, and their authenticity has been confirmed by experimental archaeology projects conducted at the Department for Restoration and Research of the Museum of Ancient Glass in Zadar. Recycling by remelting glass was also explained, which was economical in antiquity due to the unavailability or high cost of basic raw materials (quartz and sodium carbonate). In addition to historical and archaeological data, a third group of data on the possible recycling of glass in antiquity is provided by data inherent in its structural nature. The idea already presented (Harriet E. Foster, H.E. and Jackson, C.M. (2010). The composition of late Romano-British colourless vessel glass: glass production and consumption, Journal of Archaeological Science, Vol. 37, 12, 3068-3080) that the joint presence of both manganese oxide and antimony oxide in colorless samples is evidence of recycling of glass material, since only one of these two oxides was usually used for decolorization, is additionally verified by a project of systematic PIGE analysis on samples of roman and late antique glass from the Museum of Ancient Glass in Zadar.

1043. Roman glass at the twilight of the Empire: composition and recycling of Late Roman glass from northeastern Tarraconensis

Authors: Iva Mihova (GRQ-SERP, Department of History and Archaeology, University of Barcelona) – Lluis Casas (Department of Geology, Autonomous University of Barcelona) – Ignasi Queralt (Laboratory of X-ray Analytical Applications, IDAEA-CSIC | University of Girona) – Joana Teixeira (Center for Applied Photonics, INESC TEC | Department of Physics and Astronomy, University of Porto) – Diana Guimarães (Center for Applied Photonics, INESC TEC) – Montserrat Sanz – Joan Daura (GRQ-SERP, Department of History and Archaeology, University of Barcelona)
Format: Oral

Archaeometric research on Late Roman glass from the Iberian Peninsula remains limited. This study analyses 186 Roman glass fragments from two sites in the northeastern Tarraconensis province, Cova del Gegant and Masia de les Coves. A combination of analytical techniques was employed: (i) portable X-ray fluorescence (p-XRF) instrumentation to explore compositional distinctions despite its limited elemental range on 180 samples; (ii) micro energy-dispersive X-ray fluorescence (m-EDXRF) applied to five samples with identifiable shapes; and (iii) Raman spectroscopy and XRF mapping on one sample to characterise pigments used in red-coloured decorations present in nine fragments. The results reveal clear chemical differences between the assemblages of the two sites, suggesting different raw glass sources or production technologies. The Cova del Gegant glasses, ascribed to the 4th-7th

centuries CE, largely relate to Late Antiquity glass reference groups and exhibit signs of recycling. Their composition correlates with the High iron, manganese and titanium glasses (HIMT), Levantine I and Foy 2 groups. Whereas the Masia de les Coves material aligns with the Roman 'naturally' coloured blue-green and yellow glasses 2 group (RNCBGY 2). Combined with typological indicators, these results suggest that the Masia de les Coves assemblage may belong to an earlier period (1st to 4th centuries CE). Raman spectroscopy and complementary XRF confirm the use of a copper-based pigment to produce the red decorative trails. Typological evidence is consistent with a funerary or ritual setting due to the abundance of shapes, such as beakers/lamps and unguentaria, commonly attributed to such contexts. Overall, this study highlights the difference in production technologies and recycling practices across two periods of the Roman Empire in the same spatial setting.

926. Keynote: Losing Marbles: Glass Imports and Social Change in the Roman Iron Age Baltic

Authors: Karolis Minkevicius (Vilnius University, Department of Archaeology) – Kotryna Bojarskaitė (Lithuanian Institute of History, Department of Archaeology) – Gustė Mickevičiūtė (Vilnius University, Department of Archaeology)
Format: Oral

Glass, as a largely imported and technologically distinctive material, provides a sensitive indicator of long-distance connectivity and social interaction in prehistoric Europe. In the south-eastern Baltic, the earliest glass finds date to the 5th century BC, with a marked increase from the early centuries AD, reflecting the region's growing integration into pan-European exchange networks. Unsurprisingly, glass – particularly from mortuary contexts – has traditionally been used to explore cultural contacts and social differentiation through typological approaches. Recent research, however, demonstrates its broader interpretive potential when integrated with settlement archaeology and environmental evidence. This paper presents an interdisciplinary analysis of Roman Iron Age (1–400 cal AD) glass imports from south-eastern Baltic settlements, combining artefact typology with archaeobotanical, zooarchaeological, and isotopic datasets to examine how glass circulation intersected with wider social, economic, technological, and environmental transformations. The results show that shifts in glass distribution closely correlate with changes in mortuary practices, subsistence strategies, settlement organisation, and technological traditions, particularly from the late 1st–2nd centuries AD, during the expansion of major exchange routes such as the Amber Road. While archaeologically these exchange networks are most visible through Roman imports – particularly glass – other datasets indicate that their significance extended well beyond the circulation of exotic objects. Settlement evidence points to the transmission of knowledge, technologies, and ideas, which in turn contributed to broader social, economic, technological, and environmental transformations in Baltic societies. This study demonstrates how the circulation of Roman imports both reflected and actively shaped social connectivity and change in the Iron Age Baltic region, while also offering insight into the origins and dissemination of key socioeconomic developments.

1994. Glassware from a villa rustica. A case study from north-western Alps: Costigliole Saluzzo (Cuneo, Italy)

Authors: Veronica Bellacicco (University of Turin, ASSA PhD programme) – Diego Elia (University of Turin, Department of Historical Studies) – Valeria Meirano (University of Turin, Department of Historical Studies | Standing Committee of the International Bronze Congress) – Monica Gulmini – Dmytro Nykonenko (University of Turin, Department of Chemistry)
Format: Oral

The presence of Roman glassware in rural contexts is still not sufficiently documented in Northern Italy, compared to the knowledge about the circulation and use of these artefacts in funerary areas and urban centres. Excavations conducted by the University of Turin at Costigliole Saluzzo have brought to light a large Roman villa rustica and a Late Antique settlement located in a strategic position along the road leading to Gaul across the Alps. The site, which covers an area of approximately 3 hectares, is one of the largest rural complexes yet discovered in north-western Italy dating to the Imperial period. A wide range of activities have been identified at the villa, including the processing of agricultural products, grain milling, winemaking, and the manufacture of bricks, ceramics, and metal tools. The presence of a mansio suggests that the villa also accommodated travellers and merchants. The site has yielded a wide assemblage of glass vessels enabling us to reconstruct tableware and pantry glass sets (bottles, plates, cups, etc.) in a diachronic perspective, from the 1st century BC to the 5th century AD. These items exhibit remarkable morphological and typological variety as well as evidence of various production techniques, ranging from moulded to standardised blown glass vessels, some of which were imported and others produced in local workshops. Interdisciplinary approaches (e.g. hyperspectral imaging) applied to coloured and decorated specimens have allowed for the identification of colourants. A distributive analysis has shown significant concentrations of finds in specific residential units, related to food and beverage consumption, and to health and body care. Together with the study of other materials, the analysis of glassware has enabled Costigliole to be placed within a broader territorial context, demonstrating the important role of rural settlements in the circulation of products, objects and people in Roman times.

321. Glassware as Indirect Evidence of Glassworking in Barbaricum: Current State of Research and Future Perspectives

Authors: Vladyslav Shchepachenko (Institute of Archaeology National Academy of Sciences of Ukraine | V. N. Karazin Kharkiv National University)
Format: Oral

The possibility of manufacturing glassware in Barbaricum during the Roman and Early Migration periods has been a subject of conjecture since the early 1970s. The publication of the initial results of excavations at a glass workshop in Komariv on the Middle Dniester, discovered in the middle of the last century in the Cherniakhiv/Sântana de Mureș cultural area, more than 300 km from the nearest section of the Roman border, was pivotal to the development of this discussion. The numerous production waste, raw materials, and remains of a glass-melting furnace unearthed in this location essentially became the material embodiment of this hypothesis. Another argument supporting such a viewpoint was revealed in an analysis of the distribution patterns of the so-called thick-walled facet-cut beakers, which had previously been designated by H.-J. Eggers as types 230, 237-238. The majority of these artefacts were discovered outside the limes, and to date, such vessels lack any counterparts among synchronous glassware forms in the Roman provinces. The number of similar items gradually continues to increase. Recent research has revealed that the category of 'barbarian' artefacts most likely also includes vessels with coloured glass overlay, thick-walled facet-cut glass beakers of E. Straume's IB3 variant and IX type, which were common in Northern, Central and Eastern Barbaricum, glass cups with fire-rounded rims, which gained spread in Eastern Europe, mainly in the Cherniakhiv/Sântana de Mureș area, as well as many other forms of Roman period glassware, currently known only in one or two specimens. The increasing number of such artefacts prompts a more cautious approach to the definition of Roman objects in Barbaricum, thereby underscoring the significant role of 'barbarian' products in the circulation of glassware outside the limes.

2443. "Live Long and Prosper!": the many rebirths of Roman glazed-composition melon beads

Authors: Anastasia Cholakova (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences | Institute of General and Inorganic Chemistry, Bulgarian Academy of Sciences) – Peter Tzvetkov (Institute of General and Inorganic Chemistry, Bulgarian Academy of Sciences)
Format: Oral

Melon beads, also known as Melonenperlen, are among the most characteristic small finds at early Roman sites, especially in those related to the Roman military. They are made of a synthetic glassy material, essentially ground quartz sintered with alkali-rich ingredient and added colourant, which is sometimes inaccurately referred to as 'faience'. Considered as products of an originally Egyptian technology, these distinguishable small items of adornment, supposedly worn also because of their ascribed apotropaic properties, have been manufactured on a large scale in the 1st c. AD but had remained popular throughout the Roman period. Due to their material durability and appealing colours, a considerable amount of these beads had survived their initial cultural and technological milieu and had evolved into a range of later and extended 'biographies'. The aim of this presentation is to outline the diverse archaeological and modern contexts in which the Roman glazed-composition melon beads are found, starting from their primary 1st – 3rd c. settings, through some quite intriguing finds from late antique and medieval burial sites, to modern cases of illicit antiquities trafficking and imitations. With an emphasis on materials from present-day Bulgaria, while also taking into account examples of melon beads from other parts of Europe and beyond, we will seek to explore the purely material, and the presumed semiotic, significance of these objects behind their longevity. The results of a combined analytical study of chemical and phase composition (XRF and XRD) of findings from present-day Bulgaria provide a further basis for a more comprehensive understanding of the phenomenon of multiple life cycles of the Roman glazed-composition melon beads.

1006. Photogrammetric approaches to studying Iron Age glass working: a case study of glass artifacts from the Odesa Archaeological Museum

Authors: Yaroslav Chentsov (Scientific and research lab «Archaïc») – Oksana Hrytsiuta (Odesa Archaeological Museum of the National Academy of Sciences of Ukraine)
Format: Oral

Currently, the glass collection at the Odesa Archaeological Museum includes over a thousand artefacts. In 2025, thanks to the museum's participation in the Ukrainian Heritage Digitisation and Dissemination Initiative (2024-2025) project, a number of 3D models of glass products stored at the institution were created using photogrammetry. The creation of 3D models from glass has its own technological specifics and requires a certain set of equipment to create a high-quality model from such a capricious material. The availability of ready-made 3D models of glass artefacts allows scientific research of such materials to be carried out for specific scientific purposes -metrological, technological, morphological, tracological or any other. If we take as an example the existing model of a glass goblet dating from the last quarter of the 4th – first third of the 5th century, some measurements can be taken directly (diameter of the rim and neck, diameter of the bottom, as well as counting the number of ornamental figures and measuring their parameters). In cases where direct measurement of the model cannot provide sufficient accuracy, the model can be edited to enable more accurate measurements - removing those parts that prevented access to the required distances. Such a 'cut' model can be loaded into a specialised software environment and measured using standard tools. These parameters include the maximum diameter of the vessel, the height of the neck, and the total height. The volume parameter involves automated calculations in the same programmes (Radchenko, Chentsov 2025). The results of such studies, in addition to their direct scientific significance for a specific object, provide an opportunity, when creating a sample, to study the processes of standardisation of glassware and to take a different look at already known glass artefacts from the collections of the Odesa Archaeological Museum.

1508. Roman glass imports in Pomerania and lower Vistula region. Typology, import routes and most

comon deposition.

Authors: Patryk Talar (Uniwersytet Mikołaja Kopernika w Toruniu)
Format: Poster

From the mid first century AD, imported Roman glass vessels became an element of social prestige in the European Barbaricum. They represent only a small fraction of the enormous range of glassware produced in the Imperium Romanum, and at the end of antiquity, manufactured to a very limited extent in the northern Black Sea region, an area of direct interaction between ancient traditions and the barbarian world. The inflow of such luxury goods was neither continuous nor evenly distributed and depended primarily on the relations between the Romans and the barbarians. The spread of glass vessels in the Barbaricum was undoubtedly influenced by the popular custom among barbarian elites of exchanging luxury items as gifts. A significant number of diverse Roman glass vessels reached the southern Baltic Sea basin, where they concentrate in Pomerania and the lower Vistula region. Here, they appear primarily as part of the grave deposition among aristocratic burials, including individuals situated at the very top of the social hierarchy, such as those found in "princely graves" of the Lubieszewo type. Among these vessels, one may distinguish, for example, rare types of cups decorated with painted scenes of gladiatorial combat, a unique fish-shaped vessel originating from Italy or the Near East, ribbed bowls and finally, a series of vessels with walls covered in ground oval facets. The latter are considered examples of products that reached the north via an exchange route linking Scandinavia and the Pontic region in the 3rd and 4th centuries AD.

2427. Luxury glass vessels from Eleutherna-Sector I: exploring the networks of interaction in Early and Middle Imperial Roman Crete

Authors: Kalliopi Nikita (Ephorate of Antiquities of East Attica, Hellenic Ministry of Culture)
Format: Poster

This paper presents and discusses selected assemblages of glass vessels that were found in two villas in Sector I of the excavated city of ancient Eleutherna in north-central Crete dating to the Early and Middle Imperial Roman period, early 1st century – late 3rd century AD. A combined archaeological and scientific analysis yielded significant information about the archaeology and technology of glass vessels that comprise wares characterised as luxuries. Starting with the distinction between luxury glass vessels and their contemporary utilitarian glass vessels that were also found in the two villas, the discussion will focus on aspects of their manufacturing technology, namely glass-making raw materials, glass-working techniques as well as glass vessel forms and decoration. More specifically, electron-microprobe analysis of selected monochrome and polychrome strongly-coloured vessel glass shed light on the range of raw materials involved in their making. Technological similarities that were noted amongst the highly-coloured vessels, glass tesserae from the wall mosaics and minor glass finds uncovered in the area of the two villas are also discussed. Given the rarity of recognised glass workshops on Roman Crete as well as the limited number of workshops for primary glass production within the empire during the chronological period considered, the study offers a comprehensive discussion about possible connections of Eleutherna with other sites on Roman Crete and with related glass workshops within the empire. By tracing the likely networks of interaction through glass trade in conjunction with other luxuries across the Mediterranean during the Early and Middle Imperial Roman times the paper aims to explain the occurrence and use of luxury vessel glass within the context of Eleutherna, in particular, and of Roman Crete, in general.

2807. Chemical composition of Late Iron Age glass bangles from Central North Bulgaria

Authors: Anastasia Cholakova (National Institute of Archaeology with Museum, Bulgarian Academy of Sciences | Institute of General and Inorganic Chemistry, Bulgarian Academy of Sciences) – Elitsa Dimitrova-Nikolova ("Man and Earth" Museum, Sofia) – Zhivko Uzunov (New Bulgarian University) – Peter Tzvetkov (Institute of General and Inorganic Chemistry, Bulgarian Academy of Sciences)
Format: Poster

This poster presents the preliminary results of an analytical study of a set of glass bangle fragments dated to the 3rd – 2nd c BCE. The majority of them were found during rescue excavations of an open settlement site near the present-day village of Dimcha in Central North Bulgaria. A few more pieces discovered at other sites in the area complement the dataset. Stylistically, the bangles belong to well-known groups of Celtic glass jewellery. Fifteen fragments were measured by ED-XRF, as semi-quantitative analysis, aiming at minimal damage of the finds and mostly non-invasive approach. The results suggest that the bangles were made of Na-Ca-Si glass, produced with mineral soda, most likely with a Levantine origin of the raw glass used. The intense blue colouration of all the fragments was achieved by addition of cobalt containing ingredients, while also increased iron, copper, and/or lead contents are evident. The white and yellow opaque glasses used for the thread decoration of the bangles were produced with calcium antimonate and lead antimonate, respectively. In terms of their chemical glass composition, morphology, and decorative style, the bangle fragments from Central North Bulgaria pertain to the glassworking traditions of the Celtic culture in Central and Western Europe. Nevertheless, their presence in the Northern Balkans rises questions regarding identities, connectivity, and exchange in the broader context of the Late Iron Age social dynamics.

183 ARCHAEOLOGY IN THE LEAD: DRIVING INTEGRATED INTERDISCIPLINARY APPROACHES TO SUSTAINABLE URBAN AND ENVIRONMENTAL DEVELOPMENT

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Friso Kater (EARTH Integrated Archaeology) – Vibeke Martens (Norwegian Institute for Cultural Heritage Research - NIKU) – Michiel Vanhecke (Geosonda Belgium)
Keywords: Archaeology-led interdisciplinary research, sustainable spatial planning, geotechnics, geophysics and geoarchaeology, hydrology, environmental sciences, data-driven approaches, urban development resilience
Format: Discussion session
Affiliation: Archaeological Prospection Community

SESSION ABSTRACT

Global challenges such as urbanization, climate change adaptation, and sustainable resource management demand cohesive, interdisciplinary approaches. Traditionally, archaeology has been introduced late in development projects, responding reactively to mitigate impacts. This session argues for a fundamental shift: archaeology should not simply participate in planning processes but actively lead them, guiding early-stage soil investigations, risk assessments, and spatial analyses while coordinating geotechnical, hydrological, and environmental expertise. Placing archaeology at the core of urban planning makes heritage protection a proactive—and structuring—component of development. Integrating archaeology within political and regulatory frameworks is essential for shaping its influence. Whether archaeology is embedded through strict legislation or flexible governance models determines its ability to act as a driving force rather than a reactive stakeholder. Understanding these political contexts strengthens archaeology's capacity to steer planning and ensure that heritage considerations inform development from the outset. By positioning archaeology as a leading discipline, this session shows how archaeological knowledge can guide research frameworks, structure interdisciplinary collaboration, and shape risk assessments. Rather than functioning as one of many parallel contributors, archaeology can integrate data from geology, hydrology, digital technologies, and environmental studies, thereby directing other disciplines involved in urban and infrastructural planning. Presenters will share case studies and methodologies that illustrate archaeology's leadership in urban planning. These examples show how archaeological and geological data, when placed at the forefront of development strategies, inform spatial design, zoning decisions, and long-term resilience. They highlight planning models where archaeological insight not only protects heritage but also enhances sustainable and culturally grounded development. In sum, this session emphasizes archaeology's capacity to transform spatial development by moving from a supportive role to a leading discipline. By advocating policy frameworks that integrate archaeology at the earliest planning stages, archaeologists can help shape future landscapes that balance contemporary needs with heritage preservation.

CONTRIBUTION ABSTRACTS

911. Build a digital twin of the subsurface and get to know your fellow soil experts

Authors: Michiel Vanhecke (Geosonda)
Format: Oral

Understanding ground investigation campaigns with the aim of pursuing sustainability starts with fostering collaboration among experts. An interdisciplinary approach provides significant support to clients navigating complex legislative frameworks. By integrating expertise and methodologies, geodata can be efficiently utilized, with the development of a dynamic digital twin. This digital simulation of the subsurface on a local scale, based on existing data, newly acquired data and real-time data, plays a key role in knowledge transfer and connectivity between geotechnical engineers, archaeologists, environmental researchers and other experts related to soil research. Secondly, a sustainable approach to ground investigation focuses on minimizing environmental impact. By combining fieldwork techniques such as geophysics, cone penetration testing (CPT) and boreholes, the need for excessive mobilization and demobilization is reduced, thereby significantly lowering CO_2 emissions. The combination of non-invasive techniques and CPT are essential for mapping landscapes with minimal disruption. Preceded by a comprehensive preliminary investigation, this enables targeted sampling during drilling and excavations, supporting a more sustainable and less intrusive research methodology. Furthermore, an integrated approach enhances economic sustainability by optimizing the use of time, energy, and resources. The dynamic digital twin acts as a central platform for data sharing, enhancing the understanding of soil properties and soil behavior and streamlining decision-making processes. By combining geodata efficiently, research teams can reduce redundancy (e.g. more correct assumptions for calculation of pile foundations), improve resource allocation, and increase the overall cost-effectiveness of projects. This methodology not only benefits archaeological and geotechnical investigations but also contributes to more sustainable urban and environmental development. By leveraging collaborative strategies, digital innovation, and sustainable methodologies, ground investigations can drive responsible development while balancing ecological and economic priorities.

1834. Archaeological Risk Assessment in Southeastern Romania: A Data-Driven Modeling Approach

Authors: Cristina Covataru (ArcheoSciences, ICUB, University of Bucharest) – Cornelis Stal (Department of Built Environment, HOGENT University of Applied Sciences and Arts) – Vasile Opris (ArcheoSciences, ICUB, University

of Bucharest | Bucharest Municipality Museum)
Format: Oral

In large metropolitan areas and their peri-urban zones, archaeological heritage is increasingly exposed to pressures generated by urban expansion, infrastructure development, and environmental processes. In this context, international organizations such as UNESCO stress the importance of preventive approaches capable of integrating heritage considerations into spatial planning from the earliest stages of development. This study presents a data-driven spatial modelling framework for archaeological risk assessment in the Bucharest–Ilfov metropolitan region, designed to quantify how environmental and anthropogenic factors contribute to the degradation of archaeological sites. The model is calibrated using logistic regression and integrates openly available geospatial datasets, including land cover change (CORINE), road infrastructure (OpenStreetMap), flood hazard data, slope derived from digital elevation models, land-use classifications from the Urban Atlas, and the dynamics of built-up areas from the Global Human Settlement Layer. The model produces high-resolution archaeological risk maps and classifies each site into risk categories (low, medium, high) based on the cumulative influence of the analyzed variables. Beyond identifying vulnerable sites, these outputs provide a decision-support framework for planners and heritage authorities by highlighting spatial patterns where development pressures intersect with archaeological sensitivity. The resulting risk layers can therefore guide zoning strategies, prioritize preventive investigations, and inform development scenarios before irreversible impacts occur. By placing archaeological risk modelling at the beginning of spatial analysis, the approach demonstrates how archaeology can actively structure planning processes rather than merely respond to them. In this framework, archaeological datasets become a coordinating layer capable of integrating environmental, infrastructural, and land-use information, positioning archaeology as a leading discipline in interdisciplinary urban planning and preventive heritage management. This research was carried out with the support of a grant from Ministry of Research, Innovation, and Digitalization, CNCS–UEFISCDI, project number PN-IV-P2-2.1-TE-2023-0876, carried out within PNCDI IV.

1969. Testing Tools to Send Archaeology in the Lead in Planning Processes

Authors: Vibeke Martens (NIKU - Norwegian Institute for Cultural Heritage Research | CCH - Community on Climate Change and Heritage) – Sunniva Halvorsen (NIKU - Norwegian Institute for Cultural Heritage Research)
Format: Oral

Archaeology can integrate data from geology, hydrology, digital technologies, and environmental studies, thereby directing other disciplines involved in urban and infrastructural planning. This paper presents results from Norwegian pilot projects testing and evaluating new tools for archaeological environmental monitoring. The study compares results across contrasting archaeological and environmental contexts and assesses the performance regarding installation, data quality, stability, sensitivity, and interpretability. A particular focus will be on communication of measured results to other sciences, heritage management authorities, and developers. Monitoring data helps inform heritage management authorities on possibilities for in situ site preservation - or needs for adaptive measures or rescue excavations. Particularly in the context of climate change, in situ site preservation may be more an illusion than reality, but archaeological monitoring data brings hard science data on the real environmental conditions and thus allows informed decisions. In addition, the SoilVue probe is evaluated as a methodological mitigation tool, with particular emphasis on its strengths and limitations relative to other established monitoring approaches. The SoilVue probe is a slim (5 cm diameter), vertically installed sensor capable of monitoring nine points in the upper metre of archaeological deposits directly from the surface. This enables targeted observation of the most vulnerable stratigraphic zones without the need for open sections or dipwells. Compared to traditional methods, the probe is less invasive, cheaper, faster to install, and more flexible in deployment. It has been tested at archaeological sites representing markedly different environmental conditions. Despite these differences, a consistent methodological framework was applied, providing a robust basis for assessing the probe's applicability, limitations, and potential role in securing that archaeology and archaeological knowledge has a leading role in planning processes that impact archaeological sites.

185 ARCHAEOLOGICAL OBJECTS AND THEIR TEXTUAL AND VISUAL AFTERLIVES: A COMPLEMENTARY BIOGRAPHICAL PERSPECTIVE

Theme: 1. Widening perspectives in material culture studies
Organisers: Daniel Modl (Universalmuseum Joanneum Graz, Department Archaeology & Coin Cabinet) – Katie Meheux (University College London, Institute of Archaeology, Library)
Keywords: Archaeological object biographies, Afterlives of archaeological objects, Transmedia documentation, Recontextualization and reinterpretation
Format: Regular session

SESSION ABSTRACT

The afterlives of archaeological objects constitute an important and much-discussed issue in archaeological thought, heritage studies, and critical museology. It has been the subject of decades of crucial anthropological and material-culture theory. The fundamental works of Igor Kopytoff, Arjun Appadurai, and Alfred Gell as well as the more recent works of Michael Shanks, Daniel Miller, Bjørnar Olsen, Timothy Webmoor, Christopher Witmore, and Dan Hicks have transformed the field of research by repositioning material culture from passive residue to active, relational, and politically charged participants in social worlds. This session invites

contributors to explore theoretical ideas about object agency, temporality, identity, ontology and epistemic authority, and movement in practical work-based contexts, examining how our theoretical models work when applied to objects in post-excavation contexts, for example, museums, heritage sites, archaeological companies, and even libraries. Contributions examining how the practical processes of conservation, restoration, documentation, scholarly interpretation, and public presentation change objects are invited. An emphasis on case studies from museums, but also archives and libraries, is encouraged, allowing for an analytical understanding of both the practical processes that create change and the networks of sources that arise from these changes, for example the network of interlinked textual and visual sources: excavation diaries, field plans, drawings, and photographs record the circumstances of discovery while museum inventories, exhibition catalogues, loan records, digital databases, publications, 3D-modells, films, audio content, and social media document the museum's handling or public presentation. By examining the practical afterlives of artefacts and the evolving histories of their transmedia documentation within theoretical contexts, researchers gain a multidimensional understanding of how archaeological heritage is continuously reconstructed, recontextualized, and reimagined across time and whether our theories find practical application.

CONTRIBUTION ABSTRACTS

143. The cult wagon of Strettweg and its afterlife in textual and visual sources after 1851

Authors: Daniel Modl (Universalmuseum Joanneum Graz, Department Archaeology & Coin Cabinet)
Format: Oral

The cult wagon of Strettweg is a miniature cauldron wagon dating in the Early Iron Age period and ranks among the most significant archaeological finds in Austria. The object is displayed at the Universalmuseum Joanneum in Graz. Through a comprehensive analysis of textual and visual sources, in combination with the examination of three-dimensional plaster and metal replicas, it was possible to reconstruct the object's 175-year-long biography since its discovery in 1851. This approach enabled the identification of at least eleven distinct phases of restoration, ranging from early mounting and completion efforts in the nineteenth century to modern conservation and stabilization measures. The documentation of these interventions is highly heterogeneous in both scope and quality. While some restoration campaigns are thoroughly recorded through detailed reports and correspondence, others can only be traced through fragmentary evidence such as brief entries in accounting records or isolated photographic documentation. These gaps highlight changing standards in conservation practice and documentation over time. Beyond the object's material transformations, the analysis of textual and visual sources reveals shifting modes of museum presentation as well as significant changes in public perception of the cult wagon. Over the decades, the object has been variously interpreted and contextualized, reflecting broader developments in archaeological scholarship and museological practice. Moreover, the examination of its media presence and changing value demonstrates the cult wagon's growing importance within the cultural awareness in Austria. Taken together, these findings underscore the cult wagon's outstanding status as one of the most important prehistoric artefacts in Europe.

2467. Displaying Libation: The Afterlives of Zoomorphic Cups in Museums

Authors: Turkan Pilavci (Brooklyn Institute of Social Research)
Format: Oral

Animal-shaped cups of the second millennium BCE are iconic cultic vessels embedded in practices of libation, feasting and rituals across the ancient Western Asia and the Eastern Mediterranean. Their materiality through form and medium enhance their active roles in ritualized performance, manifesting the mythic and embodied qualities of the zoomorphic shapes they take on. Yet their post-excavation journey to conservation, storage, documentation, and exhibition profoundly transform their meaning by means of altering the level of engagement by the onlooker. The shift in the epistemic framework will be examined in this paper through selected examples from major museum collections. Tracing the changes stemming from reconstruction, mounting, classification, and display, material and perceptual ontologies of the cups will be examined as a case study for afterlives of archaeological objects in museum collections. Recast as arrested visual cues instead of functional containers, the zoomorphic vessels behind glass appear as small-scale animal figurines to be admired only aesthetically. Lost in this transition is the active role of the ritual object, which will be pursued in contemporary textual and material culture.

856. The excavation as a material object – models in archaeological exhibitions

Authors: Charlotte Schreiter (LVR-Landesmusem Bonn)
Format: Oral

For almost 200 years, analogue models have been an indispensable part of archaeological museums and exhibitions for communicating and visualising complex excavation situations. They make it possible to comprehend large-scale situations on a small scale and to locate the finds, which are often exhibited in close proximity. These models thus have a variety of functions: they document findings, reconstruct buildings and terrain situations, and provide insight into historical living environments. As a rule, they reflect the state of research at the time of their creation. Produced at great scientific and financial expense, they often remain in the corresponding exhibition contexts for decades, even when knowledge about the subject of research has changed. The lecture will present various types of models from a historical perspective in order to answer the question of the extent to which the excavation itself experiences an afterlife as an archaeological object in visualisation. The focus will be on the interplay between models, objects,

text and possibly also graphic representations, and their impact on communicating archaeological contexts to a broad audience.

496. The Rongorongo Tablets in the Weltmuseum Wien: Object Biography and Colonial Provenance

Authors: Peter Rohrbacher (Austrian Academy of Sciences)
Format: Oral

This paper explores the diachronic object biography of the two Rongorongo tablets at the Weltmuseum Wien from combined object-biographical and object-agency perspectives. Acquired in the context of the German SMS Hyäne expedition (1882) via Alexander Salmon Jr. and Heinrich August Schlubach, the tablets demonstrate how colonial collecting practices, shifting interpretations, and evolving museum classifications influence the significance and epistemic status of archaeological artifacts. This study focuses on the material and medial afterlives of the tablets, including squeezes, plaster casts, photographs, publications, and ongoing digital 3D documentation. It traces how these objects have been continuously reproduced, mediated, and recontextualized. The tablets' interpretive history, ranging from early diffusionist interpretations and transoceanic contact hypotheses to independent invention models supported by recent radiocarbon dating, exemplifies how museum practices actively construct and reconstruct the epistemic agency of these objects. Examining the interplay of physical artifacts and their textual and visual representations highlights the hybrid archaeological-ethnographic nature of the Rongorongo tablets, which are both prehistoric writing media and colonial collection objects. The study offers insights into how post-excavation contexts, such as museums, mediate knowledge production and participate in shaping the resonant pasts of material culture.

2343. Post-excavation public imaginaries and itineraries of seals and sealings of the Indus Valley Civilisation

Authors: Swati Chandra (Indian Institute of Technology Kanpur)
Format: Oral

This research explores the Indus Valley Civilization (IVC) seals and sealings within their post-excavation contexts, tracing their journeys as they have evolved into various material and interpretive expressions. While IVC seals and sealings have predominantly been studied within the framework of their ancient origins, uses, and value, their post-excavation lives have forged distinct paths of significance, encompassing archaeological, art-historical, commercial, and national dimensions. Throughout these re-engagements, seals have navigated different scholarly interpretive frameworks shaped by colonial, post-colonial, and decolonial trends. This study highlights IVC seals in two distinct roles: as a colonial cultural imaginary and as a postcolonial cultural commodity, both influenced by spheres of publicity and sensationalism. By emphasizing IVC seals within the socio-cultural context of early 20th-century colonial archaeological publicity and the post-colonial drive for nation-building, this paper reveals the intricate ways in which these artefacts and their narratives are interconnected in the formation and dissolution of national and global identities. By revisiting archival and publicity broadcast instances, the study underscores how artefacts, in their post-excavation lives, continuously transform and emerge with varying meanings, identities, and social positions. Adopting an object itinerary approach, the study examines how IVC seals navigate these two roles, acquiring or losing value and accumulating new layers of meaning through their interactions with ideologies, perceptions, and disciplinary methods. The research views the seals as active agents in the social processes of constructing and deconstructing the meanings they represent. The examined itineraries demonstrate the profound interconnection between the artifacts and their narratives in shaping national and global identities. Ultimately, this study enriches our understanding of material culture while shedding light on the role of archaeological artifacts in producing, sustaining, and shifting broader cultural, political, and social narratives.

1139. The Afterlives of a Wartime Excavation: Museum Practices, Documentation, and the Changing Meanings of a Chernyakhov Collection

Authors: Dmytro Teslenko (Universalmuseum Joanneum Graz)
Format: Oral

In 1943, during the Nazi occupation of Ukraine, a "Gothic" burial ground was excavated near the village of Novooleksandrivka on the Dnipro River. The post-excavation afterlives of the artefact collection included conservation and processing in the Museum of Early History of the Dnipro, its transfer to Germany, and partial restitution to the USSR in the 1960s. The most "valuable" artefacts were not returned. Only the ceramic assemblage was brought back, first to the Mykolaiv City Museum and later to the Dnipro Museum. The ceramics were displayed as artefacts of the Chernyakhov culture and became an object of scholarly analysis only in the 2010s, in connection with growing interest in Nazi cultural policies. This collection represents not a stable archaeological assemblage, but rather the result of successive institutional and documentary practices. Wartime excavation, forced displacement, restitution, museum inventory practices, exhibition, and delayed academic research created different "afterlives", in which the collection was repeatedly redefined in terms of value, identity, and epistemic authority. The absence of associated finds and the incompleteness of field documentation contributed to a long suspension of interpretation. Theoretical interpretations depended on prevailing scholarly paradigms. Initially, the collection was interpreted by German scholars as "Gothic"; later, its interpretation depended on Soviet and post-Soviet archaeological frameworks, which conceptualised the Chernyakhov culture in different ways. The provenance of the collection was also a politically sensitive and often avoided topic in the Soviet period. By tracing the evolution of a network of textual and visual sources – from field reports and museum inventories to exhibition narratives and later publications – this Abstract demonstrates that archaeological knowledge is produced unevenly through post-excavation practices. The case highlights

the limitations of object agency shaped by political and institutional contexts and shows how archaeological heritage is continuously reconstructed and recontextualised within museum and heritage settings.

1540. Mutably Displaced Objects: Archaeological Afterlives of Forced Migration in Museum Contexts

Authors: Hadiqa Khan (University College London | Pitt Rivers Museum)
Format: Oral

This paper introduces the concept of mutably displaced objects to examine how objects associated with forced migration acquire shifting meanings, agencies, and ethical valences as they circulate through museum and archival systems. While object biography approaches have been central to understanding how objects accrue value across social contexts, they often presume a relatively linear or stage-based life history. By contrast, mutably displaced objects foreground non-linear, recursive, and institutionally mediated transformations, where displacement is repeatedly reactivated rather than resolved. Drawing on contemporary archaeology, material culture theory, and critical museology, the paper argues that objects linked to forced migration are not simply documented after displacement, but are continually displaced anew through practices of collecting, cataloguing, conservation, exhibition, and digital remediation. These post-excavation processes generate dense textual and visual afterlives (inventory records, exhibition texts, photographs, databases, and media outputs) that materially reshape what the object is understood to be and do. Using the Pitt Rivers Museum as a case study, this paper traces how everyday items carried during flight or created in refugee camps are reframed as evidence, testimony, or humanitarian symbol. Unlike conventional object biography, which often emphasises accumulation of meaning, the concept of mutability highlights instability, epistemic contestation, and ethical tension. Objects do not move toward closure but remain suspended between personal history, institutional authority, and public affect. By testing archaeological theories of object agency, temporality, and material presence in museum contexts, this paper demonstrates how displacement persists as an ongoing material condition. It contributes to debates on archaeological afterlives by showing how heritage is continuously reconstructed through practices that simultaneously care for, transform, and control displaced material worlds.

2521. Afterlives of Jericho's Objects: Textual, Visual, and Institutional Biographies

Authors: Ilia Salvaterra (Paris 1 Panthéon-Sorbonne)
Format: Oral

This paper explores the "afterlives" of artefacts excavated at Tell es-Sultan, ancient Jericho, through a complementary biographical approach that integrates material culture theory with archival and museological analysis. Excavated during multiple campaigns throughout the twentieth century, the objects from Jericho were distributed through systems of excavation partage, institutional transfers, and museum acquisitions and are today dispersed across more than forty institutions worldwide. Their biographies extend far beyond excavation, unfolding across excavation diaries, field drawings, photographs, correspondence, museum inventories, conservation records, exhibition catalogues, and digital databases. This wide dispersion of both objects and archives forms a dense and fragmented network of sources, in which textual and visual documentation actively contributes to shaping object identities. The paper also interrogates what constitutes an "archaeological object" across time: which materials were selected, defined, and valued as objects during excavation, how these definitions have evolved, and how selection, distribution, conservation, and exhibition practices have transformed objects conceptually and materially. Particular attention is also given to restoration practices, histories of display, and movements within collections, as well as to moments of fragmentation, reassembly, and loss, when objects become known primarily through images or texts rather than direct access. By tracing these trajectories, the study highlights how archaeological objects operate as relational entities embedded in networks of individuals, institutions, and diplomatic contexts. It ultimately examines how object agency and identity have varied over the twentieth century, testing object-biography and materiality theories within concrete post-excavation and museum-based settings

2601. Expanding the study of archaeological museum materials through ancient DNA analysis

Authors: Mary Lucas – Claire-Elise Fischer – Stephen Wickler – Inger Alsos (Arctic University Museum of Norway, UiT-the Arctic University of Norway) – Antony Brown (Arctic University Museum of Norway, UiT-the Arctic University of Norway | School of Geography and Environmental Science, University of Southampton)
Format: Oral

Artefacts and bulk materials held in archaeological museum collections are an invaluable resource for understanding the human past. Biomolecular analysis of these items has the potential to evolve the way we interact with these materials. This study aims to use ancient DNA to examine materials held in museum collections to examine them as biomolecular reservoirs, holding information about their use history, past human lifeways, and advance how we interact with these materials in museum collections. As we are still understanding how different material types preserve ancient DNA, we analysed multiple object types from various storage conditions from NTNU University Museum and The Arctic University Museum of Tromsø. These objects include rope and daub from different time periods, held in the collections as well as a medieval wooden bowl, freshly excavated and stored under clean and controlled frozen conditions. Materials were analysed using both metabarcoding of plants and animals and shotgun sequencing. Results focus on a piece of unworked medieval rope that preserved DNA indicative of the use-history of the object, its depositional environment, and the storage environment at the museum. The material had a high number of marine species. These results, together with the archaeological context, suggest it was used on a fishing boat. How the results from the DNA analysis reveal information

about the depositional and storage environments will be discussed. Rope is often catalogued as bulk material in the museum collections, affecting how the item is processed and treated in the collections. This research has the potential to alter how we view and interact with this material as we gain more information from it at the biomolecular level. How these findings can further be included in the public museum databases to revise not just how we interact with these items physically but digitally will be discussed as well.

1335. Beyond Storage: The Many Lives of the Greek Pithos

Authors: Myrto Kokkalia (Postdoctoral Researcher, ULB)
Format: Oral

The transformations an object undergoes, such as wear, repair, or breakage, provide a material record of its entanglement with people. Pithoi, large earthenware storage vessels, although common in the archaeological record, remain largely understudied not only in relation to their primary function as storage containers, but especially in their broken, repaired, and repurposed afterlives. As valuable household assets, pithoi were rarely discarded when damaged but instead repaired and recontextualised, demonstrating their significance across generations and positioning them as objects with multiple biographies. This paper offers a dual perspective on the afterlives of pithoi. First, it examines how material transformations following breakage reveal changing functions and values. It engages in a re-examination of both published and unpublished material through the lens of object biography, aiming to understand the extended lives and social agency of pithoi. Case studies, from the Aegean islands and Mainland Greece, include repaired pithoi with lead clamps, pithos fragments reused as building material in workshops, as well as for wellheads, chimneys, water pipes, or basins. Ethnographic parallels are also incorporated to reflect on the long-term continuity of reuse practices. Second, the study considers the afterlives of pithoi as mediated through post-excavation processes (conservation, documentation, exhibition), focusing on how museum displays and catalogues highlight complete vessels, emphasising their monumental size and static significance. Such choices recontextualise pithoi, foregrounding particular aspects of their form while leaving other histories less visible. Using case studies from archaeological museums in Greece (Tenos, Herakleion, Sparta, Thessaloniki), this research revisits the visual depiction of pithoi, exploring how curatorial decisions, cataloguing, and exhibition practices shape, and at times limit, our understanding of their material histories and social significance. Ultimately, the study aims to highlight the multiple narratives pithoi carry across time, revealing their layered histories that extend from their original use through ongoing documentation and display.

275. Excavations reports: timeless tools fit for the twenty-first century?

Authors: Kathryn Meheux (University College London)
Format: Oral

Excavation reports (also known as site reports) are the bibliographic building blocks of archaeology. Seemingly the most ubiquitous and innocuous of literary formats, they record the processes and products of archaeological excavations, providing access to the archive and tying results together in coherent narratives. They are consulted and consumed by archaeologists, museum and heritage specialists, universities, and the public throughout the world. Yet their familiarity has bred indifference. Whilst important new approaches to excavation, for example archaeological ethnography, and new interests in story-telling and performance have arisen, we rarely ask questions about excavation reports and few attempts at innovation in their format or contents have been made. We show no interest in their origins and development and their astonishingly unchanged standard format, over a century old, goes unremarked. Most importantly, we neglect to question whether they remain fit for purpose for twenty-first century archaeology. This session reflects on these issues, revealing that excavation reports have a past of deep complexity, at once the product of European Enlightenment antiquarianism, late nineteenth century scientific endeavour, and colonialism. It queries whether a standard format developed to privilege visual illustration and artefactual data over most multisensory interpretation and scientific techniques is still versatile enough to support the complexities, diversities, and sophistication of modern archaeological practices and asks why the standard format remains both unchallenged and unchanged. Unpicking and critiquing the past and present of reports, the session also explores how we could do site reports differently and where new approaches could take us in creating multivocal, multisensory, participatory narratives for communities engaged in interpreting and presenting the past.

187 MATERIAL JOURNEYS AND NARRATIVES: INVESTIGATING THE LIFE HISTORIES OF PREHISTORIC STONE AXES AND OTHER OBJECTS

Theme: 1. Widening perspectives in material culture studies
Organisers: Lasse Sorensen (The National Museum of Denmark) – Tasos Bekiaris (University of Thessaloniki) – Michael Brandl (Austrian Academy of Sciences, OeAI) – Onur Bamyaci (Çanakkale Onsekiz Mart University)
Keywords: Biographies, Stone tools, Raw materials, Manufacture, Socio-economy, Meanings
Format: Regular session

SESSION ABSTRACT

Stone tools are fundamental markers for reconstructing past human activities and socio-economic behaviors. Among them, stone edge tools (axes, adzes and chisels) form a significant artefact category, employed in a wide range of activities including woodworking,

butchering, hide processing and mining. Reconstructing the life cycles of these objects from raw material procurement and manufacture, to use, maintenance, and discard or intentional deposition is, therefore, crucial for understanding the development of prehistoric socio-economic systems, as they are closely tied to the evolving needs of prehistoric communities. This session explores the dynamic biographies of materials as they move through diverse social, technological, and symbolic landscapes. Focusing on both common and exotic substances—such as jadeitite, marble, obsidian, and spondylus—we examine how materials acquire, transform, and enhance their identities through processes of extraction, production, exchange, use, and deposition. By mapping these journeys from the source to the place of deposition, contributors are invited to consider how communities actively engage with materials, shaping and reshaping their physical and cultural forms. We aim to foreground the discussion on how meanings are not inherent in artefacts but emerge relationally—through shifting forms of engagement. Through cross-cultural and interdisciplinary perspectives, this session invites dialogue on how the life histories of materials reflect broader social values, technologies, and interactions, illuminating the intertwined development of people and things across time and space. Contributions are encouraged to address among others the following points: 1. How the biographies of different materials are formed, altered, and enhanced during different processes and within different stages of their journeys. 2. How materials-both common and exotic- (e.g. various types of stone, marble, obsidian, spondylus etc) are treated by different communities. 3. How the meaning(s) ascribed to objects emerge, and change during their life-cycle, through manufacture, use and deposition.

CONTRIBUTION ABSTRACTS

2380. Perspective and the Order of Things in the Museum: A Hermeneutic-Philosophical Systematization Exemplified by Neolithic Stone Axes

Authors: Julia Menne (Niedersächsisches Landesamt für Denkmalpflege) – Michael Schultz (Independent Researcher)
Format: Oral

This paper addresses the interpretation of Neolithic stone axes and critically analyzes how they are staged as artifacts within the museum space. It contrasts two fundamental presentation strategies: on the one hand, the "cabinet presentation," in which objects are detached from their original context to facilitate a typological comparison, and on the other, the "in-situ presentation," which reconstructs the original context of use. To theoretically ground these approaches, the study draws on cultural-philosophical concepts of engagement, affordances, and semiotic networks. Within this framework, "perspective" is understood not merely as a visual viewpoint, but as an active means of ordering things. Against this background, the paper examines central questions: How does the chosen staging support the viewer in recognizing aesthetics and the ordering of objects? To what extent is this perception culturally mediated? Finally, the work addresses the epistemological challenge of whether a contemporary museum perspective can claim objectivity, or if reliving the original user experience remains an illusion due to historical distance. The aim is to re-evaluate the interaction between museum presentation and the construction of subject identities.

2273. Material interplay: antler and stone axes in the Baltic Sea region during the Mesolithic

Authors: Aija Macane (Stockholm University | University of Latvia | Klaipeda University | University of Tartu) – Erika Rosengren – Joan Leffler (Historical Museum at Lund university) – Björn Wallebom (National Historical Museums) – Sara Gummesson (Stockholm University)
Format: Oral

This paper investigates the material interplay between antler and stone axes in the Baltic Sea region during the Mesolithic, with particular attention to how raw material availability shaped technological choices and cultural practices. While axes and adzes are commonly manufactured from a range of lithic materials, several areas around the Baltic Sea lack suitable stone, possibly prompting the use of osseous resources for the production of these tool types. Drawing on new analyses of antler and bone assemblages from the region, this study examines how antler functioned not only as a substitute for stone but as a complementary material with distinct mechanical and functional properties. By comparing raw-material selection, manufacturing techniques, and depositional contexts, the research emphasizes that hunter-fisher-gatherer communities made raw material decisions based on task requirements, resource availability, and/or cultural preferences. The resulting material interplay accentuates broader themes of adaptability, mobility, and resource management in postglacial landscapes but also raises questions of preservation and the "hidden" archaeological record. Antler and stone axes emerge as components of an integrated technological toolkit that reflects the ingenuity and ecological responsiveness of Mesolithic groups across the Baltic Sea region.

2357. Lithic chopping tools of Russian Karelian type: From quarry to deposition in "sacred" and profane contexts

Authors: Alexey Tarasov (—)
Format: Oral

The industry of chopping tools (axes, adzes, chisels) of the Russian Karelian type, which were produced on the western shore of Lake Onega during the Eneolithic period from local volcanic rocks, can be regarded as a striking phenomenon of exchange-oriented production in the Early Metal Age. Items of this type, which were distributed across a vast territory of Northeastern Europe through exchange operations, have been found in various contexts, including primarily workshops, settlements, with a very significant

portion of stray finds – objects that are lacking archaeological context as such but deposited in various landscape situations. The paper discusses their generalized life histories from rock procurement and making these tools to final discard / deposition. Analysis of the features of items from different contexts shows that stray finds generally exhibit higher quality compared to those from settlements, which can evidently be seen as evidence of intentional non-utilitarian actions accompanying their deposition.

1278. Polished stone artefacts of Jomon in Japan: Distribution and transportation of nephrite and jadeitite from a geological perspective

Authors: Yoshiyuki Iizuka (Institute of Earth Sciences, Academia Sinica | Tohoku University)
Format: Oral

In East Asia, the production and exchange of polished stone artefacts, made of nephrite, was active during the Neolithic. However, their utilization, distribution, and transportation are still little understood. In this study, a series of lithological investigations of polished axes and ornaments carried out by non-invasive chemical analyses using p-XRF and SEM-EDS, focusing especially on nephrite and its geological sourcing in the Early Jomon period (ca. 5000-3500 BCE) in Japan. The results show that large quantities of S-type (Serpentine origin: actinolite dominant) nephrite artifacts distributed in central and northeastern Japan, and limited numbers of D-type (Dolomite origin: tremolite) nephrite were also identified based on mineral chemistry. Early Jomon polished stone axes were mostly made of S-nephrite, its associated rocks, hornblendite, and actinolite-epidote schist (so-called Aotora-stone). Ornaments, in contrast, were made of monomineralic rocks, mostly talc, and, also tremolite (D-nephrite), jadeite, pyrophyllite and muscovite. The use of D-nephrite and pyrophyllite was almost exclusively limited to the Early Jomon period. D-nephrite ornaments, slit earrings and their fragments, were confirmed in only Early Jomon sites, but disappeared after the Middle Jomon period. Typological studies suggest that such white slit earrings originated from farming societies in northern China, such as the Xinglongwa culture (ca. 6200-5400 BCE). Geological evidence with mineral chemistry indicates that D-nephrite is not from domestic deposits in Japanese archipelago but from eastern Eurasia. Thus, analytical results support the hypothesis of material transportation from the East Asian mainland. Conversely, S-nephrite tools widespread in East Japan, mostly axes and chisels, were sourced from local deposits in north Central Japan; the same geological area as jadeitite. From the middle Early Jomon period onward, jadeitite (jadeite and omphacite jade) began to be used for pendants; appearing later than talc and S-nephrite use. This may suggest advances in stone processing technology.

2389. Papa was Rolling Stones – Investigating Procurement and Curation of Ground Stone Tools in Central Anatolia and Upper Mesopotamia

Authors: Keshia Akkermans (University of Liverpool)
Format: Oral

Set in the evolutionary whirlwind of the Pre-Pottery Neolithic A, the communities that inhabited the central Anatolian sites of Pınarbaşı and Boncuklu Höyük, as well as the Upper Mesopotamian site of Mendik Tepe, showcase remarkable variety in their ways of life and site use, including their choices regarding subsistence, settlement size, and patterns of occupation. The three sites are located in markedly different kinds of environments – from ancient wetlands to areas not unlike Braidwood's "hilly flanks" – and this appears to have had its effects on the procurement, fabrication, and use of objects made of stone. What materials were sourced for use in ground stone tools at these sites? Does increased distance from material sources evoke a greater sense of value of said material? If so, how does value manifest itself? And does the choice of material change over time, with the introduction of new technologies? This paper will provide a broad overview of the complex and dynamic interplay between ground stone tools, their makers, and their users, set against the backdrop of some of Türkiye's most significant areas of PPNA activity.

1446. Symbolism of Ground Stone Tools in the Northeastern Aegean: Practises from Gulpınar

Authors: Onur Bamyaci (Canakkale Onsekiz Mart University)
Format: Oral

This work explores the functional and symbolic practices of ground stone tools and objects at Gülpınar, a Late Neolithic–Chalcolithic settlement (5320-4940 BC) in northwestern Anatolia, within the Aegean chronological framework. Typological and contextual analyses demonstrate that ground stones held significant ritual and social meanings beyond their utilitarian roles in food preperation. Their deliberate placement within architectural contexts—such as burials, pits, foundations, walls, and interior spaces—reveals patterned practices reflecting beliefs in fertility, protection, and continuity. Evidence of deliberate fragmentation and structured deposition suggests that ground stones actively participated in ritual activities, marking their transformation from functional implements to symbolic objects of commemoration. The embedding of these artifacts in architectural foundations and walls is interpreted as a form of offering or protective rite, while their occurrence in burials and pits points to connections with ancestor veneration and domestic identity. These practices illustrate the deep integration of material culture, ritual activity, and social memory in Chalcolithic Gülpınar. The study contributes to a broader understanding of the symbolic dimensions of utilitarian tools in prehistoric Anatolia and emphasizes the need for a unified methodological and typological framework for interpreting the multicultural significance of ground stone assemblages.

1627. Crafting Communities: Stone Edge Tool Technologies and Traditions in Neolithic Kastoria

Authors: Tasos Bekiaris (Aristotle University of Thessaloniki | Hellenic Ministry of Education, Religious Affairs and Sports)
Format: Oral

Macrolithic stone edge tools such as axes, adzes, and chisels have long been recognized as vital elements of Neolithic material culture, offering crucial insights into everyday life, technology, and social practices. Beyond their practical roles in woodworking, cutting, scraping, and digging, these tools reflect choices related to raw material procurement, technical knowledge, skill transmission, and social meaning. Examining how edge tools were produced, used, maintained, and discarded provides valuable perspectives on the economic strategies and social practices of early farming communities. This paper focuses on the stone edge tool industries of Neolithic communities in the Regional Unit of Kastoria, exploring the diverse ways in which axes, adzes, and chisels were produced, used, and discarded within different social contexts. The discussion is based on a comparative analysis of stone axe assemblages from three Neolithic settlements in the Kastoria region—Dispilio, Avgi, and Koromilia. By comparing assemblages from these broadly contemporary settlements, we aim to move beyond site-specific interpretations and identify patterns at both community and regional scales. This approach allows us to distinguish shared technological traditions from local practices and to assess whether differences in raw material selection, manufacturing techniques, tool forms, and use-wear reflect environmental constraints, functional needs, social identities, or interaction networks. In this way, stone edge tools provide a lens through which to explore not only technological organization but also mobility, exchange, and the social relationships linking Neolithic communities in the Kastoria region.

2658. Pieces of Places: The Discovery of Novel Neolithic Exchange Networks in the Aegean

Authors: Lasse Sorensen (The National Museum of Denmark) – Michael Brandl (Austrian Academy of Science) – Onur Bamyacı (Çanakkale Onsekiz Mart University)
Format: Oral

The polished stone tools of the Eastern Mediterranean were crafted from both common and rare materials, with jadeitite standing out as one of the most exceptional. Despite its significance, the origins of the jadeitite sources exploited in the Aegean were until recently unknown. Recent archaeological and geological surveys within "The Jade Odyssey Project" conducted by a Greek-Danish team with international collaboration on the Cycladic island of Syros, Greece, have revealed previously unknown jadeitite quarries and associated sites. These discoveries provide a groundbreaking opportunity to explore the procurement, production, and distribution of jadeitite tools, illuminating the interconnected exchange networks that spanned within local, regional, and super-regional scales. This paper presents the first preliminary findings from our investigations on Syros, addressing critical questions about when, how and why the exploitations took place and the origins of jadeitite tools and their role in the cultural and economic landscapes of the Eastern Mediterranean. By mapping the scale and practices tied to jadeitite exploitation, we aim to reconstruct the pathways of exchange and uncover some significantly symbolic practices of this desirable and rare raw material in Neolithic societies across the Aegean.

1914. From Stone to Network: The Rise of Sesklo and Dimini as Neolithic Hubs of Exchange

Authors: Michael Brandl (Austrian Academy of Sciences) – Lasse Sørensen (The National Museum of Denmark) – Katia Manteli (Hellenic National Archaeological Musuem)
Format: Oral

This paper explores the material biographies of stone axes, adzes and chisels within Neolithic exchange networks of the Aegean, focusing on how their meanings and social roles were shaped through production, circulation, and use. The main goal of this study is to examine the scale and provenance of the raw materials used to produce these artefacts at the major Thessalian sites of Sesklo and Dimini to investigate how specific materials were embedded within broader networks of interaction. Approximately 800 polished stone tools from these sites excavated in the early twentieth century and curated in the National Archaeological Museum of Athens were analysed using a strictly non-destructive analytical protocol combining portable X-ray fluorescence (pXRF) and Fourier Transform Infrared Spectroscopy (FTIR). This integrated approach allows both high-precision raw material characterisation and the identification of source-specific spectral signatures. These signatures allow artefacts of unknown origin to be systematically compared with geological reference materials in order to assess their most probable provenance. Our preliminary results show that although most tools were made from regionally available lithologies, a significant minority were produced from non-local metamorphic rocks and jadeitite. While the sources of most non-local lithic raw materials are still unidentified, jadeitite predominantly originates from the island of Syros, a well-established source of this material. Notably however, even more common raw materials such as serpentinite and dolerite were frequently transported over distances of 20–30 km although suitable alternatives were locally available. We propose that Sesklo and Dimini functioned as nodal points within a dynamic exchange network in which specific materials circulated as socially meaningful objects, whose biographies linked technological practice with social affiliation, connectivity, and value across the Neolithic Aegean.

2414. Small Tools, Long Lives: Ground stone cutting tools from the Early Bronze Age Settlement at Koropi

(Attica)

Authors: Maria Mexi (Ephorate of Antiquities, Greek Ministry of Culture)
Format: Oral

This paper focuses on stone tools with cutting edges from the Early Bronze Age settlement at Koropi (Attica, Greece). Despite their limited number, these small-sized artefacts reveal rich and complex life histories—from raw material selection and manufacture, to use, reuse, transformation, and eventual deposition. The study argues that these tools were not merely functional implements, but were embedded in broader economic and socio-material practices. Made primarily from fine-grained igneous and metamorphic rocks—materials not locally available in the geological context of the prehistoric site—these tools exhibit typological and technological affinities with comparable assemblages from central and southern mainland Greece. The ground and polished cutting tools from Koropi, used as axes and adzes, along with other edge-tools employed in crushing or pounding activities, show intense use-wear, signs of repeated maintenance, and in some cases, clear evidence of functional transformation. Macroscopic examination of their active surfaces reveals that many were used to the point of raw material exhaustion, with some subsequently repurposed for alternate uses. These characteristics suggest that their perceived value extended beyond their immediate function, encompassing the significance of the material itself. Their dispersed spatial distribution across the site—often with no direct association with other tool categories—further points to diverse roles, potentially including symbolic or curated uses. The prolonged use-life of these tools and the evident care invested in their repair and processing underscore their importance within the domestic sphere and raise questions about the cultural meaning of raw material selection. By reconstructing the biographies of these objects, this study contributes to broader discussions on how prehistoric communities engaged with materials, and how even artefacts could embody both practical utility and culturally embedded significance throughout their lifespan.

1456. Flat Adzes in Motion: Wear Trajectories, Function, and the Emergence of a Key Neolithic Prototype

Authors: Laura Dietrich (Martin-Luther-University Halle-Wittenberg) – Christoph Von Tycowicz – Julius Mayer (Zuse Institute Berlin) – Lohengrin Baunack (Martin-Luther-Univesity Halle-Wittenberg) – Michael Brandl – Iris Schmidt (Austrian Archaeological Institute)
Format: Oral

Flat adzes are central implements of the Early Neolithic in Central Europe (LBK and SBK). Their emergence raises the question of whether a functionally efficient woodworking prototype—potentially developed within south-eastern European Neolithic contexts during the second half of the sixth millennium BCE—was adopted and stabilized in Central Europe, or whether flat adzes represent a locally generated innovation. Ground and polished stone adzes were already integral to forest management and carpentry in south-eastern Europe, providing a plausible technological background for such a prototype, but its role in the formation of the Central European assemblages remains to be critically assessed. The widespread and persistent occurrence of flat adzes within the LBK suggests the circulation of a proven technical solution through expanding farming communities, rather than the diffusion of a stylistic template. Once established, the design persisted because its geometry was effective and resilient, allowing repeated resharpening without functional loss. The morphological diversity observed archaeologically is best understood as the cumulative outcome of use, maintenance and discard, representing successive wear states rather than discrete cultural types.

2470. Transforming and appropriating exotics: A longue durée study on the appropriation of exotic flint in the Rhine-Meuse Delta (5500-2500 BCE)

Authors: Annelou Van Gijn – Lasse Van Den Dikkenberg (Leiden University)
Format: Oral

Combining use-wear analysis with raw material studies uniquely enables us to trace how exotic objects are appropriated by past communities. In this paper we explore the import and appropriation of exotic southern flint in the Rhine-Meuse delta from the Late Mesolithic to the Late Neolithic (5500-2500 BCE). The oldest exotic objects that were imported by communities in the delta were not used; rather, they were kept as 'pieces of places'. During the Middle Neolithic, exotic imported flints were incorporated into the local technological system. However, they were only used for specific activities, notably for fire-making, cereal harvesting, and ornament production. While they were thus put to use, they maintained a special position within the local technological system. It is not till the Late Neolithic Vlaardingen period that exotic flint items, and especially finished polished axes, are imported in higher quantities. These axes, when broken, were frequently recycled as cores for the production of small tools, which in turn were used for the same range of activities as non-exotic flint. Knapping experiments with such broken axes have shown that archaeologists have severely underestimated the importance of exotic flint for the delta inhabitants. The appropriation of exotic flint in the Rhine-Meuse delta was thus a gradual process that took place over the course of approximately three millennia, along with the increasing consolidation of contacts between the delta and inland communities.

1518. Different Ways of Being. The Quyarrying, Processing and Use of Metabasite Stone Axes in Central European Neolithic

Authors: Petr Sida (University of Hradec Králové) – Pavel Burgert – František Trampota (Institute of Archaeology of the Czech Academy of Sciences, Prague) – Antonín Přichystal (Masaryk University, Brno) – Václav Kachlík (Charles University, Prague)
Format: Oral

During the Early Neolithic period, an extensive distribution network using a specific raw material, contact metamorphosed metabasite, was established in Central Europe. This rock was quarryied and processed in several places in northern Bohemia, and subsequently distributed throughout wider Central Europe. The scale of the quarrying operation was so significant that the quantity of semi-finished polished tools produced was sufficient to supply a large part of the Linear Pottery culture area. A complex distribution system also emerged at this time, capable of transporting finished tools over hundreds of kilometres. The detailed form of this system is the subject of long-term research. Some localities where semi-finished products were finished are known, and there are indications that the size of distributed tools decreased with increasing distance (southern Bohemia was supplied via Bavaria and Upper Austria). However, we are not yet able to determine the system's exact structure. Excavations in Northern Bohemia have revealed extensive evidence of Neolithic quarrying, which has recently been documented using advanced mapping techniques (SLAM LIDAR). The age of the quarrying can be determined using radiocarbon dating of materials from contexts such as hearths, production workshops and quarrying pit fillings. In the Late Neolithic, we observe the breakdown of this complex system. Quarring on primary outcrops in the mountains of northern Bohemia probably ceased, new local raw materials emerged, and the number of secondary workshops producing ground tools locally increased. These workshops often reused older, broken Early Neolithic tools. The distribution system fragmented into many more local circuits, resembling the system used for producing chipped tools.

638. Stone in Motion: Use-Life and Recycling of Serpentinite Axes in the Neolithic

Authors: Bernadeta Kufel-Diakowska – Marcin Chłoń – Wojciech Bronowicki (Institute of Archaeology University of Wrocław) – Michał Borowski (Institute of Archaeology UMCS Lublin)
Format: Oral

Post-linear communities emerged in northern Central Europe in the second half of the 5th millennium BC. Transformations in cultural practices extended to lithic production, as demonstrated by the introduction of shaft-hole axes and an increased diversity in raw material procurement, with a marked emphasis on locally available rocks, particularly serpentinite. Stone assemblages from Lengyel culture settlements comprise complete, repaired, and fragmented shaft-hole axes, alongside extensively modified tools and reused by-products. The present study seeks to reconstruct the life cycle of serpentinite artefacts, with particular attention to the operational sequences linking the manufacture of shaft-hole axes to their subsequent use in heavily transformed and reduced forms. A multi-proxy analytical framework was employed, integrating morphometric, petrographic, technological, and use-wear analyses, complemented by experimental studies using serpentinite tools. The results contribute to the understanding of the organisation of production and patterns of use of serpentinite artefacts. This research was supported by the National Science Centre (NCN), Poland (project no. 2020/38/E/HS3/00285).

1620. Organisation of Neolithic Polished Stone Industry Production Based on the Research of Workshop Areas Processing Želešice-type Metabazite (Moravia, Czech Republic)

Authors: Jaroslav Bartík – Filip Hájek – David Cibulka – Kristýna Trnová (Institute of Archaeology of the Czech Academy of Sciences, Brno)
Format: Oral

Metabasic rocks of the Želešice-type were one of the most intensively utilized raw materials used for the manufacture of Neolithic polished industry in the Middle Danube region. Primary sources are located in the Ophiolite Belt (formerly Metabasite Zone) of the Brno Batholith, approximately 5 km SW of Brno. The paper focuses on issues of production organisation of the polished stone industry made from Želešice-type metabazite, based on the study of workshops that processed this raw material and that can, on the basis of current knowledge, be hierarchised into several categories. The investigation of workshops is crucial for understanding Neolithic production systems, as these sites linked the exploitation of raw material sources with the manufacture of semi-finished products intended for further distribution into settlement contexts. The aim of the study is to contribute to the theoretical discussion on the internal structure of workshop areas and the spatial organisation of production activities. The analysis is based on data obtained from multiple workshops located in the wider vicinity of primary metabazite outcrops, with particular emphasis placed on the spatial distribution of workshop waste. Both spatial distribution and related assemblages were analysed by machine learning statistics. By examining the concentrations of individual categories of production debitage, semi-finished products, and associated material, potential production zones and areas of specialised activities are identified. These spatial patterns are interpreted within the framework of the technological chain (chaîne opératoire) and allow for a discussion of the degree of spatial differentiation of production activities. The absence or limited occurrence of final production stages supports the interpretation of workshops situated near the primary raw material source as sites primarily oriented towards the production of semi-finished products, which were subsequently ground and finally finished in the context of secondary workshops located further away from the source.

2121. The journey of early Neolithic copper axes and their impact on the contemporary material culture

in Scandinavia

Authors: Anne Birgitte Gebauer (National Museum, Copenhagen)
Format: Oral

A large amount of copper appears in southern Scandinavia during the early Neolithic Funnel Beaker Culture (4000-2800 BCE) with an obvious peak around 3500-3300 BCE even though local copper sources were not available. According to recent analyses the metal was extracted in Serbia and Bulgaria but perhaps passed on through intermediaries in the eastern Alpine area. The Scandinavian copper objects show several characteristics that are alien in the areas where the copper originated. Consequently, the imported objects must have been remelted and used in the production of new objects matching local preferences. Evidence of local metallurgy is provided by a crucible and a possible tuyere found beneath a long dolmen. These artifacts document the introduction of pyrotechnical metallurgy 1500 years before the Bronze Age in Scandinavia. Copper was only used in prestige items as jewellery and weapons, mainly flat axes, but not in everyday utensils such as awls and fishhooks. The exotic copper items had an immense impact on the contemporary material culture with copies being made in a range of raw materials even after the copper supplies ran out around 3300 BCE. – The journey of the Early Neolithic copper in the North is an example of the transfer of knowledge and raw materials through vast pan-European as well as local networks. Additionally, communication of pyrotechnical knowledge would only be possible through direct personal instruction and perhaps restricted to certain members of society. This paper discusses the impact of the copper import on the material culture in the North as reflected in types of weapons and jewellery as well as the socio-economic role of these items. Moreover, other aspects of knowledge exchange in the supra- regional networks will be considered.

2355. Craft, Context, and Change: The Multiple Lives of Stone Battle Axes in Third-Millennium-BCE Finland

Authors: Kerkko Nordqvist (University of Helsinki | University of Tartu, Estonia)
Format: Oral

Coastal areas of Finland represent the northernmost extent in the distribution of the Corded Ware complex in Europe during the 3rd millennium BCE. In this region, unlike many others, the phenomenon emerged in a northern boreal environment inhabited by diverse hunter-fisher-gatherer communities. The area is further characterised by varied bedrock (part of Fennoscandian or Baltic shield), encompassing a range of igneous and metamorphic rocks. Within these settings, Finnish CWC groups and craftspeople developed a distinctive local tradition of producing battle axes (also termed hammer or boat axes). This tradition is particular not only in the forms and morphology of the axes, at most partially comparable to neighbouring regions of Sweden and Estonia, but also in the deliberate and regionally focused procurement of raw materials. At the same time, parallel to or underlying the similarities, there are trends that suggest changing meanings, expressed, for instance, through different deposition patterns, direct imitation, as well as reworking and reuse. Traditional views have often approached the axes though the lenses of status, violence, and burial, but have rarely ventured further. This contribution explores the qualities and potential meanings of stone battle axes found in Finland by examining the artefacts themselves, together with aspects of the social and physical contexts in which they were produced, used, and discarded.

188 URBAN DESIGN AND REGIME CHANGE

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Penelope Davies (University of Texas at Austin) – Christina Williamson (University of Groningen)
Keywords: Regime, Urbanism, Architecture, Dissent, Control
Format: Regular session

SESSION ABSTRACT

The broad impact of autocratic government on ancient cities, and indeed on cities throughout history, is well acknowledged: urban designs are often modified, sometimes radically. In a time of rapid political change across the globe, this session aims to explore, at a more granular level, any urban and/or architectural causes, mechanisms and results of ancient regime change. Scholars long believed, for instance, that the Hippodamic plan of the classical Greek city, thought to reflect democratic ideals, came to an end with the rise of kingdoms and presumed loss of autonomy; but is this the case? And how can we situate the massive scale of public monuments, not only under Greek tyrants, but increasingly sponsored by the Rome-centred elite in the East (e.g. Heller and Hallmansecker 2024, Ma 2025)? With the start of the principate, Rome grew if not more regularised in design, at least more monumental in its public spaces (e.g. Favro 1996), but what kinds of urban discontent led to political instability, how vulnerable were urban designs to sedition (e.g. Hobsbawm 2005), and what kinds of urbanistic change helped control or suppress political dissent? Beyond the euergistic provision of 'bread and circuses', articulated by Paul Veyne (1976), and the supply of water, how did local elites use urban form to propel political shift? What were the means of popular and elite seduction, as articulated in architecture? And what, in the ancient world, were the urban manifestations of regime change, abrupt or gradual? Topics might cover monumental construction and filtered access, but also urban narratives and associations, provisions for food or health, changes in housing or living standards,

or architecture of control and fear.

CONTRIBUTION ABSTRACTS

2540. Total City Planning: Urban Design and Regime Change in Akragas and Metaponto

Authors: Seraphina Vasilodimitrakis-Hart (Aristotle University of Thessaloniki)
Format: Oral

This paper examines the water resource management in two Greek colonies in Magna Graecia, Akragas and Metaponto, and the relationship between resource management and political regime. I ask how similar ancient urban theory was to the practical reality, and if and to what extent different forms of government made different provisions for water management. By outlining urban and health theories found in the works of ancient theorists, I disavow the term "Hippodamian grid planning," while introducing the concept of 'total' city planning. The focus of Classical scholarship on Athens necessitates discussions of several Athenian water systems and how resource management changed or continued through different governments in Athens as a point of comparison for Akragas and Metaponto. This is constructed through literary analysis and introduces the controversial Southeast Fountain House, with an in-depth consideration of the fountain's naming and dating problems. The role of tyrants and democracies in water management is examined through the lens of these two cities with comparison to Athens. Regardless of authorship, water resource management and water systems are necessary for any city, and so most tyrannical water infrastructure continued to be used and improved upon under different governments. Even under tyranny water management is a provision of the state and is engaged with and managed by the citizens of the city.

2698. Urban transformation at Teotihuacan: from a more exclusionary power strategy to a more collective governance

Authors: Maria Torras Freixa (Boston University)
Format: Oral

Teotihuacan (c. 1-650 CE), a pre-Hispanic city in Central Mexico, was unique in Classic period Mesoamerica for its size—with approximately 125.000 inhabitants living in an area of 25 km2—and for its grid-like plan divided into four sections by two large avenues and a civic-ceremonial center dominated by monumental pyramids. This urban site had a multi-ethnic population who lived in multi-family corporate apartment compounds, and it has been portrayed as a state with a more collective political strategy where inequality was present but not polarized. However, a more comprehensive view of the first phases of the city (1-250 CE) depicts a political shift from more exclusionary forms of governance to more collective ones. The primary aim of this contribution is to discuss the urban manifestations of this shift and how urban design and new forms of housing helped to consolidate the new government system. During this change, the city was redesigned and monumentalized, and the settlement achieved a high degree of urban planning and coordination and standardization among buildings and spaces. In addition, residential architecture was politically controlled or coordinated through urban regulations and access to construction materials. In summary, the architecture forms and the urban design of the city underwent a profound transformation due to a political shift.

2799. 'It is safer to be feared than loved': Augustus's Rome as a city of menace

Authors: Penelope Davies (University of Texas at Austin)
Format: Oral

In 27 BCE, according to Cassius Dio (53.16), before settling for 'Augustus' the young Octavian 'was exceedingly desirous of being called Romulus'. He was only deterred from his efforts to obtain the title 'when he perceived that this caused him to be suspected of desiring the kingship'. Romulus made an attractive model; the city's founder, he was also a valiant warrior, and departed mortal life in a dark cloud of apotheosis while reviewing his troops; thereafter he was a god, Quirinus. But there was also a more sinister aspect to his story, which scholars tend to downplay. When Remus mocked Romulus's city walls, Romulus murdered his own twin brother: Romulus was a fratricide. And yet, Romulus did not vanish from Augustus's political narrative; in fact, he featured prominently, especially in Augustus's architectural oeuvre. To name a few examples: references to the divinisation of the city's founder were implicit in the placement of two early monuments that alluded to Augustus's desired 'afterlife', his Mausoleum and Agrippa's Pantheon; and, decades later, a sculpture of Romulus bearing the spolia opima stood in an exedra in the Forum Augusti. That Augustus was ignorant of the darker tradition beggars belief: one of its chief purveyors was Livy, writing in his lifetime, and Ovid alludes to it as well. This paper dwells on the darker side of this and various other associations and themes emphasised in Augustus's urban propaganda (e.g., Apollo, victory), and argues that they served to instil in the urban populace a fear of resisting the new regime. To be sure, Augustus seduced the people with a gleaming city of marble, replete with generous acts of benefaction, but his public building can (and probably should) also be characterised as an architecture of political menace that, centuries later, Niccolò Machiavelli would readily have recognised.

2792. Monumental Women and the Urbanization of Augustan Power

Authors: Margaret Woodhull (University of Colorado Denver)
Format: Oral

It is well known that Augustan women gained exceptional public presence in the Augustan city, but the extent to which their unprecedented monumental benefactions helped facilitate that political transformation in the city itself is less scrutinized. This paper argues that the transition from republic to principate evolved not only through imperial fora, spectacle architecture, or the monumental self-fashioning of the princeps, but through buildings associated with imperial women that helped render dynastic power legible in the urban fabric. Focusing on the Porticus Octaviae and the empress Livia's broader program of benefactions, it examines how Augustan women's architecture materialized regime change through gendered practices of legitimation, memorialization, and spatial reordering. These monuments did more than honor elite female figures: they embedded the domus Augusta within Rome's public landscape and helped naturalize the social logic of dynastic rule. Taken together, these monuments suggest that Augustan urbanism operated not only through spectacle or coercion, but through subtler architectural modes of persuasion: ritualized movement, moralization, dynastic visibility, and the spatialization of kinship. The Porticus Octaviae demonstrates how Augustan power redirected republican monumental traditions into a new familial narrative, recoding an established urban zone through lineage, cultural display, and memory. Livia's benefactions reveal a complementary transformation mechanism that converted elite domestic and civic spaces into morally charged amenities achieved through restoration and civic repair, guided by an ethic of feminine virtue. Taken together, women's contributions indicate that Augustan urbanism operated not only through spectacle or coercion, but through subtler architectural modes of feminine persuasion. Monuments associated with imperial women were thus not peripheral ornaments of a new order, but key urban instruments through which Augustan power made itself familiar, persuasive, and enduring.

90. Early Christian Architecture and Urban Transformation in Dardania in Late Antiquity

Authors: Zana Hoxha (Institute of Albanology - Prishtina)
Format: Oral

This paper examines early Christian architecture as a material expression of ideological and political transformation in Late Antiquity, focusing on its role in reshaping urban and fortified landscapes. Framed within debates on urban design and regime change, the study argues that the emergence of Christianity altered existing spatial orders not through radical redesign, but through targeted architectural interventions that redefined access, movement, and symbolic authority. The central Balkans provide the primary context, with Ulpiana serving as a key case study. Here, the appearance of churches, martyria, and burial complexes within the Roman urban fabric reconfigured civic and ritual hierarchies, transforming the city into a space increasingly structured around Christian practices and authority. These developments reflect a gradual yet profound shift in how urban space was inhabited, perceived, and governed. Beyond urban centres, the paper addresses the rehabilitation of fortified landscapes during Late Antiquity, particularly the reuse of prehistoric and earlier hilltop castles. The construction of churches within or near these elevated sites represents a strategic convergence of defence, visibility, and ideology, converting long-standing loci of power into instruments of Christian legitimacy and control. Rather than treating early Christian architecture solely as religious infrastructure, this contribution situates it within broader mechanisms of governance, persuasion, and identity formation. By analysing how architecture articulated continuity and change, the paper demonstrates how regime change in the ancient world was materially inscribed into both cities and landscapes.

38. Did the kings invent a new urban architecture in the 4th century BC? The spread of theatre-like bouleuteria and Macedonia

Authors: Jordan Voillot (UMR 7044 Archimède, University of Strasbourg)
Format: Poster

In the study of Greek architecture, the emergence of a new architectural form or a new urban design is usually associated with the establishment of a new and strong political regime. In this way, the development of a first civic architecture and her monumental shape in the first half of the Vth century BC in Athens is linked to the birth of Athenian democracy. On the other hand, the construction of the Milesian bouleuterion, between 175 and 164 BC, is blended with the Seleucid king Antiochus IV. While the thesis of the royal origin of this building and its model can be rejected, a new study of the Greek bouleuteria sheds new light on the development of these buildings. The theatre-like bouleuteria, which feature sloping stone seats built in a long-axial rectangle room, appeared in the second half of the 4th century BC. This new design is accompanied by a new aesthetic, noticeable in the walls, their treatment and large windows. The spread of these buildings and their stylistic and technical particularities seem to suggest a Macedonian origin. This conclude is apparently paradoxical: this democratic "lieu du politique", where the boule held its meetings, knew a remarkable development in a kingdom. This result can be explained by the specific context of the time of the last Argead kings and the last decades of the 4th century BC. They brought stability, civic reforms and wealth to the cities of the kingdom during the activity of a great fertile and innovative architectural workshop. Thus, the advent and the spread of these buildings can be explained by local civic needs, which were specific to the democracies of that time, as well as the royal context – two scales that are interrelated.

189 MULTI-SCALAR STUDIES OF INEQUALITY AND DIVERSITY IN ANCIENT SOCIETIES

Theme: 7. Interaction, connectivity and mobility
Organisers: Kathryn Reese-Taylor (University of Calgary) – Felix Kupprat (Universidad Nacional Autónoma de México)
Keywords: Theory, Methods, Population dynamics, Political systems, Economics, Settlement patterns
Format: Regular session
Affiliation: Community for the Archaeology of the Americas - EAA4Am, Community for Urban Archaeology

SESSION ABSTRACT

In light of ongoing global debates surrounding social injustice, wealth distribution, and migration, archaeologists have renewed their focus on inequality and diversity in ancient societies. These topics invite comparative and multi-scalar analyses that connect household and community dynamics with regional and macro-regional processes. Such approaches reveal how inequality and diversity were created, maintained, or mitigated within ancient social, political, and economic systems. This session will feature contributions that operationalize inequality and diversity in archaeology by integrating multiple scales of analysis with critical theoretical and methodological perspectives. We invite authors to present case studies that explore the potential and limitations of these two concepts. We encourage emphasis on the interplay between inequality and diversity to ultimately address the question of how economic, social, and cultural differentiation intersected to shape lived experiences in the past. We especially welcome papers that engage with theoretical frameworks capable of refining these discussions, including economics, intersectionality, and network theory. Equally important are methodological advances that address long-standing challenges in the archaeological record: measuring wealth and access, reconciling contradictions between datasets, and identifying marginalized or underrepresented groups whose material traces are minimal. By integrating multi-scalar data, robust theoretical perspectives, and innovative methodologies, this session seeks to advance comparative studies of inequality and diversity in ancient societies and to strengthen their analytical and interpretive roles within archaeological research.

CONTRIBUTION ABSTRACTS

211. Quantifying Inequalities in the late Prehistory of Upper Mesopotamia: A Diachronic Application of the Gini Coefficient at Tepe Gawra

Authors: Marco Iamoni (University of Udine) – Riccardo Valente (CNR - Italy) – Francesco Venturoso (Sapienza University of Rome) – Sebastiano Bortoluzzi (University of Verona)
Format: Oral

Excavations conducted at Tepe Gawra (northern Iraq) during the 1930s yielded a vast body of data and finds, representing a milestone in the archaeological knowledge of northern Mesopotamia. However, this important corpus of information was recorded and made available mainly through analogue media, such as traditional printed publications. This paper presents a reassessment of the topographic data of structures documented during the Tepe Gawra excavations using open-source, well-established GIS tools, highlighting the potential of digitising archival documentation. The analyses focus in particular on the assessment of social inequality within the ancient settlement across the Late Pottery Neolithic–Late Chalcolithic phases, based on stochastic analyses of the geometric properties of architectural structures. The data extracted from these analyses are then explored through the application of the Gini coefficient in order to identify the patterns and dynamics of increasing or decreasing (in) equality over a period spanning the Late Pottery Neolithic and the Late Chalcolithic of Upper Mesopotamia. The results contribute to a renewed understanding of the site, providing new insights nearly seventy years after the last archaeological fieldwork activities.

1330. Houses, Communities, and Empires A Comparative GINI-Based Analysis of Wealth Distribution in Northern Italy

Authors: Gabriele Lamanna – Lorenzo Zamboni – Enrico Croce (Università degli Studi di Milano) – Mattia Fochesato (Università Bocconi)
Format: Oral

This paper offers a comparative investigation of long-term economic inequality in ancient Northern Italy, a region that provides an exceptional laboratory for examining how different political and economic regimes shaped wealth distribution over time. Spanning from the Early Iron Age to Late Antiquity, the study compares household-level inequality across subsequent socio-political configurations, from pre-Roman communities to Roman imperial integration and post-imperial transformations. Using a multi-scalar framework that integrates community-level with a regional, and macro-regional perspective, the paper provides the first quantitative proxies of inequality, i.e. the GINI index, from Northern Italian archaeological data. The analysis is based on a newly constructed, expandable database of residential structures and domestic buildings, covering approximately 1,500 years of evidence. This approach allows assessing both the synchronic difference between regions and the diachronic shift associated with changing political powers, economic integration, and urbanization processes. A particular focus is also on the methodological challenges, including data quality, excavation bias, and the visibility of underrepresented groups. The results highlight patterns of both continuity and rupture in

wealth concentration before and after Roman rule, demonstrating the potential of comparative, quantitatively grounded approaches to refine archaeological discussions of inequality, diversity, and lived experience in ancient societies.

2201. Household variability and the question of inequality in the Maya city of Calakmul, Mexico

Authors: Felix Kupprat (Universidad Nacional Autónoma de México) – Kathryn Reese-Taylor (University of Calgary) – Verónica Vázquez López (University College London) – Sofía Gutiérrez Rodríguez – Atasta Flores Esquivel (Universidad Nacional Autónoma de México) – Joshuah Lockett-Harris (University of Calgary) – Debra Walker (University of Florida)
Format: Oral

It has long been assumed that the emergence of complex societies and state formation on local and regional scales in Mesoamerica implied the development of pronounced inequality in wealth distribution. Influenced by Colonial accounts of a noble class and the materialist concept of class struggle, scholars have broadly used binary social categories of elite / non-elite to characterize social classes, although in recent decades there has been increasing interest in defining status and wealth on a fluent and dynamic spectrum. In this paper we integrate several proxies for inequality and cultural diversity in the larger urban Calakmul area that date from the Classic period (200–900 CE). Calakmul has long been assumed to have been high up on the scale of social complexity, at least in Mesoamerican terms, since it was the seat of one of the dominant hegemonic ruling houses of the Classic Maya. Nevertheless, our recent findings, based on large-scale settlement distribution, test excavations in residential areas, material analyses and legacy data, suggest that inequality may have been less pronounced than expected and that differences in household size and location may be related more to diverse and competing lifestyles and economic models than uneven wealth distribution. Since Calakmul features a great number of extensive, multi-courtyard domestic compounds, we furthermore argue that the predominant focus in Maya studies on wealth-differences between households should be complemented by measures of inequality withing large households.

2637. Bridging inequalities and diversity: Creating communities in an ancient Maya landscape

Authors: Jason Yaeger – M. Kathryn Brown (University of Texas at San Antonio) – Bernadette Cap (San Antonio College) – Rachel Horowitz (Washington State University)
Format: Oral

The Mopan River valley of western Belize was home to Maya farmers by at least 1000 BCE. Over the course of the 1st millennium BCE, society in that region became more complex, with the growth of social and economic inequalities and the development of hierarchical polities. By the Classic period (300-900 CE), the region was home to a series of small kingdoms, with capitals set in a landscape of dispersed urbanism marked by agricultural intensifications to support the large population. Archaeologists have long used differences in investment in domestic architecture and the content of household artifact inventories as proxies for economic differences and inequality. In this paper, we use LiDAR and excavation data to examine economic differences at two scales: within the small villages (8 to 25 households) that comprised the region's ancient landscape and within larger geographic zones (marked by differences in soil, slope, access to water and other resources) that comprised the region's heterogeneous landscape. In some of these zones, small villages show marked inequality; in others, they do not. We evaluate these differences in light of agricultural intensification and creation of landesque capital in each zone. We also discuss the diversity amongst the region's households—in economic pursuits, household composition, geographic origin, etc.—that is elided by a narrow focus on inequality. The social and economic dimensions of difference that marked ancient Maya society in this region required bridging, however, and its inhabitants engaged in commensal activities at multiple scales, including feasts in small villages; political and calendrical celebrations and rituals in hinterland focal nodes and in the capitals of the region's polities; and marketplaces in the regional capitals. Through their shared (but differential) participation in these activities, the region's inhabitants recognized their differences and their similarities at the same time, constituting communities through their shared activities.

2162. From egalitarian warriors to brokerage elites: multi-proxy evidence for early inequality in La Tène Central Europe (4th–3rd c. BCE)

Authors: Alzbeta Danielisova – Daniel Bursák – Samuel Kertés (Institute of Archaeology of the CAS Prague) – Eleftheria Orfanou – Zuzana Hofmanová (Max Planck Institute for Evolutionary Anthropology) – Jana Čimářová (Moravian Museum)
Format: Oral

We propose a multi-proxy study on how inequality and diversity formed in Central Europe (Bohemia and Moravia, Middle Danube/Amber Road corridor) between the 4th and 3rd centuries BCE. We operate with communities that appear archaeologically "egalitarian" yet foreground martial identities. Over the 3rd century BCE, long-distance connectivity intensified, production concentrated at emergent open agglomerations, which gave rise to the new "brokerage-based elites". To implement this theoretical framework into operational processes, we integrate three complementary datasets: (1) archaeometallurgy (alloy recipes, trace elements and Pb isotopes) to reconstruct shifts in procurement, standardisation and craft organisation; (2) bioarchaeology and isotopes (mobility, diet and life-courses) to evaluate differential access to resources and movement; and (3) aDNA to explore kinship, ancestry and demographic diversity. Methodologically, we treat these high-dimensional datasets as "big data" relative to conventional archaeological evidence and experiment with workflows that translate multi-proxy similarity and provenance signals into spatially explicit, weighted social-network models. We embed these proxies in a political-economy framework that combines network and resilience theories, modelling how changing connectivity altered redundancy, vulnerability and control over key material and human flows, and how these dynamics translated into intersectional lived experiences. Comparative datasets spanning other Iron Age and Roman-period contexts highlight recurrent pathways by which connectivity and technological choices produce early inequality and diversity.

2320. The variability of care: a multiscalar perspective on disability and care in a wealthy family in medieval Treviso

Authors: Lisa De Luca – Ilaria Gorini (University of Insubria, Varese) – Omar Larentis (University of Trento | University of Insubria, Varese)
Format: Oral

This study contributes to ongoing debates on inequality and diversity in past societies by exploring disability and impairment as both biological conditions and socially mediated experiences. Rather than treating disability as a fixed or uniform state, this research emphasizes how differential access to resources shaped individual life trajectories in medieval contexts. The paper focuses on two adult individuals recovered from the lost medieval context of Santa Maria di Betlem (Treviso, Italy). Using the theoretical and methodological framework of the bioarchaeology of care, osteological analyses were conducted to reconstruct biological profiles through macroscopic examination, including the assessment of non-metric skeletal traits to explore possible kinship relationships. Diaphyseal cross-sectional geometry, together with the Cortical Bone Ratio (CBR) and Cortical Index (CI), was analyzed to investigate biomechanical adaptation and pathological remodeling. Evidence suggests the presence of congenital skeletal dysplasias that would have required sustained and intensive care. Despite severe pathological impairment, skeletal markers indicate functional adaptation compatible with some degree of active social participation. The possible familial relationship between the two individuals allows a multiscalar interpretation of care variability as an expression of social diversity. The privileged burial of the individual with the most severe disability suggests potential membership in the clergy and provides an opportunity to discuss medieval charitable institutions as mechanisms of selective familial care. This case study highlights inequalities in access to care and the role of family networks, power, and patronage in supporting vulnerable individuals, contributing to broader discussions on inequality, disability, and social inclusion in medieval societies.

190 MICRO-STORIES, MACRO-QUESTIONS: AN INTEGRATED MICROSCALE APPROACH TO STONE AND CLAY ARTEFACTS IN PREHISTORIC EURASIA

Theme: 1. Widening perspectives in material culture studies
Organisers: Chen Shen (Royal Ontario Museum) – Hong Chen (School of Art and Archaeology, Zhejiang University) – Jiying Liu (School of Archaeology and Cultural Heritage, Zhengzhou University) – Huiru Lian (University of Science and Technology Beijing) – Liping Xue (Department of Archaeology, Hangzhou City University | School of Earth Sciences, Zhejiang University)
Keywords: Stone, Clay, Microscopic approach, Prehistoric technology, Economic practice, Eurasia
Format: Regular session

SESSION ABSTRACT

Stone and clay artefacts constitute fundamental archives of prehistoric human behaviour, preserving critical data on technological choices, economic activities, and social practices. This session seeks to decode these material archives by advocating for an integrated, microscopic-led approach that moves beyond conventional isolated material or typological studies. We specifically focus on utilizing high-resolution analytical methods—particularly experimental archaeology, use-wear analysis, and residue analysis—to systematically reconstruct the entire chaîne opératoire of prehistoric objects. This comprehensive approach traces artefacts from initial raw material procurement and manufacturing processes through their use-life, circulation patterns, and eventual deposition contexts. By integrating technological, functional, and contextual data at micro- and macro-scales, we aim to develop more nuanced understandings of past technological systems and their social embeddedness. This session invites contributions that employ integrated micro-archaeological techniques to investigate: 1. The organization of craft production and its relation to social complexity; 2. Economic practices revealed through functional analysis; 3. Exchange networks and interaction zones traced through microscopic sourcing and use patterns. We welcome comparative case studies from Prehistory to Early Bronze Age across Eurasia, to stimulate dialogue on technological traditions and social organization. Ultimately, this session will foster interdisciplinary discussions on how microscopic data can illuminate large-scale socioeconomic questions, thereby advancing methodological innovation in the study of prehistoric technology and exchange networks.

CONTRIBUTION ABSTRACTS

1086. Activity locales at Ohalo II, an submerged camp in Israel, reconstructed through experimental archaeology and contextual taphonomy of broken bladelets

Authors: Jiying Liu (School of Archaeology and Cultural Heritage, Zhengzhou University) – Dani Nadel (The Zinman

Institute of Archaeology, University of Haifa) – Hong Chen (School of Art and Archaeology, Zhejiang University) – Iris Groman-Yaroslavski (The Zinman Institute of Archaeology, University of Haifa)
Format: Oral

This study investigates human behavior and site formation processes at the submerged fisher-hunter-gatherer's camp of Ohalo II (ca. 23,500 – 22,500 cal BP). Combining breakage pattern analysis, use-wear studies, and contextual taphonomy, we analyze bladelets and microliths from three distinct contexts: a brush hut floor (Locus 1), an area with open-air hearths (Locus 7), and a small pit (Locus 8). Despite excellent preservation, artifacts show very high frequencies of breakage caused by intentional activities (e.g., knapping, tool use) and unintentional processes (e.g., trampling, accidental exposure to fire). Use-wear analysis reveals that bladelets and microliths were primarily used as projectile inserts, but also for processing wood, bone, and leather, indicating diverse domestic tasks. Spatial and functional analyses of the artifacts and of the various breakage patterns were used to identify activity locales: the floor of Locus 1 served as a multifunctional domestic space, showing evidence of intense trampling and exposure to fire; open air hearths in Locus 7 were focal locales of tool maintenance and wood-working, with primary refuse and secondary cleaning; and Locus 8, containing dense debris, is interpreted as a secondary dump. Our integrative methodology—linking functional, spatial, experimental, and taphonomic data—provides new insights into the details and sequences of a variety of past activities, their spatial distribution, and the interplay of multiple intentional and unintentional human actions affecting the flint assemblages. This approach offers a replicable framework for interpreting the causes of damage to delicate laminar elements, and for better understanding Epipalaeolithic open-air camps with structures and other features.

1162. Microwear Experimental Study on Stone Artifacts from Shoushan Xianren Cave, Huadian, Jilin

Authors: Yanyu Shen – Chunxue Wang (School of Archaeology, Jilin University)
Format: Oral

Use-wear analysis and experimental archaeology have become essential approaches for reconstructing the use and function of archaeological artefacts, particularly in studies of lithic technology and functional interpretation in the Paleolithic. This paper applies an integrated use-wear and experimental framework to a selected assemblage of stone tools from the Shoushan Xianrendong site in Huadian, Jilin Province, Northeast China. The analysed artefacts are made of obsidian, porphyritic rhyolite, and calcareous dolomite, representing raw materials with distinct mechanical properties and use-wear formation patterns. Low- and high-power microscopic observations were conducted to document and classify micro-wear traces, including edge rounding, micro-flaking, striations, and polish development. Experimental replication and controlled use experiments were further employed to establish comparative reference criteria for interpreting wear formation under different tool morphologies and working motions. Based on the distribution and characteristics of observed traces, the study provides preliminary functional interpretations suggesting tool use in activities such as cutting, scraping, and processing animal and plant materials. The results contribute micro-scale evidence for reconstructing subsistence-related behaviors at the site and offer methodological support for broader discussions of Paleolithic lifeways and site significance in the Jilin region.

1544. An Experimental Study on Use-wear of the Prehistoric Tektite Artifacts

Authors: Yue Wu – Jiayi Wang (Zhejiang University)
Format: Oral

Tektites, natural glass formed through special geological and astronomical events, are frequently discovered in prehistoric sites in Guangxi province, China, while research on the associated artifacts remains limited. This study comprehensively integrates methods from experimental archaeology and microwear analysis, aiming to reconstruct prehistoric subsistence strategies involving tektites and to conduct a comparative analysis with obsidian. With reference to tektite artifacts unearthed at the Yahuai Cave site in Guangxi, the study selected tektites from the Australasian strewn field, which share similar chemical compositions and derive from the same formation event as the archaeological specimens. A series of controlled experiments were designed and conducted to simulate different working materials of varying hardness and a range of tool-use motions. The experimental samples were systematically observed and documented using both low- and high-magnification microscopy. Based on the shared characteristics of natural glass in terms of formation processes, chemical composition, and material properties, the resulting microwear features on tektite tools were then compared with existing obsidian use-wear studies. The comparation shows that the two materials are highly similar: Their use-wear such as striation, polish, rounding and scars, are consistent in multiple dimensions. This study explores the formation mechanisms and diagnostic characteristics of use-wear on tektites artifacts under different working conditions while trying to extend the conclusions to the category of vitreous materials. It highlights the interpretive potential of tektite artifacts for future functional analyses related to prehistoric subsistence strategies and patterns of raw material use, particularly in regions where natural glass resources were available.

1878. Research on the tektite artifacts unearthed at the Yahuai Cave site in Guangxi

Authors: Yunhao Guo (Zhejiang University)
Format: Oral

Tektites are frequently discovered in prehistoric sites in Guangxi, yet research on the associated artifacts remains limited. This study conducts an in-depth archaeological analysis of the tektite artifacts unearthed at the Yahuai Cave site in Guangxi, exploring their role and significance in the lives of ancient humans. These tektite specimens originate from the Australasian strewn field and exhibit identical provenance to those tektites recovered from sedimentary strata within Baise Basin, Guangxi. Their formation correlates with the Australasian tektite event, dating to approximately 700,000~800,000 years before present. A comprehensive approach we employed that includes methods such as technological analysis, statistical analysis, energy dispersive Xray spectroscopy (EDXRF) analysis,and usewear analysis to investigate the physical and chemical characteristics, flaking strategies, retouch logic, postdepositional modification, and usage conditions of the tektite assemblages.Overall, this article discusses the uniqueness of these tektites and their prevalence in the Yahuai Cave site, highlighting their important role in ancient toolkits. The results suggests that the utilization of tektites reflects the ability of ancient humans to adapt to their environment and make economic strategy choices. Furthermore, it provides a new perspective and evidence for exploring both the trend of stone artifacts miniaturization in southern China and the dispersal routes of modern humans.

1094. From Utilitarian Tool to Ritual Object: A Re-investigation of the Double-winged Stone Knives of the Liangzhu Culture

Authors: Liping Xue (Hangzhou City University | Zhejiang University) – Hong Chen (Zhejiang University) – Xiqi Shi (Jiaxing Municipal Institute of Cultural Relics and Archaeolog) – Ye Zhao (Zhejiang Provincial Institute of Cultural Relics and Archaeolog) – Ling Shen (Hangzhou City University)
Format: Oral

The double-winged stone knife constitutes a distinctive class of artifact that emerged in the late Songze Culture period and prevailed during the Liangzhu Culture period in the Taihu Lake region. Previous studies, often based on morphological characteristics and ethnological analogies, have proposed various hypotheses, including its use as a weeding or hoeing tool, a harvesting tool, a leather-working tool, a tool for processing meat, bamboo, or reeds, a textile tool, or even a salt-making tool. Through a systematic examination of archaeological records—integrating analyses of typology, technology, contexts of use and deposition, and micro-wear patterns—this study reveals that these knives underwent a process of transformation from utilitarian tools into ritual objects. Their avian-inspired form was employed in rituals intended to invoke bountiful harvests. The morphological transformation and functional evolution of these knives serve as a microcosm of the developmental trajectory of the Liangzhu society, demonstrating how the ritualization of material culture facilitated the construction and expression of a communal belief system.

1839. Ground Stone Production and Emerging Craft Specialisation in the Late Neolithic Lower Yangtze: Evidence from the Xianshengwan Site

Authors: Yongming Lu – Hong Chen (Zhejiang University) – Minghui Chen (Zhejiang Provincial Institute of Cultural Relics and Archaeology)
Format: Oral

Ground stone artefacts constitute an important line of evidence for investigating handcraft production organisation, economic behaviour, and processes of social complexity in Neolithic societies. This paper examines a ground stone assemblage from the Xianshengwan site, attributed to the Late Neolithic Haochuan culture in the Lower Yangtze region of China. Guided by chaîne opératoire framework, the study combines morphology, hierarchical dynamic typology, and use-wear analysis to reconstruct production sequences and patterns of use. Focusing on stone arrowheads, the analysis identifies recurring patterns of standardisation and task segmentation, suggesting a locus of specialised production potentially operating as an arrowhead workshop. Use-wear evidence indicates that these tools were employed in specific economic activities and circulated beyond the immediate production context. When considered in comparison with similar evidence from contemporaneous sites in the Lower Yangtze region, the Xianshengwan assemblage contributes to a broader discussion of emerging craft specialisation, the organisation of handcraft production, and their roles in the development of increasingly complex economic and social networks during the Late Neolithic.

1415. A Microscale Chain of Evidence for Tin-Coated Pottery: Materials, Techniques, and Product Properties in Eastern Zhou Shandong

Authors: Meng Guo (Northwest University) – Wenbin Dong (Shandong Provincial Institute of Cultural Heritage and Archaeology)
Format: Oral

This paper investigates a group of pottery vessels with bluish-grey and greyish-white surface coatings excavated from the Eastern Zhou–period cemetery of Gejiazhuang in Qufu, Shandong Province. Rather than focusing on chronology, the study adopts an integrated microscale analytical approach to explore how fine-grained material evidence can be mobilized to reconstruct technological choices and product properties in ceramic production. A combination of portable X-ray fluorescence (pXRF), scanning electron microscopy with energy-dispersive spectroscopy (SEM–EDS), X-ray diffraction (XRD), and high-depth-of-field optical microscopy was applied to the surface coatings. The analyses demonstrate that the coatings consist primarily of tin oxides, with localized preservation of metallic tin, allowing the vessels to be identified as tin-coated pottery. Crucially, microscale observations reveal a stratified coating structure, providing direct evidence for the application of tin foil rather than pigment-based or slurry-applied surface treatments. This microstructural "chain of evidence" links material composition, manufacturing sequence, and surface modification

at the level of individual artefacts. Typological patterns indicate that tin-coated pottery is mainly associated with forms such as gai-dou, lei, zhi, and cups. The incomplete overlap with conventional bronze-imitation ceramic ritual sets suggests that tin coating gradually emerged as a decorative practice independent of established bronze-imitative traditions. By foregrounding microscale analytical resolution and cross-method integration, this study demonstrates how micro-stories embedded in artefact surfaces can be systematically translated into macro-level interpretations concerning technological innovation, craft knowledge transmission, and the social meanings of material choices in early Eurasian material culture.

1409. Technological Diversity and Independent Production: A Multi-Analytical Study of Pottery from the Aktala Site Complex, China

Authors: Wenlin Xia – Huiru Lian – Kunlong Chen (University of Science and Technology Beijing | Key Laboratory of Materials Archaeology and Conservation, Ministry of Education)
Format: Oral

The Aktala site complex, situated on the southwestern margin of China's Tarim Basin, represents a large Bronze Age to Early Iron Age settlement comprising over 60 individual sites. Its position marks it as a key zone of cultural interaction between the Tarim Basin and the Pamir Plateau. Its discovery is pivotal for refining the prehistoric chronology of the Kashgar region and establishing a spatiotemporal framework for southern Xinjiang. To investigate pottery technology and production organization within this complex, pottery samples from eight representative sites were analyzed using a multi-method approach, including petrography, XRD, XRF, SEM-EDS, and FTIR, to characterize raw material selection, manufacturing techniques, and firing conditions. The results reveal significant variation in the raw material sources and technological levels of the pottery across the complex. The pottery composition is generally similar, with mica-tempered pottery found only at specific settlements. Furthermore, pottery from the central settlement (Kangxuan site) exhibits finer craftsmanship. These phenomena indicate that the complex likely lacked a centralized system of pottery production and distribution, with individual settlements relying primarily on locally available resources and independent production. The technological variation also points to a connection between pottery production, social differentiation, and settlement development. This study provides important empirical evidence for understanding production organization and technological adaptation in early complex societies along the southwestern margin of the Tarim Basin.

1487. Technological Evolution and Production Organization of Pottery at Sanxingdui, China: A Multi-analytical Approach

Authors: Xiaotian Zeng – Huiru Lian (University of Science and Technology Beijing | Key Laboratory of Materials Archaeology and Conservation, Ministry of Education) – Honglin Ran (Sichuan Provincial Institute of Cultural Relics and Archaeology) – Kunlong Chen (University of Science and Technology Beijing | Key Laboratory of Materials Archaeology and Conservation, Ministry of Education)
Format: Oral

As a prominent archaeological site in the upper Yangtze River region, Sanxingdui is pivotal for understanding the development of early civilization in the Sichuan Basin. This study analyzes 86 pottery samples from various locations within the site using chemical composition, petrographic, and Fourier-transform infrared spectroscopy (FTIR) analysis. The results demonstrate that while pottery production across Sanxingdui relied on consistent raw material sources, variations in techniques and standards suggest decentralized production by multiple workshops rather than a unified, centralized system. Technological practices diverged significantly across cultural phases. Early production, represented by flaring-mouth jars (Labakouguan) and wide-rimmed basins (Kuanyanpen) from the late Baodun culture, displayed high uniformity in paste recipes and a preference for high-temperature firing. During the Sanxingdui culture phase, high-stemmed Dou (Gaobingdou) employed distinct paste recipes for different components. For instance, river sand temper was added to the bowls but not to the stems. Meanwhile, small flat-bottomed jars (Xiaopingdiguan) underwent a technological transition during Phase VI, shifting toward fine fabric production and increased standardization. Although the underlying drivers for these shifts require further investigation, the observed variations underscore the complexity of pottery production at Sanxingdui. By elucidating material utilization and technical features across cultural periods, this study provides a diachronic perspective on the evolution of ceramic technology, ultimately contributing to a more refined understanding of the site's chronology, cultural sequence, and internal organization of craft production.

1788. Study of Early Yangshao Burned Stone and Related Problems at the Didong Site of Central China

Authors: Tianxing Cui – Jiarui Guo – Yuan Zhao (School of Archaeology and Cultural Heritage, Zhengzhou University) – Shiwei Li (Henan Provincial Institute of Cultural Heritage and Archaeology)
Format: Oral

As a crucial physical evidence of early human fire use, fire-stained stones (FSS) serve as vital clues for studying prehistoric heat treatment techniques, food processing methods, and ancient human behavior. Although these artifacts have long attracted academic attention, existing research remains insufficient. While China has discovered a considerable number of FSS remains, their functional determination has predominantly relied on macroscopic observation and ethnographic analogy due to limitations in early archaeological data and analytical methods, with systematic scientific research being relatively scarce. This study focuses on three early Yangshao culture sandstone FSS excavated from the Lingbao Didong site in Henan Province. Through integrated approaches

including macroscopic morphology observation, thermogravimetric-differential thermal-gelation (TG-DTG-DSC) experiments, and starch grain analysis, we systematically investigate their thermal characteristics and functional applications. Results demonstrate that the samples underwent moderate-to-low intensity thermal treatment, which significantly affected clay minerals and carbonate cementation without inducing major mineral phase transformations. Additionally, starch grains from millet and root crops were detected on the surface and within cracks of the FSS, exhibiting typical water-boiling damage features. Multiple evidences collectively indicate a close association between these FSS and the "stone-boiling" cooking practice. This study provides new experimental evidence for functional determination of FSS and offers fresh research perspectives for exploring the technical characteristics and cultural context of early Yangshao stone-boiling techniques.

191 FOLLOW THE THREAD: CROSS-CULTURAL CONNECTIVITY AND MOBILITY PATTERNS OF TEXTILE FIBERS AND FIBER CROPS

Theme: 1. Widening perspectives in material culture studies
Organisers: Nofar Shamir-Shafir (Ben-Gurion University of the Negev | School of Archaeology and Maritime Cultures, University of Haifa) – Daniel Fuks (Ben-Gurion University of the Negev) – Orit Shamir (Israel Antiquities Authority) – Ali Caimi (University College London) – Christopher D Buckley (Tracing Patterns Foundation)
Keywords: Trade networks, Fibers, Textiles, Plants, Archaeobotany, Archaeological Science
Format: Regular session
Affiliation: Crop History Community, Community for Textile Archaeology and Conservation (ComTex)

SESSION ABSTRACT

As added-value commodities often traded over long-distances, ancient textiles encapsulate past journeys and exchanges. This session aims to tune into stories of connectivity in archaeological plant-based fibers and textiles, through a range of approaches and methodologies. From the identification of diverse fibre sources to the analysis of dyes and weaving techniques, the study of ancient textiles lends itself to integration across multiple disciplines. We invite submissions employing various techniques applied to organic remains – including, but not limited to fibre morphology, ethnoarchaeology, experimental archaeology, archaeobotany and the range of archaeological sciences. We also encourage submissions integrating textual, linguistic and iconographic sources. Papers in this session may deal with fiber types (e.g. linen, cotton, silk, hemp, ramie and palm), or the plants used in producing and processing them (e.g. flax, cotton, mulberry, woad, etc.). By bringing together researchers working across these diverse fields, this session aims to offer complementary perspectives on production processes and commerce. By examining textiles as focal points of knowledge transfer, cross-craft interaction, and long-distance exchange networks, we seek to follow the thread on ancient textile production and trade as catalysts for technological innovation and cross-cultural connection.

CONTRIBUTION ABSTRACTS

243. The Past Inside the Present: Piecing Together the Emergence and Spread of Weaving and Fiber Usage in East Asia

Authors: Guillaume Jacques (CNRS | EPHE | INALCO) – Christopher Buckley (Tracing Patterns Foundation)
Format: Oral

Archaeological sites with textile fragments are rare and precious: in contrast to our knowledge of more durable materials such as stone and pottery, we understand our textile pasts through brief glimpses. In this talk we will discuss how scarce early textile remains from East Asia (the region that is now China, and beyond) can be integrated into a broader picture by supplementing this information with data from indirect sources, including a wide-area survey of archaeological instances of spindle whorls, occasional discoveries of loom parts, ethnographic studies of looms, and the ethnography of present-day fiber preparation. Using mapping, we will discuss how weaving emerged alongside rice and millet agriculture between the Yellow River and Yangtze river and spread eastwards to the foothills of the Tibetan plateau and beyond with sedentary farming lifestyles, and how the spread of weaving could be correlated with that of domesticated crops and language families such as Sino-Tibetan. Trends in whorl types signal the emergence and spread of silk textiles for elites, and differences in fiber types used in the north and south. On the Tibetan plateau and 'Silk Road' routes they signal the merging of cultures from the east, west, and south, and the arrival of animal fibers and novel weaving techniques brought by nomadic herding peoples.

310. Mass-produced plant fibre textiles An investigation on use wear and recycling from plant fibre textiles in the salt mine Dürrnberg

Authors: Ronja Lau (Ruhr-University Bochum)
Format: Oral

The salt mine at Dürrnberg near Hallein, Austria, offers predestined conditions for researching prehistoric textiles because of the preservation in salt. Unlike Hallstatt, Dürrnberg dates from the late Hallstatt to the early Latène period (600-100 BC) and is usually

regarded as the replacement of Hallstatt as the economic centre of the region. The large proportion of plant fibre textiles in the mine is particularly noteworthy. Their uniformity makes them stand out. Some of them also show signs of wear and tear, cuts, seams, holes and weaving faults, allowing for specific investigation into the purpose for which these fabrics were used in the specific context of mining. The question of workwear or textiles used in the direct process of salt mining has not yet been answered anywhere else. In this presentation I would like to offer ideas and open a discussion on how to investigate work specific textile in correlation with the fibre material. The cultural shift from the Hallstatt to the La Tène period brought about changes in material culture, not only in terms of weapons and pottery, but presumably also in relation to textiles. The influences and trade relations, especially in the Mediterranean region, can be traced primarily in the burial grounds around the Dürrnberg. The sudden emergence of plant fibre textiles in this region could be linked to new exchanges of knowledge or the movement of people. For example, there is no Iron Age linen in the Hallstatt mine, just a few kilometres away. The origin of this knowledge or textile processing technique is a matter for discussion at this point.

1216. Threads Between Empires: Textile Culture and Trade in the Avar Khaganate

Authors: Kayleigh Saunderson (Independent Researcher)
Format: Oral

The early medieval Avar Khaganat encompassed parts of Central and Eastern Europe from 567 to the early 9th century CE, lying between major empires - the Frankish to the west and the Byzantine to the east. While the Avar culture formed, many diverse influences can be seen in the archaeological record. This presentation views this phenomenon from a textile archaeological perspective, whereby research has shown a very distinct textile culture in the Khaganate based on flax, which on the one hand challenges hypotheses on nomadic Avar communities and on the other hand brings up questions on the appearance of clothing. These textiles are very standardised in their production, which makes outliers all the more interesting to investigate. The evidence strongly suggests a western origin for most of these textiles based on comparable technological features. The first material evidence of silk has now also been identified in a quite inconspicuous burial. Likely connected to an armour amulet, this case shows how trade to the east can be traced solely through textile fibres.

1950. Early Islamic Textiles (7th–9th Centuries CE) Excavated in Israel: Indicators of Global Trade Networks

Authors: Orit Shamir (International Exhibitions Department, Israel Antiquities Authority)
Format: Oral

Excavations along the Spice Routes in the ʻArava and the Negev—including sites like Nahal `Omer, `En Evrona, `En Marzev, Nahal `Amram, Nahal Shahaq, Yotvata and from a site which was recently excavated (at the end of 2025)—have yielded a rich corpus of textiles. The Early Islamic period in Bilad al-Sham is marked by a technological shift: the increased use of cotton and silk, complex weaving and dyeing techniques, and the first evidence of "cut-to-shape" garments. While cotton was rare in the region prior to the Umayyad period, the Arab conquest fostered new trade links with Asian centers such as India, China, and Persia, where cotton was more common. This is most evident at Nahal ʻOmer, a small village and way station where nearly 4,000 textile fragments were recovered from ancient rubbish middens. Unlike neighboring sites where cotton remains scarce, Nahal ʻOmer yielded an abundance of imported cotton and approximately twenty rare silk fragments. The diversity of organic finds at Nahal ʻOmer—including textiles, basketry, cordage, leather, and ate-palm kernels, human hair, bird feathers, several wood artifacts, and papyri bearing Arabic writing—serves as a "social archive" of daily life. Specifically, the presence of weft-faced compound tabbies (zilu), warp-ikat cotton and cotton textiles with supplementary weft strongly suggests origins in India and East Asia. These finds attest to robust inter-regional networks, positioning small desert way stations as vital links in the vast connectivity between the East and the Mediterranean.

773. Ikat Cotton Textiles from Nahal Omer: Trade Networks and Technological Transfer in the Early Islamic Period

Authors: Nofar Shamir-Shafir (Ben-Gurion University of the Negev)
Format: Oral

This research examines an assemblage of approximately 200 cotton ikat textile fragments excavated at Nahal Omer, dating to the 8th century CE. Ikat is a complex resist-dyeing technique involving thread binding, multi-stage dyeing, and unbinding to create characteristic blurred patterns. The textiles demonstrate high standards of craftsmanship and rich color combinations. The assemblage was classified into four typological groups based on decorative patterns and technical characteristics. The study aims to determine their origins and the economic and social networks they reflect, drawing on theoretical frameworks of textile technology dispersal along trade routes, with comparisons to known production centers in East Asia, Central Asia, and the Arabian Peninsula. Analysis reveals diverse cotton fibers, various patterns, evidence of secondary use, and motifs similar to Yemeni ʻaṣb textiles. The findings suggest multiple production centers in Central and West Asia. This assemblage reflects the movement of ikat technology along the Silk Roads and positions the Arava as a reception point for luxury textiles. The Nahal Omer collection contributes significantly to understanding economic frameworks and trade patterns in the early Islamic period.

135. Taphonomic Processes and Preservation of Linen Textile Across Diverse Soil Mediterranean Environments

Authors: Nafsika Andriopoulou (Dept. of History and Archaeology, University of Ioannina)
Format: Poster

Archaeological and historical textiles are highly susceptible to decay, with their preservation strongly influenced by the mineralogical and biogeochemical properties of the burial environment. This study investigates the long-term burial behaviour of an experimental, undyed, handwoven flax-fibre linen textile (Linum usitatissimum) across six contrasting soil Mediterranean environments – Cyprus, Crete, Volos, Pella I, Pella II, and Corfu – over a period of 5 years and 9 months; and aims to determine how soil mineralogy, chemistry, and pH influence textile preservation. Comprehensive soil characterisation was performed using X-ray diffraction (XRD), X-ray fluorescence (XRF), and pH measurements. Textile fibres, yarn morphology, and fabric structure and composition were thoroughly analysed before and after burial using Optical Light Microscopy (OLM), Scanning Electron Microscopy with Energy Dispersive Spectroscopy (SEM/EDS), Fourier Transform Infrared Spectroscopy (FTIR), Thermogravimetric Analysis (TGA), and XRF. The results indicate that all soils were alkaline (pH 7.41-7.93); however, textile preservation varied according to carbonate and magnesium content. Carbonate-rich soils (Crete, Pella I/II) mitigated cellulose degradation and promoted partial mineralisation, whereas silica-dominated soils (Volos, Corfu) were associated with pronounced fibre fragmentation and significant loss of hemicellulose and pectin. Iron-bearing soils (Cyprus, Crete, Pella I/II) led to mineral encrustation and fibre staining. In several cases, lignin proved more resistant than polysaccharides, contributing to the persistence of fibre structures despite progressive degradation. Overall, the findings demonstrate that textile survival was determined not solely by alkalinity but also by carbonate buffering capacity and mineralogical composition, with clay-rich matrices accelerating fibre deterioration. These findings underscore the critical interplay between soil mineralogy, chemistry, and pH in the preservation of archaeological and historical linen, and provide a framework for predicting textile survivability, thereby informing conservation strategies across diverse burial environments.

2064. Towards a Model Conservation Protocol for Plant-Based Textiles

Authors: Magdalena Majorek-Lipowicz (University of Lodz; Institute of Archaeology)
Format: Poster

This poster presents a comprehensive overview of methods, techniques, and tools employed in the conservation of archaeological plant-based textiles. Conserving these materials requires an interdisciplinary approach that integrates knowledge of textile technology, chemistry, and archaeological conservation. The workflow begins with pre-conservation studies, including material identification, fiber characterization, and assessment of degradation mechanisms. Analytical techniques such as microscopy, spectroscopy, and colorimetry are emphasized as essential for evaluating the condition of fibers and dyes prior to intervention. Following assessment, a conservation program is developed, outlining objectives, proposed treatments, required resources, and risk evaluation. This ensures that interventions are adapted to the specific properties and deterioration patterns of plant-based textiles while respecting their historical and cultural significance. The treatment pathway includes cleaning, stabilization, and structural support, with careful selection of materials compatible with the original fibers. Emphasis is placed on reversible and minimally invasive methods, thorough documentation of procedures, and monitoring of environmental conditions throughout the conservation process. Finally, post-conservation recommendations address preventive measures, storage solutions, handling protocols, and exhibition guidelines to ensure long-term preservation. By systematically integrating assessment, intervention, and preventive strategies, this approach preserves the integrity and longevity of plant-based textile heritage. The presented framework serves as a model scheme for conservation practice, offering practical guidance for conservators while promoting sustainable and culturally sensitive preservation of fragile archaeological textiles.

192 BETWEEN DESERTS AND MOUNTAINS: CONNECTIVITY AND CULTURAL CHANGE IN BRONZE AGE CENTRAL ASIA

Theme: 7. Interaction, connectivity and mobility
Organisers: Barbara Cerasetti (Freie Universität Berlin) – Athina Nikolopoulou (National and Kapodistrian University of Athens, NCSR "Demokritos") – Abdul Hafiz Latify (Freie Universität Berlin) – Elise Luneau (CNRS, UMR 8215 Trajectoire)
Keywords: Central Asia, Bronze Age, connectivity, exchanges, technology, materials
Format: Regular session

SESSION ABSTRACT

During the Bronze Age, the geographical area known as Central Asia and its neighbouring regions witnessed the emergence of complex societies (BMAC/Oxus Civilisation/GKC) situated between some of the world's most challenging environments, in which a very dynamic interaction zone was formed in the past. Within this broad landscape, people, materials, and technologies circulated between oases, steppes, and highlands, linking communities across ecological and cultural boundaries. This session focuses on material and technological perspectives that illuminate these connections. We welcome contributions that highlight recent

archaeological and scientific research on metals, ceramics, and semi-precious materials, addressing provenance studies, resource acquisition, and production organisation, as well as the relationship between technology and local environments. Discussions may explore how raw materials, resources, and finished goods were transported, and how both mobile pastoral and sedentary groups contributed to networks of production and exchange. The aim is to bring together new analytical and contextual data on materials and connectivity in the region and to assess how this evidence fits within existing interpretative models. By comparing technological, environmental, and social perspectives, the session seeks to evaluate which aspects of current frameworks remain relevant and where new models are needed to explain the complexity of Bronze Age interaction across the Oxus basin and its neighbouring areas. Through this integrated approach, the session aims to refine our understanding of how movement, technology, and environment shaped the material worlds of Central Asia.

CONTRIBUTION ABSTRACTS

42. Herding and Hunting at Kattabulak: Animal Exploitation in Sapalli-period Surkhan Darya

Authors: Marcella Festa – Yuxuan Wang (Northwest University, Xi'an)
Format: Oral

Zooarchaeological research in prehistoric southern Central Asia has outlined general patterns of animal economies, yet site-specific studies remain limited. The newly excavated Bronze Age site of Kattabulak, located on the eastern foothills of the Kugitang Mountains in the Surkhan Darya region (Uzbekistan), provides an opportunity to examine animal exploitation strategies and landscape use within the Sapalli culture (2100–1500 BCE), the northern variant of the Bactria–Margiana Archaeological Complex (BMAC). Zooarchaeological evidence suggests a diversified subsistence system integrating ovicaprid and cattle herding, equid management, and irrigated agriculture, with domestic livestock at its core and a significant contribution from wild fauna. The presence of hunted high-altitude ovicaprids, open-steppe species, and some woodland taxa indicates the sustained use of diverse ecological zones within the local foraging range. The high proportion of wild species cannot be explained by subsistence alone. Rather, hunting contributed to complementary economic, technological, and social roles by providing raw materials for manufacture, with some products attested in funerary and ceremonial contexts. Given the availability of local salt resources and the targeted hunting of prime-age animals, wild game may also have been preserved for delayed consumption or circulated within regional exchange networks.

1684. Bombyx mori cocoons and mulberry charcoal within the BMAC highlight the Silk Road at 2000 BCE

Authors: Hui Shen (Chinese Academy of Sciences)
Format: Oral

Historical narratives hold that sericulture originated in China and spread along the Silk Road roughly two millennia ago. Challenging this paradigm, we integrate analyses (micromorphology and proteomics) of three cocoons from the proto-urban site of Sapalli Tepe (ca. 2000–1500 BCE) in southern Central Asia. We identify them as mulberry silkworm cocoons, directly dated to 1940–1765 cal. BCE, representing the earliest Bombyx silkworm remains identified outside eastern China. Complementing these results, we further report the earliest mulberry (Morus sp.) charcoal from Central Asia, demonstrating local sericulture in the Oxus Civilization (BMAC – Bactria Margiana Archaeological Complex) nearly 2,000 years earlier than previously documented. We theorize that early Bombyx mori and mulberry trees might have dispersed along the southern slopes of the Himalayas; although, given the piecemeal archaeological record, we theorize other possible explanations as well. The establishment of sericulture seems to attest to a previously undocumented aspect of long-distance trade as part of the extensive reach of the Oxus Civilization, which was reshaping Eurasian technological development much earlier than has been acknowledged.

1876. Ceramics, Environment, and Connectivity: Bronze Age Pottery from Togolok Depe in the Murghab Alluvial Fan (Turkmenistan)

Authors: Nicola Martinelli (Università di Napoli "L'Orientale") – Elise Luneau (Centre national de la recherche scientifique, Trajectoires) – Verónica Martínez Ferreras (Departamento de Historia y Arqueología, Universitat de Barcelona) – Luana D'Ippolito (School of Specialization in Archaeological Heritage, University of Trieste) – Barbara Cerasetti (Freie Universität Berlin)
Format: Oral

Increasing archaeometric studies of Bronze Age ceramics offer new opportunities to explore the interplay between technology, raw material procurement, and environment in Central Asia. This paper presents new archaeological and archaeometric analyses of ceramic assemblages from Togolok Depe 1 (ca. 2100–1500 BCE) in the Murghab alluvial fan, present-day Turkmenistan, aiming to understand how ceramic production responded to local environmental conditions that are now largely desertic. The study combines macroscopic and typological analyses with petrographic and geochemical approaches to investigate ceramic fabrics, tempers, and clay sources. Provenance analyses assess the use of local versus non-local raw materials, shedding light on the degree to which production was embedded within the alluvial and marginal landscapes of the Murghab. Special attention is given to how potters adapted their technological strategies to a dynamic hydrological and ecological context. The Murghab region also functioned as a key interaction zone between BMAC/Oxus Civilization communities and the so-called mobile pastoral groups. Comparative analyses examine similarities and differences in ceramic technologies and compositions between these groups, providing insights into

patterns of interaction, knowledge transfer, and material connectivity across ecological and social boundaries. By integrating technological, environmental, and social perspectives, this contribution offers new data for assessing models of production, exchange, and connectivity in Bronze Age Central Asia.

2087. Forging Networks: Copper Metalworking at Gonur Depe

Authors: Athina Nikolopoulou (National and Kapodistrian University of Athens | NCSR "Demokritos") – Eleni Filippaki (NCSR Demokritos) – Olga Papachristou (Independent Researcher) – Yiannis Bassiakos (NCSR Demokritos)
Format: Oral

In Bronze Age Central Asia, technological knowledge, resource circulation, and social organisation were closely intertwined. Within the Oxus cultural sphere, metallurgy constituted a key domain through which materials from different regional contexts were transformed and integrated into local systems of production and exchange. This presentation examines metallurgical remains from the workshop complex at Gonur Depe, focusing on crucible fragments and slags recovered from Areas 8, 9, 13, and 15. An integrated archaeometric methodology (XRF, OM, SEM-EDS, XRD) contributes to understanding metalworking activities within the site, allowing the examination of high-temperature processes, alloy preparation, and secondary metallurgical activities. The crucibles and slags are approached as material indicators of technological choices, craft practices, and the use of copper and alloying elements within wider regional interaction networks. By situating this evidence within broader patterns of resource acquisition and material circulation across Central Asia, the presentation considers metallurgy as a practice connected to interactions between oasis communities and surrounding resource zones. In this perspective, metal production can be understood as an important element within the economic and social organisation of Bronze Age societies in the Oxus world.

2763. Cosmetic sticks at Farkhor and in other sites of Southern Tajistan

Authors: Giovanna Lombardo (Retired)
Format: Oral

The burial ground of Farkhor, in Southern Tajikistan, is located in the hill of Urtoboz, not far from the modern town of Parkhar; it was discovered and excavated in the last ten years, more than fifty burials have been unearthed. The burial furniture included pottery vessels, personal objects like beads in semiprecious stones, once part of necklaces, metal objects, such as mirrors, pins, cosmetic sticks, sometimes daggers and spear points. We shall speak here about cosmetic sticks.Cosmetic sticks in central Asia have a decorated head, this kind of objects is well known in the necropolises of Middle East and Central Asia in the Early and Middle Bronze Age (3000-2200 BCE). There are examples of these objects in Eastern Iran, at Shahr-i Sokhta, an urban centre very important for the mining, processing, and long-distance trade of semi-precious stones such as lapis lazuli and various types of agate; there are comparisons between the cosmetic sticks from Shahr-i Sokhta and those from Farkhor and Gelot. Other comparable specimen have been found in the major urban centers of Central Asia, such as Altyn Depe, Togolok in Margiana, Djarkutan in Bactria: here and in particular in Southern Tajikistan, they have been found also in the necropolis of Gelot. What we intend to do in this paper is to examine various types of cosmetic sticks from the Tajik necropolises of Farkhor and Gelot, comparing them with specimen from Central Asian and Iranian sites, in order to give a picture of some sites of Southern Tajikistan in the broader picture of central Asian and, more generally, middle eastern metallurgy and to document the long distance trade existing in the 4th and 3rd millennia among different areas of Central Asia, Iranian Plateau and Near East.

263. Stone cosmetic vessels from the Early Bronze Age burials of Farkhor in southern Tajikistan

Authors: Natalia Vinogradova (—)
Format: Oral

The Farkhor burial ground is the earliest known burial complex in southern Tajikistan. It is located on the Urtoboz hill at the outskirts of the city of Parkhar, two kilometres from the border with Afghanistan. Of particular interest are three stone cosmetic vessels with lids that were excavated from the rich graves 18, 19, and 65. Previously, these objects have been described as lamps in the archaeological literature. However, a study of the chemical composition of the material on the walls and lids of these "lamps" from Shahr-i Sokhta and Altyn-Depe has confirmed that they were intended for cosmetic use. All stone flacons are executed from the soft stone – gypsum, flacons are of the same type in shape and ornamentation. There are two main types among their forms: 1 – rectangular vessels with an ornament of four slotted circles with a dot in the center; 2 – cubic vessels with a bell-shaped throat and an ornament in the form of vertical grooves. Cosmetic vessels, along with cosmetic sticks made of metal or stone, are revealed in both women's and men's "elite" burials at the Farkhor burial ground. The closest analogies to the stone flacons from the Farkhor burial ground can be found in the necropoleis of Altyn-Depe, Shahr-i Sokhta, Hissar IIIC, Shahdad (necropolis A), and northern Afghanistan (looted burial grounds). This wide area of distribution of stone cosmetic vessels suggests the existence of trade and exchange relations between the populations of these regions during the early and middle 3rd millennium BC. The trade route could pass near Farkhor, where there is a convenient crossing over the Panj River, allowing for the population of Farkhor to participate in interregional contacts and trade in raw materials such as lapis lazuli with neighboring territories.

1552. Central Asia as a Nexus: Reconstructing Lapis Lazuli Exchange Networks during the Bronze Age

Authors: Abdul Hafiz Latify (Freie Universität Berlin and Berlin Graduate School of Ancient Studies)
Format: Oral

During the Bronze Age, the vast landscapes of Central Asia—encompassing present-day Turkmenistan, Uzbekistan, Tajikistan, and northern Afghanistan— were home to several distinct archaeological sites with their own characteristics that functioned as significant areas of cultural material distribution. Among the many exchanged commodities, lapis lazuli from the primary geological source, located at the high altitude of Sar-e Sang in Badakhshan, was widely distributed among the communities in the surrounding regions. Before reaching the western zones where it was highly demanded (i.e., Mesopotamia), this semi-precious stone often traveled via the northwest route (one of the suggested routes), which passes through the urban centers and transit corridors of Central Asia. This paper, part of my ongoing PhD research, re-evaluates the role of archaeological sites in the above-mentioned regions by integrating quantitative archaeological data and ethnographic insights. The quantitative data comes from a comprehensive database of lapis finds across Central and South Asia, as well as Iran, tracking the stone in raw, semifinished, and finished forms. This study focuses on the contextual and typological characteristics of the finds, assessing whether particular sites were actively involved in the use, production, or circulation of lapis lazuli. Preliminary analysis provides a revised overview of lapis distribution, identifying shifts in site frequency and patterns of use across the Early, Middle, and Late Bronze Age. Furthermore, for a better understanding of the logistical challenges of these routes, the research incorporates ethnographic fieldwork from Badakhshan, interviewing modern traders who still use traditional transport methods involving human and animal labor. These modern parallels offer a framework for understanding how ancient "traders" traversed the difficult terrain of the Hindu Kush to reach the plains of Central Asia.

334. Patterns of Cultural Dialogue of the Bronze Age in Central Asia

Authors: Emma Usmanova (Saryarka Archaeological Institute Karaganda Buketov University) – Viktor Merts – Ilya Merts (Toraigyrov University, Pavlodar)
Format: Poster

Bronze Age cultures of the Eurasian steppe interacted with agricultural cultures such as Sarazm (Tajikistan), the Bactria–Margiana Archaeological Complex (BMAC), and Namazga V–VI (Turkmenistan). The movement of steppe cultures is observed for the active period of the Eurasian Metallurgical Province (XX – X centuries BC).). Fragments of the steppe Andronovo pottery were found at the settlements of Sarazm IV and Gonur. The appearance of imported pottery there indicates emerging communications between the Eurasian steppe and the Central Asian agricultural cultures. Particularly active interactions date back to the period of the cultures of roll (valikova) ceramic in the mid–second millennium BC. Towards the end of the Bronze Age, the mobility of groups of people increased in their search for new sources of metal ores, moving toward the eastern and central regions of the Eurasian Metallurgical Province. Bearers of farming cultures became transmitters of new technologies into the steppe environment, exchanging their products for local ores and metals. For the steppe peoples, Central Asian building technologies and stone and metal processing technology became part of a system of "barter". Imported thrown pottery and beaker-shaped vessels spread to the steppe peoples' daily life as prestigious status items. Local technologies for producing thrown pottery developed at steppe settlements as imitation of import ceramic. On the basis of intercultural contacts, symbolic sign systems emerged as means of transmitting non-verbal information. The settlements Kent, Akkezen, and Semiyarskoe (Central Kazakhstan and the Irtysh region of Kazakhstan) testify about the formation of the first proto-state communities in the steppe part of Eurasia at the end of the Bronze Age (16th–14th centuries BCE). Their development combined local economic achievements with innovations coming from agricultural civilizations, which contributed to the emergence of the phenomenon as "steppe urbanism."

193 INVASIONS: THE ARCHAEOLOGY OF SUDDEN MIGRATIONS

Theme: 7. Interaction, connectivity and mobility
Organisers: Lorenzo Zamboni (University of Milan) – Manuel Fernández-Götz (University of Oxford)
Keywords: Mobility, Invasions, Social complexity, Conflict Archaeology
Format: Regular session

SESSION ABSTRACT

In the contemporary world, relocations, invasions, ideological divides, and social conflicts are once again emerging as pressing global concerns. Archaeology can provide a deep-time perspective on such phenomena, revealing the diverse ways in which human communities have responded to episodes of mobility, displacement, and contact. By examining the material traces of these past encounters, archaeology enables us to explore how people negotiated change — from conflict, inequality, and domination to diplomacy, risk-sharing, and the creation of new communities. In this session we want to specifically focus on phenomena of sudden migrations, particularly those that have tended to be classified as 'invasions'. Our aim is twofold: on the one hand, to analyse case studies for which there is evidence for the substantial movement of people within a relatively short period of time; and on the other hand, to critically discuss previous archaeological interpretations phrased around 'invasionist' narratives, including the biases and stereotypes that this type of rhetoric can often entail. We seek to move beyond traditional narratives and instead invite contributions that highlight the complexity and varied outcomes of these processes. We welcome papers from all periods and regions that adopt diverse methodological and theoretical perspectives. Topics may include, but are not limited to: • Archaeological signatures of conflict, invasion, and resistance. • Material expressions of negotiation, cohabitation, and hybridisation. • Mobility, identity, and power dynamics in contact zones. • Environmental, social, and economic impacts of sudden mobility. • Comparative or interdisciplinary approaches to migration and conflict. The session aims to foster a cross-regional and diachronic dialogue on how archaeology can illuminate the human experience of invasion, encounter, and adaptation.

CONTRIBUTION ABSTRACTS

1650. Phoenician presence in the bay of Cadiz and surrounding areas: colonization and/or invasion?

Authors: Mariano Torres Ortiz (Universidad Complutense de Madrid) – Ester López Rosendo (Universidad de Alicante)
Format: Oral

The Phoenician diaspora of the late 9th century BC implied a sudden migration that reached several Mediterranean regions and Southwestern Iberia. From that moment, Phoenicia settlements such as Teatro Comico (ancient Gadir), other sites in nowadays Cádiz and Castillo de Doña Blanca (El Puerto de Santa María) are attested in the bay of Cadiz. This migration implied the arrival of a substantial amount of Phoenician population in areas inhabited by local peoples. Thus, the aim of this paper is to analyse if there is evidence of conflict and warfare in this region, the material evidence of hybridization, well attested in the pottery (Grey ware pottery), the expression of the identities of migrating and local populations (well attested in the mortuary practices and the urbanism), the technological impact (adoption of the potter's wheel) and the economic impact of Phoenician mobility (attested in the introduction of new crops such as vine and olive tree).

7. The collapse of the Hallstatt princely complexes (5th c. BC): invasion or implosion?

Authors: Sophie Krausz (Université Paris 1 Panthéon Sorbonne)
Format: Oral

In the northern Alpine region, the end of the Hallstatt princely complexes around 450-420 c. BC remains enigmatic today. Unable to resolve this question, researchers generally suggest that the collapse of this culture was linked to a combination of internal and external problems. This suggestion is not wrong, but it conflates all possible causes without ultimately identifying any of them. This presentation proposes to compare the contexts and chronology of the destruction of the Hallstatt princely complexes in the northern Alpine region. Indeed, most of them, such as La Heuneburg (Baden-Württemberg, Germany), Vix (Côte d'Or, France) and Bourges (Cher, France) show archaeological evidence of destruction by fire, with in some cases successive fires, as at La Heuneburg (Baden-Württemberg, Germany). Others reveal statues broken into pieces, as at Glauberg (Germany), or with amputated heads, as at Vix. My objective is to examine the archaeological evidence revealing the destruction of princely complexes and to compare the chronology and conditions of these destructions. From there, it should be possible to propose new hypotheses that will lead us either towards the presumption of wars of conquest or invasions, or towards internal destroys leading to the implosion of the Hallstatt princely system.

182. Rethinking the "Celtic Invasion" of Northern Italy: Mobility, Archaeology, and Narrative Bias

Authors: Lorenzo Zamboni (University of Milan)
Format: Oral

The arrival of so-called Celtic groups in northern Italy between the 4th and 3rd centuries BCE is traditionally framed as a sudden and violent invasion, derived largely from Greco-Roman literary sources and reinforced by long-standing culture-historical models. This paper critically reassesses this narrative by confronting historical accounts with the archaeological and bioarchaeological evidence from the Po Valley and adjacent regions. Drawing on recent reassessments of settlement patterns, funerary contexts, material culture, and isotopic data, the paper argues that the archaeological record does not support large-scale, homogeneous migrations corresponding to the dramatic events described in the sources. Instead, evidence points to a complex and regionally varied set of mobility processes unfolding over several generations, including small-scale movements, chain migration, elite mobility, mercenary activity, exogamy, and the gradual integration of incoming groups into existing social landscapes. Particular attention is paid to the weak archaeological visibility of 4th century BCE "invasion horizons," the heterogeneous character of communities traditionally labelled as Celtic, and the widespread presence of hybrid material cultures that defy straightforward ethnic attribution. Bioarchaeological studies, while offering important insights into individual mobility, are also discussed critically, highlighting the risks of reintroducing deterministic or invasionist interpretations through uncritical use of isotopic or genetic data. By situating the case of northern Italy within broader theoretical debates on mobility, identity, and post-colonial approaches to the past, this paper advocates moving beyond invasionist explanations toward multiscalar models that better capture the diversity of social interactions and historical trajectories in Iron Age Europe. The "Celtic invasion" thus emerges not as a single catastrophic event, but as a long-term process of encounter, negotiation, and cultural transformation.

2460. Sudden migration, gradual process... or both? The settlement of the Celtici in southwest Iberia

Authors: Manuel Fernández-Götz (University of Oxford) – Luis Berrocal-Rangel (Universidad Autónoma de Madrid) – Lucía Ruano Posada (Universidad Complutense de Madrid)
Format: Oral

This paper will address the question of the so-called Celtici that inhabited the region known as Baeturia in southwest Iberia, and which in the Late Iron Age constituted the southernmost 'Celtic' communities in Europe. According to Pliny the Elder, these Celtici would have been descendants of the Celtiberians, stating that this was recognised by their language, beliefs, and the names of their oppida. Archaeology, for its part, indicates the arrival of new populations in this region in the late 5th and early 4th centuries BC, a settlement process that is particularly visible in the development of hillforts with a distinctive material culture. Some of these sites would last until the incorporation of this territory into the Roman world. However, in addition to a relatively short-lived immigration horizon, we can also observe some longer-term trends of mobility of populations between the northern Meseta and the area of southern Extremadura, a process visible, for example, in the distribution of object types such as certain fibulae and saltboxes. In this contribution, we will try to distinguish different temporalities and types of mobility, placing the evidence of the region within the wider context of migrations in Iron Age Europe.

190. Shadows of Crisis or Footprints of Archaeologists? Spatial Patterns of Hoarding along the Central Balkan Section of the Via Militaris

Authors: Marija Maric (University of Novi Sad, Faculty of Philosophy) – Marija Kalicanin-Krstic (Cultural Heritage Preservation Institute, Kragujevac)
Format: Oral

Traditionally, the 3rd-century crisis in the Balkans is viewed through political instability, with coin hoards interpreted as indicators of "barbarian" incursions. Thus, the Great Morava valley, as a key segment of the Via Militaris in the Central Balkans, represents an archetypal example of such interpretation, where each hoard was almost automatically fitted into written sources concerning the movements of armies. Such an approach was criticised by Mihajlović (2010), who introduced the concept of equifinality as an analytical framework for understanding the fact that different processes may generate similar archaeological patterns. The present study re-examines this issue using digital analytical methods, within which equifinality is not regarded as a limitation of interpretation, but as a testing ground for multiple scenarios. Spatial-temporal analysis was applied to 18 hoards, with particular focus on the relationship between the find locations, time of deposition, and the route of the Via Militaris. Although precise findspots are mostly unknown, requiring the analysis of broader distributional trends, the crucial task was to distinguish genuine ancient patterns from the "recovery bias" within a landscape where modern infrastructure and agricultural activities largely overlap with the ancient route. The analysis is based on the application of Kernel Density Estimation and proximity analysis methods within GIS, supported by Python scripts for statistical processing. In this way, it was tested whether the spatial distribution of hoards reflects the "military logic" of the Via Militaris route or whether their clustering can be better explained by civil and economic spatial patterns. By excluding the factor of research intensity, the results revealed that the distribution of hoards in the Great Morava valley does not depict a simple conflict zone, but rather a complex landscape of risk shaped independently of military campaigns. The Via Militaris was not solely a military route, but an axis of economic instability.

1691. Nomads, Ancestors, and Invaders: A Case Study of Khazar Graves from the Pontic-Caspian Steppe

Authors: Irina Shingiray (University of Oxford)
Format: Oral

In the 7th century CE, the Pontic-Caspian Steppe of Western Eurasia experienced a wave of migrations of pastoral nomads from the East, namely from Central Asia and beyond. During those migrations, new people arrived together with innovations in material culture, new technologies, new beliefs and practices, and a new social order. The new migrants formed the Khazar Empire—a nomadic imperial confederation centered in the Volga-Don interfluve, from where they controlled various populations that inhabited the lands from modern Ukraine to Kazakhstan. Why these people migrated from the East is not entirely clear. Nomads left no records of their own. Medieval literati from the South (the Caucasus and the Byzantine Empire) saw them as invaders, although periodically, the Byzantines and the local Caucasian leaders entered into military alliances with the nomads and sought their help. Still, the stereotypes of brutal barbarians and invaders persisted in the literature. For a long time, the Khazar nomads were practically invisible archaeologically. Only in the past thirty years or so, have their ancestral graves been recognized—some have been studied and some published. But by and large, this body of material remains obscure legacy data, which deserves attention and thorough analysis. In this paper, I will deal with a sample of the Khazar burial material. I will focus on archaeological evidence which supports the view that within relatively short time after their arrival, the Khazar nomadic emigres were able to mark, ritualize, and acculturate the new landscape by burying and commemorating their dead ancestors. These actions, associated with the concept of "negative authority" (David Graeber), were paramount in the process of nomadic migration to a new territory. Nomads also rapidly recreated local exchange networks, extending trade routes and diplomacy all the way to the Byzantine Empire and to the Islamic Caliphate.

1038. Re-thinking Scandinavian-Eastern Baltic Coastal Interactions in the 'Viking East'. Transculturation and Settlement (a Case Study of Grobiņa)

Authors: Alla Kurzenkova (Gerda Henkel Scholars-at-Risk Postdoctoral Fellow, University of Glasgow)
Format: Oral

This study re-examines the Grobiņa archaeological complex (the mid-7th to the mid-9th centuries AD), a type of settlement featuring a hillfort and associated cemeteries in Latvia, by moving beyond the prevailing 'narratives of Scandinavian colonisation'. Placing Grobiņa within the wider context of Eastern Baltic coastal interaction zones, the analysis highlights the hillfort-settlement-cemetery complex and personal adornments (e.g. disc-on-bow, beak-shaped, tool and box brooches), exemplifying long-term transculturation rather than simple colonisation or assimilation. The selective 'adaptation' and re-contextualisation of some Scandinavian artefacts alongside local Baltic elements reveal a community actively negotiating its identity through these emulative practices. Rather than being seen as 'passive ethnic markers', these artefacts could be considered 'active media' in the negotiation of identities within a 'middle ground colonisation' (Mägi, 2018). Reflecting on the Grobiņa case study, the paper reveals that it represents neither full assimilation, but rather a transcultural hub within the wider Baltic and Scandinavian interaction zones. Lastly, it also makes us think about how other 'isolated' archaeological objects from 'Viking East' sites (e.g., the silver and copper alloy brooches from Kyivan Rus' hillforts) can be contextualised within the wider sphere of early medieval interaction.

1464. Latgalian expansion (7th-9th centuries AD) and lake-settlements: islands of conquerors?

Authors: Janis Meinerts (Latvian Academy of Culture)
Format: Oral

The Latgalian tribe, part of the Eastern Baltic peoples, formed and consolidated as a distinct ethno-linguistic group on the right bank of Daugava River during the 5 – 6th centuries AD. During the fallowing centuries, Latgalians expanded their territory into the lands inhabited by groups of related Baltic tribes and Baltic Finns, thus becoming the dominant cultural group in Eastern Latvia. One peculiar phenomenon connected with the Latgalian expansion is the emergence of a rare type of settlement – fortified lake-settlements on artificial platforms were constructed by the Latgallians in the lakes of Vidzeme Upland. Only 10 such sites are known up to now and only two of them have been studied in detail. Nevertheless, their construction has been explained in scholarly literature in context of violent and sudden land-grab by the warlike, migrating Latgalians, especially in context to the Baltic Finns, who are seen as driven northward or destroyed in the process. The Latgalians inhabiting the lake-settlements are portrayed as conquerors settling in unfriendly territory inhabited by vengeful past owners of the land, thus explaining the choice of constructing the fortified lake-settlements. This paper will aim to challenge this view by analysing three case studies: the lake-settlements of Āraiši and Brici and the natural Cepurīte Island settlement in Lake Indzeris. An approach using GIS environment to interpret both archaeological and palaeoecological data will be used to reconstruct the ancient landscape and settlement patterns, thus illustrating the situation before the arrival of the Latgalians, the nature of the migration processes and the changes that took place with their arrival. The paper will argue for a more source-based, case-to-case approach, highlighting the different nature that the Latgalian arrival took at each of the sites.

2324. Archaeological Evidence of Mongol Raids in the Territory of Present-day Belarus in the Mid – Late 13th Century

Authors: Mikalai Plavinski (Faculty of Archaeology, University of Warsaw)
Format: Oral

The Mongol invasion of Eastern Europe in the mid-13th century is a well-known historical event. The capture of Old Rusian towns by the Mongols, the mass extermination of their populations, and the devastation of rural areas are vividly described in both local chronicles and foreign written sources. Archaeological research conducted from the mid-20th century through the early 21st century has yielded a substantial body of evidence that largely confirms the information provided by written sources. Excavations at a number of towns – both major capital centres and so-called "small towns" of Rus' – have revealed traces of assaults and fires, abundant finds of Mongol-type arrowheads, and mass graves of massacre victims. Such features are characteristic of Mongol warfare. However, this evidence primarily pertains to the lands of southern and eastern Rus' (present-day territory of Ukraine and Russia), while the lands of Western Rus', corresponding to the territory of present-day Belarus, have remained a kind of "blank spot" on the map of Mongol raids in Eastern Europe. This paper presents an analysis of excavation materials from Belarusian towns and the identification of traces of Mongol military activity dating to the mid-to-late 13th century.

2131. The Enemy Within: Invasion and Embargo as Tools of State Warfare in the Oaxaca Valley, Mexico

Authors: Lacey Carpenter (University at Buffalo) – Sofía Pacheco-Forés (University of Minnesota Twin Cities)
Format: Oral

Conflict and sudden mobility are often correlated in the archaeological record; however the timing and nature of a relationship between these variables is complex and historically-contingent. In the Valley of Oaxaca, Mexico, the transition from the Middle

to Late Formative period (500 BCE) was a time of population movement and nucleation in the region marked by the founding of Monte Albán, a site that would be come the New World's first urban center. These population movements, documented through regional survey, coincided with possible evidence for conflict such as relocation of settlements to naturally defensible hilltops, the construction of defensive walls, and burning of public architecture at large sites. However, the nature of conflict and its relationship with these population movements is not well-understood. We examine the case of Tilcajete, one of the three largest settlements in the Oaxaca Valley at this time. The earliest occupation of the site was abruptly abandoned around 300 BCE following an episode of burning and destruction of the civic ceremonial plaza. The entire site was rebuilt 800 m upslope in a more defensible location. Following the re-building, the site's population continued to grow and persist for two centuries. We evaluate multiple lines of evidence for resistance and negotiation. Using chemical sourcing techniques such as XRF and INAA along with more traditional analyses of household assemblages to evaluate evidence for change and continuity in access to resources essential for the survival of the residents of Tilcajete. Our findings indicate that conflict continued during this period in the form of economic isolation. We document disruption in access to local, regional, long-distance resources. We argue that this is evidence of interference by other powerful sites, likely Monte Albán, whose dominance in the region was solidified by 100 BCE, coinciding with the abandonment of Tilcajete.

956. Where are the Invaders? The Case Study of the Galatians in the Eastern Mediterranean

Authors: Kevin Parachaud (UMR TRACES -Toulouse)
Format: Poster

In 280-279 BC, Celtic armies attacked Thrace, Greece, and Macedonia. After mixed outcomes (Macedonia was sacked, but Brennos died after unsuccessfully trying to plunder Delphi), other Celtic groups moved through the Hellespont, once again engaging in conflicts with local cities before threatening Byzantium. Around 277 BC, some of these groups crossed into Asia Minor, settled in central Anatolia, and became a threat to the cities and local populations of the peninsula. However, a typochronological analysis of latenian remains discovered throughout the Eastern Mediterranean reveals a different chronology from that suggested by the historical narrative. Remains from Greece predate, mainly from the 4th century BC, the attacks of 280-279 BC, while evidence from Anatolia appears later (2nd and 1st c. BC) than the assaults on the Hellenistic cities of the Ionian coast. Moreover, divergences between Anatolian and European typologies suggest local production of latenian artefacts and indicate long-term settlement processes rather than traces of sudden and violent incursions. This poster proposes an overview of the latenian remains known in the Eastern Mediterranean and a comparison between the history of the Celtic invasions, well documented in Hellenistic literary and iconographic sources, with the chronology derived from the archaeological record. The lack of correlation between these two dimensions raises questions about our ability to identify archaeologically the early phases of sudden migrations.

194 GROWTH OF POLITICAL POWER AND URBANIZATION IN SOUTHERN CAUCASIAN REGION

Theme: 7. Interaction, connectivity and mobility
Organisers: Jong-Ii Kim (Seoul National University) – Zaur Hasanov – Ceyhun Eminli (Azerbaijan National Academy of Sciences)
Keywords: the Southern Caucasian region, Scythian Kurgan, Caucasian Albania, Catacomb burial, urbanization.
Format: Regular session

SESSION ABSTRACT

In recent years, the South Caucasian region has gained increasing attention due to the discovery of numerous new archaeological sites and artefacts. These findings encompass a wide range of types and periods, for example, from Scythian kurgans to the capital city of Caucasian Albania and its associated mortuary practices such as catacomb burials, spanning from the Late Bronze and Early Iron Ages through to the Antique period (up to the 4th century AD). The artefacts recovered from these sites vividly illustrate the region's role as a crossroads of cultural exchange between East and West. Examples include Scythian art, Roman glassware, Sarmatian weaponry, and Parthian coinage, all reflecting dynamic interactions and the growth of political power in the region. This session aims to present these recent archaeological discoveries from the South Caucasus—an area seldom introduced to the Western academic world—and to explore the long-term processes of social change and urbanization as revealed through shifts in material culture.

CONTRIBUTION ABSTRACTS

1703. General issues on Kurgan in South Caucasus

Authors: Byoungrok Yu (Hanbit Research Institute of Cultural Heritage) – Donguk Yi (Sejong Research Institute of Cultural Heritage)
Format: Oral

The Southern Caucasian region, which connects Central Asia and the West, serves as a land bridge between the Caspian Sea to the

east and the Black Sea to the West. Azerbaijan, in particular, is home to numerous kurgans of Southern Caucasus. In Azerbaijan, a great number of kurgans dating from the Bronze Age (c. Fourth millennium BCE) to the Iron Age (c. First millennium BCE to 400 BCE) were identified. These kurgans display various forms across different periods and regions, believed to reflect cultural influences possibly from the northern Black Sea or Central Asia. This paper integrates existing archaeological research data from the Southern Caucasus with the presenter's own field research on kurgans, chronologically spanning from the Bronze age to the Iron Age. In specific, the study examines further on recent findings from Southern Azerbaijan, shedding light to new tomb structures and cultural aspects of Iron Age kurgans associated with Scythian influence.

2281. A preliminary report of the archaeological investigations at "Yedditepe-Fizuli", kurgan site in 2022-2025

Authors: Zaur Hasanov (Institute of Archaeology and Anthropology, ANAS) – Jongil Kim (Department of Archaeology and Art History, Seoul National University) – Byoungrok Yu (Sejong Research Institute of Cultural Heritage) – Narmin Mammadli (Institute of Archaeology and Anthropology, ANAS) – Gino Caspari (Institute of Archaeological Sciences, University of Bern)
Format: Oral

The Yedditepe archaeological site is located in Azerbaijan's Karabakh region, in a valley between the Kondelenchay and Guruchay rivers. The site consists of parallel chains of soil-built kurgans. Between 2022 and 2025, an Azerbaijan–Korea–Switzerland archaeological expedition investigated three kurgans at the site. Kurgan 3 is the largest mound, measuring approximately 5.6 m in height and 45–50 m in diameter. The soil excavated from the chamber formed two large crescent-shaped backfill features around it, covered with reed and wooden fragments. A narrow dromos was identified at the upper edge of the chamber, which had originally been roofed with massive wooden logs. Inside the chamber, a two-wheeled chariot drawn by oxen was discovered, accompanied by six horses. A human skeleton was found within the chariot cabin, together with various artifacts. Kurgan 4 revealed a complex structure consisting of a central entrance shaft and two catacombs with dromoi. The entrance shaft contained two concealed caches, yielding various gold, silver and bronze artifacts. The catacombs contained Scythian-type trilobate arrowheads, zoomorphic horse harness fittings, gold plaques, and other artifacts, along with horse skeletons and human remains. The burial architecture, finds, and radiocarbon dates place Kurgan 3 in the late 8th to 7th centuries BCE, and Kurgan 4 in the late 7th century BCE. Kurgan 5 exhibits a complex layered construction with alternating yellow and black soils, ash layers containing reed remains, wooden elements, as well as a narrow dromos and a backfill layer similar to that of Kurgan 3. Ceramic fragments, closely resemble those from Kurgan 3. Excavations at Kurgan 5 will continue in 2026. Overall, the burial rituals and material culture at Yedditepe demonstrate strong connections with Scythian traditions of the North Caucasus and Black Sea regions, while also reflecting distinctive local features in pottery and metalwork.

1716. Comparison of Kurgans between Silla and Scythia in Azerbaijan

Authors: Ikhee Nam (Sejong Research Institute of Cultural Heritage)
Format: Oral

This paper focuses on a comparative review of Silla tombs from the Three Kingdoms period of Korea and the Scythian Kurgans in Azerbaijan. Despite there is a clear differences in chronological and regional context of their construction, Silla tombs from the Three Kingdoms period of Korea and the Scythian Kurgans in Azerbaijan share a commonality, that both tombs housed a 'wooden chamber' or 'wooden cist' as a primary burial feature; furthermore, some scholars have proposed a perspective suggesting Scythian culture as a potential cultural origin of the Silla burial tradition. Therefore, this study introduces the ancient Silla tombs located in Gyeong-ju, at Southeastern region of Korean peninsula, which was the capital of Silla. Then this study focuses on the main burial feature of Silla's ancient tombs and Azerbaijan's Scythian Kurgans, termed a stone-mounded wooden chamber('Jeokseok-mokgwak'). This paper provides a concise comparison and examination regarding the tomb structure, characteristics of the tomb, and assemblages.

1756. Catacomb burials in ancient Caucasian Albania – Focusing on the Salbir site –

Authors: Sanghyun Bae – Siwon Baek (Seoul National University)
Format: Oral

Caucasian Albania is regarded as the first political power in this region. However, its material culture and lifeways have remained largely fragmented hitherto. Recent excavations disclose diverse aspects of its material culture. Life and death of people in Caucasian Albania is assumed based on mortuary practices and dwellings of the period. In this regard, 'catacomb' burials at the Salbir site are particularly noticeable. Approximately 20 catacomb burials have been investigated, each consisting of a vertical shaft, a burial chamber and a passage (or 'dromos'). These burials yielded various burial goods, including Antique pottery, armoury (i.e. iron bident and arrowheads), Roman glass, Parthian coins, beads and dress fittings. Fragments of human skeleton were also recovered. The mortuary practices mediated by these catacombs reveal that they were contemporaneous with other burial types, such as inhumation, urn, and roof tile burials, Furthermore, they demonstrate dynamic cultural influences, well exemplified by Sarmatian armoury (iron bident and arrowheads), Roman glass manufactured by blown technology, and Parthian coins. Additionally, cranial deformation observed in the skeletal remains would tell the presence of the Alans, one of the main ethnic groups in the Southern Caucasus.

Consequently, it can be argued that Caucasian Albania served as a cultural nexus in this region, bridging between various political and cultural powers such as the Roman Empire, Sarmatia and Parthia, while maintaining its own idiosyncratic culture through the mortuary practices evidenced in its catacomb burials.

1609. Funerary Practices of Classical Antiquity in the Tepebashi and Kish-Dokhun Necropolises (Azerbaijan)

Authors: Narmin Mammadli (Institute of Archaeology and Anthropology, ANAS)
Format: Oral

The Tepebashi and Kish-Doxun necropolises in northwestern Azerbaijan represent complex funerary landscapes with diverse grave types and both individual and collective burial practices dating to Classical Antiquity. This study offers a comparative analysis of burial customs at both sites, focusing on grave architecture, interment types, and associated ritual practices. At Tepebashi, burials are predominantly individual and include earth and jar graves, anatomically intact interments, disturbed skeletal remains, and graves lacking human bones; collective burial occurs only once. Separate ritual areas adjacent to some graves indicate the inclusion of ceremonial elements in the burial process. In contrast, Kish-Doxun is dominated by collective and repeated burials, extended-supine inhumations, three-tiered graves, rich grave inventories, and defined ritual areas, reflecting a more complex, multi-stage funerary process. Sarmatian-type weapons and ceramics bearing tamga (symbolic marks linked to tribal identity or pottery production) suggest cultural infusions from Late Scythian–Sarmatian–Alan interactions. At Kish-Doxun, disturbed skeletal remains, retention of grave goods, reburial of earlier remains in jars, and coexisting extended-supine burials within the same structures indicate deliberate ritual interventions rather than post-depositional disturbance. Comparative analysis shows that, despite differences in grave construction and burial organization, both necropolises share common ritual elements, including intentional skeletal manipulation and the use of designated ceremonial spaces. Ceramic assemblages at both sites reflect local Caucasian Albanian traditions while incorporating imported ritual concepts, demonstrating both continuity in local craft and the infusions of external cultural contacts. These findings enhance our understanding of social behavior and cultural interaction in the Caucasian Albania during Classical Antiquity, highlighting the interplay between local traditions and Sarmatian ritual infusions.

1390. 'Frontier Dynamics' of Burial assemblage: Case of Salbir, Qabala

Authors: Young Jae Kim – Kyo Jin Eom – Dong Kyun Han (Seoul National University)
Format: Oral

Salbir is located to the south of the Caucasus Mountains in Qabala, Azerbaijan. The ancient capital city of Caucasian Albania has been identified as a major political center with structural remains, hydraulic systems, and burial pits found within the fortified area. This presentation aims to examine the burial features at Salbir, which suggests that occupation of the area continued throughout and beyond the period of Caucasian Albania. From the unique Antique tombs incorporating roof tiles to medieval Muslim pit graves, Salbir exhibits variability and shifts in mortuary customs, reflecting its significance as a cultural frontier. Since interaction and the mixture of diverse cultures are defining characteristics of frontiers, many scholars have emphasised the dynamic processes at transition zones, which involve more than just the passive adoption of foreign influences. Graves dating back to the first century CE will be examined in this paper. In addition, it discusses burials situated within the stratigraphic sequence of the earthen rampart. A long-term burial assemblage within a single archaeological context offers potential material evidence for determining the site's occupation period and identifying significant cultural changes. These archaeological remains highlight not only the broad cultural exchanges in the Southern Caucasus's, but also the specific socio-political transformations of Salbir throughout its dynamic occupational patterns.

1718. Fortification of the Salbir site and its construction technology

Authors: Jaehyun Son (KAREC) – Seungcheol Ha (Research Fellow, Gyeongnam Studies Center) – Sanghyun Bae (Department of Archaeology and Art History, Seoul National University)
Format: Oral

The Salbir site, in Qabala, Azerbaijan, has been spotlighted for over 15 years, as it has been believed it would be the capital city of Caucasian Albania-the first state in southern Caucasus. Despite its significance, comprehensive archaeological data on the site requires further effort. Ongoing joint excavation by Azerbaijani and Korean archaeologists are gradually revealing its characteristics, most notably the earthen wall fortifications. Based upon stratigraphic evidence, inhumation and roof tile burials within the wall, combined with AMS dating confirmed that the fortification of Salbir was initially constructed during the antique period (4th C. BCE to 4th C. CE), and underwent repeated modification. Intensive research has found that this process involves various sophisticated construction technologies. In this presentation, the following topics will be discussed; (1) the construction process of earthen wall (2) Adoption of various construction technologies (i.e. stacking method and varied mud brick sizes) (3) the relationship between these diverse construction technologies and their archaeological significance in terms of cultural exchange (4) the archaeological importance of the Salbir fortress within the wide context of in southern Caucasian fortification. This presentation demonstrates the urbanization process in the region through the lens of fortification.

1628. An Iron Age Settlement in Ağstafa (Azerbaijan): The 2025–2026 Seasons at Ağalıqtəpə

Authors: Martin Gruber (University of Würzburg) – Shamil Najafov – Zaur Hasanov (Azerbaijan National Academy of Sciences)
Format: Oral

In 2025 and 2026, a joint Azerbaijani-German expedition conducted two seasons of excavations at the previously unexplored settlement mound of Ağalıqtəpə. This site is located between Dağ Kəsəmən and Ağstafa in northwestern Azerbaijan. The mound revealed substantial mud-brick architecture from the mid-1st millennium BC, including multi-room structures that were partially associated with small-scale metal production, as evidenced by ash deposits, slag fragments and furnace remnants. The material culture reflects local Iron Age traditions similar to those seen at nearby sites, as well as other influences such as Scythian-type arrowheads, pottery forms, and fabrics that can be linked to the Achaemenid presence in the South Caucasus. These discoveries shed new light on previously poorly known settlements of this period, serving as a vital counterpoint to the region's dominant funerary archaeology. The Ağalıqtəpə excavations thus offer fresh insights into mid-1st millennium BC settlement archaeology—a research avenue of paramount importance for understanding how communities shaped their living spaces through time amid shifting cultural influences.

1639. Formation process of Urban Centre in Caucasian Albania in comparison with European oppida

Authors: Jinoh Kim (University of Cambridge)
Format: Oral

Comparative analysis always brings insight to archaeology. It enables archaeologists to explore universal pattern from individual peculiarities, in the sense of "difference and repetition". As long as the naive form of diffusionism is not pursued, the geograhpical and chronological distance between the compared cases does not matter. In this regard, this paper aims to compare the fortified settlement sites in Iron Age Europe north of Alps and Southern Caucasus region. For the sites of Southern Caucasus region, I will focus mainly on the Salbir site located in Gabala region in Azerbaijan, which is often referred to as the central place of Caucasian Albania. For the sites of Iron Age Europe, the hillforts of Late Hallstatt period and oppida of Late La Tene period will be discussed. First, the fortification, settlement layout, and settlement biography will be under comparison. After that, I will compare the sites from the two regions in terms of urbanism and see whether the concept of urban is relevant for them.

1723. Urbanisation Process of Caucasian Albania – by comparison with of East Asian cases

Authors: Jong-Ii Kim (Seoul National University) – Chang Eog Kim (Sejong Research Institute of Cultural Heritage)
Format: Oral

Urbanisation in Central Eurasia has a long history since the Middle Bronze Age. For example, as already known, the Sintashta culture (approx. 2200 BCE to 1700 BCE), of northern Kazakhstan, provides clear and compelling evidence of circular pattern of multiple houses and fortifications with metal production, which implicates the emergence of settled and, in a sense, an urban way of life for the first time in the region. This tendency towards fortified settlements increased steadily and continuously across Central Eurasia; Nevertheless, identifying clear evidence for such urbanisation in the southern Caucasus remains challenging, due to the scarcity of investigated settlement sites. Salbir, the capital site of Caucasian Albania, is an exemplary case highlighting the urbanisation process in this region. In particular, the site has been suggested to be the 'first evidence of urbanisation'. It invites comparison with early Neolithic settlements in Anatolia and China, for example Çatalhöyük and the Banpo site in Xi'an, China. In addition, many arguments have been made that the earliest urbanisation in Europe began with the appearance of hillfort and oppida. European views provide valuable implications for a better understanding of urbanization process in a comparative context with southern Caucasus. Likewise, the emergence of fortified capitals and the urbanisation processes in East Asia-including Wolseong and Pungnap fortress sites, which are respective capital cities of ancient Silla and Baekje kingdom (approx. from 3rd Century AD)-implicate important features to characterise the developments in Caucasian Albania. In this paper, the urbanization process and its characteristics inherent to Caucasian Albania will be examined in a comparative perspective.

2542. Reconstructing Hydrological Landscapes and Urban Development at the Salbir Site, Azerbaijan

Authors: Mirae Jo (Washington University in St. louis) – Jaehyun Son (The Korean Association of University Museums) – Euijung Kim (Kangsan Cultural Research Institute)
Format: Oral

Across time, societies have adapted to diverse environments by developing and adopting water management techniques and transforming hydraulic landscapes. Because control over water is closely tied to the organization of labor and territorial authority, water management has played a key role in shaping urban growth and political development. Understanding how past societies understood and engineered natural hydrological systems to facilitate urbanization in challenging environments remains an important archaeological question. This presentation investigates water management systems at the Salbir site (1st c. BCE–10th c. CE) of Gabala in Azerbaijan, considered as the capital of Caucasian Albania. Excavations have revealed a sequence of water systems, including qanats (kariz), wells, pipelines, ditches, and reservoirs, that correspond with shifts in urban function. These co-changes reflect deliberate

technological choices shaped by local environmental constraints as well as changing urban roles. By examining diverse water-use strategies, we hope to contribute to broader debates on the hydrosocial dimensions of urbanism in the Southern Caucasus and beyond.

195 STRATEGIES FOR PRESERVATION, VALUATION AND MANAGEMENT OF CULTURAL HERITAGE IN AN INTERCONNECTED WORLD

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Asmita Basu (Army Institute of Management) – Prabir Biswas (HMG College, Kolkata) – Edoardo Bedin (Witley Court and Gardens Manager English Heritage) – Durga Basu (University of Calcutta)
Keywords: Heritage, Preservation, Management
Format: Discussion session

SESSION ABSTRACT

Heritage management plays a crucial role in preserving cultural and historical assets while ensuring their sustainable use for future generations. Effective strategies integrate conservation efforts with economic valuation to highlight the tangible and intangible benefits of heritage sites. This session explores the intersection of heritage preservation and economic sustainability, emphasizing frameworks for assessing cultural heritage, funding mechanisms, and policy interventions. It will delve into different traditional and contemporary valuation methodologies, to quantify heritage's socio-economic impact. Appropriate heritage management for the complex and vast archaeological and heritage landscape of different countries requires certain new approaches for solving different issues including development of unexplored and new sites for the sustainable growth of tourism in the region. Additionally, case studies will illustrate how heritage sites contribute to tourism, local economies, and community development. By aligning heritage conservation with economic principles, this session aims to foster a balanced approach that ensures both cultural significance and financial viability. This session also invites discussions on sustainable development, preservation, and management of lesser-known archaeological sites, rich in cultural resources, beyond the purview of the list of World Heritage sites.

CONTRIBUTION ABSTRACTS

754. Negotiating Forgotten and Sensitive Archaeological Heritage on Linapacan Island, Philippines

Authors: Zuzanna Kowalczyk (Poznan Archaeological Museum)
Format: Oral

This paper addresses forms of archaeological heritage that are forgotten, unknown, contested, or at times actively unwanted. It draws on research conducted on Linapacan Island in northern Palawan, Philippines, where more than ten previously undocumented archaeological sites have been identified in recent years. These sites span a wide chronological range, from Neolithic and Metal Age contexts to Spanish colonial remains and more recent, possibly indigenous burial sites. The research combines archaeological methods with approaches from social anthropology and has been carried out in close cooperation with local authorities and community members. While such collaboration is essential for ethical research and sustainable heritage protection, it also introduces significant challenges. Archaeological interpretations do not emerge in a neutral space but are shaped through negotiation, local concerns, historical experiences, and contemporary politics. Some sites raise sensitive questions related to colonial violence, indigenous ancestry, land use, or spiritual beliefs, complicating both documentation and public interpretation. By reflecting on these encounters, the paper explores how archaeological narratives are co-produced and how decisions about visibility, protection, and interpretation are made in practice. It argues that heritage management strategies must move beyond universal models and instead adopt context-sensitive approaches that acknowledge local epistemologies, historical trauma, and the uneven power relations embedded in colonial and indigenous pasts.

1395. Financial Planning and Revenue Generation in Heritage Management: A Study of Lesser-Known Heritage Sites in India

Authors: Asmita Basu (Army Institute of Management, Kolkata) – Anustup Chatterjee (IIT-ISM Dhanbad | Techno International New Town)
Format: Oral

Heritage management in India has traditionally focused on conservation, preservation, and cultural significance, often overlooking the critical role of financial planning and revenue generation in ensuring long-term sustainability. While prominent heritage sites benefit from structured funding, institutional support, and tourism-driven revenues, lesser-known heritage sites frequently struggle with inadequate financial resources, limited visibility, and weak management frameworks. This study examines the financial planning mechanisms and revenue generation strategies employed in the management of lesser-known heritage sites in India, with the objective of assessing their financial sustainability and operational viability. Using a qualitative & quantitative, case-study-based approach, the research analyzes selected lesser-known heritage sites across different regions of India to understand the need for structured financial planning models, diversified revenue streams, and participatory governance frameworks that involve local communities and stakeholders. By linking financial management with heritage conservation, the study contributes to policy discussions on sustainable heritage management and offers practical insights for heritage institutions, policymakers, and conservation practitioners seeking to enhance the financial resilience of India's lesser-known heritage sites.

2035. Archaeological sites in local tourism and promotion strategies: two case studies from Poland

Authors: Jan Czeski – Paulina Sowa (Adam Mickiewicz University, Poznań)
Format: Oral

Our paper discusses the results of research conducted in 2024 and 2025 within the framework of the project "The value of archaeological heritage from the perspective of local communities – a comparative analysis". It addresses key issues of heritage management and the sustainable use of archaeological resources by examining how local tourism and promotional strategies shape the socio-economic visibility of heritage sites. The analysis is based on a methodology combining a review of relevant academic literature and local policy documents—particularly development strategies—with field research carried out in the summer of 2024. It compares two archaeological sites in Poland — Wietrzychowice and Lubomia — regarding their integration into local tourism development and heritage management frameworks. The first case study concerns a Neolithic megalithic complex known as the Kuyavian Pyramids, while the second focuses on an exceptionally well-preserved early medieval stronghold, one of the largest in Silesia. Both sites are located in rural areas, possess clearly distinguishable forms, and cover extensive areas, yet they differ markedly in terms of their management approaches, public visibility, and contribution to local development. Wietrzychowice constitutes a central element of the local tourism strategy, which integrates natural and cultural heritage and contributes to sustainable tourism growth. The site forms part of the main local tourist route and hosts a nationally recognised archaeological festival, generating both economic and social value for the local community. By contrast, the Lubomia stronghold remains largely absent from local tourism and promotion strategies and, despite its significant heritage potential, functions primarily within academic discourse, with limited impact on the local economy and community engagement. By analysing these contrasting cases, the presentation seeks to identify the factors shaping effective and ineffective heritage management practices and to highlight the role of local policies and valuation approaches in the sustainable development of lesser-known archaeological sites.

2727. Heritage: has it reached the saturation point? Reflection on heritage management and its financial viability in United Kingdom

Authors: Edoardo Bedin (Independent researcher)
Format: Oral

Heritage management has grown from a niche study to a well established field with the aim to preserve and promote heritage to present and future generations, but it faces the challange of a world in constant evolution, changes of interests by users, new technologies, new competitors in an environment which could be at saturation point. Like any other business, heritage management needs to reflect on what it has achieved since its first notable example (National Trust 12th of January 1895) and how it can rejuvenate and evolve. In United Kingdom there are 5 main heritage organisations: National Trust, English Heritage, National Trust for Scotland, Historic Scotland and Cadw. The author will reflect on their achievements and challenges and draw comparisons with non-heritage businesses to propose ways to survive the current challenging economic environment which is posing a threat to preserving and promoting our heritage and maintaining adequate staffing levels and creativity within its field.

196 LATE BRONZE AGE IN EUROPE, AS A REVOLUTION IN THE SOCIAL, ECONOMIC AND ANTHROPOLOGICAL DOMAINS

Theme: 7. Interaction, connectivity and mobility
Organisers: Mihai Wittenberger (National History Museum of Transilvania) – Jeanette Varberg (National Museum of Denmark) – Alexandra Comsa (Vasile Piarvan Institut)
Keywords: bronz, social, economic, demografic, revolution
Format: Regular session

SESSION ABSTRACT

The purpose of this session is to try to decipher the revolutionary changes which took place between the Middle and Late Bronze Age. First of all, bronze becomes popular, even if there are also prestige goods, some made from precious metals. The enormous quantity of bronze pieces (tools, weapons, ornaments, moulds, ingots) proves a radical change in society regarding the metal use. Even if bronze metallurgy, as a technique, remains the same, there are many other aspects that should be highlighted. The changes we are referring to encompass all economic, social and demographic, as well as other anthropological aspects. The economic changes that occurred in society, from the production to the sale system, made this period a revolutionary one. Trade develops extraordinarily, exchanges being now trans-European. The most eloquent example is the circulation of glass and amber in the South-North direction and vice versa. A second objective of this session should be to establish and define the characteristics of the economic life, as it could be archaeologically documented in the new stage of development of the societies, possibly in comparison with the previous

period. It would be interesting for the participants to focus on the causes of these changes, of economic life, of trade exchanges, of relations between cultures and people, from all points of view. Of course, in society, the demographic changes, as resulted from the economic development, had played an important role. We should try to evaluate their role in those profound transformations, which could be archaeologically and anthropologically observed in the communities from the half of the second millennium BC. It is a known fact that that during that time, two large groups of populations penetrated the central and eastern space of Europe: Noua-Sabatinovka-Coslogeni and the Tumulars in central Europe.

CONTRIBUTION ABSTRACTS

653. The Bloody Rise of Velim: Biological Consequences of Demographic Change in the Tumulus Culture Revealed by New Bioarchaeological Data

Authors: Dalia Pokutta (Stockholm University | Rzeszow University)
Format: Oral

The transition from the Middle to the Late Bronze Age in Central Europe is widely recognised as a period of profound economic and social transformation, marked by intensified metallurgy, long-distance exchange networks and demographic growth. Far less is known, however, about the biological costs of these changes for local communities. This paper addresses this gap through new large-scale bioarchaeological evidence from Velim, one of the largest fortified settlements of the Tumulus Culture in Central Europe (c. 1800-1200 BC). Velim represents an exceptional case study of a densely occupied, strategically fortified center embedded within trans-regional exchange systems. The site is characterised by complex depositional practices and abundant evidence for interpersonal violence, suggesting prolonged social tension during a period of rapid economic expansion. Here, we present an integrated dataset comprising 50 new AMS radiocarbon dates, dietary reconstructions for approximately 100 individuals based on stable carbon and nitrogen isotopes, and several hundred $^{87}Sr/^{86}Sr$ measurements obtained through high-resolution strontium isotope analysis. These data allow, for the first time, the construction of a refined internal chronology for Velim alongside detailed reconstructions of mobility patterns, dietary strategies and population dynamics across successive occupation phases. The results reveal marked temporal shifts in mobility regimes and subsistence practices, consistent with increased population density, intensified resource exploitation and heightened interaction between local and non-local groups. Taken together, the bioarchaeological evidence points to significant biological stress accompanying economic growth, manifested in altered life histories and changing patterns of mobility and diet.

832. Anthropological changes occuring in the Bronze Age of Romania

Authors: Alexandra Comșa (“Vasile Pârvan” Institute of Archaeology -Bucharest)
Format: Oral

Bronze Age was a period of intense transformations, in all domains of life, but also an economic revolution, for the entire Europe. On the teritory of Romania, the population movements that manifested all accross the continent had partly modified the characteristics of the local populations, both concerning the general appearance of their body, but also their cephalic index. For the last mentioned situation, we could observe that the weight of the intruding populations was rather significant and we refer here to the bearers of the tumular ochre burials, like Yamnaya, Katakombnaya, or Mnogovalikovaya (with a predominant influence exerted by the Yamnaya communities) which determined the diminishing of the cephalic index in the extra-Carpathian region of Romania, but also to those of the Otomani Culture which, on the contrary, resulted in the increasing of its value. Demographically, it was observed an increase of life duration with about four years, resulted from the improvement of their living conditions, which were determined by the significant economic and commercial changes that occured at that time. Anyway, further and more detailed studies have to be done, in order to establish the full amplitude of these changes, from anthropologicall point of view.

996. Observations on the Social, Economic and Spiritual Revolution in the Late Bronze Age of the North-Eastern Carpathian Area

Authors: Bogdan Niculica (National Museum of Bukovine)
Format: Oral

The large-scale spatial analysis of cultural phenomena specific to the Bronze Age, with a particular focus on the north-eastern Carpathian area, allows for the reinterpretation of an entire body of earlier discoveries in the light of the most recent research. Our contribution primarily addresses several key aspects of the transformation of Bronze Age society within the studied region, aiming at a precise definition of its cultural content, chronological framework, and internal periodisation. Secondly, we focus on the artefact repertoires and on understanding the technologies involved in the production of copper and bronze objects, highlighting local evidence for metallurgical activities, corroborated with the spiritual dimension of bronze hoarding practices. The specificity of this large-scale, Europe-wide phenomenon of hoarding can be further understood through the detailed discussion of selected case studies, as well as by integrating certain categories of exogenous prestige objects which, when discovered in the north-eastern Carpathian area, shed light on long-distance connections, distinctive social status, and refined chronological considerations. The systematic inventory of copper and bronze artefacts and their comparative analysis now allow us to approach from a new perspective issues related to typological developments and changes in hoarding practices, within which Middle and Late Bronze Age communities of the region displayed particular preferences that require further clarification. Our discussion also highlights amber, salt, stone

maces and the characteristics of settlements and barrow cemeteries within broader trans-Carpathian exchange networks. Special attention is devoted to the funerary landscape, in which tumuli occupy a central position, recent research carried out over the last 25 years allowing the identification of new traits in funerary behaviour.

1103. Analysis of the exchange network of singular objects and personal ornaments in the Late Bronze Age of eastern Iberia

Authors: Esther Frances Galvañ (INAPH, University of Alicante) – Gabriel García Atiénzar – Virginia Barciela González (INAPH, University of Alicante | Departamento de Prehistoria y Arqueología, University of Alicante)
Format: Oral

The Late Bronze Age (c. 1500–1250 cal BC) represents one of the most transformative periods in the recent prehistory of the Iberian Peninsula. Along the eastern façade, the reorganisation of different cultural groups laid the foundations for an increasingly structured society, characterised by the growth of settlements and the development of processes of territorial and social hierarchisation. These changes are clearly reflected in the economy, where, alongside a consolidated agricultural and pastoral base, an intensification of exchange networks involving prestige goods can be documented, particularly personal ornaments and other singular items. In order to analyse the dynamics and scope of these networks, a multiscalar approach is proposed. At the small scale, the main materials involved in exchange are identified, focusing on personal ornaments made from exogenous raw materials—such as gold, silver, ivory or glass—as well as singular objects characterised by advanced manufacturing techniques, most notably three-barbed, tanged bone arrowheads. At an intermediate scale, the distribution patterns of these objects and their spatial articulation are examined, allowing for the identification of possible circulation axes and areas of concentration. Finally, at a big scale, a historical interpretation is proposed, aimed at evaluating contacts between different groups and the role of these networks in processes of social differentiation. From a methodological perspective, this study is based on Social Network Analysis (SNA), understood as a relational approach that enables the modelling of interactions between archaeological sites. Through the application of specific metrics, SNA facilitates the analysis of network structure, the identification of central and peripheral nodes, and the assessment of cohesion and hierarchisation within the system, providing a robust framework for the historical interpretation of social dynamics during the Late Bronze Age.

1197. The Glass Road – Exchange Networks between South Scandinavia and the Eastern Mediterranean in the Late Bronze Age

Authors: Jeanette Varberg (National Museum of Denmark)
Format: Oral

Around 1400 BC, the first glass beads appear in Danish Bronze Age graves. Chemical analysis shows that the glass was produced in Mesopotamia and Egypt. The same type of glass has been found throughout Europe, indicating that an exchange network between the Eastern Mediterranean and South Scandinavia was being activated (c. 1400 BC) and expanded (c. 1300 BC) during the transition between the Central European Middle and Late Bronze Age. Glass beads are often found together with amber, suggesting that they were part of the same exchange network — one material coming from the south (glass) and the other from the north (amber). Part of the presentation will discuss glass analyses of beads excavated at Cioclovina cu Apă Cave between 2016 and 2019. These beads were made using Mesopotamian raw glass; however, they were probably produced in a secondary workshop that cannot be identified through chemical analysis alone. This suggests that Mesopotamian glass was widely distributed during the Bronze Age. Its presence has been documented at Amarna in Egypt, in Romania, France, Germany, and Denmark in the far north. By the transition between the Middle and Late Bronze Age, long-distance exchange systems had developed connecting the shores of the Euphrates and Tigris in Mesopotamia and the Nile in Egypt with the beaches of the Baltic and North Seas, as well as key intermediary sites such as Cioclovina cu Apă Cave in Transylvania. Nordic amber and Egyptian and Mesopotamian glass linked the widest expanse of this world, the two materials forming a kind of dialogue between exotic materials from distant lands.

1742. At the Currents of Change: Connectivity and Mobility at the Late Bronze Age cemetery of Inzersdorf, Austria

Authors: Michaela Fritzl (Austrian Academy of Sciences)
Format: Oral

The Bronze Age is widely recognised as a period of profound social transformation across Europe, reflected in changing burial practices, settlement patterns, and material culture. From the expansion of the Middle Bronze Age Tumulus culture to the emergence of the Urnfield phenomenon, increasing homogeneity in archaeological assemblages has often been linked to intensified connectivity and, in some cases, population movements, potentially facilitated by bronze technology and long-distance exchange networks. This paper presents results from the Urnfield-period cemetery of Inzersdorf ob der Traisen, located in the Lower Traisen Valley (Austria) near the Danube confluence. Tributary rivers (Traisen and Kamp) provided access to southern and northern regions, while the Danube formed a major west–east corridor for supra-regional interaction. Material culture analysis, focusing on imports and external influences, is combined with strontium isotope data from 182 individuals to investigate patterns of mobility and connectivity during the formation of the Urnfield phenomenon. A regional baseline of bioavailable strontium, established using 163 plant samples, indicates intensified land use along the valley floor and river corridors during the later Urnfield period. While individual

mobility appears limited, the combined isotopic and archaeological evidence reveals structured interaction patterns. Early phases of cemetery use show stronger eastern material affiliations, consistent with Urnfield expansion trajectories, while western influences increase during later phases. Raw material procurement patterns further reflect the site's favourable geographical position. Bayesian modelling of 49 radiocarbon dates and correspondence analysis document a gradual transition from Middle Bronze Age-influenced burial rites to standardised Urnfield practices. Integrated with an analysis of local topography and surrounding settlement patterns, these results embed the Lower Traisen Valley within wider regional networks of interaction. Overall, the study highlights how local developments, situated within broader supra-regional exchange systems, shaped Late Bronze Age social change.

668. Economic Life in the Late Bronze Age in the Carpathian Space

Authors: Mihai Wittenberger (National History Museum of Transylvania)
Format: Oral

We will try to discern, based on the extent of the information we have, the revolutionary nature of the economy in the Late Bronze Age in the Carpathian area. Starting from the inventory of settlements, a picture of economic life can be drawn: the osteological remains speak of animal husbandry and the carbonized grains and tools discovered add important data about plant cultivation, diet and household economy. The presence of bronze pieces and patterns also gives us a picture, even if incomplete, of metallurgy the end of the Bronze Age. Unlike the Middle Bronze Age, now bronze pieces are not only prestigious but also accessible tools. The huge number of pieces is proof of this. In just one deposit, Uioara, over 6,000 bronze pieces were discovered: sickles, celts, saw blades, bronze cakes, bracelets and others. From the data we have, we cannot speak of a discontinuity between the metallurgy of the Middle and Late Bronze Age, most likely due to the influence of the local element, of the Wietenberg tradition, which certainly held the secret of processing bronze with tin. An argument in this sense is the technology of processing bronze with tin, which did not change essentially, but only improved. This seemingly trivial change actually hides a profound change in mentality and perhaps in the structure of society. The Carpathian space is very rich in mineral resources: salt, gold, copper, silver, lead and even tin. I will try to present the changes in the main areas of economic activity: agriculture, animal husbandry, mining and metalworking, stone processing, trade both short-distance and trans-European, from the Mediterranean Sea to northern Europe.

1270. Late Bronze Age Communities in the Eastern Carpathians. Classical and new interdisciplinary approaches

Authors: Vasile Diaconu (Neamt National Museum Complex)
Format: Oral

The Late Bronze Age communities in Eastern Romania developed during the XVI-XII centuries BC and are associated with the Noua culture that experienced various territorial dynamics. The lifestyle of these populations was focused on pastoral practices, leading thus to a more intense habitation of the low-lands areas, with open landscape and dominated by forest-steppe vegetation. In the hilly Subcarpathian area, the Noua culture communities are less frequent, reason for which the investigation of Late Bronze Age sites has not been very intensive. Over the last two decades, efforts have been made to conduct a more consistent analysis of the Noua culture communities in the area at the foot of the Eastern Carpathians, in order to map settlements patterns, the anthropic impact on the natural environment, the use and reliance of resources, the factors of attractiveness, but also the connections to other populations and geographical areas. Although no extensive archaeological research has been done, new interdisciplinary approaches allow us to better understand these groups. Particular emphasis was placed on studying the settlements configuration and inventories. In order to do this, we used magnetometry to map and assess the shapes and dimensions of sites, while selected artifacts went through various laboratory procedures such as use-ware analysis, petrography and ceramic study. Several recent burial findings were also analyzed. Until recently there were no known absolute chronological landmarks for the Late Bronze Age in the Subcarpathian region of Eastern Romania either. Here we also provide 14C dates for a couple of sites, providing clarifications about the temporal setting of this culture. Overall, we show that interdisciplinary studies and the usage of new laboratory techniques complement classical research methods, offering a more complex and detailed picture of the lifestyle of Late Bronze Age communities in Eastern Europe.

1739. The Golden Fleece, between legend and reality

Authors: Mihai Wittenberger (National History Museum of Transilvania)
Format: Poster

We all know the legend of the Golden Fleece, but this time we move the legend from Cholchida (Caucasus) to the reality of the Apuseni(Western) Carpathians at Roșia Montană. A few years ago, a menhir representing a miner was discovered. The equipment is well defined: a lamp, an axe-pick and a bag on the back for ore. Whether it was a deity of the miners or a representation of a miner is still a mystery. Personally, I think it represents a deity. Also in Transylvania (in the Sic-Gherla area) another menhir, of a female gender, was discovered. This one comes from a saline area, where salt is extracted by evaporation. In the 1930s, a great photographer, Teofil Pop, photographer the gold-mining peasants of Roșia Montana (Alburnus Maior in Roman times). The equipment of the children who entered the mine is identical to that on the menhir after breaking the raw ore with stamps, the resulting material was washed through sheep fleece. The source of the legend, Golden Fleece, very likely comes from the technique used. The interpretation from the Greek legends must be considered metaphorical.

2237. Indigenous and Allochthonous, Social Status, Elites. From the Late Bronze Age to the Iron Age in the North-Eastern Carpathian Area

Authors: Bogdan Niculica (Muzeul National al Bucovinei)
Format: Poster

The present poster addresses the dynamics of change between indigenous and allochthonous elements in the north-eastern Carpathian area from the Late Bronze Age through the Iron Age. Particular attention is paid to transformations in settlement patterns, the funerary landscape, and the material manifestations associated with social status and the expression of elites. The integrated approach correlates data concerning settlement organisation and funerary practices with the circulation and deposition of specific categories of artefacts carrying significant symbolic and social value. Indigenous resources—such as salt, copper and gold, as well as human resources—are examined within the broader context of ancient communication routes that traversed the north-eastern Carpathian region. Stone and copper axes, together with bronze hoards, represent key markers for understanding both local continuities and external influences, reflecting indigenous technological traditions alongside mechanisms of cultural transfer. At the same time, prestige objects made of gold and bronze, whether isolated, integrated into funerary contexts, or associated with ritual depositions, signal processes of social differentiation and the consolidation of elitist structures acting as mediators between local communities and supra-regional networks. The evolution of a standardised funerary landscape, characterised by accentuated symbolism—most notably tumuli organised into cemeteries—constitutes a clear indicator of profound ideological and spiritual transformations, as well as of the reconfiguration and redefinition of social identities among allochthonous groups interacting with the indigenous cultural substrate. Consequently, the north-eastern Carpathian area emerges as a dynamic zone of ethno-cultural synthesis, distinctly structured into layers of power, in which emerging elites played a central role in shaping and articulating new social and cultural models from the end of the Bronze Age into the Iron Age.

198 DIGGING SITES OVER AND OVER AGAIN: EVOLVING APPROACHES, VISIONS, AND METHODOLOGICAL INSIGHTS

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Eva Kars (Earth Integrated Archaeology BV) – Dušan Medin (University of Donja Gorica, Faculty of Culture and Tourism, Podgorica) – Ernst Dekkers (EARTH Integrated Archaeology BV)
Keywords: Interdisciplinary approaches, Long term excavations, Contract archaeology, Methodological development, European network, Multi-scalar
Format: Regular session

SESSION ABSTRACT

This session brings together projects from long-term and repeatedly excavated archaeological sites — from early medieval trading centres such as Dorestad, Ribe, Kaupang, and Birka to major Roman and Greek settlements and sanctuaries and prehistoric cult sites. These sites share a common challenge: decades of excavations have transformed research questions, field strategies, and interpretive frameworks. Such long-term investigations raise crucial questions about the advancement of archaeological practice. How have our archaeological field work strategies, research agendas and theoretical frameworks changed, and how should we investigate these sites today? The session explores how approaches and visions have shifted — from early culture-historical traditions toward interdisciplinary, multi-scalar, and technologically advanced frameworks that increasingly intersect with cultural heritage management and contract archaeology. central focus will be the interaction between academic and commercial approaches. We will look at how new data systems, digital recording tools, and the combination of different research methods are changing the way projects are designed and how findings are interpreted. With these new ways of working — which often include faster workflows, standardized procedures, and data-driven decision-making — we ask: Do current methods give us the tools to revisit and update earlier conclusions? Or do they, within these new operational models, actually risk fixing existing narratives even more firmly in place? We also aim to address the broader European dimension of these practices: how archaeologists working on sites with continuous or recurrent excavations can exchange experiences and methodologies across regions and time periods. By linking projects from diverse archaeological traditions and periods, the session seeks to encourage comparative thinking and a discussion on what constitutes "progress" in archaeology conducted over decades, balancing scientific continuity with practical innovation.

CONTRIBUTION ABSTRACTS

978. Re-excavating Dorestad? The value of already excavated terrain in the Vicus Famosus

Authors: Ernst Dekkers – Arhur Griffioen – Timo Verhoeven – Eva Kars – Nils Schuurmans (Earth Integrated Archaeology BV)
Format: Oral

Since the middle of the 19th century archaeological excavations have taken place in Wijk bij Duurstede, on which grounds Dorestad,

the famous early medieval trade-settlement, was discovered. Especially since 1967 a lot of this site has been excavated: about 65 hectares. Most of those areas have been built over with new quarters of the ever-growing town of Wijk bij Duurstede. The last few years however, the first buildings in those quarters, developed since the nineteensixties, have been demolished to make way for new developments again, unveiling again parts of already excavated terrain. Since this part of Dorestad had been excavated, no archaeological remains were expected. Therefore, in this part of Wijk bij Duurstede no regulations on archaeology were in place anymore. However, while the contractor was busy digging trenches for foundations, pipes and drains, a human burial had come to light. EARTH Integrated Archaeology was called in to inspect the burial and come up with advice on how to proceed. The two-week excavations that EARTH executed yielded interesting new information. Features in the already fully excavated former trenches were not excavated at all, not sectioned etc. Especially many of the waterwells/cesspits seem not to have been excavated below groundwater level. The process itself, but also the consequences of the fact that important archaeological remains of Dorestad were/are still in place, raises questions: • How can we assess the value of the already excavated archaeological remains of an important site like Dorestad, which has proven to still hold a lot of information? • How can local, regional and national authorities deal with these archaeological remains? • How can we link digitally recorded data to analogue data? • What new knowledge has been gathered in the recent excavations by Earth Integrated Archaeology?

2366. Re-excavating Prehistoric Settlements: A Geoarchaeological Protocol for Updating Interpretations at Long-Term Sites from the ERC GEODAP Project

Authors: Federico Polisca (University of Padova | University of Bologna) – Marta Dal Corso – Francesco Breglia – Cristiano Nicosia (University of Padova)
Format: Oral

Within the framework of the ERC "GEODAP - Geoarchaeology od Daily Practices" project, a dedicated geoarchaeological excavation protocol has been developed for prehistoric settlement contexts, specifically addressing sites with long research histories and earlier excavation phases conducted using markedly different methodologies. The case study discussed here, the terramara site of La Muraiola di Povegliano Veronese (Middle Bronze Age, Verona, Italy), was partially excavated during the 1980s, resulting in an interpretative framework that was conditioned by a culture-historical approach and limited stratigraphic resolution. New excavations took place between 2022-2025. The geoarchaeological approach adopted by GEODAP places stratification – largely anthropogenic in this context – at the centre of archaeological interpretation, treating it as an artefact of human behaviour. Stratified deposits are considered not only as containers of finds, but as archives of contextual information for those finds and meaningful records of ancient practices and activities in their own right. Excavation was directed by geoarchaeologists and systematically coupled with targeted micromorphological sampling at key points for interpreting space use, diachronic transformations, and the formation processes of deposits and structures that proved ambiguous at a macroscopic scale. This strategy provided a robust stratigraphic framework for extensive archaeobotanical sampling carried out for each stratigraphic unit in close coordination with specialists present on site, together with zooarchaeological and artefact analyses. Field observations and micromorphological data were integrated within a GIS environment, supported by photogrammetric documentation. A rigorously constructed and graphically enhanced Harris Matrix enabled the integration of all datasets within a coherent stratigraphic grid, forming the basis for improved radiometric dating and Bayesian modelling. Crucially, the application of this protocol has led to the modification – and in some cases complete reinterpretation – of earlier conclusions, demonstrating how updated field strategies and analytical integration can critically reassess legacy data rather than simply reinforcing established narratives.

1134. Urban Archaeology in Motion: Methodological Shifts and Long-Term Research at Budva (Montenegro)

Authors: Dušan Medin (Faculty for Culture and Tourism University of Donja Gorica | Association for Cultural Development "Bauo") – Martina Blečić Kavur (Faculty of Humanities University of Primorska)
Format: Oral

Budva, located on the eastern Adriatic coast of Montenegro, preserves an archaeological record spanning over 2,500 years of continuous occupation. Archaeological research began in the late 1930s with the chance discovery of Hellenistic and Roman necropoles near the fortified Old Town. Early investigations, conducted without local institutional heritage frameworks, caused significant disturbance and dispersal of finds, many of which entered regional museums or private collections. Subsequent campaigns in the 1950s, led by teams from Croatia and later Serbia, introduced more systematic approaches but remained limited in scope and continuity. The most extensive excavations followed the destructive 1979 earthquake, under emerging Montenegrin heritage institutions. However, prolonged deficiencies in local heritage infrastructure, including the absence of a museum and specialised staff, resulted in uneven methodological practices and fragmentary records, leaving significant archaeological remains unpublished for decades. Only in the early 2000s, with the establishment of the Budva City Museum, could archaeological finds be systematically curated, studied and displayed. This paper examines Budva as a site of repeated but discontinuous investigations, shaped by evolving methodological paradigms, institutional capacities, and socio-political contexts. Focusing on ancient necropoles and museum collections as cumulative outcomes of long-term research, it explores how successive interventions reshape archaeological interpretation, how earlier practices constrain contemporary analyses, and how future work on complex urban sites can reconcile scientific continuity, methodological innovation, and heritage management. By reflecting critically on the history of excavation at Budva, the study contributes to broader debates on the evolution of urban archaeology, long-term research strategies, and the adaptive management of Mediterranean coastal heritage.

2699. From Paper to Point Clouds: Re-investigating "Old" Sites Through Digital Synergies

Authors: Nenad Joncic (IARC)
Format: Oral

Revision excavations of previously investigated archaeological sites are often undertaken to address unresolved questions or respond to new development-driven opportunities. This session examines how contemporary digital technologies have fundamentally reshaped the planning, execution, documentation, and interpretation of such "legacy" sites through three case studies from Slovenia and Serbia. At the Zavrč site, emphasis is placed on effective data management: from collection and documentation to the analysis of legacy digital archaeological data and their impact on archaeological theory. The presentation covers changes in digital archaeology at the European level, with particular focus on format obsolescence, the need to create metadata and paradata, and recommendations for long-term data accessibility and usability. This highlights the transformation of archaeological discourse through digital data. The eponymous Starčevo site (Grad-Starčevo), a key Early Neolithic settlement (ca. 6200–5300 BC) and the namesake of the entire Starčevo culture, has been excavated since 1928, with significant revision campaigns in 1969 and 2003/2004. New investigations launched in 2025 began with the digitization of historical documentation, georeferencing of old plans and maps, acquisition of archival aerial photographs, analysis of satellite imagery, new field prospection, and drone-based LiDAR scanning at three adjacent locations with Neolithic remains. This integrated approach enables a better understanding of pit-houses, painted pottery, and early agriculture at this site of exceptional cultural significance. At Donja Branjevina, excavations resumed in 2020 to establish precise stratigraphy and resolve open questions. From the outset, cutting-edge technologies were integrated: for the first time in Serbia, mobile LiDAR scanning (using iPhone Pro/iPad Pro) was applied for documentation, complemented by drone LiDAR and thermal imaging—establishing an innovative methodology for high-resolution spatial recording. These examples illustrate the transition from paper archives to multidimensional digital point clouds, improving data quality, interoperability, and theoretical contribution while addressing challenges of digital obsolescence and preservation.

2642. New methods - old problems: Benefits and challenges of integrating scientific innovation into established ways of working

Authors: Andy Boucher – Christopher Carey – Peter Turner – Ruschane Joginder (Headland Archaeology)
Format: Oral

Excavation is a destructive process, the very nature of gaining an understanding layer by layer of a site removes those same deposits and features leaving nothing for future methods to explore. This paper explores the potential of two innovative scientific approaches to excavation and our understanding of sites. It will look at the use of detailed geophysical survey applied direct to the excavation surface alongside the vertical susceptibility profiling of deposits across excavation sites. The aim is to place these methods in the hands of the site archaeologist rather than the specialist. We look at the value of the information recovered and how it contributes to understanding elements of an excavation that standard observation fails to elucidate. The use of a range of detailed geophysical survey can distinguish the orientation of features such as kilns allowing interventions to be planned in advance rather than having to blindly remove deposits, this approach is particularly suited to long running excavations allowing better planning for the next season at the end of the last. We also look at the relationship between susceptibility profiles to advise on features that fill concurrently as well as ones that hold more detailed clues about depositional sequences. Finally, we consider why, when these methods show such strong potential, it is difficult to change the ways in which people have always worked. We will also look at the impact of changing methodology over part of a site where previously a different one was used. We are looking to empower the next generation of archaeologists with accessible scientific methods that will further advance our understanding of past societies and the environments they occupied.

2539. Covering Old Ground: Ground Stone Tools as Part of Legacy Data from Ayia Irini, Kea

Authors: Jami Baxley Craig (Florida State University)
Format: Oral

Excavations at the Bronze Age town of Ayia Irini on Kea, conducted in the 1960s-70s by the University of Cincinnati, uncovered thousands of artifacts inside and nearby houses, much of which is currently under (re)study. Using the ground stone assemblage as a case study, this paper discusses the various challenges involved in the ongoing analysis of the Ayia Irini archaeological record. Two post-excavation practices, combining lots and the discard of less diagnostic or interesting artifacts, impact greatly the current state of the assemblage. In addition, the roof of the original apotheke collapsed in 2007, requiring the relocation of all stored artifacts to a new apotheke. The ground stone assemblage was especially impacted by this event: their field tags were damaged or lost, and the subsequent storage of many on the floors and in the bathroom of the new apotheke led to their poor preservation. These issues exacerbate the already difficult nature of ground stone tool studies of the prehistoric Aegean, where they have often been relegated to appendices of early excavation volumes and rarely integrated into major interpretations of sites. The recent examination of archival excavation documents and micro- and macroscopic studies of the tools emphasize that ground stone tools from legacy data can yield important technological and social information about prehistoric peoples if using the right investigative techniques. As studies of ground stone tools have become less marginalized in the prehistoric Aegean over the last 20 years, it is necessary that we readdress those recovered from earlier excavations, utilizing new analytical techniques that have developed over the past two

decades. This paper elucidates the ways in which we can begin to integrate this artifact class into interpretations of BA sites excavated in 20th century and enhance our overall understanding of socio-economic practices of houses in the prehistoric Aegean.

2742. Magnetic Susceptibility Fingerprinting: Old method - new approach

Authors: Andy Boucher – Christopher Carey – Ruschane Joginder (Headland Archaeology)
Format: Poster

To advance understanding in quantum science Richard Feynman proposed that it is necessary to guess, theorise and then test when developing any idea. The poster outlines an idea that has developed along the lines of this methodology. It looks to explore the difference in understanding of an archaeological site both with and without the application of a new method for understanding and comparing depositional sequences. Firstly the variations in susceptibility are compared against the excavator's original interpretation. The variation between two simple metrics (does a feature have one fill or more?) is illustrated across 100's of features measured using this method. Secondly we explore whether there are patterns in the data and how these can help us group or understand different features across a site based on changes in surrounding depositional environments throughout the period that the feature served as a receptor. Overall the poster aims to highlight the value of introducing science to archaeological investigations at any stage of the work on site.

202 MOUNTAIN HISTORIES THROUGH SOILS AND SEDIMENTS: GEOARCHAEOLOGICAL FRAMEWORKS FOR HIGH-ALTITUDE LANDSCAPES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Kerstin Kowarik – Valentina Laaha (Austrian Academy of Sciences) – Francesca Cornella (Newcastle University) – Isabella Prackwieser (University of Innsbruck)
Keywords: Mountain Archaeology, Geoarchaeology,, Digital Archaeology, Bioarchaeology, Soils, Sediments
Format: Discussion session

SESSION ABSTRACT

Mountain regions pose distinct challenges for archaeological research. Sparse and discontinuous material traces, fragmented preservation, and dynamic environmental processes—combined with the logistical difficulties of accessing high-altitude and high-relief settings—create enduring obstacles for fieldwork and interpretation. In recent years, however, advances in bioarchaeology, geoarchaeology, and soil science—alongside targeted digital and instrumental techniques—have markedly improved our capacity to investigate human engagement with mountain environments. Crucially, mountain soils and sediments have emerged as central archives, preserving evidence of ecological change, land-use practices, and human activity across diverse temporal and spatial scales. This session brings together researchers who develop and apply innovative approaches to study mountain soils and sediments as primary repositories of past human–environment interactions. We are especially interested in interdisciplinary frameworks that integrate geoarchaeological, bioarchaeological, and soil-focused digital methods to access, characterize, and interpret these sedimentary archives. Relevant approaches include, but are not limited to: soil geochemistry, multi-element and isotopic analyses, micromorphology, biomolecular techniques (e.g., ancient DNA, lipids, proteins), geophysical prospection specifically applied to soil stratigraphy or sediment architecture, and digital terrain or erosion modelling used to contextualize soil formation and sediment movement. We also welcome contributions addressing sampling strategies, scale-related challenges, and the practical or ethical complexities of working in dynamic mountain environments. We welcome: • Approaches that leverage new methodological advances to generate fresh perspectives, theories, and research questions grounded in soil and sediment analysis • Critical assessments of methodological effectiveness, including partially effective, ineffective, or still-emerging soil- or sediment-focused techniques • Contributions from researchers whose soil/sediment methods have strong potential for mountain contexts but have not yet been applied there By fostering exchange across disciplines and scales, this session seeks to deepen expertise and build synergies in the soil- and sediment-oriented geoarchaeological study of mountain landscapes.

CONTRIBUTION ABSTRACTS

586. SLOPE: Soil Loss and Pastoral Ecologies. A Digital Geoarchaeological Approach

Authors: Francesca Cornella – Francesco Carrer (Newcastle University) – Tim Kinnaird (University of St Andrews) – Thomas Reitmaier (Archaeological Service of the Canton Grisons) – Lisa-Marie Shillito (Durham University)
Format: Oral

Soils constitute invaluable natural archives for reconstructing landscape changes, especially in high-altitude mountain regions. Recent studies suggest that different long-term pastoral strategies have shaped mountain landscapes and triggered soil erosion since prehistory. Despite growing research, the functional relationships between pre-modern pastoralism and soil loss remain poorly understood, suggesting that some practices might have been more sustainable than others. This study applies Digital Geoarchaeology to investigate the extent to which long-term Alpine farming (Alpwirtschaft) triggered soil loss in two high-elevation sectors of the Silvretta Massif (Central-Eastern Alps). By integrating geoarchaeology, landscape modelling in GRASS GIS and soil analysis, the research develops a novel interdisciplinary framework to reconstruct the co-evolution of pastoral systems and mountain environments, exploring the effects of different land-use strategies and assessing ecological changes through time. To do so, the research adopts a methodological framework rooted in Socio-Ecological Systems (SES), a dimension that helps building and testing hypothesis about the bi-directional connections between human factors and changing environments. The research demonstrates this approach to be effective for exploring landscape transformations at three analytical scales: i) landscape, ii) catchment, and iii) micro. By bridging the gap between different scientific disciplines, the research assesses long-term socio-ecological changes and trajectories in Alpine upland regions, clarifying the role of pastoralism in shaping mountain landscapes and ecosystems –while eventually shedding light on how natural systems have influenced pastoral choices. Furthermore, the study also hopes to inform and support future sustainable Alpine pasture management.

626. Geoarchaeology of Mound Structures: A Sedimentary Micromorphological Analysis of Lapa da Meruje Dolmen (Viseu, Portugal)

Authors: Daniel Hindson Martins – Carlos Duarte Simões (ICArEHB, University of Algarve) – António Faustino Carvalho (CEAACP | ICArEHB, University of Algarve)
Format: Oral

Megalithic monuments are among the most visible markers of Neolithic landscape transformation, yet their earthen components and formation processes remain poorly understood. This study presents a geoarchaeological analysis of the Lapa da Meruje dolmen (municipality of Vouzela), focusing on mound construction, chamber infilling, and pre-monument land-use practices. Sedimentary micromorphology was applied to undisturbed samples collected from both the mound and the funerary chamber. Thin-section analysis under a petrographic microscope enabled the identification of depositional processes, sediment sources, and post-depositional alterations, allowing the distinction between anthropogenic and natural dynamics. Results indicate that the construction sediments were predominantly of local origin, derived from granitic soils and nearby fluvial terrace deposits. The presence of abundant amorphous organic matter, charcoal fragments, and other plant-derived materials suggests possible vegetation clearance and soil preparation activities prior to monument construction. The mound exhibits stratigraphy indicative of multiple construction and preparation phases rather than a single accumulation event. In contrast, the funerary chamber shows clear evidence of medieval and post-medieval disturbances, although basal Neolithic deposits (ca. 5800 cal BP) remain partially preserved. These findings highlight the analytical potential of micromorphology for reconstructing megalithic construction practices and human–environment interactions. They demonstrate that Neolithic monument building involved structured landscape modification and deliberate sediment selection within a mountainous granitic setting, while also raising important questions about preservation processes.

2508. A row of houses, a combination of proxies: micromorphology and phosphate mapping in and around La Tène-period buildings

Authors: Isabella Prackwieser – Susanna Cereda – Florian Müller (University of Innsbruck)
Format: Oral

A substantial number of La Tène-period hilltop settlements have been identified in the Tyrolean low mountain ranges in western Austria. The region's topography is characterised by terraces formed by the former Inn Valley glacier, lying c. 100–500 m above the valley floor. This shared landscape setting provides a broadly comparable framework for analysis. Although the predominant house type — buildings that are either partially or completely dug into the ground and surrounded by low dry-stone walls — is well documented and widespread, many questions remain unanswered. This is partly because finds are often limited, and many buildings were investigated during previous excavation campaigns and subsequently disturbed. Key issues therefore concern identifying functional areas within and around buildings, reconstructing flooring and assessing maintenance and abandonment processes as recorded in the remaining sediment archives. This study presents the results of a microarchaeological investigation of three adjacent La Tène-period buildings located at the Hohe Birga settlement in Tyrol, Austria. Soils and sediments are regarded as primary archives for reconstructing domestic activities and formation processes. The methodology combines micromorphological analyses of undisturbed sediment blocks with phosphate spot tests on soils and near-surface deposits. While micromorphology is used to document microstratigraphic evidence potentially related to floor construction and maintenance, phosphate spot tests are employed to explore spatial patterns of organic enrichment that may indicate activity zones within and immediately outside the buildings. Alongside the results, the study also shows which problems the methods have in this setting and how strongly this affects the interpretation of activity areas.

207 RECONSTRUCTING PREHISTORIC LIFEWAYS: MULTIDISCIPLINARY APPROACHES TO STUDYING MOBILITY, SUBSISTENCE, POPULATION STRUCTURE, AND SETTLEMENT PATTERNS

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Tamara Blagojevic – Jelena Jovanovic – Aleksandra Žegarac (BioSense Institute) – Camille De Becdelièvre (The Hebrew university of Jerusalem, Institute of Archaeology | Ass. Research.: Lampea, Aix-en-Provence) – Jelena Bulatovic (University of Gothenburg)
Keywords: Multidisciplinarity, Prehistoric lifeways, Population structure, Mobility, Diet, Settlement patterns
Format: Regular session

SESSION ABSTRACT

A rapid increase in bioarchaeological, biogeochemical, and molecular studies that combine different methods and analyses is undeniable. These methods are often coupled with traditional archaeological approaches, such as settlement archaeology and contextual analyses, as well as quantitative methods that include basic statistics, simulations, and modeling of various datasets. Therefore, multidisciplinarity has been present in archaeological studies more than ever, covering a vast number of subjects and subfields, refining theoretical frameworks and methods. Such versatility enables the researchers to tackle some grand processes, such as demographic changes on a continental level, individual histories of single sites, or even the level of one person's lifetime diet and mobility. The multiple-scale approach is becoming fundamental in studying prehistoric phenomena such as Mesolithic-Neolithic contacts, the Neolithic Demographic Transition, and Bronze Age social differentiation, to mention some of the most prominent topics. In this session, we would like to welcome studies that employ multidisciplinary approaches to research demographic patterns, as well as the population structure, including kinship and settlement patterns. We particularly encourage studies that adopt multiple-scale perspectives on archaeological questions and processes, ranging from individual experience to demographic patterns. Multidisciplinarity involves the use of stable isotopes, aDNA, and various methods in archaeology, biological anthropology, and zooarchaeology in defined archaeological contexts, regardless of region, method(s) applied, or period in prehistory. We also encourage researchers to present their work that employs different modeling techniques and frameworks (such as Bayesian or agent-based modeling) to stimulate discussion about the role of modeling in archaeological studies and to enhance interest in a better understanding of the practice and its potential in developing evidence-based interpretations.

CONTRIBUTION ABSTRACTS

241. SPEGEOCHERT: Innovative Analytical Approaches to Upper Palaeolithic Mobility in the Pyrenees

Authors: Marta Sanchez De La Torre – Julien Le Guirriec – Eulàlia Rafart – Jonàs Alcaina – Xabier Lizarralde – Alejandro Prieto (SERP-IAUB. Universitat de Barcelona)
Format: Oral

The ERC Starting Grant project SPEGEOCHERT examines patterns of human mobility across the Pyrenean mountain range during the Upper Palaeolithic, challenging long-standing interpretations of mountainous environments as marginal or restrictive landscapes. Recent archaeological evidence increasingly demonstrates that hunter-gatherer populations not only occupied high-altitude regions but also moved through them repeatedly, even during the coldest phases of the Late Pleistocene. In this perspective, the Pyrenees are understood as active corridors of movement and interaction that facilitated connections between human groups located on both sides of the range. A core component of the project is the investigation of chert, a primary raw material for prehistoric lithic production. The complex petrographic and geochemical variability of chert has traditionally limited the effectiveness of provenance studies. To overcome these constraints, SPEGEOCHERT applies portable Laser-Induced Breakdown Spectroscopy (LIBS), enabling fast, minimally invasive, in situ analysis of stone tools, including artifacts held in museum collections. This approach is complemented by portable X-ray fluorescence and VNIR spectroscopy, alongside advanced multivariate statistical analyses. By identifying and characterizing the main geological sources of lithic raw materials, the project aims to reconstruct mobility networks of Homo sapiens during the Late Pleistocene. More broadly, SPEGEOCHERT contributes to a renewed understanding of mountain landscapes as integral to the social, economic, and technological organization of prehistoric populations.

1182. Discussing the importance of multidisciplinary approaches in studying Neolithic mobility

Authors: Tamara Blagojevic – Jelena Jovanović – Maja Kokanović (BioSense Institute, University of Novi Sad)
Format: Oral

The period of the Neolithic represents a huge shift in human organization of life in all segments—economic, residential, social, and ideological. New practices, originating in Anatolia, spread further to Europe, including movements of people as a crucial catalyst of these changes on the continental level, with different paces at different stages and points in space and time. Understanding mobility patterns of Neolithic communities, especially those pioneering through new landscapes, can help us in better understanding of the ways they adapted to new environments and how they organized their settlement and subsistence strategies. An increased mobility is often assumed for the Early Neolithic as part of these processes of "getting to know" and adapting to new environmental conditions.

The importance of a multidisciplinary approach lies in the fact that there is no one unambiguous line of evidence, but rather a set of different indicators that, combined together, could offer answers about Neolithic mobility patterns. Project MOVE represents an example of this kind of approach in studying lifetime movements of both Early and Late Neolithic communities in the Southern Carpathian Basin. The combination of stable isotope analyses of carbon, nitrogen, sulfur, and strontium with archaeozoological research provides data both on economic practices and lifetime movements of people. Combined with the settlement archaeology approach, the project aims to reconstruct this important aspect of Neolithization as well as the consolidation of Neolithic practices in this part of Europe. Throughout its implementation, numerous questions regarding Neolithic settlement mobility have emerged, and this paper represents a step toward defining them and promoting discussion and potential solutions. This research was supported by the Science Fund of the Republic of Serbia, GRANT No. 7498, Moving across the plain: reconstructing the lifetime movements of farming pioneers and their successors during the Neolithic in the Southern Carpathian Basin-MOVE.

2525. Tracing Neolithic lifeways: a multi-proxy biogeochemical study of bioarchaeological remains in the Southern Carpathian Basin (7th-5th millennium cal BC)

Authors: Jelena Jovanovic (BioSense Institute, University of Novi Sad) – Camille De Becdelièvre (The Hebrew University of Jerusalem, LAB - Laboratory for Archaeo-Bioanthropology | CNRS, Aix Marseille University, Ministry of Culture, LAMPEA, UMR 7269) – Mario Novak (Institute for Anthropological Research, Zagreb | Faculty of Humanities, University of Primorska, Koper) – Andrej Starović (National Museum of Serbia) – Dragan Milanović (Archaeological Institute, Belgrade) – Dragana Rajković (Archaeological Museum Osijek) – Guy Andre (CNRS, Aix Marseille University, Ministry of Culture, LAMPEA, UMR 7269) – Abel Guihou – Helene Mariot (UMR 7330 CEREGE, Aix Marseille Univ, CNRS, IRD, Collège de France, INRAE) – Gwenaëlle Goude (CNRS, Aix Marseille University, Ministry of Culture, LAMPEA, UMR 7269)
Format: Oral

Reconstructing population movements, interactions with the environment, and spatial behaviors is crucial in the research of human residential mobility patterns during the period that shaped human practices toward sedentary and agriculture-based lifestyles. This is especially important when studying communities that settle in new areas for the first time and establish new economic practices during the Early Neolithic. The Southern Carpathian Basin (SCB) represents a key region for investigating these processes and dynamics of agropastoral expansion, as well as the ways in which different elements of the "Neolithic package" were adapted to new environmental settings. The MOVE project seeks to explore the emergence of sedentary lifeways by examining residential mobility, lifetime movement, and settlement organization among early farming communities and their successors in the SCB during the Neolithic period (~6250–4500 cal BCE). Furthermore, examining individual dietary choices during events of migration provides important insights into the diversity of food consumed and/or mobility and visited environments. To address this, stable isotope analysis on bone collagen (δ13C, δ15N, δ34S) and teeth apatite (87Sr/86Sr), are employed to directly assess the degree of individuals' mobility throughout their lifetime and reconstruct the dietary and environmental exploitation patterns of Neolithic communities. Overall, results suggest that Neolithic communities practiced mixed subsistence strategies that combined plant and animal resources, and that only a few consumed aquatic resources in moderate amounts. A trend toward higher animal protein intake among males is observed, potentially reflecting gendered roles or differences in activities through their lifetime. Variability among individuals and sites likely reflects local environmental conditions and community-specific adaptations to available food resources. This research was supported by the Science Fund of the Republic of Serbia (GRANT No. 7498)-Moving across the plain: reconstructing the lifetime movements of farming pioneers and their successors during the Neolithic in the Southern Carpathian Basin-MOVE. Acknowledgment: Other coauthors contributed to the preparation of this paper: Maja Kokanović and Tamara Blagojević (BioSense Institute, University of Novi Sad), Lidija Balj and Darko Radmanović (Museum of Vojvodina, Novi Sad), Maja Krznarić-Škrivanko (Municipal Museum Vinkovci), Pierre Deschamps (UMR 7330 CEREGE, Aix Marseille Univ, CNRS, IRD, Collège de France, INRAE, Aix en Provence).

1666. A Hidden Gem of the Wilderness: Faunal Remains and Environmental Adaptation at the Early Neolithic Site of Golokut-Vizić

Authors: Maja Kokanovic – Jelena Jovanović – Tamara Blagojević (BioSense Institute, University of Novi Sad) – Darko Radmanović (Museum of Vojvodina, Novi Sad) – Gwenaëlle Goude (CNRS, Aix Marseille University, Ministry of Culture, UMR 7269 LAMPEA)
Format: Oral

Animals and their products were essential to Neolithic subsistence systems, although the balance between husbandry and hunting differed greatly depending on local environmental conditions. The Early Neolithic site of Golokut-Vizić, located on the forested western slopes of the Fruška Gora Mountain in northern Serbia, provides an exceptional case for exploring the lifeways of the first agropastoralists of the Starčevo culture (~6250–5300 cal BC) in the Southern Carpathian Basin. Excavated intermittently between the early 1970s and the early 2000s, the site has yielded a substantial faunal assemblage. This study integrates new faunal data with published and previously studied assemblages. Preliminary results indicate a higher representation of domestic mammals, accompanied by a significant proportion of wild species. Previous studies emphasized the predominance of wild fauna, and the new findings likewise confirm the continued importance of hunted species within a mixed subsistence system. Unlike many contemporaneous lowland communities of the Pannonian Plain, where domestic taxa predominate, this assemblage shows a comparatively elevated proportion of wild species, reflecting intensive exploitation of forest resources and indicating that hunting remained a significant

component of local subsistence practices. Faunal evidence is examined alongside stable isotope analyses of carbon, nitrogen, and sulfur, complemented by seasonality and anthropological data, providing insights into diet and resource use. This integrated multi-proxy approach enables a comprehensive reconstruction of subsistence behavior and environmental exploitation while questioning simplified diversities between hunting and herding in the Early Neolithic economy. Golokut illustrates the micro-regional diversity of Early Neolithic lifeways and the distinct character of upland woodland settlements, where hunting persisted as an adaptive component of early farming economies. This research was supported by the Science Fund of the Republic of Serbia, GRANT No. 7498, Moving across the plain: reconstructing the lifetime movements of farming pioneers and their successors during the Neolithic in the Southern Carpathian Basin—MOVE.

2082. Vinča - Belo Brdo settlement catchment

Authors: Kristina Penezic (Biosense institute, University of Novi Sad)
Format: Oral

Vinča - Belo Brdo is the type site for the Late Neolithic cultural complex of the Central Balkans. It is also one of the rare Neolithic tells in the area that also has stratigraphic sequences from Early Neolithic up to its final, Late Neolithic/Eneolithic phases. It is located next to the Danube, a major river that dominates the landscape and acts as a natural border between the northern flat landscape of the Pannonian plain, and the southern hilly region of Central Serbia. This study explores the position of the type-site with surrounding settlements, from both Early (45 sites) and Late Neolithic (65 sites) periods. The settlement distribution in different periods is compared to available soils and explores the possible shift in land-use strategies over the Neolithic period in the micro-region. Also, based on the limited, but available data on the crop and livestock land use of the type-site, a network of communications surrounding Vinča - Belo Brdo is reconstructed throughout its Neolithic time span.

2429. Diet of the Bronze Age population in the North Pontic Steppe according to oral pathology and stable isotope analyses

Authors: Claudia Sharapova (Lithuanian Institute of History) – Alexandra Kozak (The Institute of Archaeology of the National Academy of Science of Ukraine) – Giedrė Keen Motuzaitė Matuzevičiūtė (Lithuanian Institute of History)
Format: Oral

In the North Pontic steppe zone, the livelihoods of Bronze Age populations have been associated with various forms of pastoralism and mobility. The Yamna culture lacked permanent settlements and relied mainly on small livestock, indicating high mobility. However, researchers disagree on whether the following Catacomb Culture, which maintained even larger cattle herds, enabled a semi-sedentary lifestyle with agriculture. Currently, it is not well understood whether dietary peculiarities exist between populations inhabiting different ecologies and whether diet varies among individuals of the sample populations. The analysis of dental and jaw pathologies, along with stable isotope analysis, provides a framework for assessing the dietary practices of the Bronze Age population. Here we present research results from burials located in three regions of Ukraine: the Middle Dnipro area, the unevenly developed hydrographic banks of the Middle Siverskyi Donets River, and the valley of the Sugokleja River. The analyzed individuals were dated to the Early and Middle Bronze Age (3300-1750 BCE). Macroscopic examination revealed dental calculus, caries, apical lesions, antemortem tooth loss, periodontal disease, mandibular torus and torus palatinus, hypercementosis, tooth wear, secondary dentin formation, enamel chipping, interproximal grooves, and linear enamel hypoplasia, thereby allowing a closer look into the life history of Bronze Age individuals. We present an anthropological assessment, together with stable isotope analysis of bone collagen, to better understand subsistence strategies of the European steppe populations.

414. Quantitative Approaches to Demographic Analysis of Bronze Age Settlements in China: The Semi-subterranean Dwellings at Xiaomintun as a Case Study

Authors: Yanjun Wang (University of Munich)
Format: Oral

Eighty-six semi-subterranean dwellings dating to Phases I–II of the Yinxu period, the Chinese Bronze Age associated with Yinxu, the late Shang (ca. 1300-1050 BCE) capital (present-day Anyang), were identified at the Xiaomintun site. Located approximately 2.5 km east of the palatial core at Xiaotun, these dwellings form three spatially separate clusters. In contrast to many contemporaneous settlements within Yinxu, no cemeteries or trash pits have been identified at Xiaomintun, limiting the applicability of existing demographic reconstruction methods. This paper presents a quantitative estimation of Xiaomintun's population size based on measurements of these semi-subterranean dwellings and their associated material remains. The analysis focuses on estimating population ranges and settlement scale and compares the results with other settlements within Yinxu, contemporaneous sites outside of Anyang and selected Bronze Age contexts of other civilizations. These comparisons aim to situate Xiaomintun within broader patterns of Bronze Age demographic and settlement variability. This paper further seeks to demonstrate how quantitative methods can be employed to reconstruct aspects of residential life in Bronze Age settlements, and to propose a methodological framework applicable to sites where excavation data have not yet been fully published.

785. Ancient DNA and New Radiocarbon Dates Reframe Multiple Burials at Bronze Age Tiszafüred–Majoroshalom

Authors: Anja Furtwängler (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Anett Gémes (Department of Biological Anthropology Eötvös Loránd University Budapest | Salisbury Zrt.) – Klára Fischl – Kristóf Fülöp (ELTE Research Centre for the Humanities Institute of Archaeology Budapest) – János Dani (Department of Archaeology, University of Szeged | Déri Museum) – Edit Mester (Kiss Pál Museum, Tariczky sétány 8, 5350 Tiszafüred, Hungary) – István Major (INTERACT, HUN-REN Institute for Nuclear Research ATOMKI, Debrecen) – Alissa Mittnik (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Tamás Hajdu (Department of Biological Anthropology Eötvös Loránd University Budapest | Centre for Applied Bioanthropology, Zagreb) – Johannes Krause (Max Planck Institute for Evolutionary Anthropology, Leipzig)
Format: Oral

Tiszafüred–Majoroshalom I-II. (eastern Hungary) is a well-known Bronze Age cemetery excavated between 1961–1975 near to the Tiszafüred-Ásotthalom tell settlement. The cemetery (with 1,006 graves, in use until around 1300 BC) captures change across the Otomani–Füzesabony and Tumulus horizons (Hungarian Middle–Late Bronze Age transition around 1500/1450 BC). At site Tiszafüred–Majoroshalom III, between the cemetery and the tell, two settlement pits were excavated in 2020, uncovering the remains of 44 individuals. We combined this archaeological framework with genome-wide ancient DNA. Screening 81 human samples for DNA preservation we generated genome data passing quality thresholds for 37 individuals (26 males, 11 females). Forty-four normative graves were directly radiocarbon dated, and further thirteen 14C dates were measured from the settlement pits. Kinship analysis identifies no first- or second-degree relatives, supporting a burial community based on specific selection criteria other than biological kinship. Population structure shows one dominant genetic cluster in every phase, with mass-grave and regular-grave individuals present in all clusters. Outlier frequencies suggest episodic mobility and admixture tests indicate overall continuity without population replacement while permitting additional ancestry streams. An identity-by-descent (IBD) network links seven males via very distant biological ties (>6th degree) that span the mass grave (Feature 4) and normative graves, which is consistent with a shared community background concept rather than family-group deposition practice. Together, these data refine mobility models and place the phenomenon of the mass grave in context.

1915. Paleogenetic Insights into Mobility and Population Structure of Late Iron Age Individuals from North and South of the Alps

Authors: Stefania Zingale (Eurac Research, Institute for Mummy Studies, Bolzano) – Zita Laffranchi (Department of History, Area of Prehistory, University of Córdoba) – Alice Paladin (Eurac Research, Institute for Mummy Studies, Bolzano) – Sandra Lösch (Institute of Archaeological Sciences, University of Bern) – Vanessa Haussener (Bernisches Historisches Museum) – Irene Dori (Soprintendenza Archeologia, Belle Arti e Paesaggio, Verona | Department of Biology, University of Florence) – Roby Stuani (Institute of Archaeology, University of Barcelona) – Albert Zink (Eurac Research, Institute for Mummy Studies, Bolzano | Bavarian State Collection for Anthropology, SNSB, Munich) – Marco Milella (Department of Biology, University of Pisa) – Valentina Coia (Eurac Research, Institute for Mummy Studies, Bolzano)
Format: Oral

The spread of the La Tène culture in Europe during the Late Iron Age (LIA, 4th–1st centuries BCE) is traditionally associated with the migration of "Celtic" groups. Archaeological evidence places its origin mainly in central Europe and documents a subsequent southward diffusion through the Alpine region, including into northern Italy. Paleogenetic data from key regions involved in this process remain limited. To address this gap, we analyze two LIA groups from Switzerland (CH) and northern Italy (NI). Using a combined genetic and bioarchaeological approach, we reconstruct the genetic structure and mobility of CH and NI groups to investigate demographic processes associated with the southward spread of La Tène culture. We present high-quality genomic data (shotgun and enrichment of ~ 1.3 million SNPs) from 181 LIA individuals (n=88 from 15 CH sites and n=93 from 2 NI sites). Genetic sex determination identified 98 females (XX) and 83 males (XY). Kinship analyses reveal close biological relationships up to the third degree, primarily within archaeological sites, with only one third-degree relationship between two CH sites, and no close kinship links between CH and NI cemeteries. Comparative analyses show that approximately half the individuals from CH and NI share common ancestry and genomic affinity with western- and central- European IA individuals. Some NI individuals (~ 25%) deviate from this pattern, showing ancestry referable to individuals from IA Italy. Isotopic data of strontium, oxygen, and sulfur suggest short- and long-distance mobility in both studied groups. Overall, our study supports central Europe as a core region in the diffusion of the La Tène culture, with population movement contributing to its southward spread. Additionally, it suggests that the NI group also included local individuals, possibly culturally integrated in the incoming community.

2142. Dual sulfur-oxygen isoscape of Denmark using novel archaeological faunal remains

Authors: A. Ja'Net Baide – Daniel Dalmas (University of Utah) – Malene Beck (Østfyns Museer) – Jens Berthold (Bornholms Museum) – Katrine Balsgaard Juul (Museum Horsens) – Mette Klingenberg (Holstebro Museum) – Thomas Guntzelnick Poulsen (Museum Østjylland) – Jens Ulriksen (Museum Sydøstdanmark) – Dorthe Dangvard Pedersen (Syddansk Universitet) – Alexandra Greenwald (University of Utah | Natural History Museum of Utah)
Format: Oral

Isotopic methods in Danish archaeology predominantly focus on reconstructions of paleodiet and the application of strontium isotopes in paleo mobility. Recent research highlights the promise of stable sulfur isotopes (δ34S) for provenance studies in Northwestern Europe and is of particular promise for Denmark's relatively homogenous geology. We employ stable isotope analysis of bioavailable sources to model the variation of environmental signatures across Denmark's historical landscape utilizing fauna remains dating to the Viking Age and Middle Ages. We present the first spatially robust dataset representing 42 sites across Jutland, Fyn, Zealand, Bornholm, and Denmark's southern islands. Faunal remains (n = 90) belonging to genera including Sus, Rattus, and Microtus were analyzed for δ34S, stable carbon (δ13C), stable nitrogen (δ15N) and stable oxygen (δ18O). Results from these analyses are used to construct the region's first multi-isotope sulfur-oxygen isoscape utilizing archaeological sources, paving the way for research in human mobility and animal trade in Scandinavian archaeology. These data also permit the reconstruction of dietary patterns of Sus domesticus recovered from both inland and coastal sites, which shed light on animal husbandry practices and human diet across the Viking and Middle Ages.

972. A Millennium at the Edge: The Impact of Isolation on Ancient Populations from El Hierro (Canary Islands)

Authors: Rosa Fregel (University of La Laguna) – Javier Serrano (University of La Laguna | University of Copenhagen) – Jonathan Santana – Alejandra Ordóñez (University of Las Palmas de Gran Canaria) – Clara Díaz-Pérez – Sara Armas-Quintana (University of La Laguna)
Format: Oral

The human colonization of oceanic islands represents an exceptional opportunity to explore the effects that founder effects and isolation have on human populations. One extreme example of isolation is that of El Hierro in the Canary Islands. This island is the smallest, youngest and westernmost island of the archipelago, and represents a hostile environment in which the first colonizers would have needed a longer adaptation phase with the possibility of stronger bottleneck effects. This is also a remarkable case of colonization because it is thought that the indigenous people were isolated in El Hierro since the initial colonization in the 3rd century CE until the beginning of the European conquest in the 15th century. In this project, we applied paleogenomic techniques and radiocarbon data to explore signatures of isolation in the indigenous people of El Hierro though a time transect, going from the first centuries CE to present-day populations. Paleogenomic data shows extensive runs of homozygosity, bottleneck events and intense genetic drift in the indigenous population. The diversity observed in early individuals steadily declined due the effect of continuous bottlenecks, reaching the lowest diversity values and highest levels of consanguinity by the 12th-13th century. This high background relatedness likely led to the manifestation of homozygous recessive diseases, explaining the osteological abnormalities observed in the archaeological record. The present-day population also shows signs of genetic drift and inbreeding, suggesting that the same isolation processes affecting them during the indigenous period also affected them in historical times. Overall, this study sheds light on the complex demographic history of El Hierro, illustrating the profound effects of over 1,000 years of isolation in a low-resource environment but also highlighting the population's remarkable resilience in adapting to these harsh conditions.

975. Paleogenomic analysis of the temporal evolution of the human population of Gran Canaria

Authors: Sara Armas-Quintana – Clara Díaz-Pérez (Universidad de La Laguna) – Javier G. Serrano (University of Copenhagen, Lundbeck Foundation GeoGenetics Centre) – Jonathan Santana (Universidad de Las Palmas de Gran Canaria) – Martin Friess (Ecoanthropologie | UMR 7206, Muséum national d'Histoire naturelle, Paris Université) – Rosa Fregel (Universidad de La Laguna)
Format: Oral

Multidisciplinary studies of the indigenous population of the Canary Islands have concluded that the settlement of the archipelago occurred around the 3rd century CE and that its inhabitants originated from North Africa. However, whether these populations remained isolated until the European conquest in the 15th century remains unclear. A paleogenomic study published in 2023, determined that the indigenous population of Gran Canaria exhibited the highest genomic diversity across the entire archipelago. Furthermore, its genetic composition, along with Fuerteventura and Lanzarote, differed from that of the western islands. While these findings may be attributed to asymmetric migrations within the archipelago, as proposed based on archaeological evidence, paleogenomic data analyzed thus far indicates no evidence of a significant gene flow in Gran Canaria. A limitation of previous studies lies in the small sample size, particularly during the early and middle periods of indigenous settlement. To address this, we propose a detailed temporal analysis of the human population of Gran Canaria, spanning from the onset of indigenous colonization to the establishment of the colonial society. This study will examine remains from 20 new archaeological sites and 117 individuals, enabling a comprehensive reconstruction of demographic and genetic changes. Through Bayesian radiocarbon data modeled we identify the chronology of the dispersion throughout the island and explore if additional migration reached Gran Canaria.

1291. Child burials at Lepenski Vir: insights into social and population dynamics

Authors: Aleksandra Žegarac – Tamara Blagojević – Jelena Jovanović (BioSense Institute) – Camille De Becdelièvre (The Hebrew university of Jerusalem, Institute of Archaeology | Lampea, Aix-en-Provence) – Sofija Stefanović (Faculty of Philosophy, University of Belgrade)
Format: Oral

Lepenski Vir in the Danube Gorges area is one of the rare archaeological sites that provides direct evidence of contact between Mesolithic and Neolithic communities. In addition to the characteristic sandstone boulders, burials of neonates were found in association with trapezoidal houses dating to the Mesolithic - Neolithic transition period (6200–5900 BCE). These burials were cut into the red-plastered floors, always at the rear of the buildings. Although this funerary practise was not unique to the Balkans, but also well known in other cultures, particularly in Anatolia, the reasons behind it remain unknown. A multidisciplinary approach to Lepenski Vir research (integrating information on burial practices and context, individuals' age and sex, as well as genetic, isotopic and radiocarbon data), has provided detailed insights into diet, health, ancestry and kinship ties, offering a deeper understanding of socio-cultural interactions and biological admixture. Considering the recently obtained paleogenomes of infants from Lepenski Vir, as well as the growing research interest in children in archaeological contexts, here we discuss recent interpretations of this famous site and the specific practise of burying neonates. Such studies can help us to understand the function of these unique trapezoidal houses (whether they served the broader community, nuclear families, or had a protective role in transforming infant death), as well as how children were perceived in past societies.

1125. "United by Crisis?" (Part One) - A Multidisciplinary Approach to the LBK Settlement Cluster of Asparn/Schletz- Line Walking, Landscape, Pottery

Authors: Julia Längauer (University for Continuing Education Krems) – Michael Schober (Technical University of Leoben) – Cornelia Hascher (University for Continuing Education Krems) – Franz Pieler (State Collections of Lower Austria) – Maria Teschler-Nicola (Natural History Museum Vienna) – Johanna Irrgeher – Thomas Prohaska (Technical University of Leoben) – Olivier Duboc (BOKU University, Vienna) – Friederike Novotny (Natural History Museum Vienna) – Jakob Maurer (University for Continuing Education Krems)
Format: Oral

The site of Asparn/Schletz in the Lower Austrian Weinviertel ranges among the most prominent Linear Pottery Culture sites in Middle Europe, due to evidence suggesting a massive violent attack on the settlement around 5.000 BC. However, the long history of the site and the surrounding region preceding this presumably final massacre was largely unknown. To address these gaps, the project "United by Crisis?" (funded by the GFF Lower Austria) followed a multidisciplinary approach of archaeology, anthropology, and chemistry applying a range of scientific methods for the investigation. Besides new anthropological evaluations and strontium isotope ratio analysis, a strong focus was on the archaeological context of line walking surveys, archive work and integrating old find collections into the new data. A big emphasis within the project was on the inclusion of Citizen Scientists in the data collection and analysis. With this talk (Part One) we want to present the results of the line walking surveys, the landscape archaeology as well as the typochronological pottery analysis in combination with new ^{14}C dates. We will show the development of the settlement cluster, its time range, and interaction with surrounding settlements. This work was crucial for the further understanding of the 87Sr/86Sr isotope ratio analysis, discussed in the second part. (Part Two) The project "United by Crisis?" is presented in two separate contributions in order to provide a thorough information of our conclusions. Additionally we will give a short inside into the follow up project "ReCLAYm", focused on the pottery finds analysis of Asparn/Schletz.

2101. "United by Crisis?" (Part Two) - Strontium Isotope Ratios for Provenancing the Population of the Settlement at Asparn/Schletz

Authors: Michael Schober – Thomas Prohaska (Technical University of Leoben) – Maria Teschler-Nicola (Natural History Museum Vienna) – Olivier Duboc (BOKU University, Vienna) – Cornelia Hascher – Julia Längauer (University for Continuing Education Krems) – Friederike Novotny (Natural History Museum Vienna) – Markus Puschenreiter (BOKU University, Vienna) – Jakob Maurer (University for Continuing Education Krems) – Johanna Irrgeher (Technical University of Leoben)
Format: Oral

The interdisciplinary project "United by Crisis?" (UBC) investigates the settlement at Asparn/Schletz in Lower Austria from the Neolithic era. A combined approach of archaeology, bioanthropology, and chemistry examines the settlement with its surrounding region. Hereby, the research of the UBC project (funded by the GFF Lower Austria) with its first outcomes is presented in two separate parts. The settlement of Asparn/Schletz is considered a center within a network of smaller settlements due to its size and fortification. It potentially functioned as a defensive structure for inhabitants of the settlement cluster in times of crisis, especially perhaps during a violent event approximately 7,000 years ago. Line walking surveys and dating of Linearbandkeramik (LBK) pottery were conducted to research the development of the settlement cluster (Part One). Human teeth directly from the central settlement and recent environmental samples from the site and its vicinity were analyzed by isotope ratio analysis of strontium (87Sr/86Sr) to study the locality of the population (Part Two). A total of 90 enamel samples were collected from individuals excavated at the settlement of Asparn/Schletz and were first processed by hot-plate assisted acid digestion. In addition, the bioavailable Sr fraction was extracted from river water and soil samples to establish a local 87Sr/86Sr isotope signal. All samples then followed an automated Sr/matrix separation before strontium isotope ratio analysis was performed by multi-collector inductively coupled plasma mass spectrometry (MC-ICP-MS). The presented findings combine recent results from UBC and data based on earlier subsamples analyzed since the 1990s. 87Sr/86Sr isotope ratios of human enamel samples are compared with the so-called local signal of the environmental samples shown on spatial distribution maps of the Asparn/Schletz settlement cluster. In accordance with previous studies, the individuals of the settlement reflect a broad locality.

2139. The victims of the Bronze Age conflict in the Tollense valley, Northern Germany: Strontium isotope evidence for a heterogeneous community

Authors: Corina Knipper (Curt-Engelhorn-Center Archaeometry gGmbH, CEZA) – Ute Brinker – Hella Harten-Buga (MuSeEn gGmbH) – Detlef Jantzen (State Office of Culture and Heritage, Mecklenburg-Western Pomerania) – Gundula Lidke (Leibniz Center for Archaeology, LEIZA, Schleswig) – Sebastian Lorenz (University of Greifswald. Institute for Geography and Geology)
Format: Oral

Since the late 1990ies archaeological investigations documented multiple concentrations of disarticulated human remains in the Tollense River valley, Northern Germany. Traces of traumatic injuries as well as weapons suggest that the sites represent an extensive area of interpersonal violence. Weapons, especially arrowheads, some of them still stuck in the bones, as well as radiocarbon dates, place the find contexts into the Nordic Bronze Age (c. 1400 - 1000 cal. BC). An extremely heterogeneous dataset of an initial strontium isotope study attests to the involvement of people coming from multiple, geologically different locations. Currently, the interdisciplinary project "The Bronze Age battlefield in the Tollense Valley – touristic development and research", under the leadership of the MuSeEn gGmbH and the State Office of Culture and Heritage, Mecklenburg-Western Pomerania, expands the previous investigations. Strontium isotope analyses of enamel samples from additional, earlier or later forming teeth from the same individuals confirm the exceptional diversity of the dataset. At the same time, similarity of both samples of the same skulls suggests that the individuals spent several years of their childhood in consistent locations, before moving in adulthood and falling victim in the conflict. Moreover, enlarging the sample set regarding individuals confirms the wide data spectrum. It also consolidates several data groups, supposedly representing individuals from different locations. Expanding the collection of comparative data using samples of modern vegetation specifies the regional isotope baseline and addresses questions regarding the influence of modern agriculture on the isotope composition of modern plants.

2391. Beyond the Burial Context: Investigating Diet and Mobility at Jurilovca–Orgame (Romania) during the Early Iron Age.

Authors: Noria Petrache – Ana García-Vázquez (University of Bucharest) – Mihai Constantinescu (University of Bucharest | Institute of Anthropology "Francisc I. Reiner") – Cătălin Lazăr (University of Bucharest) – Viorel Atudorei (University of New Mexico) – Tiberiu Sava (University of Bern) – Sorin Ailincăi (University of Bucharest)
Format: Oral

Reconstructing ancient life-ways is a central objective of archaeological research. For this purpose, the present study adopts a multidisciplinary approach to investigate subsistence strategies, mobility, and individual life histories in the Dobruja region of Romania, during the Early Iron Age, focusing on deviant burial case studies attributed to the Babadag culture. Using stable isotope analysis of carbon ($\delta^{13}C$), nitrogen ($\delta^{15}N$), and oxygen ($\delta^{18}O$) derived from human and animal bone collagen, teeth enamel and archaeobotanical samples, the research moves from individual life histories to group-level patterns and their regional context. The research presents the isotopic data obtained from 12 human individuals interred in a single pit at the Jurilovca–Orgame site, Romania. Given the absence of designated cemeteries and the exclusive adoption of pit burials, described in literature as atypical burial treatments, characteristic for the Babadag culture, the study addresses fundamental archaeological questions concerning identity and social differentiation: who were these individuals, and why were they buried in atypical contexts? Here, we treat such labels as historiographic indicators and focus on reconstructing the social and environmental circumstances that may have produced these depositional choices. Our dietary interpretation is grounded in a local isotopic baseline, integrating stable isotope faunal data from proxy archaeological sites attributed to the Babadag culture, and mobility assessment via δ18O is evaluated against regional baseline expectations (local water/faunal ranges). Using Bayesian modeling we will present intra-pit isotopic relations and discuss how these results complement existing anthropological, zooarchaeological, and paleobotanical investigations, offering new perspectives on differentiated access to resources and social dynamics in order to refine interpretations of population structure in the Early Iron Age Lower Danube region.

1990. Stable carbon and nitrogen isotopic studies reveal uniform dietary habits in Roman age communities in Aquincum, province of Pannonia

Authors: Istvan Major (HUN-REN ATOMKI, INTERACT Laboratory | MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Group) – Orsolya Láng (BHM Aquincum Museum | MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Group) – Krisztián Kiss (MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Group | ELTE RCH Institute of Archaeogenomics | Institute of Practical Methodology and Diagnostics, University of Miskolc) – Anna Biller – Paula Zsidi (MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Group | BHM Aquincum Museum) – Anikó Kecskés – Viktória Oravecz (MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Group | ELTE RCH Institute of Archaeogenomics) – István Futó (HUN-REN ATOMKI, INTERACT Laboratory) – Balázs Mende (MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Gro | ELTE RCH Institute of Archaeogenomics) – Anna Szécsényi-Nagy (MTA-ELTE HTK Lendület "Momentum" Bioarchaeology Research Group | ELTE RCH Institute of Archaeogenomics)
Format: Oral

Aquincum, as the capital of the Roman province of Pannonia Inferior was inhabited by a mixed population of Romanized Celts and immigrants of the Roman Empire itself. We analysed almost 60 humans and 17 animals from different archaeological sites of Aquincum for stable carbon and nitrogen isotope ratio to reconstruct the dietary habits of the communities. Related to animals, some effect from C4 plants is implied for the case of chicken, which we assume is due to feeding with millet. In the case of humans, most of our stable nitrogen isotope results are located in the 8-10‰ range, indicating a mixed consumption of plant-animal derived protein. The carbon isotopes do not indicate significant millet consumption, although a regional comparison revealed that the values are less negative than the range suggested by other communities assumed to be exclusively C3 plant consumers. This may have been influenced by the values of the animals consumed. We did not detect any significant differences in the diet of males and females, but the values for infants, especially those in the weaning period, clearly indicate the effect of millet consumption. Whether, this is due to some fundamental sociocultural influence or the effect of population exchange with barbarians is a subject for further investigation.

847. At the crossroad of the Mediterranean: tracing population dynamics and mobility in Sicily through archeogenomics

Authors: Rajiv Boscolo Agostini (University of Ferrara) – Margherita Vanni (University of Florence) – Federico De Pizzol – Maria Teresa Vizzari (University of Ferrara) – Giulio Catalano (University of Palermo) – Alessandra Modi – David Caramelli (University of Florence) – Luca Sineo (University of Palermo) – Stefania Vai (University of Florence) – Silvia Ghirotto (University of Ferrara)
Format: Oral

Sicily is located at the center of the Mediterranean basin and has long served as a crossroads for population movements and cultural interactions. The development of maritime trade from the early 2nd millennium BCE increased mobility, connecting Sicily with neighbouring Mediterranean and Aegean populations. Despite a rich archaeological record and the growing availability of ancient genomic data, key evolutionary and demographic processes remain poorly understood, thus preventing a comprehensive reconstruction of human population dynamics. Here, we present 18 newly generated ancient genomes (average coverage ranging from 0.1x to 4x) from 11 Sicilian necropolises, spanning from the Paleolithic (~14,000 BCE) to the Middle Ages, including individuals from key cultural contexts such as Sicanians, Punics, Greeks, and Byzantines. These data, combined with 23 previously published ancient Sicilian genomes and approximately 500 ancient individuals from the Mediterranean basin and Europe, provide high-resolution insights into demographic dynamics, ancestry patterns, and genetic contributions within the island. In addition, we investigate temporal variation in pigmentation phenotypes among Sicilian individuals. We detect evidence of Steppe pastoralist ancestry from approximately 2,200 BCE, along with elevated proportions of Iranian-related ancestry compared to the Italian mainland, consistent with increased connectivity with the Aegean, including groups such as the Minoans and Mycenaeans. In the Iron Age, we observe a genetic shift and a shared genetic variation between Sicilian and Eastern Mediterranean populations. In addition, we identify a North African genetic component, which reaches its maximum during the Middle Ages. We also detect genealogical affinities among necropolises and local patterns of genetic continuity through time. Overall, our findings provide direct archaeogenomic evidence for the complex population dynamics and long-term genetic consequences of cultural interactions that shaped Sicily during the Bronze and Iron Ages, highlighting the crucial role of the island within Mediterranean networks.

825. Exploitation of Faunal Resources in the Late Copper/Early Bronze Age Eastern Croatia

Authors: Jelena Bulatovic (University of Gothenburg) – Ivana Dimitrijevic (Institute of Archaeology in Belgrade) – Ina Miloglav (University of Zagreb) – Jacqueline Balen (Archaeological Museum in Zagreb)
Format: Poster

This study presents the results of zooarchaeological analyses of faunal assemblages from Copper Age sites in Eastern Slavonia, Croatia, conducted within the project CULPLUS (Culinary practices, husbandry, and land-use strategies during the Copper Age in Eastern Slavonia). The material derives from the Late Copper Age sites of Prisunjača (2890–2470 cal BC) and Verušed, as well as the Late Copper/Early Bronze Age site of Viškovci-Gradina (2570–2340 cal BC), providing insight into animal exploitation patterns and dietary practices. By integrating taxonomic, taphonomic, and contextual data, the study examines regional variability and diachronic trends in culinary practices and subsistence strategies. The zooarchaeological results reveal clear inter-site differences in animal management, resource use, and dietary practices. Variation in the relative importance of wild and domestic taxa suggests contrasting economic orientations among the sites. At Prisunjača, hunting and herding appear to have functioned as complementary components of subsistence, whereas at Viškovci domestic animals clearly predominated, indicating a stronger emphasis on husbandry. Although the Verušed faunal assemblage is limited in size, it displays several noteworthy characteristics, including a high degree of weathering and the presence of horse bones bearing butchery marks, suggesting occasional consumption of horse meat. Differences in refuse disposal practices further distinguish the sites, with open-area accumulation at Prisunjača contrasting with pit deposition at Viškovci. Together, these patterns point to locally specific combinations of environmental adaptation and cultural practice, underscoring the diversity of subsistence strategies and foodways during the Copper Age in Eastern Slavonia.

1997. Kinship, demography and social organization during the Bronze Age in northeastern Iberia: Insights from Mas d'en Boixos archaeological site

Authors: Cristina Santos – Maria Rosa Campoy-Caballero – Daniel R. Cuesta-Aguirre (Universitat Autònoma de Barcelona)

– Nuria Armentano (Museu d'Arqueologia de Catalunya | Universitat Autònoma de Barcelona) – Pablo Martínez (Universitat de Barcelona) – Xavier Esteve (Departament de Cultura de la Generalitat de Catalunya) – Assumpció Malgosa (Universitat Autònoma de Barcelona)
Format: Poster

Mas d'en Boixos (MDB) is the largest prehistoric archaeological site in the Catalan Pre-littoral Depression (Penedès region, Barcelona, northeastern Iberia), comprising more than 580 structures dated from the Early Neolithic to the Ancient Iberian period (~7.5–2.2 ka). This extensive stratigraphic sequence captures key demographic and cultural transformations, including the Neolithic transition and the emergence of Bronze Age social complexity. We present new genome-wide and strontium isotope data from eleven Bronze Age individuals recovered from Structure E-452, a monumental collective burial formed by a hypogeum excavated as a lateral chamber within a large silo. Published genomic data from another Bronze Age funerary structure at Mas d'en Boixos (E-35) were also compiled and integrated for broader contextualization. Genetic sexing of the E-452 individuals identified eight males and three females. Kinship analyses based on genome-wide data reveal multiple first- and second-degree relationships, indicating a highly structured kinship network in which most individuals were closely related. All males belong to Y-chromosome haplogroup R1b, with evidence for two distinct sublineages. In contrast, despite strong autosomal kinship links, mitochondrial DNA displays high haplogroup diversity, consistent with a patrilocal residence pattern. This pattern parallels observations from the previously studied hypogeum E-35, reinforcing the presence of local patrilineal groups incorporating women from neighbouring communities. Notwithstanding, the previous study of E-35 identified an Eastern European mitochondrial lineage, a result that complicates the model of a strictly male-driven Bronze Age transition and points to sporadic but notable female-mediated long-range connections. Taken together, these results position Mas d'en Boixos within broader European Bronze Age social dynamics, highlighting the persistence of kin-structured male lineages combined with predominantly localized female mobility. These findings contribute to a more nuanced understanding of social organization, mating practices, and community structure in northeastern Iberia during the Bronze Age.

2017. Paleogenetic and osteological investigation of Bronze Age individuals from Tischofer Cave (Eastern Alps, Austria)

Authors: Silvia Frigo – Stefania Zingale – Frank Maixner (Eurac Research, Institute for Mummy Studies, Bolzano) – Peter Pindur (High Mountain researcher, Münster) – Katharina Rebay-Salisbury (Department of Prehistoric and Historical Archaeology, University of Vienna | Austrian Archaeological Institute, Austrian Academy of Sciences, Vienna) – Fabian Kanz (Center for Forensic Medicine, Medical University Vienna) – Valentina Coia (Eurac Research, Institute for Mummy Studies, Bolzano)
Format: Poster

The Tischofer Cave (Kaisertal Valley) is renowned for its Paleolithic artefacts and cave bear remains. Moreover, the cave was frequented by humans during the Bronze Age, as evidenced by human remains and artefacts similar to those of the early Bronze Age northern Alpine Straubing group. However, the purpose for which the cave was used remains unknown, and there is no evidence to suggest that it was used as a burial site. The human bones are in excellent condition. Using an interdisciplinary approach, we have reconstructed the biological profile of the individuals from the cave, radiocarbon dated from 1921 to 1502 cal BC. Minimum Number Individual-analysis based on bone morphology revealed at least 23 individuals (18 subadults, 5 adults), most of which were of indetermined sex. The analysis was challenging because the bones were found disarticulated, with a greater number of postcranial bones than skulls. Molecular screening of 25 human samples (humerus, petrous bone and teeth) revealed a good preservation of human reads (HR, from 1.2% to 76%) in 15 samples, which were then enriched for informative SNPs of the human genome (~ 1.3 million). The samples with the best preservation included four humeri, possibly due to the favorable conditions of the cave environment. The remaining samples with HR <1% were excluded for downstream analyses. Molecular sex determination indicates that the number of females is approximately twice that of males. Kinship analyses identified several relatives, including a mother and daughter who share the same maternal lineage (T2b). Finally, all the males analysed have the same paternal lineage (R1b1a1b*). This study presents the first paleogenetic analysis of prehistoric groups from this Alpine eastern area and is of particular significance, as the predominant Bronze Age mortuary practice of cremation typically precludes paleogenetic investigation.

209 ARCHAEOLOGICAL DATA WORK: INTERDISCIPLINARY PERSPECTIVES TO INTERDISCIPLINARY PRACTICES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Isto Huvila (Uppsala University) – Sabina Battle Baró (Universitat de Barcelona) – Costis Dallas (Vilnius University)
Keywords: data work, digital data, datafication, interdisciplinarity, knowledge production, digitisation
Format: Regular session
Affiliation: Computer Applications & Quantitative Methods in Archaeology (CAA)

SESSION ABSTRACT

Digitalisation and datafication of archaeological practices mean that rapidly evolving data work has become a central aspect of practising archaeology. Instead of documenting finds and features and publishing results, archaeology is more and more about making, processing, organising, managing and (re)using data. These data are increasingly digital and expected to be findable and accessible online, interoperable for digital processing and reusable for a wide range of secondary purposes, within and outside archaeology. The data work in archaeology has expanded in how it has progressively become a more interdisciplinary enterprise requiring multiple types of expertise beyond archaeology. But also, in how archaeological data is increasingly used outside of archaeology, and how understanding archaeological data work benefits from f perspectives outside of archaeology. This session welcomes presentations of evidence-based, theoretical, critical and applied research relating to contemporary and historical archaeological data work. The purpose is to inquire into how data work is conducted in practice, what influences data work and how, what implications different types and approaches to data work have on data, archaeology and archaeological knowledge production, what methods and theories help us to understand archaeological data work, what concerns and new challenges are introduced or exacerbated by the increasing centrality of data work in archaeological research, curation and communication, and how we can theorise and practice data work in the future. Submissions are invited from archaeologists but also from other disciplines conducting research on archaeological data work or working with archaeological data, and practitioners who are engaged in data work. The session is sponsored by the CAA SIG ARKWORK Archaeological practices and knowledge work in the digital environment.

CONTRIBUTION ABSTRACTS

2248. Understanding data reuse: the role of excavation reports in Catalan archaeological research practice

Authors: Sabina Batlle Baró (Departament de Biblioteconomia i Documentació, Universitat de Barcelona)
Format: Oral

The increasing emphasis on the FAIR principles in archaeology presumes that making raw digital data openly available will facilitate reuse and advance knowledge production. However, this study of data reuse practices among archaeological researchers in Catalonia reveals a more complex reality. Through semi-structured interviews with researchers—predominantly based in universities and institutes across all archaeological periods—, this research demonstrates that while data reuse occurs, it remains limited and shaped primarily by social rather than technical barriers. Findings reveal that researchers rarely engage directly with raw datasets, instead relying on excavation reports as their primary source. This practice reflects both pragmatic constraints—data are often unavailable—and epistemological beliefs that data lack interpretive value without the data creator's expertise. Significantly, social norms discourage accessing others' work without direct contact, and researchers express concerns about appropriateness of reuse without collaboration. These social barriers—trust, professional etiquette, and perceived requirements for personal communication—fundamentally shape reuse practices. This research highlights excavation reports' crucial yet underexamined role in archaeological data sharing and knowledge circulation. Rather than bypassing reports in favor of raw data repositories, data infrastructure should recognize and enhance reports as vehicles for FAIR-compliant information sharing, bridging current practice with open science aspirations.

2534. Information Work and Data Regimes of Archaeological Research Data: Flows and Trajectories in Institutional Data Infrastructures

Authors: Michal Lorenz – Filip Hájek (Masaryk University)
Format: Oral

This presentation examines information work with archaeological research data, focusing on how data are organised, stabilised, and transformed within institutional data infrastructures. It addresses the problem of heterogeneous data regimes that shape everyday information work across institutions and the resulting tension between diverse local practices and the need for standardised procedures within shared data environments. The aim is to describe and compare flows and trajectories of archaeological research data, tracing their movement from data creation through long-term storage to preparation for reuse. The study draws on semi-structured interviews with data stewards and curators from five institutions operating their own databases or data repositories. The analysis employs Cognitive Work Analysis, with a particular emphasis on Strategies Analysis. Information work practices identified in the interviews are examined as alternative strategies for organising and managing data under different institutional data regimes. These strategies are subsequently modelled as information flows and data trajectories, representing sequences of organisational and transformational steps through which data move across the research and preservation lifecycle. The paper provides a comparative, practice-oriented account of information work with archaeological research data across institutional settings. By relating information work to data regimes and modelling it through flows and trajectories, the study offers an analytical basis for the design of standardised data infrastructures, including shared workflows and metadata configurations, while remaining attentive to the diversity of archaeological data and research contexts.

366. Tracing interdisciplinarities of archaeological data work: identifying and turning evidence visible

Authors: Isto Huvila (Department of ALM, Uppsala University)
Format: Oral

Earlier research on archaeological documentation practices suggest that the inclusion of different aspects of archaeological work in documentation vary heavily. Especially knowledge representation and organisation related decisions and practices in the context of data work are explicated seldom in comprehensive detail. It has been, however, noted that evidence of such activities can be identified across documentation and in investigation data. What remains particularly underresearched in this context so far is where specifically in research documentation such evidence could be found and how it could be identified. The aim of this presentation is to report results from a qualitative/quantitative investigation drawing from information science methods and theory to summary descriptions of archaeological research projects to understand how data work is described directly and indirectly in archaeological documentation, and how the representation of different types of data work differ from each other. The purpose of the work is to identify keywords, contexts and articulations how documentation refers to and indirectly implicates varieties of data work, and to understand how the disciplinarities of data work are reflected in the documentation. The findings suggests that data work is often implied in documentation through its outcomes and effects on other practices but that it is also possible to identify keywords that directly suggests of data work taking place. In parallel, the findings suggests that the disciplinary origins and traditions of specific practices of data work influence how they are described and implicated. The practical relevance of the findings is that they can inform development of protocols for identifying and extracting process documentation (i.e. paradata). On a theoretical note, a better understanding of the documentation of data work helps to understand how archaeologists conceptualise data work and how it is positioned as a part of the cross-disciplinary practice of archaeological work.

2031. Dealing with Uncertainty: Archaeological Practices Around Osteological Sex Data

Authors: Eleonore Pape (Marburg University)
Format: Oral

Burials materialize past funerary practices while generating dense datasets that today span multiple forms of expertise, from geology and zoology to osteology and biomolecular analysis. Across Europe, archaeologists have long relied on osteological assessments to determine age and sex—and, by extension, gender—of deceased individuals in prehistoric, preliterate populations. Importantly, this osteological knowledge is most often encountered through archaeological publications, frequently in brief annexes authored by osteologists, which archaeologists then integrate, interpret, and operationalize within broader archaeological narratives and datasets. Although methods such as aDNA and proteomic sex determination now enable chromosomal sex identification, these techniques are rarely applied to systematically reassess existing collections. As a result, vast bodies of burial data continue to depend on osteological determinations that carry historically and methodologically sedimented uncertainty. This uncertainty stems from a largely unquantifiable combination of methodological error margins, population variability across time and space, preservation conditions, and the life histories of individuals. It is further compounded by heterogeneous documentation practices and the accumulation of assessments made with different methods over decades of research. Yet abandoning these datasets is not an option—not for archaeology, nor for other disciplines seeking longue-durée evidence. This paper asks: how do archaeologists work with uncertain and sometimes contradictory osteological data in practice? Focusing on Central European burial sites, it examines how uncertainty has been recorded, ignored, negotiated, or operationalized in archaeological analysis . Through selected case studies, the paper demonstrates how data practices shape archaeological interpretation and knowledge production, and outlines strategies to make legacy osteological data more transparent, interoperable, and analytically productive.

2210. Transforming Archaeological Data Work: Evidence from ArcheoBase Implementation in Swiss Archaeology from Fieldwork to Publication

Authors: Emmanuel Clivaz (AnalyticBase - ArcheoBase)
Format: Oral

Contemporary archaeology increasingly centers on data work, the practices of making, processing, organizing, managing, and reusing archaeological information. This presentation examines how comprehensive digital platforms reshape archaeological data work practices, using ArcheoBase as a case study with evidence from multi-year implementation across Swiss archaeological institutions. ArcheoBase is a web-based platform integrating the complete archaeological data lifecycle: field documentation, post-excavation analysis, laboratory work, storage management, and online publication. Developed through collaboration between computer engineers and archaeologists, it centralizes previously fragmented data work into a unified environment with customizable forms, GIS integration, automated Harris matrix generation, vector drawing tools, AI-assisted analysis, and collaborative workspaces. Drawing on user testimonials and project documentation from excavations managing up to 50 team members across 2+ hectares, this presentation analyzes how platform design influences data work practices and archaeological knowledge production. Evidence demonstrates dramatic transformations: elimination of manual data transcription, reduced post-excavation processing time, instant access to linked documentation, and real-time collaboration across multiple specialists. Three critical transformations emerge: direct field-to-database capture replacing repeated manual transcription; simultaneous specialist collaboration replacing sequential workflows through shared access to linked documentation; and restructured publication workflows. The Swiss Archaeology AS Portal demonstrates this final shift: ArcheoPublication enables archaeologists to write directly in a digital environment that automatically synchronizes content to organizational websites, transforming over 6,000 publication records from static archives into searchable, interconnected resources. This represents a fundamental shift from publication as endpoint to publication as integrated data work practice. By analyzing concrete evidence of how tool architecture shapes archaeological practice, this contribution addresses the session's core concerns: how interdisciplinary expertise collaborates in platform development, how data work practices change when

systems become integrated, and what implications these transformations have for archaeological knowledge production, particularly for making archaeological data FAIR while maintaining scholarly rigor and institutional control.

974. From Graves to Graphs: Archaeological and Anthropological Data Work with OpenAtlas and THANADOS

Authors: Nina Richards (Natural History Museum Vienna | Austrian Centre for Digital Humanities) – Stefan Eichert (Natural History Museum Vienna)
Format: Oral

Digital archaeological research increasingly depends on complex data work that bridges disciplinary boundaries, infrastructures, and epistemic traditions. This paper examines archaeological and anthropological data practices through the lens of two interconnected digital projects: OpenAtlas (https://openatlas.eu/), a flexible, open-source database system for archaeological and historical research, and THANADOS (https://thanados.net/), a domain-specific digital platform for the documentation and analysis of burial contexts and associated anthropological data. Focusing on the types of data processed and presented within these projects, the paper explores how heterogeneous archaeological and anthropological information—ranging from burial contexts, spatial and temporal relations, and material culture to biological and osteological observations—is modelled, structured, and made interoperable. Particular attention is paid to the challenges of integrating disciplinary data standards, terminologies, and analytical perspectives within a shared digital environment, as well as to the implications these decisions have for data reuse, interpretation, and knowledge production. By analysing concrete data workflows, modelling choices, and representational strategies, the paper highlights how OpenAtlas enables relational data structures that support complex contextualisation, while THANADOS translates specialised burial and anthropological datasets into a format that is both analytically robust and accessible for broader reuse. The contribution situates these practices within ongoing discussions on FAIR data principles, interdisciplinarity, and the increasing centrality of data work in archaeology. Ultimately, the paper argues that projects such as OpenAtlas and THANADOS exemplify how archaeological data work is not merely a technical task but a form of scholarly practice that actively shapes research questions, interpretative possibilities, and cross-disciplinary collaboration between archaeology and the Digital Humanities.

1813. Making Methods Explicit: The Modular Research Pipeline in Archaeological Research

Authors: Steffen Strohm (Cluster of Exc. ROOTS, Kiel University) – Daniyal Kazempour (Kiel University) – Andrea Göhring – Hendrik Raese – Hartwig Bünning (Cluster of Exc. ROOTS, Kiel University) – Nicolas Da Silva (Kiel University) – Jutta Kneisel – Matthias Renz – Peer Kröger (Cluster of Exc. ROOTS, Kiel University)
Format: Oral

Archaeological research is shaped by chains of analytical and interpretive decisions. Even when data and final results are made openly available, it is often difficult to reconstruct how specific methods were combined, which alternatives were considered, and why particular choices were made. Standards such as the FAIR and FAIR4RS principles have significantly improved access to data and software, yet they usually leave the procedural reasoning behind archaeological analyses implicit. We propose the **Modular Research Pipeline (MRP)** as a conceptual approach to make these research processes more transparent and communicable. MRP understands research not as a single linear procedure, but as a sequence of clearly distinguishable and connected research steps (similar to a pipeline) in which data are prepared, analysed, and interpreted. Conceptually, it brings together two established perspectives: the Research Data Lifecycle, with its emphasis on planning, documentation, and long-term reuse, and a structured approach to data-oriented analysis that emphasise the stepwise transformation of data towards interpretation. The main benefit of MRP lies in making research practices easier to understand, discuss, compare, and reuse. Explicitly describing research steps and their relationships supports collaboration among project members, facilitates critical assessment by reviewers, and allows later researchers to better contextualise and build upon existing work. Importantly, MRP does not aim to standardise archaeological interpretation; instead, it highlights methodological choices and their consequences. The applicability and versatility of MRP is illustrated through two use cases. The first addresses ancient DNA (aDNA) research, where complex analytical procedures (Principal Component Analysis and Machine Learning-based predictions) intersect with expert-driven interpretive decisions. The second focuses on an archaeological research process in which an existing Bronze Age chronology for Denmark was refined. Together, these examples demonstrate the potentials, challenges and limits of how MRP can help communicate complex research processes in a clear and discipline-sensitive manner.

1066. Why Data Work Matters: Translating Narrative Flood Histories into Interdisciplinary Evidence on Flood Resilience (THR-FRD)

Authors: Mei Ai (Ludwig-Maximilians-Universität München)
Format: Oral

In the context of climate change, "learning from the past"is frequently invoked, yet empirically grounded explanations of how prior experience shapes future disaster resilience remain limited. One key barrier is insufficient interdisciplinary integration: geography and risk research often lack long, continuous, high-quality and computable datasets, while historical scholarship frequently privileges political history or case-based narratives with limited engagement with contemporary climate-risk governance. This paper argues that data work—the production, processing, organisation, management and reuse of historical climate information is a crucial

component of enabling such interdisciplinary collaboration. The Tea-Horse Road region in southwest China has been repeatedly exposed to floods over the last two millennia and preserves rich documentary evidence. However, these materials largely circulate as narrative texts, heterogeneous archives and fragmented records whose temporal scales, spatial units and evidential logics are often incompatible with spatialised and quantitative models. Using the Tea-Horse Road Flood Resilience Dataset (THR-FRD; AD 0–2025; 50-year bins; county-level historical administrative units) as a case, this paper discusses the significance and costs of data work, and examines how it is shaped by documentary regimes, digital tools/infrastructures, and interdisciplinary divisions of labour. Three points are emphasised: (1) datafication can serve as a bridge for interdisciplinary communication, enabling narrative evidence to enter spatial and quantitative reasoning while also reshaping how evidence is understood and compared; (2) datafication is also a process of interpretation and selection—extraction, coding, standardisation and aggregation are not neutral steps—therefore key rules and decision points must be documented, and each record should carry provenance and uncertainty annotations so that downstream users can assess scope and potential bias; and (3) when datasets are reused beyond history (risk assessment, heritage management, public communication), they must balance computability with source fidelity to avoid decontextualised indicators.

2677. From Technical Data to Archaeological Data: Interdisciplinary Work with LiDAR in Forested Areas

Authors: Vanessa Antunes (CGeo - Centro de Geociências | Universidade Autónoma de Lisboa | Instituto Politécnico de Tomar | Património Cultural IP | ERA Arqueologia) – Telmo Pereira (Universidade do Minho | UNIARQ—Centre for Archaeology, School of Arts and Humanities | CGeo - Centro de Geociências) – João Fonte (ERA Arqueologia | Centre for the Humanities - CHAM, Universidade NOVA de Lisboa) – João Marques (CEAACP- Centro de Estudos em Arqueologia, Artes e Ciências do Património | CHAIA – Centro de História da Arte e Investigação Artística) – Paulo Regato (Centro Português de Geo-história e Pré-história)
Format: Oral

The increasing digitalization of archaeological practices has shifted the discipline's focus from documenting remains to creating, processing, managing, and reusing data. In this context, remote sensing data, particularly LiDAR (Light Detection and Ranging), play a central role in contemporary archaeological knowledge production, especially in forested areas where direct observation is limited. Working with LiDAR data exemplifies the interdisciplinary expansion of archaeological data work, involving collaboration across multiple fields and circulation of data between different application domains. Data originally produced for cartography, forest management, or wildfire risk modeling are reinterpreted within archaeology to identify and analyze structures hidden beneath vegetation. This process engages specialists in geospatial engineering responsible for point cloud processing, forestry technicians who interpret vegetation dynamics and erosion patterns, and archaeologists who attribute cultural significance to topographic anomalies. Simultaneously, the resulting archaeological data are reused beyond archaeology, including in forest planning, protected area designation, and wildfire mitigation strategies. This study analyzes LiDAR as a specific form of archaeological data, emphasizing the processes through which technically generated data are transformed into interpretable information for research and heritage safeguarding. By describing workflows for acquisition, filtering, visualization, and interpretation, it shows how archaeological knowledge emerges from technical and interpretative practices involving multiple actors and specialized expertise. In regions with dense vegetation and recurring disturbances, such as wildfires, LiDAR proves particularly valuable, enabling identification of hidden structures, monitoring of vulnerable areas, and assessment of post-event impacts. In this way, working with LiDAR data supports a preventive approach to heritage management, integrating archaeological information into broader land-use planning. By linking technical practices, interpretative decisions, and institutional contexts, this contribution reflects critically on how LiDAR data are produced, transformed, and reused as archaeological data, demonstrating how data work in archaeology constitutes an inherently interdisciplinary practice.

1717. Archaeological research questions as a basis for semantic data modeling and querying

Authors: Pavlos Fafalios (Centre for Cultural Informatics, FORTH-ICS | Technical University of Crete) – Athina Kritsotaki – Christianna-Despina Pratikaki – Martin Doerr (Centre for Cultural Informatics, FORTH-ICS)
Format: Oral

Representing knowledge about the past in the form of semantic database schemata is particularly effective for worldwide access to and integration of research data, especially archaeological records. The adequate design of the schemata and query systems requires the analysis of real, detailed research questions. However, people and domain experts equally do not easily remember more detailed questions, but instead their good answers. Consequently, respective IT systems are mostly based on intuitive guesses, often not even from the domain experts, but from their IT consultants. To our knowledge, there are no publicly available collections of archaeological research questions below the level of research grant applications. For that sake, we have provided an empirical collection of detailed scientific questions of archaeologists, as a corpus for further studies and for improving the adequacy of IT systems for archaeology, by extracting questions from the abstracts of the EAA 19th Annual Meeting, section A: "Interpreting the Archaeological Record" (Sessions A01-A08), or by reconstructing the questions reversely each abstract appears to answer to. This material is directly related to the above problem, and is representative of the research trends of that year. After a linguistic formulation of 388 questions covering the above material, we used several abstraction and classification methods to assess the frequency of occurrence of certain types of questions, by subject coverage, entities of interest, interpretative processes, generalization levels and a parametric form of query structures, accessible at https://isl.ics.forth.gr/archaeological_questions/. The results reveal a rich variety and complexity, hardly addressed so far by database designers. We present our conclusions from this analysis for database design and query systems, including requirements for a theoretical data model for addressing the questions, a comparison of its coverage by CIDOC CRM, and the need of query mechanisms exceeding first-order query languages like SPARQL. Further studies may refine this analysis.

212 TRANSFORMING DATA INTO EXPERIENCE: INTERDISCIPLINARY STRATEGIES FOR SUSTAINABLE ARCHAEOLOGICAL TOURISM

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Marta Rakvin – Jacqueline Balen (Archaeological Museum in Zagreb | Iron Age Danube Route) – Szilvia Fábián (Hungarian National Museum | Iron Age Danube Route) – Sarah Kiszter (Universalmuseum Joanneum | Iron Age Danube Route) – Raffaela Woller (University for Continuing Education Krems)
Keywords: Archaeological Tourism, Interdisciplinary Collaboration, Sustainable Heritage Management, Public Archaeology, Archaeological Interpretation, Knowledge Transfer
Format: Regular session

SESSION ABSTRACT

This session is dedicated to exploring interdisciplinary and collaborative strategies that successfully transform complex, and often highly academic, archaeological knowledge into engaging, accessible, and sustainable cultural tourism products. In an era demanding resilience and renewed relevance from heritage institutions, we spotlight the vital necessity of bridging the gap between academic research and public engagement. We seek to highlight effective approaches—developed through collaboration among museums, universities, cultural routes, and other heritage institutions and often within international projects, in regard of or in partnership with local communities within their respective cultural landscapes—that enhance public awareness and generate sustainable cultural tourism models and new visitor programs. We welcome papers that demonstrate successful knowledge transfer, showcasing innovative methodologies and tools that apply archaeological academic research to offer tangible connections to the past (e.g. using databases or ALS imagery to assess site suitability for public presentation, developing new interpretations based on academic research, connecting archaeological research with new digital technologies, utilizing the results of various archaeological analysis to recreate the past (such as past environments, menus, clothing...etc.) Ultimately, this session calls for abstracts that underscore the critical role of strong interdisciplinary and international collaboration in creating vibrant, educational, and economically viable heritage experiences.

CONTRIBUTION ABSTRACTS

445. Digital Twins and Open Trenches: Bridging Research and Public Engagement at the Chalcolithic Site of Cucuteni-Cetățuia (NE Romania)

Authors: Radu Brunchi – Andrei Asăndulesei – Felix-Adrian Tencariu – Casandra Brașoveanu (Alexandru Ioan Cuza University of Iasi)
Format: Oral

The Chalcolithic settlement of Cucuteni-Cetățuia (NE Romania, Iași county) represents a cornerstone of "Old Europe," yet its academic depth often remains disconnected from the public. This paper examines the interdisciplinary strategy of the Arheoinvest Center to transform complex research into sustainable archaeological tourism products. Our approach integrates physical outreach with digital innovation. A central pillar is the "Acad. Mircea Petrescu-Dîmbovița" Research Base, established by repurposing an abandoned school in Băiceni. This facility now acts as a multifunctional hub for experimental archaeology, workshops, and scientific events, revitalizing local infrastructure. During the 2025 "Open Doors Day," the site transitioned from a specialist enclave into a transparent platform where visitors engaged with active stratigraphic sections and "fresh" artifacts in situ. While social media dissemination reached over 119,000 views, the initiative highlighted a stark paradox: academic research and spectacular results versus severe rural demographic decline and logistical barriers. To ensure long-term sustainability and overcome physical limitations, we developed a comprehensive 3D Virtual Tour. Utilizing ArcGIS Pro, we created a digital "Hub" centralizing research data from 1909 to 2025. By overlaying magnetometric surveys with high-resolution 3D models of active trenches, we offer tangible connections to the past for a global audience. This dual-track model—narrative-driven for tourists and analytical for specialists—demonstrates how 3D GIS and the adaptive reuse of rural spaces can mitigate accessibility issues. Ultimately, this project underscores the role of interdisciplinary collaboration in creating resilient, economically viable heritage experiences. By bridging the gap between academic research and public engagement, we preserve the relevance of the Cucuteni culture within a transitioning landscape, offering a replicable model for sustainable archaeological tourism in marginalized regions.

1587. From Hidden Archaeological Traces to Visitor Experience: Developing Sustainable Tourism Infrastructure for Roman Heritage beyond the Middle Danube Limes

Authors: Balázs Komoróczy – Katarína Liščáková – Pavla Růžičková – Marek Vlach (Czech Academy of Sciences, Institute of Archaeology, Brno)
Format: Oral

For several decades, the Institute of Archaeology of the Czech Academy of Sciences, Brno, in cooperation with various partners, has conducted systematic research on Roman military presence north of the Danube frontier, particularly in southern Moravia, western Slovakia, and Lower Austria. This long-term research has gradually produced substantial new knowledge about the dynamic relationships between the Roman Empire and local Germanic communities. As a result, dozens of Roman temporary camps and numerous remarkable finds are now known, documenting intensive contacts and, at times, large-scale conflicts within this region. Despite these important discoveries, this segment of shared cultural heritage remained largely invisible and difficult for the general public to comprehend. Due to the absence of a specialized institution for presentations in southern Moravia, our institute took the initiative to develop, drawing on its research expertise, a comprehensive concept for public presentations. The aim of this concept has been to transform specialist archaeological data into accessible physical and digital forms of interpretation and to complement them with a broad range of educational and outreach activities. The most significant outcome of this effort has been the establishment of a visitor centre at the Mušov-Burgstall site, accompanied by thematic educational trails and additional interpretive infrastructure. Current international projects, such as Interreg "Roman Trails" (CZ–AT) and Interreg Danube "Roman Legacy," provide new opportunities to further develop this infrastructure, integrate archaeological heritage across borders, and create joint tourism products based on shared Roman history. The paper will present the methodological and organizational strategies behind this process. Drawing on experience gained through communication with regional institutions, municipalities, and the public, the paper aims to demonstrate how an academic institution can effectively connect scientific research with public interest and transform archaeological knowledge into a sustainable, widely accessible cultural tourism offer.

2291. From Data to Experience: Reimagining Watermill Heritage in Senokos through Landscape, Community, and Cultural Tourism

Authors: Nemanja Pavlovic (University of Belgrade - Faculty of Philosophy | Neozoik Fondation) – Mila Mitrović (University of Belgrade - Faculty of Architecture | Neozoik Fondation) – Jugoslav Pendić (Expert Advisor-BioSense Institute, Novi Sad) – Simeun Srdanović – Anastasija Stojanović (University of Belgrade - Faculty of Philosophy | Neozoik Fondation) – Boris Rančev (University of Niš - Faculty of Civil Engineering and Architecture | Center for Sustainable Spatial Development "BalkanARHitrav")
Format: Oral

Let's Not Grind the Past is an interdisciplinary, NGO-led heritage project focused on transforming archaeological, architectural, and ethnographic data into accessible cultural experiences within rural landscapes. The project centers on the last surviving traditional watermill in the village of Senokos, located in the Balkan Mountains, a mountain tourism destination in southeastern Serbia. Although the Balkan Mountains attract hikers, nature lovers, and eco-tourists, their watermill heritage, once a vital component of local subsistence and landscape management, remains largely invisible within contemporary tourism narratives. Historically, the Vodenička River supported a network of 23 watermills that sustained local communities until the mid-20th century. Today, due to rural depopulation, the disappearance of milling practices, and the ongoing physical deterioration and collapse of the remaining structures, this knowledge and material heritage are rapidly vanishing. Many of the mills are structurally unstable, making detailed digital documentation, particularly 3D scanning and modeling, crucial for preserving their spatial, technological, and cultural information as the physical fabric continues to decay. The project addresses this gap by repositioning the watermill not as an isolated architectural relic, but as a landscape-based system embodying vernacular engineering, environmental adaptation, and intangible cultural practices. Through collaboration between archaeologists, architects, ethnologists, students, and local residents, the project employs field schools, ethnographic interviews, photogrammetry, QGIS mapping, and 3D modeling to generate research data. Crucially, these data are translated into experiential outputs: interpretative signage along hiking routes, exhibitions, a heritage trail, digital models presented through local tourist institutions, and public discussions with the community. By embedding academic research into existing tourism flows in the Balkan Mountains, the project demonstrates how data-driven heritage documentation can evolve into sustainable cultural tourism products. In the context of ongoing "permacrisis," Let's Not Grind the Past argues for heritage practices that are resilient and capable of linking scientific research with long-term sustainability.

475. Sharing Heritage Climate Data Using Shiny Apps: A Case Study from Hadrian's Wall

Authors: Francesca Gillis (The Vindolanda Trust)
Format: Oral

The Vindolanda Trust excavates and manages two Roman forts, Vindolanda and Magna, along Hadrian's Wall World Heritage Site in the United Kingdom. Since the Trust's inception in 1970, annual excavations have taken place at Vindolanda. Over the years, archaeologists have observed changes in the preservation of organic material culture, such as leather and wood, being recovered from the site. In 2022, the Trust began installing weather stations and environmental probe arrays to explore how climate change is impacting the preservation conditions of archaeological remains. The probe data collected over the last four years shows distinct variations in the soil environment in response to the local climate. While this data can be shared with colleagues in academia and the heritage sector, distributing the same information to the general public presents some issues. A primary concern is that access to the raw data would risk misinterpretation, due to lack of context or incomplete datasets. A second concern is legibility – can users truly understand the data they are looking at? To share this data in a controlled manner, the Trust has developed a Shiny Application available through the Roman Army Museum's website. At present, the app provides site history and interaction with the data through a series of plots and summary statistics. Once launched, the Trust will continually assess and gain feedback from visitors and shareholders to determine if the app is accessible and intuitive to use for those without an archaeology or statistical background. Having an online application has the potential to allow visitors to continue to engage with cutting edge and active research from their homes as well as in the museum environment. This paper reviews the experience of implementing a Shiny Application displaying heritage climate data, looking at feedback from its user base to assess its benefits and limitations.

2129. Tharros Extended Destination: integrating XR and generative AI for sustainable archaeological tourism

Authors: Matteo Pitzalis – Chiara Sanna – Gian Mario Spiga – Anthony Muroni (Fondazione Mont'e Prama)
Format: Oral

The Fondazione Mont'e Prama presents Tharros Extended Experience, a cutting-edge digital ecosystem designed to bridge the gap between academic research and public engagement through the concept of "extended archaeology." Built on the Immersive Academia platform and the WebXR standard, the web app transforms archaeological data into immersive, cross-device experiences, accessible directly on site via QR codes. The experience is structured around scientifically accurate 3D reconstructions of seven emblematic buildings—including the Nuragic village, Punic houses, and Roman baths—which act as "temporal stargates" to narrate the cultural layering of Tharros. The project's key innovation lies in the controlled adoption of generative Artificial Intelligence. A conversational chatbot, trained through data ingestion of scientific documents selected by the Foundation's archaeologists, enables visitors to interact vocally with the site, providing personalized and academically rigorous insights. Furthermore, the project introduces "synthetic cinema" for archaeology: hyperrealistic AI-generated videos that populate the reconstructions with scenes of everyday life and human figures based on anthropological studies, bringing the past back to life according to criteria of scientific accuracy. This interdisciplinary methodology—developed through ongoing collaboration between technological experts and archaeologists—defines a new model of sustainable cultural tourism, capable of transforming academic knowledge into an emotional and inclusive experience.

2041. Science for Everyone: Transforming Academic Knowledge into Public Experience

Authors: Szilvia Fábián (Hungarian National Museum)
Format: Oral

The Hungarian National Museum has developed into a dynamic scientific research centre where archaeological scholarship, technological innovation, and public engagement converge. Building on its extensive collections, infrastructure and multidisciplinary research collaborations, the museum has evolved a strategy that transforms high-level scientific archaeological knowledge into accessible, engaging, and enjoyable cultural content. This presentation examines how the institution fosters partnerships among archaeologists, museologists, natural scientists, digital technologists and local communities to create integrated knowledge-transfer pathways. Through case studies, I would like to demonstrate how methodologies—ranging from archaeometric analyses and environmental reconstructions to 3D modelling and immersive experiences—are applied to interpret and present scientific results. These tools enable the Museum to recreate past environments, diets and everyday practices, transforming raw analytical data into vivid, evidence-based narratives. The resulting outputs include interactive exhibitions, digital reconstructions, thematic heritage tours, and educational resources that strengthen cultural tourism while maintaining scientific integrity. By highlighting the Museum's collaborative frameworks, innovative workflows, and commitment to open knowledge exchange, the presentation showcases examples of how archaeological research institutions can bridge the gap between academic inquiry and public experience. The Hungarian National Museum's approach demonstrates that rigorous scientific research, when paired with creative communication and digital technologies, can generate sustainable cultural products that deepen public understanding of the past and enrich contemporary cultural landscapes.

389. Playing the Roman Past: Ancient Board Games as Educational and Interpretative Tools

Authors: Ema Kosnica – Jacqueline Balen (Archaeological Museum in Zagreb)
Format: Poster

This poster presents an educational and public engagement programme developed by the Archaeological Museum in Zagreb (AMZ) within the framework of the Interreg project Roman Legacy, which focuses on the interpretation and sustainable valorisation of the Roman limes. The programme uses reconstructions of ancient board games, based on archaeological finds and academic research, as an innovative tool for knowledge transfer and heritage interpretation. Games such as Nine Men's Morris (mill), ancient tic-tac-toe variants, memory games, and Roman-period board games have been reconstructed and incorporated into museum-based educational activities and school workshops. Through a combination of short lectures and participatory gameplay, children are introduced to archaeological research, museum collections, and material evidence related to games and leisure in antiquity. Several original gaming artefacts are also presented in the permanent exhibition of the Archaeological Museum in Zagreb, creating a direct link between research, collections, and public presentation. Within the Roman Legacy project, these games function as an accessible entry point for presenting aspects of everyday life along the Roman limes, including social interaction, leisure practices, and cultural continuity within the wider Roman landscape. The programme demonstrates how interdisciplinary collaboration between archaeology, museums, education, and international heritage projects can transform academic knowledge into engaging, transferable, and sustainable heritage products, contributing to public awareness and the development of innovative cultural tourism and educational models.

1977. Archaeology and Visitor Engagement: Museum Interpretation and Creative Industries in Vučedol

Authors: Mirela Hutinec – Mirna Šuljug – Petra Rajtarević (Vucedol Culture Museum)
Format: Poster

Using the example of the permanent exhibition of the Vučedol Culture Museum and the Archaeological Park Vučedol, the paper analyzes the process of transforming complex scientific interpretations into accessible content and products of creative industries. A contemporary museum exhibition in a museum building integrated into the cultural landscape of a prehistoric site clearly communicates with the audience, conveying knowledge as well as experiential experience. Based on many years of interdisciplinary research of the Vučedol site and the Vučedol culture, the museum exhibition dedicated to a specific Eneolithic community (3000-2500 BC) integrates contemporary museological interpretation, landscape-integrated architecture, digital tools and educational programs to enable visitors to understand the complex social, technological and symbolic aspects of a prehistoric community. The future Archaeological Park Vučedol represents an example of the successful transformation of scientific archaeological research into a comprehensive and sustainable tourist experience. The project emphasizes experiential learning by enabling audience participation in experimental archaeology and consequently creating an emotional connection with the site. By participating in international projects like Creative Europe and Interreg, and by receiving the European Heritage Label (EHL), Vučedol actively engages with the broader European community. Such an approach not only encourages the development of sustainable tourism in the Danube region, but also strongly strengthens local and wider European identity and raises public awareness of the importance of shared cultural heritage. Vučedol is a prime example of how innovative methodologies and collaborative practices create accessible heritage reconstruction using scientific interpretations of archaeological data and creating educational and experiential content in an authentic location.

214 SHOULD WE SAFEGUARD AN IMPERIAL HERITAGE? POST-IMPERIAL CULTURAL POLITICS IN AN ARCHAEOLOGICAL MUSEUM

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Mariia Lobanova (Odesa Archaeological Museum of the National Academy of Science of Ukraine) – Tiziana Carboni (University of Palermo) – Dmytro Kiosak (Leibniz Zentrum für Archäologie, Standort Schleswig)
Keywords: Cultural Heritage, Archaeological museums, Identity, Decolonization
Format: Session with keynote presentation

SESSION ABSTRACT

Empires have been part of human life for thousands of years. None of them disappeared without a trace, but their material legacy varies greatly: from the ephemeral encampments of Genghis Khan's Mongols to the monuments to the builders of the British Empire, from thousands of identical statues of Lenin to the Chinese bronze army. Preserving them allows future generations to understand their past – both the achievements and the injustices. On the other hand, for many, imperial heritage represents trauma, subjugation, and inequality. Preserving it "as is" is like preserving colonial dominance. Newly independent nations often seek to redefine identity through indigenous heritage, traditions, and narratives, which have been suppressed under empire. Complete forgetting is evidently not the right path, yet preserving the imperial cultural landscape unchanged is equally untenable. Which way should we proceed? We propose to address this question in the context of archaeological museums. Reclaiming museum spaces for other, non-imperial narratives – those of the suppressed, the indigenous, and the non-official – requires deliberate decisions regarding imperial heritage, both physical and cognitive. We cannot simply reproduce the same power relations in reverse, where former "goods" now dominate and former "evils" are condemned. Such an inversion does not transform the structure of discursive power – it merely flips the image. What is needed is a deeper rethinking: a change in the very frameworks of discursive power, particularly within archaeological museums. We invite contributions from archaeologists, historians, museologists, and cultural heritage specialists who have recently confronted these difficult questions, as well as from scholars examining the hidden structures of imperial cognitive dominance in archaeology.

CONTRIBUTION ABSTRACTS

1574. Keynote: Land of conquest or crossroads of cultures in the Mediterranean sea? A story of identity: The case of Sardinia

Authors: Danila Artizzu (SABAP CA OR, Italy)
Format: Oral

Sardinia's strategic position, at the center of the western Mediterranean, has marked the cultural and political history of the communities that inhabited the island since the auroral moments of human presence. If only we consider the two great antagonists of history, Carthage and Rome, it will be enough to remember that the Sardinian land was for centuries a possession of both empires, and, going forward in history, found itself alternately in the orbit of Byzantium and the barbarian kingdoms of Africa, until the

brief independent parenthesis of the Giudicati of Sardinia. The material traces of the alternating events thus briefly summarized are now preserved and exhibited in museums, but they are also the subject of debate not only within the scientific community, but also among public opinion, in light of the rediscovery of a "national identity" that views Sardinia's protohistory as the moment of the self-affirmation of an original and independent culture. But what language did museums use to construct the narrative of the different realities of those who lived in power, of those who suffered it, of those who fought it, and, ultimately, how about integration? Through what ways, and with what tools, has the narrative changed today? The aim of this work will be to define with which languages, and under the impetus of which particular social and cultural demands, in these days the museums communicate these complex concepts, of which the collections on display become vectors.

432. Expansion without Empire: Yamna phenomenon in Archaeological Museums

Authors: Svetlana Ivanova (Institute of Archaeology, National Academy of Sciences of Ukraine)
Format: Oral

Excavations conducted by Vasily Gorodtsov in Ukraine at the beginning of the twentieth century enabled him to identify new Bronze Age archaeological cultures and make a significant contribution to the creation of new museum exhibitions. Gorodtsov was known not only for his scholarly works and archaeological excavations, but was also a specialist and theoretician of museum studies. Gorodtsov, having developed a periodization of archaeological cultures, established the first scientific exhibition grounded in the cultural and chronological classification of materials, with a particular emphasis on the Yamnaya culture. It occupied an enormous territory of Eurasia, and this fact alone calls into question the existence of cultural unity. The examination of kurgans from different regions has made it possible to conclude that the unifying component is the funerary rite, which reflects the religion and social structure of ancient societies. The material culture, above all ceramics, shows these differences. In this case, the Yamna culture should be recognized as the first world religion that spread among the population of the Early Bronze Age. It should be considered in the context of a religious worldview adopted by people of different cultures. This leads to a change in the museum paradigm with regard to the "Yamna culture" and the necessity of developing a new-format museum exhibition concept connected with the history of religion.

760. Sarmatian Archaeology and Colonial Legacy: Lost Finds, Lost Contexts, and Old Myths

Authors: Olena Shevchenko (Odessa Archaeological Museum)
Format: Oral

Research on Sarmatian archaeology in Eastern Europe was largely shaped by imperial and Soviet academic systems. Interpretation and theory were concentrated in metropolitan centres, particularly Moscow and Leningrad, while archaeological work in present-day Ukraine and Moldova was treated as peripheral and limited to the extraction of material rather than knowledge production. Local interpretations were often ignored or marginalised. Linguistic domination reinforced this imbalance. Most twentieth-century publications, reports, and archival records exist only in Russian, making many Sarmatian sites and assemblages inaccessible to international scholars and largely invisible in English-language research. A major consequence of these practices is the systematic loss of bioarchaeological data. Human remains were frequently not collected or poorly preserved, resulting in the near absence of anthropological material from Sarmatian sites in the Northern Black Sea region. This prevents the reassessment of earlier interpretations and the application of modern methods such as aDNA and isotopic analysis. Colonial legacies are also evident in rigid typological models and gendered interpretations, particularly the concept of Sarmatian "Amazons," where female burials with weapons were framed as ideological proof of matriarchy rather than examined within their social context. This paper explores how Sarmatian archaeology can be decolonised today by re-evaluating legacy data, restoring local perspectives and languages, and challenging inherited interpretative frameworks.

1634. Exhibiting the Past: A Long-Term Perspective from Odesa (Ukraine)

Authors: Mariia Lobanova (Odesa Archaeological Museum of the National Academy of Sciences of Ukraine) – Dmytro Kiosak (LEIZA)
Format: Oral

The Odesa Archaeological Museum, founded in 1825, is the oldest archaeological museum in Ukraine and has long served as a major scholarly center contributing to the development of archaeological research in the region. Over nearly two centuries, the institution operated under multiple political contexts and endured significant disruptions, including revolutions, wars, and occupation, which shaped the narratives communicated to both scholarly and public audiences. This study argues that shifts in institutional narratives and research priorities are revealed through changes in administrative records, exhibition planning, and scholarly work. By analyzing increasingly systematic documentation from the 1930s onward, the study demonstrates how exhibition concepts and interpretative frameworks transformed institutional directions throughout the twentieth and early twenty-first centuries. The paper demonstrates that political contexts directly shaped how archaeological heritage was represented and which themes appeared in permanent displays. Central to the analysis is how reassessment of imperial and Soviet legacies reveals both the enduring influence and possible transformation of inherited interpretive frameworks as calls for reflection and decolonization intensify. With the permanent exhibition suspended, the museum now confronts the question of whether inherited frameworks still shape its representations of the past and its public communication of archaeological knowledge. The present moment, therefore, serves as a pivotal

test of the institution's ability to critically re-evaluate its narratives.

2796. Keynote: Constructing a Rus Empire: Archaeology and the Politics of Imagined Continuity

Authors: Alina Yarova (Rylsky Institute of Art Studies, Folklore and Ethnology) – Stepan Stepanenko (CNRS UMR 8167 Monde byzantin)
Format: Oral

The concept of "Rus as an empire" occupies a central place in both historical scholarship and modern political narratives, yet it is rarely examined across different types of evidence. This paper argues that the existence and nature of a Rus "empire" depend fundamentally on whether it is approached through textual traditions or archaeological material. Written sources suggest a more coherent political and ideological formation from the eleventh century onwards, supported by legal, religious, and historiographical developments. In contrast, the ninth-tenth centuries, often retrospectively framed as formative, present a far more ambiguous archaeological picture characterised by networks of exchange, mobility, and elite connectivity rather than clearly bounded imperial structures. This raises the question of whether a Rus "empire" can be identified archaeologically and what its material signature might be, as well as the extent to which archaeological and textual constructions of empire coincide or diverge. These issues have direct implications for museum practice, where stabilised narratives often privilege later historiographical constructions over the variability of the material record, projecting a coherence onto the past that may not have existed. The notion of a unified Rus "empire" appears less a contemporary reality than a later construction, emerging most clearly in eighteenth- and nineteenth-century historiography within the Russian Empire, where the past of Rus was selectively reinterpreted to support imperial claims. In contemporary public discourse, representations of Rus are shaped by ideological frameworks emphasising unity and continuity, often overlooking archaeological diversity. This raises the possibility that interpretations of Rus are shaped not only by historical sources but also by modern narratives, effectively reverse-engineering the past. Museums thus face a critical challenge: whether to reproduce inherited frameworks or expose the layered and contested nature of historical knowledge, confronting both the interpretative role of archaeology and the implications of reshaping deeply embedded narratives.

1517. Imperial Legacies and Colonial Silences: The Making of the Past in Algeria and Tunisia

Authors: Tiziana Carboni (University of Palermo) – Antonio Corda (University of Cagliari)
Format: Oral

Since pre-Roman times, the territories of present-day Algeria and Tunisia have been inhabited by a wide range of populations, largely organised in tribal structures, as attested by literary and epigraphic sources. Among them were the Numidae, Gaetuli, Musulamii, Quinquegentiani, Bavares, and Afri. These groups engaged with the Roman Empire in complex and evolving ways: initial phases of open conflict gradually gave way to various forms of accommodation and integration. Yet to what extent are these pre-imperial populations represented in Algerian and Tunisian museum narratives today? Taking this question as its point of departure, this paper examines the composition and organisation of two colonial-era museum institutions—the Museum of Islamic Art and Antiquities in Algiers and the Bardo Museum in Tunis—both established under French rule. Drawing on the earliest catalogues published between the late nineteenth and early twentieth centuries, the study explores the narratives of the past produced within a colonial framework of knowledge. Its aim is to assess the space accorded to pre-imperial populations within a historical discourse shaped by the interaction between the Roman imperial legacy and French colonial power.

2725. Imperial Eyes, Gendered Voices: Women Travellers, Journalists and Collectors in the Construction of Archaeological Peru

Authors: Carito Tavera-Medina (Universitat de Barcelona)
Format: Oral

This paper examines how women travellers, journalists and collectors from Europe and the United States contributed to constructing Peru as an "archaeological nation" within imperial circuits of knowledge at the turn of the twentieth century. Moving beyond celebratory narratives of female pioneers, it adopts a critical feminist history of archaeology to analyse how gendered actors participated in, negotiated and occasionally unsettled imperial epistemologies. Drawing on travel writing, epistolary fiction, press publications and museum collections, the study reveals how archaeological knowledge circulated through print culture, collecting practices and transnational intellectual networks. The paper argues that imperial heritage is not only material but also cognitive. The persistent invisibility of these women exposes a double erasure—of female intellectual labour and of the imperial infrastructures underpinning supposedly neutral displays. Rather than proposing simple moral reversals or celebratory recuperations, the contribution calls for critical curatorial strategies that make visible the entanglements of gender, empire and knowledge production. In doing so, it shifts debates on post-imperial heritage from monuments to the epistemic architectures through which archaeological pasts are constructed, preserved and communicated.

686. Beyond Relics: Curated Memories of 1857 at Meerut Museum

Authors: Rohan Nirwan (Jawaharlal Nehru University, Delhi) – Shalini Awasthi (Dr. B. R. Ambedkar University, Delhi)
Format: Oral

Revisiting the past opens new ways of interpretation and engagement with memory, shaped by discursive narratives around textual and material evidence. At times, access to material evidence is sparse, hence the past is then curated through available narratives, such as memoirs, travelogues, diaries, folklore and popular consciousness. This submission attempts to examine the visual display and aesthetics of a specific episode in Indian history, rooted in the national pride of Meerut, the city from where 1857 unfolded. The events of 1857 have been interpreted differently across various historiographical traditions. Military historians have described them as the "Sepoy Revolt", colonialists viewed these as the "Indian Mutiny", and the nationalist historians have characterized them as the "First War of Independence". On the occasion of 150 years of this event, a permanent gallery was introduced, institutionalizing memory through visual displays. The methodology of this submission examines these displays within an analytical engagement with layered memories, employing ethnographic interactions with the descendants of the participants and the systematic documentation of accessible cultural artefacts. By juxtaposing ethnographic findings with dominant British historiography, this submission seeks to decolonise the triumphalist narrative of "victory" by foregrounding absent testimonies, local memories, ritualized commemoration, and challenging archival silences, thereby offering a contested, plural, and dialogic understanding of the events of 1857.

2385. The "Soviet Stonehenge" in the Budjak Steppe: Reinterpreting the Past in the Tourist Complex Frumushika-Nova

Authors: Nataliia Petrova (Odesa I.I. Mechnikov National University)
Format: Oral

This paper explores the tourist and ethnographic complex Frumushika-Nova in the Budjak steppe (southern Ukraine) as a contemporary site of memory where the traumatic legacy of Soviet forced resettlements is reinterpreted through heritage-making practices. Established on the territory of villages liquidated during the Soviet period, the complex represents an alternative memorial landscape shaped by tourism, symbolism, and experiential engagement. Central to this space is the so-called "Soviet Stonehenge" - a monumental installation of stone blocks commemorating destroyed villages. Drawing on archetypal forms of megalithic architecture, the installation produces a sense of timelessness and sacralization, transforming historically specific acts of Soviet violence into a universalized narrative of loss. From a memory studies perspective, this process contributes to the construction of a lieu de mémoire that privileges emotional and symbolic resonance over historical contextualization. The complex also includes Soviet-era monuments removed from their original context and redefined in a new heritage setting. Though no longer used for propaganda, their inclusion raises questions about the boundary between reinterpretation, aestheticization, and depoliticization of the totalitarian past. From a heritage studies view, Frumushika-Nova shows the tensions in post-Soviet decommunization, where Soviet legacies are neither fully rejected nor critically reviewed. The case reveals the risks and possibilities of turning traumatic history into tourist heritage and stresses the need for critical narratives in Ukraine's memory decolonization.

431. Why Was Soviet Archaeology Imperialistic?

Authors: Dmytro Kiosak (LEIZA)
Format: Poster

Bruce Trigger identified Soviet archaeology as one of the classical examples of what he termed imperialistic archaeology, alongside nationalist and colonialist traditions. In his view, Soviet archaeology was imperialistic because it claimed both omnipresence (seeking to interpret the prehistory of humankind on a global scale), and omniscience (asserting that Marxism–Leninism provided methodological tools superior to those of any other archaeological tradition). However, for the inhabitants of the USSR and its surrounding territories, Soviet archaeology was imperialistic in a somewhat different sense. The acquisition of new territories was legitimised through a series of publications that asserted the historical rights of Slavs to these lands, glorified their incorporation into the Russian Empire or the Soviet Union, and vilified their previous owners. The archaeological record of newly acquired territories was rapidly appropriated and mobilised to celebrate the victorious conqueror. Archaeological expeditions were organised almost immediately, sometimes surveying landscapes that were still contaminated with landmines. Although these investigations were informed by earlier scholarship, previous research was often inadequately cited or selectively appropriated. This raises the question of whether Trigger's epistemological understanding of imperialistic archaeology and its practical, territorial manifestation necessarily represent two sides of the same phenomenon. I would argue that such a convergence is not inevitable. In the case of Soviet archaeology, however, these dimensions largely coincided.

215 UNDERSTANDING BUILDING MATERIALS: THE BROADENING FIELD OF CBM STUDIES

Theme: 1. Widening perspectives in material culture studies
Organisers: Pirjo Hamari (Finnish Institute in Athens / Independent researcher) – Annalize Rheeder (Independent researcher) – Julian Bauch (German Archaeological Institute, Berlin)
Keywords: Ceramic building materials, tile, brick, terracotta, life cycle, object biographies
Format: Regular session

SESSION ABSTRACT

Ceramic building materials have become increasingly recognized as a valuable and abundant archaeological resource in recent years. Advancements in scientific methods and technologies have enhanced documentation and facilitated the investigation of new research areas. This trend was particularly evident during our recent EAA sessions in 2024 and 2025. While traditional analyses of style, form, and function remain integral to the field, new considerations such as production, distribution, and the life cycle of objects have broadened the disciplinary scope. The 2026 session aims to consolidate discussions on new methods and the life cycle of objects. The life cycle of ceramic building materials involves various phases where objects acquire diverse functions and meanings. Throughout these stages, objects transform from products of design and production into trade goods, transported cargo, or functional building materials. Reuse is frequent, with shifts in function causing physical or symbolic transformations. Crucially, identifying traces on the objects themselves provides insights into their chaîne opératoire, construction processes, building techniques, wear, reuse, recycling, destruction, and deposition. This session invites submissions on ceramic building materials from the Bronze Age to the Medieval period across the Mediterranean and European regions. We seek papers that present new methods and recent findings concerning the CBM life cycle. Furthermore, we encourage contributions that broaden the discussion of CBM as an archaeological source, demonstrating its capacity to inform wider debates on social processes and economic factors. Specifically, papers might explore how CBM analysis enhances understanding of local production economies, trade routes, object reception within communities, resource acquisition and technological exchange.

CONTRIBUTION ABSTRACTS

2202. Future Directions in Roof Tile Research: Exploratory Analysis of Terracotta Roof Tile Data

Authors: Annalize Rheeder (Independent researcher)
Format: Oral

The study of terracotta roof tiles has advanced significantly in recent years. Pioneering research has opened new avenues of investigation, while the application of emerging technologies and methodological approaches has further expanded the field. These developments have brought roof tile studies to a critical juncture, enabling the exploration of research questions that were previously inaccessible. This paper explores several of these emerging questions through the qualitative and quantitative analysis of newly documented roof tile assemblages. By employing exploratory data analysis, it becomes possible to evaluate relationships between different roof tile parameters that had traditionally been considered in isolation. For example: innovative studies of undecorated roof tiles, for example, have demonstrated chronological developments in the profiles of pan tiles. Drawing on data from Pergamon, Olympia, and the Kerameikos, collected as part of the DAI's Digital Roofs Project, this paper examines the relationship between roof tile profiles and key indicators associated with production techniques. These include fabric grain, material density, and surface finish. By integrating morphological and technological data, this study aims to highlight the potential of exploratory analytical approaches for advancing future research in terracotta roof tile studies.

1462. The magnificent roof of the church of Ashdod-Yam

Authors: Philip Ebeling (Institute of Classical and Christian Archaeology, University of Münster) – Dana Ashkenazi (Tel Aviv-University) – Liora Bouzaglou (Paris 1 Panthéon, Sorbonne, Paris, France | Institute of Archaeology, Tel Aviv University) – Alexander Fantalkin (Institute of Archaeology, Tel Aviv University) – Myrsini Gkouma (Malcom H. Wiener Laboratory, The Cyprus Institute) – Marta Lorenzon (Department of Cultures, University of Helsinki) – Lucía Ruano Posada (Department of Prehistory and Archaeology, Complutense University of Madrid) – Johannes Sterba (Center for Labelling and Isotope Production, TU Wien)
Format: Oral

The church of Ashdod-Yam was excavated during several campaigns in 2017 and 2021 by a team from Tel Aviv University, led by Alexander Fantalkin. The site lies within the densely inhabited area of the modern city of Ashdod, Israel, but outside the limits of the ancient city of Azotos Paralios. The excavation revealed that the church is preserved only in its foundation walls, mosaic floors, and a thick collapse layer of ancient roof tiles. The tiles were embedded in a substantial mass of plastic earthen material (PEM), consisting of loam, clay, and bitumen. This assemblage is interpreted as the remains of the roof. Numerous lumps of various mortars found within the PEM and adhering to the roof tiles indicate the presence of an additional mortar layer above the PEM, into which the tiles were set. The roof tiles (tegulae and imbrices) belong to at least three different production types. The first represents a well-known and previously published production from Jerusalem. The second, less well-documented type probably originated in Cyprus, Cilicia, or northern Syria. The third type, which occurs only rarely, is also known from Cyprus but can be clearly distinguished from the second. Within the second production, different metrological types can be reconstructed. One appears to have been produced on demand and tailored to fit the dimensions of the first production type; both were likely used on the main nave of the church. Another metrological variant of the second production was probably used on the side naves. The third production type is represented too sparsely to allow further functional interpretation. In addition, many roof tiles show traces of red and black paint, applied with different purposes.

1525. Producing, Stocking and Recycling Ceramic Building Materials for Late Antique and Medieval Public Structures in Thessalonica

Authors: Konstantinos Raptis (National and Kaposistrian University of Athens)
Format: Oral

The study and the discussion on the production, the use and the life circle of the ceramic building materials have been broadened during the last decade, through thematic conferences and both traditional and interdisciplinary studies and publications. In this framework the present paper, taking into account the case studies on the quantitative requirements of large architectural projects, the organization of the production and the consumption patterns of ceramic building materials in Thessalonica, over an extended chronological period of approximately one millennium (4th - 15th c. CE), which were presented in the relative thematic sessions during the previous EAA conferences in 2024 and 2025, attempts now to discuss and draw conclusions regarding the control of the production, the possible existence of State brick and tile reserves, the extensive practical and/or symbolic reuse, and the management of the recycling of ceramic building materials, as both objects and raw material as well, in order to meet the structural needs of a large and constantly active, in terms of building activity, urban center of Late Antiquity and the Middle Ages, such as Thessalonica.

1550. Large Scale Ceramics: The Firing Temperature of Iron Age Vitrified Hillforts

Authors: Ben Medley – Malcolm Hole (University of Aberdeen)
Format: Oral

Vitrification is the melting of rock by intense heat, forming a glassy ceramic matrix that can fuse surviving rock fragments. Iron Age vitrified hillforts demonstrate large-scale ceramic building technology, likely drawing on pyro-technologies such as iron production, charcoal burning, and pottery manufacturing to create new architectural uses. Melt experiments on various local rock and surface sediments were conducted to understand the original source of the ceramic building material. Previous studies have suggested that successful vitrification requires sustained temperatures between ~1000-1250°C [1,2]. Full understanding of the temperature conditions required for vitrification is central to understanding the methods used in building these unique archaeological structures. The ceramic material (vitrified rock or vitrified surface sediment) in hillforts frequently contains quenched micro-crystalline minerals (e.g. olivine, pyroxenes) the chemistry of which can be used in geothermometers developed for magmatic systems. For use on hillforts, thermometers are calibrated for surface pressures. 5,826 individual temperature estimates were calculated across 14 hillforts using 23 thermometers. The inter-site average was 990.8°C ±148.61°C, the lower end of the previously reported temperature ranges. Firing times calculated from statistical crystal size distribution suggests that prolonged heating was needed to achieve vitrification. It seems unlikely that the timber-laced design of the walls (murus gallicus) provided adequate fuel to achieve the extent of vitrification visible at these sites and an additional source of fuel may have been required (e.g. fuel addition during firing). This geochemical approach to an archaeological problem provides a detailed understanding of vitrification mechanisms, while highlighting uncertainties relating to burn duration, scale and environment, and fuel quantities required to achieve vitrification. Our study demonstrates how techniques developed for the study of the petrogenesis of igneous rocks can be applied to archaeological investigations. [1] McCloy, J. et al. (2021), Nature, 10.1038/s41598-020-80485-w [2] Sjöblom et al. (2022), Journal of Archaeological Science: Reports, 10.1016/j.jasrep.2022.103459

1267. Bricks, Borders, and Belonging: Ceramic Building Materials and Liminal Landscapes in Northern Tuscany

Authors: Valentina Limina (UCLouvain)
Format: Oral

This paper presents new material evidence from the RELOAD project, which investigated long-term settlement dynamics in the liminal zones of the ager Volaterranus (northern Tuscany, Italy) through integrated landscape survey, ceramic analysis, and geospatial modeling. Focusing on the period between the centuries 3rd BC-5th AD, the project aimed to reassess the role of marginal areas within Volterran settlement dynamics by foregrounding ceramic building materials (CBM) as a key archaeological source. Traditionally interpreted through center–periphery models, marginal zones have often been characterized as conservative or residual spaces. Recent research, however, increasingly recognizes these areas as active components of settlement systems, capable of fostering technological adaptation, and alternative socio-economic strategies. Building on this reassessment, the project adopted the anthropological concept of liminality to reinterpret marginal landscapes as permeable systems in which identities, practices, and technologies were continuously negotiated, making them particularly informative for examining processes of long-term transformations. Particular attention was devoted to Roman-style roof tiles (a incasso) and bricks, identified exclusively within these liminal zones for the Volterran territory. Macroscopic analyses confirm on-site production and the acquisition of technical knowledge distinct from earlier Etruscan CBM traditions. This evidence points to selective technological transfer and possible integration into broader military or supply networks, alongside deeper incorporation into the Roman economic and cultural sphere. The association of CBM production with centuriated landscapes, extra-urban sanctuaries, and early Christian sites further underscores the close entanglement of construction practices with political, ritual, and economic structures. The distribution, reuse, and depositional patterns of these materials reveal complex life cycles, reflecting adaptive construction practices, resource management strategies, and continuity of occupation. Thus, by foregrounding CBM as a pivotal archaeological source, this paper demonstrates how ceramic building materials can provide new insights into settlement organization, resourse management, and social transformation, contributing to

alternative interpretations of ancient landscapes.

2419. Provenance, Networks, and Contexts of CBM in Pompeii

Authors: Julian Bauch (German Archaeological Institute)
Format: Oral

Thanks to its exceptional state of preservation following its burial during the eruption of Vesuvius in 79 AD, Pompeii offers a wealth of reference points and a unique opportunity to reconstruct the complete structure of a local building industry and its development within an ancient Italian city. While various studies have already provided results on the production, distribution and use of other building materials, the use of CBM in Pompeii has only been researched to a limited extent. This is where a new project comes in. By combining different research perspectives on this group of objects, it aims to develop and present a comprehensive reconstruction of this specific segment of the Pompeian construction industry from a diachronic perspective. The intention is to identify strategies for organising the supply of building materials and their dynamics, thereby contributing to a deeper understanding of an important aspect of ancient construction. The project correlates insights from the three fields of epigraphy (stamp analysis), archaeological building research (structural use) and archaeometry (provenance) on the origin, production and use of building ceramics in Pompeii for the first time, based on a case study in which the structural applications of building ceramic products in Insula IX 10, newly excavated between 2023 and 2025, will be fully recorded. The paper discusses the methodological basis of the project and presents some preliminary results of the first campaign.

1495. Tile and brick in Roman in architecture: A personal review into recent research directions in the field

Authors: Pirjo Hamari (University of Helsinki | Finnish Heritage Agency)
Format: Oral

Ceramic building materials, abundant in the archaeological record, have become increasingly recognized as a valuable archaeological resource in recent years. Advancements in scientific methods and technologies have enhanced documentation and facilitated the investigation of new research areas in many areas of the ancient and pre-modern world. This paper takes an in in-depth look at the recent research concerning clay brick and tile used in ancient construction, primarily during the Roman period, with a focus on the Eastern part of the Mediterranean. It aims to bring together personal experiences from two decades of research in the field, highlighting the growing realization on the value of this material as a source of information on past societies, as well as contextualise the new methods and recent findings presented in previous EAA sessions on this topic. By doing this, it aims to pave the way for future research on this topic, identifying promising avenues for research, as well as the still numerous gaps in our knowledge. The paper will finish by exploring the potential for a publication on CMB, bringing together the interesting results in this field presented in recent years.

217 CURRENT RESEARCH IN THE AMERICAS: NOVEL APPROACHES TO RESONANT PASTS

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Manuel Arroyo-Kalin (University College London) – Natalia Moragas (Universidad de Barcelona)
Keywords: Archaeology of the Americas, Heritage Studies, Archaeological Science, Americas
Format: Regular session
Affiliation: Community for the Archaeology of the Americas - EAA4Am

SESSION ABSTRACT

Despite the long trajectory of research in the Americas by archaeologists based in European institutions, few spaces dedicated to Americanist archaeology exist in European archaeological meetings. The session 'Current Research in the Americas: Novel Approaches to Resonant Pasts', organised by the Community for the Archaeology of the Americas (EAA4Am), seeks to overcome this invisibility. The sub-theme Novel Approaches explores innovation in current research practice in the Americas. Here we welcome contributions that showcase how interdisciplinarity expands our understanding of the past in the Americas. The sub-theme Resonant Pasts highlights the powerful social dimensions of heritage and archaeological practice. Here we also welcome contributions that explore the relevance of archaeological research for the political agendas of communities engaging locally with archaeological heritage. By bringing together updates on ongoing research projects alongside reflections and insights on current research practice and collaborations, we aim to create a welcoming space for archaeologists interested in the archaeology and heritage of the Americas.

CONTRIBUTION ABSTRACTS

213. Participatory Mapping and Archaeological Survey of Maritime Landscapes on Ilha de Itamaracá

Authors: Scott Allen (Universidade Federal de Pernambuco) – Josué Santos (Prefeitura Municipal da Ilha de Itamaracá)
Format: Oral

Archaeological, historical, and ethnographic research show that Ilha de Itamaracá has long been shaped by dense interactions between built structures – such as fortifications, churches, sugar plantations, and waterfront facilities – and coastal and estuarine practices structured around fishing, navigation, and systems that linked people, places, and resources across the colonial Atlantic. Despite this historical and archaeological density, heritage narratives and management policies on the island remain largely focused on a small number of monumental sites, while extensive portions of the built landscape – particularly those embedded in everyday maritime work and practices – remain poorly documented. This paper presents the initial stage of an ongoing research project that investigates the role of participatory mapping in the study, survey, and management of archaeological sites in maritime and island contexts. The project adopts participatory mapping as a central methodological framework, working collaboratively with fishing and caiçara communities on the Ilha de Itamaracá to identify, spatialize, and interpret built features, circulation routes, landing points, and architectural remains that are meaningful within local territorial knowledge. Participatory mapping is approached not merely as a descriptive, representational technique for illustrating space, but as an analytical and epistemic tool capable of informing survey strategies, refining research questions, and guiding targeted archaeological investigations. By integrating community-produced cartographies with archaeological, historical, and spatial data, the project examines how built maritime landscapes are recognized, studied, and managed.

1243. Thirty Years of Maritime Archaeology on the Tristán de Luna Shipwrecks in Pensacola Bay

Authors: John Bratten (University of West Florida)
Format: Oral

For more than three decades, the University of West Florida has conducted sustained maritime archaeological investigations of the shipwrecks associated with the 1559 Tristán de Luna expedition in Pensacola Bay. These wrecks, tied to Spain's earliest large-scale colonization effort in the northern Gulf of Mexico, represent one of the most important mid-sixteenth-century shipwreck assemblages in North America. Long-term, systematic research has produced a robust archaeological and archaeometric dataset that informs ship construction, colonial logistics, ceramic supply systems, and shipboard life. This paper synthesizes thirty years of field survey, excavation, conservation, and laboratory analysis across multiple wreck sites. Research has integrated remote sensing, hull remains documentation, artifact studies, and materials characterization, including ceramic typology, residue and pitch analysis, and wood identification. The cumulative results demonstrate the interpretive power of multi-decade, institutionally supported maritime research programs and underscore the value of integrating archaeological science with traditional nautical archaeology. Ongoing analyses and new field investigations continue to expand this dataset, offering further opportunities to refine interpretations of early colonial maritime practice in the Gulf region.

2594. Cliff Dwellings of the Canyons of the Ancients National Monument

Authors: Bartosz Foryś – Radosław Palonka (Jagiellonian University in Krakow)
Format: Oral

The Sand Canyon–Castle Rock Community Archaeological Project, conducted by the Jagiellonian University in Kraków, Poland in cooperation with the U.S. Bureau of Land Management, focuses on the investigation of cliff dwelling sites and rock art in Sand Canyon, East Fork of Rock Canyon, and Graveyard Canyon, in the Canyons of the Ancients National Monument, southwestern Colorado, USA. This paper illustrates the structural, typological, architectural, and settlement complexity of these sites, placing them within the context of social changes. It addresses the issue of the implementation of Prudden's Unit in the cliff dwellings of the Mesa Verde region during the late Pueblo III period (ca. 1225-1300 AD) and the interpretations resulting from this approach. It also presents a bidirectional evolutionary pattern in the location of this type of sites, including dwellings situated in rock shelters and against cliff faces, as well as mixed solutions found in the upper and lower parts of canyons. The discussion, based on both quantitative and qualitative research, includes regional comparisons and ethnographic analogies drawn from Pueblo architecture of later periods. The presentation includes data collected through non-invasive and invasive archaeological methods, using modern digitizing techniques, as well as traditional methods of architectural documentation.

15. Cold War Nuclear Heritage in the Cuban Countryside

Authors: Hakan Karlsson (University of Gothenburg, Dept. of Historical Studies)
Format: Oral

In the Cuban countryside the remains of the former Soviet strategic nuclear missile installations from the October Crisis 1962 are slowly decaying, simultaneously as persons living nearby and with firsthand experiences of this historical event are slowly passing away. This paper explores the results from a contemporary archaeology project that has been exploring the October Crisis (1962) and

its material and immaterial remains in Cuba since 2005. The project is a cooperation between Swedish archaeologists and Cuban archaeologists, anthropologists and historians, and it is focused on the material remains at these missile bases, its local reuse, the memories and stories maintained by people in the small farmsteads and villages surrounding them, as well as the heritagization of these Cold War remnants. Until 2010 this material was considered "difficult" and not acknowledged by the Cuban antiquarian management since it promoted negative reminiscences for the Cuban leadership, and consequently, the October Crisis was also under-communicated in the national/revolutionary narrative even though Cuba was the epicenter of the crisis. However, today this material is undergoing a slow heritagization process where it receives new values and meanings within the framework of projects striving to transform some of the former missile bases into places for reflections on the dangers of nuclear weapons/war, and for the promotion of world peace. Perhaps, the encounter with the material and immaterial remnants of this Cold War crisis can allow us to understand and respond to the present dangerous state of our world.

1981. Walking Archaeohydrology to Revive Ancestral Landscapes: Applied Archaeology in the Andes

Authors: Alexander Herrera (Universidad de los Andes)
Format: Oral

Walking and working together to reimagine a future landscape and rebuild relic hydraulic infrastructure offers a path to meaningfully integrate historic and scientific investigations with traditional water management practice and confront increasingly unpredictable climate regimes. Bringing scientists and local farming community members together to meet eye to eye in the field is a privilege predicated on ethical research practice, and on how the meanings and objectives of research dovetail with local aspirations and expectations, or not. This paper showcases the bringing together of archaeological, paleoclimatological, anthropoligcal and historic work on research on restoration of ancient hydraulic infrastructure in the Ancash highlands of Peru, three dams in the Cordillera Negra – Ricococha Chacrascocha and Weetaocha- and two infiltration systems in the Cordillera Blanca -Pariamarca and Keushu. In doing so it aims to highlight the promise and pitfalls of applied archaeology in restoring ancestral landscapes, providing water and performing rituals from the past.

2226. Market Infrastructure and Settlement in the Calakmul Region

Authors: Kathryn Reese-Taylor (University of Calgary) – Felix Kupprat – F. C. Atasta Flores Esquivel (Universidad Nacional Autónoma de México) – Armando Anaya Hernández (Universidad Autónoma de Campeche) – Matthew Longstaffe – Lisa Schmidtke – Kyle Farquharson (University of Calgary) – Mario Mercado Álvarez (Universidad Nacional Autónoma de México) – Shane Montgomery (University of Calgary) – Jordan Kobylt (Tulane University)
Format: Oral

A central question in the archaeology of urbanism is how large, diverse populations were integrated into workable cities through systems of circulation, provisioning, and exchange. Since 2022, the Proyecto Arqueológico Bajo El Laberinto (PABEL) has combined spatial analysis of an extensive lidar dataset with targeted excavations to examine how market infrastructure shaped settlement organization across the Bajo El Laberinto landscape, centered on the city of Calakmul. Results from an intensive archaeological testing program indicate rapid growth beginning in the Early Classic (ca. 200–450 CE) and continuing through the Middle Classic (ca. 450–650 CE). This expansion is characterized by a proliferation of large multi-patio residential groups and the emergence of "nested" architectural compounds that we interpret as market nodes. These probable marketplaces form a distributed network of purpose-built facilities with permanent exchange infrastructure and likely administrative, ritual, and residential annexes. Their placement suggests a structured pattern of movement that connected households across short and medium distances. Excavations in selected market nodes and in multi-patio residential groups from across the settlement zone provide initial evidence for broad access to locally produced "wealth" goods and costly long-distance imports among households that vary substantially in size and internal arrangement. Together, the settlement pattern and excavation results suggest that sustained investment in market infrastructure supported a robust regional economy by linking inhabitants of multi-patio groups to wider systems of distribution and provisioning.

1967. Archaeological Prospection at Teotihuacan. The San Juan River neighborhood project

Authors: Alessandra Pecci (eraaub, iaub, insa-ub, Universitat de Barcelona) – Agustin Oritz – Luis Barba – Jorge Blancas – Fatima Martinez (UNAM) – Genea Girimonte – Natalia Moragas (Universitat de Barcelona)
Format: Oral

In the framework of the San Juan River neighborhood project started in 2017 in collaboration between the UNAM (A. Ortiz, L. Barba) and the University of Barcelona (A. Pecci, N. Moragas), we have carried out archaeological prospection in different areas of the center of Teotihuacan. Here we show the data obtained studying areas located in the protected archaeological zone of Teotihuacan and in areas now buried under modern occupation, providing new insights to the study of the San Juan River Neighborhood and its building characteristics. The inestigates areas are located in the center of Teotihuacan, between the San Juan River, the Sun Pyramid and the Street of the Dead, named by Millon "sectors N2E1 and N2E2". The project is financed by the Spanish Ministerio de Cultura (Ayudas a proyectos arqueológicos en el exterior) and the Fundación Palarq. It is part of the activities of the Laboratorio de Prospección Arqueológica of the UNAM, the ERAAUB (2021 SGR 00696), the Institut de Arqueologia de la Universitat de Barcelona (IAUB) and the INSA-UB, MdM Unit of Excellence 2021, MCIN/AEI/CEX2021-001234-M. We thank the Consejo de Arqueologia of the Secretaria de Cultura in Mexico for the permission to carry out the project.

1793. Authenticity, Form and Technique: Morphometric and Traceological Analysis of Pre-Hispanic Stone Masks from the A. L. Pinart Collection (MQB)

Authors: Anabel Villalonga Gordaliza (Universitat Autònoma de Barcelona)
Format: Oral

In this presentation, we present the results of a geometric morphometric analysis applied to a set of pre-Hispanic stone masks (n = 8) from the Alphonse L. Pinart collection, currently housed in the storage facilities of the Musée du Quai Branly (Paris). Geometric morphometrics has previously been applied to Teotihuacan lithic sculpture (Buxeda Garrigós and Villalonga 2011; Villalonga 2013, 2015), as well as to Teotihuacan masks within a project conducted at the National Museum of Anthropology in Mexico. The Pinart collection includes particularly relevant examples which, although previously studied from typological (Walsh and Rose 2014) and petrographic perspectives (Rose and Walsh 2018), had not yet been subjected to geometric morphometric analysis. In this study, data acquisition was carried out through photogrammetry, allowing for the analysis of morphoproportional patterns and relationships among the masks. In addition, the results of a traceological study conducted on the same objects are presented, aimed at identifying manufacturing tool marks and assessing whether the lapidary techniques employed are consistent with pre-Hispanic production or, alternatively, suggest that some of the masks may represent modern reproductions.

495. Holocene Geoarchaeology of the Serdan-Oriental Basin of Mexico in the context of climate- volcanism interactions and Mesoamerican cultural transitions

Authors: Agesandro Garcia Arriola (Instituto de Geologia, Universidad Nacional Autonoma de Mexico | Postdoctoral Fellow SECIHTI) – Priyadarsi Debajyoti Roy (Instituto de Geología, Universidad Nacional Autonoma de Mexico) – Irma Vargas Martinez (Facultad de Inegnieria, Universidad Nacional Autonoma de Mexico) – Genesis Aguilar Frias (Escuela Nacional de Antropologia e Historia)
Format: Oral

Lacustrine sediments from central and eastern Mexico are important archives of the Holocene paleoenvironmental conditions and the interaction of first human groups. The early-Middle Holocene was a transitional phase between first settlers, who still coexisted with now extinct megafauna, and the first agricultural societies that gave rise to sedentary lifestyles in Mesoamerica. Multi-proxy data of this study generated paleoenvironmental information from surface processes such as erosion, runoff and authigenic precipitation in the Serdán-Oriental Basin located at the eastern margin of the Trans-Mexican Volcanic Belt. Elemental composition in inorganic fraction, oxygen isotopes and charcoal analysis from a radiocarbon-dated sequence collected from Lake Totolcingo provided valuable information in the context of environmental conditions, volcanic activities and anthropogenic perturbations from the first settlers of the region to the Postclassic Mesoamerica. In the phase characterized by first agricultural villages over the early Holocene, the proxy-registers suggested more precipitation and runoff erosion between ~7.8 and 7.4 cal ka BP between two drought periods evidenced by ancient charcoal. The early Holocene volcanic deposits and wetter conditions might have triggered an increase in plant domestication and horticultural village settlements. Stratigraphic variations after ~3.2 cal ka BP and until ~1.2 cal ka BP in δ18O and clastic fractions represented a change in the sedimentary dynamics indicating more erosion in a phase of higher lake water salinity and evaporation, probably due to an anthropic perturbation contemporary to the cultural phases of nearby Mesoamerican city at Cantona. Different phases of Late Holocene volcanic eruption also had geoarchaeological significance; the first one in 20 AD from Las Derrumbadas twin domes was contemporary to an important population increase in Cantona, and the second phase with activities between 1050-1240 AD from the Las Derrumbadas as well as the Volcancillo crater occurred during abandonment of the ancient city.

1532. A new method for obsidian sourcing in the Americas using image-based deep learning

Authors: Mike Lyons (University of Bonn, Department for Anthropology of the Americas | German Archaeological Institute) – Jeannine Langmann (University of Bonn, Department for Anthropology of the Americas) – Markus Reindel (German Archaeological Institute)
Format: Oral

Identifying the geological source of obsidian artifacts provides a valuable means of reconstructing exchange networks, political influence, and regional interaction in the Americas. Currently, the preferred method for source attribution relies on geochemical analysis using X-ray fluorescence (XRF) or neutron activation analysis (NAA), and subsequent comparison with a known reference collection. While highly effective and increasingly accessible with the advent of portable XRF (pXRF), it remains financially and logistically out of reach for many projects. This research presents a new method for sourcing obsidian using convolutional neural networks trained on standard documentation images of obsidian artifacts with a known source. As of yet, the technique has achieved high classification accuracy across several major Mesoamerican and Isthmo-Colombian obsidian sources. This approach offers a scalable and low-cost alternative for preliminary source attribution and screening of entire assemblages. With further development, the technique has the potential to democratize obsidian sourcing in the Americas and expand its application to projects that currently lack access to geochemical methods.

2485. "Happy Peoples Have No History": Integrating Multiple Methodological Approaches to Reconstruct

Sociopolitical Structures in Pre-Columbian Southern Central America

Authors: Markus Reindel (German Archaeological Institute) – Mike Lyons – Adrien Martinet (German Archaeological Institute | University of Bonn, Department for the Anthropology of the Americas)
Format: Oral

When Georg Wilhelm Friedrich Hegel famously stated in the 1820s that "happy peoples have no history", he did not deny their past; rather, he referred to the ways in which peaceful societies, lacking dramatic ruptures, collapses, or monumental political transformations, remain less visible in historical narratives. In the archaeology of the Americas, scholarly attention has traditionally focused on highly stratified societies with monumental architecture, centralised authority, and clearly bounded territories, such as those of Mesoamerica and the Central Andes. By contrast, the more horizontally organised societies of Southern Central America, characterised by flexible boundaries and networks of communities of practice, have received comparatively limited attention. This paper presents results from an interdisciplinary research project in northeast Honduras, a representative region of Southern Central America. Combining terrestrial survey and excavation with remote sensing techniques, including satellite imagery, photogrammetry, LiDAR, and GIS analysis, we reconstruct settlement patterns across a broad landscape. Archaeometric analyses of ceramics, obsidian, and jade further illuminate exchange networks linking communities and facilitating the circulation of objects, materials, and knowledge. Our findings reveal dense networks of small- and medium-sized settlements without clear centralised seats of power. These decentralised sociopolitical configurations appear to have fostered resilience and adaptability to environmental and social change. By foregrounding alternative forms of social organisation, this research contributes to broader discussions on the diversity of political systems in the pre-Columbian Americas and highlights their continuing relevance for understanding sustainable and pluralistic forms of coexistence.

2707. Refitting the Fragments. Applying Typo-Modal Classification to Late Formative (400 BC – AD 300) Ceramic Assemblages in Southern Central America

Authors: Adrien Martinet (German Archaeological Institute)
Format: Oral

The Late Formative period (ca. 400 BC – AD 300) in Mesoamerica and southern Central America witnessed the crystallization of cultural features that would become hallmarks of later Classic period societies (ca. AD 300 – 900): hieroglyphic writing, monumental architecture and sculpture, strong hierarchical systems, and interregional interaction networks. These developments have traditionally been interpreted as Maya or pre-Maya phenomena, leading regions beyond the limits of Mesoamerica, particularly Honduras, Nicaragua, Costa Rica, and Panama, to be regarded as peripheries or dependents. Although this perception has begun to change over the last two decades with the influx of new investigations in this area, much of the legacy data we rely on today, especially with ceramics, remains shaped by earlier assumptions about these regions. Southern Central American ceramic assemblages have largely been classified using site-based type-variety systems, which hinder comparative analyses and unintentionally reinforce cultural differences. Using a recently excavated Late Formative site in northeastern Honduras as a case study, this paper applies a typo-modal classification to ceramic material in order to reintegrate fragmented datasets from Mesoamerica and southern Central America. By focusing on shared morphological and stylistic attributes, this approach highlights similarities obscured by the type-variety system and identifies broader patterns of interaction among communities previously considered as isolated from one another. Rather than marginal recipients, southern Central American communities emerge as well-connected participants in Late Formative interregional interaction networks, actively negotiating the adoption and transformation of material traditions through locally embedded social practices.

2311. New Paths in Dark Waters: archaeological excavation in São Gabriel da Cachoeira, Amazonas State, Brazil

Authors: Manuel Arroyo-Kalin (UCL Institute of Archaeology) – Filippo Stampanoni Bassi (Museu da Amazonia) – Helena Lima (Museu Paraense Emílio Goeldi) – Laura Furquim (Universidade de São Paulo) – Wiktoria Sagan (UCL Institute of Archaeology) – Meliam Gaspar (Universidade de São Paulo) – Iberê Martins (Instituto Federal do Amazonas) – Rosa De Souza – Viviane Moura (Museu da Amazônia)
Format: Oral

Amazonian archaeology has expanded in recent decades, yet sustained investigations remain restricted to long-term research programmes in a limited number of regions. Difficulties of access and logistical constraints elsewhere impede or hinder the continuity of many archaeological efforts. This is evident in the upper Negro River basin, where Eduardo Neves's doctoral dissertation 'Paths in Dark Waters' (1998) reported the only stratigraphic excavations carried out during the twentieth century, and where comparable efforts were largely absent until our project started in 2018. Today, the upper Negro constitutes one of the Amazon's largest autonomous Indigenous territories, underscoring archaeology as a particularly rich domain for engaging in meaningful dialogue with Indigenous historical memory. Home to speakers of several languages of Arawakan, Tukanoan, and Nadawhupan filiation, ethnohistorical records suggests indigenous ancestors inhabited the region at the onset of European colonisation in the eighteenth century; Neves's work, in turn, shows that these histories plausibly extend back into pre-Colonial times. In this presentation, we report on excavations undertaken at São Gabriel da Cachoeira, the main town dominating the upper reaches of the Negro River in the Brazilian state of Amazonas. We emphasise the archaeological processes leading up to and including excavation and analysis; outline stratigraphy, chronology, and preliminary analytical results; and situate our findings within both the region's otherwise sparse archaeological record and broader interpretations of pre-Colonial history in Amazonia. Our results show that the pre-colonial northwest Amazon can no longer be regarded as a nexus region scantily dressed by people in the past. Instead, through intercultural research, we can now begin to assemble a more comprehensive picture of long-term human occupation and landscape management that led to rainforest domestication and human hiche construction through millennial human action.

893. Geoglyphs, productive consumption, and technologies of movement in the Atacama Desert (ca. AD 1000–1535)

Authors: Daniela Valenzuela – Adrián Oyaneder (Departamento de Antropología, Universidad de Tarapacá) – Persis Clarkson (Department of Anthropology, University of Winnipeg) – Marta Crespo-Fernández (INCIPIT - CSIC, Santiago de Compostela)
Format: Oral

Geoglyphs constitute one of the most prominent visual expressions in the pre-Columbian landscapes of the Atacama Desert. We examine the variability in the spatial distribution, formal features, and contextual associations of geoglyphs, drawing on detailed documentation supported by drone-based photogrammetry. While all occur within arid lowland environments, geoglyphs display marked differences in scale, layout, and placement, including monumental figures associated with caravan routes, smaller figures in agricultural and domestic settings, and concentrations integrated into productive and ceremonial spaces. We propose that geoglyphs can be understood as a form of productive consumption embedded within a substantive and relational economy, rather than solely as symbolic or communicative expressions. From this perspective, geoglyphs formed part of the intertwined processes of production, distribution, and consumption that structured social reproduction for late pre-Hispanic societies. Their circulation-oriented placement and recurring association with pathways, nodes of interaction, and camelid imagery suggest that geoglyphs formed part of broader technologies of movement, alongside pack animals, routes, and material infrastructure. Geoglyphs functioned as active components of economic and social life, contributing to the visual structuring of circulation, territoriality, and identity during the Late Intermediate and Inka periods (ca. AD 1000–1535).

755. Production and provenance of Inka pottery in Qullasuyu: petrographic and geochemical evidence from the Arica-Carangas macroregion

Authors: Ester Echenique (Universidad de Tarapacá) – James Davenport (University of Missouri) – Frances Hayashida (University of New Mexico) – Thibault Saintenoy (Consejo Superior de Investigaciones Científicas, Incipit-CISC) – Santoro Calogero (Universidad de Tarapacá) – Joselline Quijada (Pontificia Universidad Católica) – Paloma Arellano (Independent researcher) – Brandi Mcdonald (University of Misourri) – Suzanne Eckert (University of Arizona)
Format: Oral

The production and circulation of Inka ceramics were central to structuring negotiations between the Inka and local societies annexed to Tawantinsuyu, as well as to strategies of state legitimization and control. Archaeological and ethnohistorical evidence indicates that distinctive Inka ceramics—such as urpus (or aríbalos) and shallow plates, often decorated with polychrome designs—were used in the provinces to emphasize the state's role as both a symbolic and material sponsor. Studies of Inka ceramic production show that potters were relocated throughout the empire to provincial administrative centers and production enclaves, including in Qullasuyu, the southeastern sector of Tawantinsuyu. However, the absence of identified state pottery production sites in Qullasuyu, together with limited regional analyses of ceramic technology, has hindered understanding of the origins of Inka vessels circulating in the southern provinces—specifically whether they were produced in centralized workshops, locally produced, imported, or resulted from multiple production strategies. Using ceramic petrographic analysis and neutron activation analysis, this study shows that Inka ceramic production and circulation in one region of Qullasuyu was more complex than previously assumed. The results highlight the compositional diversity of imperial Inka-style ceramics associated with the Arica–Carangas microregion, spanning present-day northern Chile and western Bolivia, revealing that multiple processes of production and distribution operated within this province. This diversity reflects varied production origins, interpreted as the material expression of differentiated circulation and distribution networks of imperial pottery across the southern provinces. Overall, the findings support the absence of a centralized system of pottery production and suggest that vessels circulated through multiple, differentiated networks of interaction.

1388. Community, ceremony and health: Bioarchaeological insights from the Formative period site of Cerro Pacífico, Perú (1800-900 BCE)

Authors: Luis Manuel Gonzalez – Aleksa Alaica (University of British Columbia) – Milton Lujan (Independent researcher)
Format: Oral

Tooth wear is a key indicator of dietary and cultural practices, reflecting both food abrasiveness and non-dietary uses of dentition. In the Andes, extensive tooth wear is often linked to abrasive diets and is typically associated with older age. However, at Cerro Pacífico (1800–900 BCE), a site in the Lima Province of Peru, a significant number of individuals across a wide age range—ranging from 6 months to 50 years—exhibit advanced tooth wear. This challenges the assumption that severe dental wear is solely a

result of aging or pathology. In this study, we analyze 36 human burials to reevaluate the interpretation of tooth wear as a pathological condition. We examine morphological indicators of masticatory and non-masticatory stress, alongside stable isotope data to reconstruct dietary patterns. Our findings suggest that tooth wear in younger individuals was not a sign of disease, but rather a consequence of active participation in food processing and production. This evidence points to a community practice of collective care, where the maintenance of individuals with significant tooth wear enabled their continued contribution to subsistence activities. Rather than viewing care as a response to pathology, we argue that it was a central expression of embodied value and social inclusion. This reframe highlights how care practices were embedded in the social and economic fabric of the community, underscoring the importance of context in interpreting bioarchaeological data.

1683. Yllapa Ushnu as Watershed Management Infrastructure in the Sondondo Basin

Authors: Viviana Siveroni (IoA, UCL) – Teddy Traslaviña-Arias (Geography and Sustainability, University of Tennesse Knoxville)
Format: Oral

Recent scholarship has drawn increasing attention to yllapa (lightning) ushnu, Inca ceremonial platforms situated in high-altitude landscapes (Branch et al. 2014; Ramón 2014). Some studies examine how the location of these features relates to the physical and sacred topography of highland environments, while others emphasise their association with particular ecological zones. Ramón, in particular, proposes a direct relationship between ecological zones, subsistence practices, pantheons, and ritual architecture, interpreting high-altitude ushnu associated with lightning and thunder as cultural expressions of precolonial puna pastoral societies. While this approach places these platforms at the intersection of ritual and everyday life, additional interpretive possibilities remain open. Water rituals in communities of the Sondondo Basin, where yllapa ushnu are documented, together with other regional ethnographies, provide a framework for reconsidering the role of ushnu within broader systems that encompass not only ritual but also economic dimensions. Such systems can be understood as local forms of governance that bring together sectors of society that might otherwise appear disconnected, yet in practice form part of a more complex social whole. Ethnographic evidence suggests that ushnu in the Sondondo Basin were linked in the past to ritualised practices of water management. On this basis, this paper focuses on yllapa ushnu from the Sondondo Basin. We examine the spatial relationships between these platforms, valley physiography, and water resources—including their placement along drainage divides and their relationship to stream hierarchies and headwaters—to assess their probable function as elements of watershed-management infrastructure in the past.

168. Time, ritual, and bayesian reasoning: charting the Andean Kotosh religious tradition

Authors: Christian Mesia (Universidad Privada del Norte)
Format: Oral

We model 170 radiocarbon dates from 16 Late Archaic and Formative sites to build a multi-scalar chronology for the Kotosh Religious Tradition (KRT). Within the KRT we differentiate the highly codified Mito Tradition (MT) from the more variable Kotosh Broad Tradition (KBT), estimating start–end boundaries for each using OxCal with IntCal20/SHCal20 calibration (Mixed curve for highland contexts) and explicit outlier models. The synthesis resolves three episodes of activity. Phase 1, ~3400 BCE (4004–2991 BCE, 95.4%) to ~ 3000 BCE (3280–2680 BCE, 95.4%), marks the onset of the KRT, confined to Huaricanga and expressed in a coastal KBT form—the earliest materialization of the fire-offering canon later standardized inland. Phase 2, ~ 2700 BCE (2800–2565 BCE, 95.4%) to ~ 1200 BCE (1260–1097 BCE, 95.4%), represents the principal expansion and overlap of KBT and MT, when coastal and highland communities co-produced a shared ritual grammar. Phase 3, ~ 800 BCE (1001–544 BCE, 95.4%) to ~ 550 BCE (750–200 BCE, 95.4%), captures a terminal revival of fire-centric architecture at a limited number of sites, expressed mainly in the MT. Modeled intervals between phases have median durations of ~ 295 year (0–590 year, 95.4%) and ~ 407 year (170–620 year, 95.4%), indicating episodic—not continuous—adoption and elaboration of fire-centric architecture. Anchoring Bayesian boundaries to architectural canonicity provides a transparent, replicable framework for reconstructing the tempo and trajectory of early Andean ritual practice.

1463. Ccopan (Andaray): the probable capital of Cuntisuyu, the fourth part of the Inka Empire

Authors: Mariusz Ziółkowski (Centre for Andean Studies, University of Warsaw) – Gonzalo Presbitero Rodriguez (Universidad Católica de Santa Maria de Arequipa) – Jan Kłaput (Centre for Andean Studies, University of Warsaw) – Bartłomiej Ćmielewski (Faculty of Architecture, Wrocław University of Science and Technology) – Jacek Kościuk (Centre for Andean Studies, University of Warsaw)
Format: Oral

The presentation shows the results of the latest fieldwork campaigns (2025 and 2026), as well as previous research carried out in the early 2000s at the Ccopan site (Andaray district, Condesuyos province, Arequipa, Peru), located on the summit of the eponymous hill, between approximately 3200 m and 3300 m.a.s.l. The site covers approximately 20 hectares. The main objective of this multidisciplinary project is verify the hypothesis that the main Inca administrative center of Cuntisuyu, the fourth (and to date, the least known) part of the Inca Empire, was located in Ccopan. This working hypothesis is based on the following premises: 1. The layout and characteristics of the buildings on the site of Ccopan show traces of the remarkable intervention of the imperial administration and specialists (architects and stonemasons) sent from the metropolitan region. One of the strongest arguments supporting this opinion is Tomb 1, a monument built using an exquisite technique with no parallel in the Arequipa area (or ancient Cuntisuyu). 2.

The main square, with at least two kallanka-type constructions on its sides, has an area of more than 2 hectares and is thus the largest of all the plazas of Inca settlements located in the Cuntisuyu. 3. Ccopan is linked to a series of settlements and sites of funerary function. In one of them, La Joya, located about 1 kilometer to the NW, a capacocha-type sacrifice of two children, accompanied by important funerary offerings, has been discovered. We tentatively hypothesize that the erection of Ccopan could have constituted the final stage of the Inca settlement in this part of the Cuntisuyu. One of the premises in support of this thesis is the unfinished character of certain constructions.

2730. From Chimú to Colony: Territorial Impositions, Resistance, and Landscape Transformation in the Lower Chicama Valley

Authors: Víctor López-López (Incipit-CSIC) – Pablo Barruezo-Vaquero (University of Iceland and Oslo) –Felipe Criado-Boado (Incipit-CSIC)
Format: Oral

After the heydays of the Chimú society (Late Intermediate Period) inhabiting the Peruvian north coast, they suffered two territorial impositions in less than a century. The Inca domination came during the Late Horizon, and a new territorial order arose seven decades later: the Spanish colony. Completely different but successive events produced drastic territorial changes. The colonial process left long-lasting impacts. Changes in territorial and power dynamics that started during the Early Colonial Period extended into the 19th century. Socio-economic and environmental configurations were accordingly impacted. Mechanisms of resistance and transformations developed during this time, especially affecting their materiality, spatiality and environmental perceptions. The "reducciones" of the Early Colony (a resettlement of indigenous communities forced by the Spanish early administration of the Americas) generated an unprecedented territorial mobilisation and reorganisation that deconfigured their conceptions and lifeways in quite a short period. All these impacts can be seen by analysing Chicama's Lower Valley landscape. This paper seeks to understand the changes and continuities of the new social and cultural landscape. Remote and field surveys have located different material remains, from known huacas and reducciones to the Qhapaq Ñan (Inca road system) or multiple cult sites. Some remains date back to the Late Horizon, whereas others were built as part of the colonial process, reflecting changes between the 15th and 19th centuries. This paper will highlight such reality by offering a preliminary assessment of this landscape, its territorial configurations and reconfigurations, and the new living conditions faced by Chicama's lower valley people. The assessment combines ethnographical and archaeological sources, with special emphasis on digital analyses to model and hypothesise flows of movement, territorialisation and controlled exploitation.

2604. Late Pueblo III Architecture in Canyons of the Ancients National Monument

Authors: Bartosz Foryś – Radosław Palonka – Bolesław Zych (Jagiellonian University in Krakow)
Format: Poster

Since 2011, the Jagiellonian University in Kraków, Poland, through the Sand Canyon–Castle Rock Community Archaeological Project and in cooperation with the U.S. Bureau of Land Management, has conducted archaeological research within Canyons of the Ancients National Monument in southwestern Colorado, USA. This multifaceted research encompasses a wide range of archaeological sites, including Late Pueblo III (1225–1300 AD) cliff dwellings located in Sand Canyon, the East Fork of Rock Canyon, and Graveyard Canyon. The poster presents the architectural characteristics of these cliff dwellings and discusses them within a broader social and anthropological context. It summarizes the results obtained to date, outlines the current state of research, and highlights the local distinctiveness of these archaeological sites, for example in comparison with nearby Mesa Verde National Park. The visual design of the poster combines traditional hand-drawn architectural documentation (including cross-sections, perspective views, and two- and three-dimensional representations) with digital model visualizations, addressing both the current state of preservation and proposed reconstruction efforts.

218 VOICES, SOUNDS, AND MOVEMENTS OF ENCOUNTER: MEDIATING COMMUNICATION AT SANCTUARIES OF THE ANCIENT MEDITERRANEAN

Theme: 7. Interaction, connectivity and mobility
Organisers: Erica Angliker (University of Sao Paulo) – Angela Bellia (Palermo University) – Fabio Vergara (Federal University of Pelotas)
Keywords: soundscapes, music, dance, sanctuaries, communication
Format: Session with keynote presentation

SESSION ABSTRACT

The sanctuaries of the Ancient Mediterranean brought together local populations with visitors from distant lands. Arenas of encounter and exchange, they allowed people, ideas, and traditions to converge through ritual and experience vibrant, multilingual and multicultural environments full of diverse dialects, sounds, and gestures. This panel explores how auditory and performative practices mediated communication and connection. Rhythm, movement facilitated mutual understanding and collective participation,

creating non-verbal social and emotional dialogue. Focussing on Interaction, Connectivity, and Mobility from the Archaic to the Roman period, it invites scholars in archaeology, sound and dance studies, anthropology, and sensory research to engage in interdisciplinary dialogue and present papers on the following topics: Sound and Communication · How did sound and music operate as shared languages of worship for communities speaking different languages and dialects? · How did dance and sound foster emotional connection and mutual understanding at ritual gatherings? · How did the acoustic properties of sanctuaries shape or enhance these communicative experiences? Dance, Embodiment, and Connectivity · How did dance and collective movement create social cohesion in multilingual or multiethnic contexts? · Can bodily performance facilitate communication by mediating cultural and linguistic differences? · How did processional and choreographed gestures contribute to the circulation of ritual knowledge and the integration of various identities? Mobility of Sounds and Performers · How did itinerant musicians, pilgrims, and ritual specialists help diffuse musical practices? · What does the mobility of instruments, melodies, and performance style reveal about the cultural interconnectedness of sanctuaries? · How did the dance and music of multiple cultures enrich the soundscapes of Panhellenic, regional, and international sanctuaries? Material and Sensory Traces of Interaction · How can archaeoacoustic and sensory approaches help us reconstruct the experience of multilingual interaction through sound?

CONTRIBUTION ABSTRACTS

745. Hearing the Unfamiliar: Multilingual Soundscapes and Initiatory Experience from Selinunte to Samothrace

Authors: Andrew Ward (Fairfield University)
Format: Oral

Sanctuaries of the ancient Mediterranean served as arenas of encounter in which linguistically diverse populations negotiated participation through shared ritual experience. Within these spaces, sound could mediate communication even when semantic comprehension faltered. This paper argues that linguistic estrangement and semantic opacity were not impediments to worship but mechanisms of ritual transformation: by destabilizing ordinary perception, unfamiliar speech helped prepare participants for initiatory activity. This argument unfolds through a comparison of two geographically disparate Greek communities, Selinunte and Samothrace, with particular attention to how multilingual civic environments informed the ritual dynamics of the Sanctuary of Malophoros and the Sanctuary of the Great Gods. Pre-409 BCE Selinunte presents substantial evidence for multiculturalism, including indigenous ceramics in early strata, intermarriage, and onomastic traces of non-Greek individuals in inscriptions and curse tablets. Phoenician ritual vessels from urban sacred contexts further suggest that non-Greek offerings—or even practices—could be accommodated within regulated confirmation of sacred space. Against this backdrop, the suburban Sanctuary of Malophoros, long recognized as a locus of cultural interaction, gains particular interpretive force. Its continued use after the Carthaginian sack, likely by a socially mixed population, coincides with the Getty Hexameters, a Greek sacred song employing Ephesia grammata—aurally Greek yet semantically obscure. The persistence of Greek as ritual language may therefore have privileged acoustic authority over comprehension. Samothrace offers a complementary case. The Sanctuary of the Megaloi Theoi, among the most renowned mystery cults of the ancient Mediterranean, attracted initiates from across the Greek and later Roman worlds. Ancient testimony describing the retention of an ancestral dialect, alongside inscriptions hinting at local linguistic registers, suggests that initiates encountered ritual speech that was not universally intelligible. Paired with the sanctuary's dramatic soundscape—cries, percussion, and choreographed performance—such estrangement likely intensified the liminality central to mystery initiation.

171. Nature's Voice in the Sanctuary: Environmental Soundscapes and Ritual Experience in Ancient Italy

Authors: Angela Bellia (University of Palermo)
Format: Oral

This paper examines the role of acoustics within the sacred spaces of ancient Italy through the paradigm of Experienced Ancient Religious Sound Studies. Moving beyond a strictly organological approach, the research focuses on the relationship between "Aural Architecture" and the natural environment, investigating how the sonorities of the surrounding landscape actively shaped religious experience and ritual communication from the Archaic to the Roman periods. Conducted as part of the VOICING Project (FIS-02749), this investigation posits that site selection and the architectural configuration of sanctuaries were informed not only by visual or political criteria but by a deliberate intent to integrate and enhance natural sonorities, such as water, wind, echo, and biophony. Three representative case studies from the Magna Graecian, Etruscan, and Roman worlds will be discussed. In these contexts, topographical morphology and sacred structures operated in synergy to amplify environmental sound phenomena, transforming them into mediators for a non-verbal connection between the community of worshippers and the divine sphere. The analysis will explore how the "natural soundscape" did not function merely as a backdrop, but as an essential component of a shared ritual language. This interdisciplinary approach—bridging archaeology, applied acoustics, and ecoacoustics—reconsiders sanctuaries as spaces of sensory encounter where the auditory perception of nature acted as a powerful catalyst for religious emotion and social cohesion, facilitating emotional dialogue across linguistic divides.

379. Echoes of the lake: new archaeoacoustic data at the Etruscan ritual site, the Lago degli Idoli, Italy

Authors: Jacqueline Ortoleva (University of Oxford)
Format: Oral

The Lago degli Idoli is an important Etruscan ritual site located in central Italy that was utilised throughout the sixth century BC. Located south of the summit of Mount Falterona and a few hundred metres from the source of the Capo D'Arno River, the site served to geographically connect the Tuscan and Emilia-Romagna Apennines. During the early 19th century, the archaeological context of the Lago degli Idoli was destroyed. As a result, scholars have refrained from considering the site from the perspective of Etruscan ritual and religious cult. This paper utilises sound to investigate the importance of the Lago degli Idoli and its environs. Recent acoustic measurement data collected as a result of the Sounds of Silence project at the University of Oxford. The study reveals information regarding the environmental setting of the lake and assists with elucidating why ritual was potentially conducted at the lake. Ultimately, the Lago degli Idoli emerges as an important ritual site that allowed worshippers to sensorily engage with and manipulate sound as related to ancestral and deity worship. The relationship between the lake and its environs and specific acoustic characteristics, such as echo duration and outdoor sound propagation, are noted. The study demonstrates the value of acoustical fieldwork when considering exterior archaeological contexts and provides the groundwork and recommendations for future exploration of sound propagation in Pre-Roman Italy, and elsewhere in the ancient Mediterranean.

1063. Musical Instruments in the Sacred Groves of Eros and Aphrodite in Southern Italy: Evidence from Fourth-Century BCE Apulian Vases

Authors: Fábio Vergara Cerqueira (Federal University of Pelotas)
Format: Oral

This study examines South Italian outdoor sanctuaries frequented by both Greek and non-Greek communities, where prenuptial rites—particularly initiatory rituals associated with love and marriage—were performed. In fourth-century BCE Apulian vase painting, produced in Tarentum and Iapygian centres such as Ruvo and Canosa, a recurring iconographic scheme can be identified. Through the combination of figures, objects, gestures, and spatial settings, these images articulate visual formulas for the representation of religious practices connected with marriage and its ritual preparation, here defined as prenuptial rites. A frequent compositional pattern shows, on the obverse of the vase, a ritual act consecrating the marital union, and on the reverse, a prenuptial rite preparing the bride or groom, performed in the presence of older women officiating in these cults, as exemplified by the lebetes New York 17.46.2 and Tübingen 28.5440. Hundreds of such scenes depict religious actions closely integrated with the natural environment and strongly associated with the cultic sphere of Aphrodite and Eros. The repeated use of these iconographic formulas presupposes adherence to the beliefs and ritual practices they represent. The interplay of space, gesture, and object constitutes a visual syntax that designates specific moments or variants of prenuptial rites. Although symbolic rather than documentary in intent, the spaces, objects, and gestures depicted belong to lived experience. The consistent emphasis on outdoor settings points both to an iconographic shift and to the valorisation of natural sacred spaces. Spatial markers indicate that these rites were performed in the open air, involving sacra, offerings, and portable ritual furniture. In several images, built elements—such as marble lustral basins, altars, columns, or pillars—identify open-air sanctuaries adapted for ritual use. Among the objects represented, musical instruments are particularly prominent, raising the question of the sounds that accompanied these rituals, which forms the focus of the present analysis.

1439. Sounding Apollo: Music, Movement, and Multilingual Encounter at Delos

Authors: Erica Angliker (University of Sao Paulo)
Format: Oral

The sanctuary of Delos was a central hub in antiquity, bringing together diverse Aegean communities to honor Apollo, while also attracting visitors from mainland Greece and beyond. This paper examines how sound, music, and embodied performance mediated communication and social connection in this cosmopolitan context. Auditory practices functioned as shared languages of worship, enabling interaction among communities speaking different dialects. The island's open landscape shaped collective listening and performance, amplifying the social impact of sound. Drawing on archaeoacoustic and sensory approaches, the study analyses how music, ritual chanting, and bodily movement fostered engagement across linguistic and cultural boundaries. Special attention is given to dance and coordinated collective gestures as mechanisms of social cohesion, illustrating how Delos operated not only as a religious center but also as a rich, multisensory soundscape of encounter. Through this lens, the sanctuary emerges as a site where auditory and bodily practices structured communal identity and interaction.

2599. The Role of "New Music" in the Cultural Interconnectedness of Peloponnesian Panhellenic Sanctuaries

Authors: Sylvain Perrot (CNRS - University of Strasbourg)
Format: Oral

At the end of the 4th century BCE, Argos conquered the small city of Kleonai and took control of the Nemean competitions. By doing so, Argos sought to forge a panhellenic destiny, the musical and theatrical dimension of which is evident in the construction of an imposing theatre at the beginning of the 3rd century BC, thus rivalling the sanctuary of Asklepios at Epidauros and that of Poseidon on the Isthmus. Although it is difficult to reconstruct the chronology of the appearance of musical and theatrical competitions, several texts attest to the holding of such events in the Nemea and Hēraia, ancient Argive festivals to which the Argives

also added artistic competitions. A careful examination of these texts further shows that at the end of the 3rd and beginning of the 2nd centuries BCE, a common repertoire was performed in these different sanctuaries, drawn from the composers of the so-called "New Music", likely thanks to the archival work carried out by the Dionysian tekhnitai. In the Hellenistic period, Argos thus lies at the heart of a network of sanctuaries where musical and theatrical artists circulate, performing the works of Timotheus of Miletos and Philoxenos of Kythera for compositions on kithara, and of Euripides and other playwrights for tragedy. This phenomenon takes on added significance during the imperial period, when a further connection is made with Timotheos's home city, as Themison of Miletos, victor of both the Isthmia and Nemea, boasts of having composed his own music to the verses of Sophokles, Euripides, and Timotheos. The "New Music" therefore continues to provide a common repertoire for these sanctuaries – in other words, a panhellenic repertoire that ensures cultural interconnection between these different ritual soundscapes through the musicians who come to compete and the audiences who come to applaud them.

526. Tintinnabula in sanctuaries : between sound signals and soundmarks, shared tools?

Authors: Arnaud Saura-Ziegelmeyer (Institut catholique de Toulouse, UR CERES)
Format: Oral

After being published as 'miscellaneous' artefacts and small bronze objects, tintinnabula have attracted more specialised studies over the past fifteen years. Whether in site monographs or museum collections, the amount of data available on them allows us to question the place of this object in the sanctuaries and religious rites of the Mediterranean world. Particular attention will be paid to the Roman period, during which bells seem to have reached a peak of standardisation. While an exhaustive study requires a complex and collective approach, particularly given the great versatility of these objects, one may wonder how the latter managed to establish itself in numerous cults and why it could, among other things, be the symbol of an early globalisation. Thus becoming a common feature of soundscapes, as opposed to other percussion instruments presented as identity markers or associated with certain cults. This communication is a progress report on an ongoing global research project.

2755. Audible Violence: Sensory Experience and Punishment in the Stadium-Amphitheatre at Perge

Authors: Aytaç Dönmez (Istanbul University)
Format: Oral

In ancient arenas, sound was not merely an auditory backdrop but a structuring force that directed collective experience and shaped audience perception. This paper examines how communication between performers and spectators was mediated through the acoustic environment of the arena that emerged following the architectural transformation of the stadium at Perge beginning in the later third century AD. Building upon previous architectural analyses, attention is shifted toward the auditory dimension of spectacle and the ways in which acoustic arrangements shaped collective experience are explored. Archaeological evidence derived from the northern and southern animal holding compartments and recently identified execution platforms demonstrates that the arena functioned not only as a visual stage but also as an active acoustic environment. Architectural interventions associated with the restructuring—including elevated podium walls, enclosed performance zones, and controlled animal release mechanisms—are understood to have influenced the transmission, containment, and amplification of sound. Alongside animal roars, horn signals, and crowd reactions, the sharp and rhythmic sounds of violence—potentially associated with whipping scenes and executions such as damnatio ad bestias—may be interpreted as an acoustic manifestation of punishment, through which acts of violence were transformed into collectively experienced auditory events that synchronized spectators and intensified emotional engagement within a shared sensory atmosphere. In contrast to the vertically organized, hypogeum-based arenas typical of Rome, many amphitheatrical structures in Lycia and Pamphylia exhibit a more horizontal spatial configuration shaped through the adaptive reuse of vaulted substructures belonging to theatres and stadiums. Among these, Perge provides exceptionally clear archaeological evidence, suggesting that this spatial organization directly conditioned acoustic experience and may have produced sensory dynamics distinct from the canonical Roman model. The arena at Perge is therefore understood as an engineered acoustic environment in which sound functioned as a medium of emotional alignment and a performative instrument of imperial power.

2666. Sacred Sounds and Religious Communication: The Carnyx in a Gaulic Sanctuary

Authors: Marsha Mccoy (Southern Methodist University, Dallas, TX)
Format: Oral

The Gallic carnyx, the boar's head battle horn, is the most distinctive element of the Gallic warrior, and the Gundestrup cauldron showing entertainers playing carnyces at a banquet has enlarged the picture of the carnyx as a musical instrument performing an important cultural and social role in Gallic life. In 2004 over 500 ritually broken metal objects, including seven carnyces, were discovered in a Gallic religious site dating to the time of Caesar's conquest in Tintignac, France. The carnyces seems to have been constructed so that they could be played not vertically, as for the battlefield, but horizontally, and so in a different position for a religious ritual. This centrally situated Gaulic sanctuary allowed Gauls from the many tribes and dialects that composed the Gaulic peoples to gather as a unified group around a common military, social, cultural, and religious artifact, and hear the sounds of the carnyx as a sacred and religious mediator that all could understand. Using the theories of cultural anthropologists, and drawing on studies of objects in their cultural contexts, this paper analyzes the ritualistic and religious role of the carnyx, and how its use and function transform "the boundaries between 'bodies' and 'objects'", and affect cultural identity and cohesion. The player of

the carnyx is inevitably conjoined with the instrument in his mouth, creating in the player a ritualistic, religious, and aural bond between his person and the carnyx, and, by extension, with the ritual participants in the religious sanctuary and social world in which it is imbedded. As an object of ritual, religious significance as well as social and cultural importance, the carnyx and its sound transform both the player of the carnyx and those around him, creating a liminal, apotropaic space that provides a context for cultural cohesion and social identity.

1725. Anamnesis: Contemporary Ritual, Embodiment, and Archaeological Space

Authors: Apostolia Papadamaki (Founder & Artistic Director Anamnesis – Independent Artist–Researcher)
Format: Oral

This paper presents Anamnesis, a practice-based research project consisting of contemporary, site-specific, participatory performances developed in archaeological sanctuaries across the Hellenic world. It examines how dance, sound, rhythm, and spatial architecture can function as shared, non-verbal languages of communication, enabling collective participation among audiences of different nationalities, ages, cultural backgrounds, and linguistic identities. In Anamnesis performances, the audience is invited into embodied participation through carefully structured sequences. Participants learn simple movements, vocalizations, and songs during the performance, while professional dancers and volunteer performers act as embodied guides, facilitating participation through repetition, rhythm, and shared spatial orientation. Methodologically, Anamnesis draws on the ancient concept of Orchesis, understood as the inseparable unity of movement (kinesis), sacred word (logos), and melody or music (melos). This triadic structure is experienced by performers and audience alike, who move through the archaeological site engaging in ritual procession and collective movement, without fixed seating or frontal theatrical orientation. The archaeological site, its architecture, acoustics and cosmological orientation, actively shapes each performance. The paper explores how orchesis and spatial mobility generate non-verbal dialogue among participants, resonating with ancient modes of communication and interaction at Mediterranean sanctuaries and contributing to interdisciplinary discussions on sound, dance, and connectivity in antiquity.

2292. From Fragments to Ritual Performance: Silent Cinema and the Archaeological Reconstruction of Ancient Soundscapes

Authors: Patrizia Marra (Sapienza University of Rome | University Suor Orsola Benincasa of Naples | National Research Council of Italy, Institute of Heritage Science)
Format: Oral

This paper examines how early Italian silent cinema visually reconstructed the soundscapes, musical practices, and ritual gestures from around the ancient Mediterranean world. It offers a somewhat unpredictable lens through which to explore non-verbal communication in sacred contexts. Although devoid of sound, these films developed a rich visual vocabulary of instruments, dances, and choreographed movements drawn from archaeological artefacts, museum collections and antiquarian catalogues. The study shows how filmmakers reimagined ritual environments – temples, processions, sacrificial scenes – by translating ancient auditory and performative practices into expressive visual forms. The research reserves particular attention to the cinematic reinterpretation of musical instruments, as well as to the staging of collective dances and ritualised movements: these reconstructions reveal how early cinema sought to evoke the multisensory atmosphere of ancient sanctuaries, with their sounds, rhythm, and performances. Silent cinema thus engaged in a process analogous to archaeological reconstruction, in which, starting from material, iconographic, and textual fragments, it attempts to animate past practices - albeit, obviously, through a more imaginative and edulcorated approach - and make them legible to modern audiences. The paper argues that silent cinema both served as a means of visualising and communicating archaeology-informed contexts to past cinema audiences and that its function as a visual aid can be used - and implemented - as a tool capable of enriching the multisensory experience of contemporary museum and exhibition visitors, helping them to visualise better not only ancient soundscapes, but also how it was perceived and communicated though time.

219 FROM DISTANCE TO ATTRACTION: UTILISATION OF ARCHAEOLOGICAL HERITAGE AND PUBLIC INVOLVEMENT

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Shiting Lin (University of Cambridge) – Chaozhi Zhang (Fudan University)
Keywords: Archaeological heritage, Utilisation, Revitalisation, Authenticity, Public involvement
Format: Regular session

SESSION ABSTRACT

While economic development has encouraged the integration of heritage into contemporary life, it has also prompted concerns, such as over-commercialisation and threats to authenticity in tourism. Nonetheless, research on branding practices referencing Neolithic archaeological heritage in China reveals a more complex picture: in economically disadvantaged areas, such practices have created new opportunities for local participation and engagement with heritage. This invites a rethinking of what "utilisation" means and how it might contribute positively to communities. As diverse forms of heritage use emerge, ranging from study tours

and branding to cultural and creative product development, the interaction between heritage and its stakeholders grows ever intricate. The public, including both local communities and external audiences, now has greater access to archaeological heritage that once seemed "distant" from everyday life, whether through work, consumption, or embodied experience. Building on these observations, this session aims to explore how archaeological heritage is used, revitalised and experienced in contemporary contexts, and what implications this has for public involvement. We invite papers addressing (but not limited to) the following questions: 1) How is archaeological heritage revitalised through contemporary uses? 2) If possible, where should boundaries be drawn to safeguard the authenticity of heritage during its utilisation? 3) In what ways can underrepresented groups be included in archaeological heritage through its utilisation? 4) How does public understanding of heritage change through processes of involvement in heritage utilisation? We welcome both theoretical contributions and case studies from Europe and beyond that critically examine the relationship between heritage utilisation, participation, and meaning-making.

CONTRIBUTION ABSTRACTS

74. Engaging Publics to Integrate Archaeological Heritage into Urban Life: Challenges and Opportunities

Authors: Merve Çalışkan (Izmir Metropolitan Municipality | Independent researcher)
Format: Oral

Preserving archaeological sites while integrating them into contemporary urban life has become a significant topic in urban and cultural heritage studies. The utilization of archaeological sites within urban settlements—most commonly as museums—can enhance a city's cultural infrastructure; however, this approach may also limit the involvement of diverse publics, including local communities, citizens, and disadvantaged groups. Increasing urban life quality and enhancing place attachment of citizens are some ways that may foster the inclusivity of archaeological sites, adding to the sustainable development of the historic cities. Yet, the engagement of diverse publics with these sites and the ways of engagements are to be discussed and discovered. In this framework, this presentation asks how archaeological heritage can be utilized in contemporary cities in ways that foster broader public engagement. The presentation outlines a brief theoretical framework addressing the integration of archaeological heritage with public life and examines both theoretical approaches and practical applications. Drawing on case studies from the United Kingdom and Türkiye by evaluating both traditional sites and community archaeology projects, this study enriches the public archaeology approach in utilizing archaeological heritage. Accordingly, this presentation explores the challenges associated with public participation and highlights the potential of urban archaeological heritage to contribute to sustainable development and to enhance the social value of archaeological sites.

1213. Bridging the Gap: Council of Europe's Strategy 21 as a Blueprint for Activating Archaeological Heritage

Authors: Aleksandra Chabiera (Adam Mickiewicz University in Poznań)
Format: Oral

A survey conducted among over 500 Polish municipalities revealed an alarming gap in integrating archaeological heritage into development documents - namely, Municipal Monuments Care Programs, Development Strategies, and Revitalization Programs. While this heritage is widely present in the diagnostic phases, a closer observation reveals that this presence is in reality based on simple listing of monuments registers entries. Moreover, its presence decreases in goals, priorities, or other implementation-related components of the documents. These findings highlight the systemic "invisibility" of archaeology in local development documents and thus in municipal initiatives. The archaeological community recognizes the great potential of archaeological heritage for local development (entrepreneurship, education, and promotion). But how can we help communities better understand and utilize this heritage in their strategic documents and, ultimately, in their actions? The paper analyzes the survey results against the European Cultural Heritage Strategy for the 21st Century (Strategy 21) principles, developed by the Council of Europe. It recommends a holistic approach based on the Strategy's three components: social (participation), territorial/economic development (sustainable growth), and knowledge/education (research and learning). At its core, Strategy 21 serves as an interdisciplinary blueprint for effective integration of heritage assets into the everyday lives of communities, emphasizing the need for collaboration among diverse stakeholders: local authorities, scientists, museum professionals, entrepreneurs, inhabitants. We propose an implementation matrix for municipalities, drawn from Strategy 21, to enable them to easily assess archaeological assets against their potential and transform them from passive resources into active elements of local development. The matrix, grounded in the Polish case of the gap between recognition and implementation, also serves as a practical presentation of Strategy 21 solutions.

1413. From regulation to co-creation: involving metal detectorists in archaeological heritage utilisation in Estonia

Authors: Katrin Koch Maasing (Tige Tikker OÜ) – Tuuli Kurisoo (Tallinn University)
Format: Oral

Across Europe, hobby metal detecting presents both opportunities and risks for archaeological heritage management, balancing public engagement with concerns over looting and the loss of contextual information. In Estonia, this tension is addressed through a regulatory framework linking legal permission to use search devices with mandatory training. Rather than focusing on detecting techniques, the training centres on local history, archaeological heritage awareness, legal regulations, reporting obligations and methods, basic principles of the recovery and initial handling of archaeological finds, and field-based decision-making, including recognising when professional archaeologists should be involved. While feedback from participants has consistently been positive, there is increasing demand for systematic follow-up engagement opportunities, information exchange, and long-term cooperation. Included in this presentation is a case study from an ongoing research project exploring how hobby detectorists can become more deeply involved as active stakeholders in heritage utilisation, moving beyond compliance-based participation. Within this project, two participatory initiatives were developed. Detectorists contributed to selecting archaeological themes and speakers for a dedicated information day, enabling them to influence knowledge exchange according to their interests. In addition, a co-creation workshop based on design-thinking methods provided a structured space for participants to articulate concerns, reflect on their practices, and collaboratively develop responses to shared challenges. Combining mandatory training with participatory engagement aims to support responsible practices and strengthen cooperation between hobby detectorists and heritage professionals, while fostering a stronger sense of responsibility toward archaeological heritage. By providing access not only to material remains but also to dialogue, decision-making, and meaning-making processes, these approaches help transform heritage from a distant, regulated resource into a shared domain of informed and responsible participation.

1886. Stage or Classroom? Engaging children with prehistory through museum study tours in China

Authors: Shiting Lin (University of Cambridge)
Format: Oral

The temporal distance between prehistory and the contemporary world, together with the abstract nature of prehistoric artefacts, poses significant challenges for museums seeking to involve the public, particularly children, in understanding prehistoric life. Conventional exhibition formats, which often lack interactive and participatory elements, may further limit young audiences' engagement and learning. In recent years, the rapid development of study tour in China has brought students beyond the classroom and created new opportunities for museums to enhance their educational roles. Taking the Banpo Museum in China, the country's first museum dedicated to a prehistoric archaeological site, as case study, this paper examines how a prehistoric site museum has revitalized its interpretive strategies through study-tour programmes to engage child visitors. The analysis explores the museum's efforts to balance the presentation of archaeological authenticity with increasing demands for immersive and entertaining experiences. These practices reflect broader tension faced by museums in negotiating between scholarly heritage narratives and public engagement. This research provides a more nuanced understanding of the interplay between public involvement strategies and heritage presentations. It highlights how contemporary educational practices can facilitate the dissemination of prehistoric knowledge to the young audiences and contribute to museums' public education.

2786. Public engagement and Archaeology in schools

Authors: Caroline Daphne Pathy-Barker (Idependent researcher)
Format: Oral

Outline of the various projects – looking at engagement projects and archaeology in schools since 1995 and what the future holds. The projects have always been designed to increase international awareness of cultural heritage protection, excavation projects, archaeology and history management initially between the connections of Japan and Europe. Making available resources for teaching students with resources and online gateways. Looking at a number of key projects involving students within SEMH schools, YAC (Young Archaeological Groups), and community projects funded by local councils in England. The public benefit is at the heart of all my work within Archaeology. It is important to foster an appreciation of the past; make it meaningful to people's lives and ensure it is accessible to everyone - now and forever. Understanding the wide range of services and activities including commercial clients, project partners, community groups, educational providers and curious individuals. Our Community Engagement and Social Value team has a wealth of experience and passion to help bring archaeological discoveries in order to promote the interest and care for the heritage of our past.

2787. Research on Tourist Experience Preferences of Archaeological Heritage from the Perspective of Semiotics Theory

Authors: Jiangmin Li – Jiahui Zhang – Zhen Zhu (China University of Geosciences)
Format: Oral

From the perspective of cultural symbols, this study explores the tourism experience preferences of visitors to large heritage sites, taking the Shijiahe Site as the research case and constructing a two-phase integrated research framework. Initially, relying on archaeological excavation reports, academic documents and monographs as fundamental data sources, systematic data annotation is implemented to build the Shijiahe cultural identification system under the guidance of semiotic theories. This process deconstructs cultural elements into the "object-symbol-interpretant" logical chain, and further correlates cultural relics themselves with material identifiers as well as functional and spiritual identifiers, forming a hierarchical cultural identification system for the Shijiahe Site. On this basis, drawing on the Strategic Experiential Modules theory, five categories of tourism experience preference elements are manually extracted from cultural relic symbols, and a Kano questionnaire is designed and distributed to collect first-hand visitor data. Subsequently, quantitative analyses including Kano attribute analysis, mixed-class analysis and Better-Worse coefficient

analysis are conducted to measure and classify visitors' experience preferences into four dimensions. Finally, targeted optimization strategies for the tourism experience of large heritage sites are formulated according to the classification results. This study integrates semiotic theory with consumer preference analysis, and constructs a scientific research path from cultural symbol deconstruction to experience preference measurement, thereby providing a novel theoretical framework and practical methodological support for the cultural interpretation, experience optimization and sustainable development of large heritage sites.

1481. The Evolution of Adapting Lithuanian Hillforts for Public Access: From De Facto Protection to Virtual Interpretation

Authors: Jurgita Zabielienė (Department of Cultural Heritage under the Ministry of Culture)
Format: Oral

Today, the number of hillforts in Lithuania has exceeded 1,000, yet only about 150 of them have been maintained and adapted for visitors. The history of protecting these sites reflects the long path of maturity in the state's heritage preservation. It was only in the 1920s that the importance of their preservation began to be raised through the efforts of individuals and public organizations. From the 1960s, a more comprehensive approach to the adaptation of hillforts was adopted – an effort that remains relevant today. National and international documents emphasize the preservation of heritage in situ (on-site) and strictly limit physically invasive, hypothetical reconstructions. In the case of hillforts, this concerns lost wooden structures, as all buildings and fortifications were made of wood. This presentation raises the question: how can the lost architecture of hillforts be presented without compromising their authenticity? The answer is sought through the specific example of the management and adaptation of the Apuolė hillfort (Northwestern Lithuania). Identified in 1887, the hillfort was previously overgrown with trees and little known to the public. Interest in the site was stimulated by research conducted in 1931–1932 and the extensive dissemination of its findings. Subsequently, the hillfort was maintained to save it from decay and prepare it for visitors. To engage visitors with this site, a 3D virtual reconstruction of the castle was created in 2025. Today, the successful presentation of hillforts to the public can only be ensured by presenting research material through modern forms while maintaining maximum respect for authenticity. Such a strategy allows for the reconciliation of legal protection requirements with modern society's need to experience history "live," while simultaneously preserving hillforts as untouchable historical documents for future generations.

235. Archaeology within the digital cultures

Authors: Celia Orsini (Archaeology for Wellbeing)
Format: Oral

The growing visibility of archaeological content within digital cultures raises critical questions for public archaeology concerning authority, mediation, and responsibility in platformed environments. This paper examines Archaeology for Wellbeing as a methodological practice operating on social media, rather than as an impact-driven intervention. Social media function simultaneously as spaces of encounter—enabling participation, affiliation, and co-creation—and as sites of epistemic instability, where archaeological narratives compete with influencer cultures, pseudo-archaeological claims, and decontextualised wellbeing discourses. The paper focuses on challenges of interpretive drift, loss of contextual control, and the algorithmic amplification of affect over evidence. While wellbeing-oriented archaeology often foregrounds care and accessibility, its circulation within platform economies exposes structural tensions between professional accountability and communicative logics that privilege simplification, emotional resonance, and rapid consumption. The paper argues that archaeology must extend its public-facing capacity in these environments without surrendering context, evidence, or interpretive responsibility. In doing so, it positions social media not merely as tools for dissemination, but as contested methodological spaces in which archaeological knowledge, care, and authority are actively negotiated.

2296. National Identity Longitudinally Reinforced through Museum Tourism

Authors: Chaozhi Zhang – Xi Zhang (Fudan University)
Format: Oral

Employing Interaction Ritual Chains theory, this study examines how museum tourism integrates individual emotions into collective national identity and enables post-visit internalization, framing archaeological heritage not as static remains but as an affective and participatory resource activated through public engagement. Interviews with 45 visitors and longitudinal tracking of 20 participants reveal that four ritual elements—mutual focus, emotional entrainment, boundaries, and shared practice—coalesce diffuse affect into collective national identity markers: emotional energy, group solidarity, sacred symbols, and moral outrage. Post-ritual, this energy translates into sustained behavioral tendencies, shared symbols solidify into cognitive schemas, and moral belonging deepens emotional attachment, extending public involvement beyond the museum into everyday heritage-related practices and narratives. We identify an "individual–collective–individual" reinforcement loop, demonstrating that museum tourism systematically shapes visitors' cognition, emotion, and behavior, thereby collectively consolidating and individually internalizing national identity. This offers a processual explanation for museum tourism's role in revitalising archaeological heritage through public participation in identity politics.

2086. From Distant Artefacts to Marketable Crafts: Majiayao Heritage Utilisation from Contemporary Imitation Pottery in Northwest China

Authors: Xueyang Cheng (University of Chinese Academy of Social Sciences)
Format: Poster

In Dongxiang and Lintao counties of the Tao River Valley in Gansu Province, local artisans who produce imitation pottery serve as key agents transforming the prehistoric archaeological heritage of the Majiayao culture from a "distant academic object" into a tangible, experiential, and transmissible contemporary practice. These artisans primarily replicate vessel forms and decorative motifs from museum collections, with limited engagement in reconstructing traditional production techniques. This stands in contrast to imitation pottery workshops in Henan Province, which intentionally incorporate elements of prehistoric pottery-making processes. These practices are not merely acts of heritage revitalisation; they also represent, to a certain extent, commercialised production. The imitation pottery is sold as tourist souvenirs, integrated into educational travel itineraries, marketed as craft commodities with a positioning similar to that of museum souvenirs, and even collected by enthusiasts. This study focuses on the human dimensions of heritage utilisation, highlighting how local potters—who are community members at heritage sites—derive both economic livelihoods and cultural identity from these practices, positioning themselves as "living transmitters of Majiayao heritage", even as the authenticity of this transmitted knowledge remains contested. Beyond the local community, when visitors purchase imitation pottery or participate in hands-on workshops, their understanding of Majiayao culture transcends textbook descriptions. This process of "consumption" and "embodied experience" reshapes public perceptions and emotional connections to prehistoric heritage. By critically analysing these dynamics, this paper contributes to discussions on how heritage is revitalised, negotiated, and made meaningful in contemporary contexts, addressing core questions of authenticity, community empowerment, and public engagement.

220 ACROSS SEAS AND THEORIES: AEGEAN INTERCONNECTIONS WITH ANATOLIA, CYPRUS, THE LEVANT, AND EGYPT IN THE SECOND MILLENNIUM BCE

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Uros Matic (University of Graz) – Filip Frankovic (University of Heidelberg) – Louis Dautais (Université catholique de Louvain)
Keywords: Aegean, Anatolia, Cyprus, Levant, Egypt, interconnections
Format: Regular session

SESSION ABSTRACT

Interconnections in the second millennium BCE have been a central focus of Aegean archaeology since the late 19th century, at the dawn of what became known as Minoan and Mycenaean archaeology. Early studies often relied on diffusionist and migrationist models, but subsequent research has explored interactions between the Aegean and the wider Eastern Mediterranean through artistic exchange, trade, gift-giving, travel, and diplomacy (including interregional marriages). Scholars have applied a variety of theoretical frameworks, from world-systems theory to peer polity interaction models. Advances in dating methods have sparked debates over chronology, prompting archaeologists to reconsider the synchronization of events and adjust interpretations accordingly. Recent archaeological discoveries in the Aegean, Anatolia, Cyprus, the Levant, and Egypt, however, offer new data that have rarely been fully integrated into established theoretical frameworks. Third Science Revolution has triggered new research focused on stable isotope analyses and ancient DNA in attempt to explore mobility and biological kinship beyond the Aegean. This session seeks to bridge these gaps, both between the Aegean and other Eastern Mediterranean regions, and between longstanding models and newly available data. We welcome papers that provide fresh perspectives on familiar material or offer alternative interpretations grounded in new evidence. We encourage contributors to critically navigate between different seas, bottom-up approaches as well as old and new theoretical and methodological models.

CONTRIBUTION ABSTRACTS

1755. Minoans Who? Decentering the "Big Two" to Reclaim Regional Agency in the Central and Northern Aegean Middle Bronze Age

Authors: Peter Pavuk (Institute of Classical Archaeology, Charles University, Prague) – Christopher Hale (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Warsaw)
Format: Oral

Much has been made of links between western Anatolia and the Greek mainland at different stages of the Bronze Age. However, scholarship has often been grounded in culture-historical approaches with its diffusionist or migratory models, which foster a unidirectional conception of connectivity. Moreover, due to biases in the history of archaeological research in these regions, scholarship has gravitated towards the distribution and influence of so-called "Minoan" or "Mycenaean" material culture, which has rendered

other communities in the region, their agencies, and any independent networks, severely underrepresented in models of connectivity for different periods. Even new studies have tended to carry these biases forward because samples can often only be sourced from datasets built under these paradigms. Neither connected to Cretan networks (with a few exceptions), nor contemporary with 'Mycenaean' Greece, the central and northern Aegean (incorporating central Greece, northern Greece, western Anatolia, and their associated islands) during the Middle Bronze Age (MBA, ca. 2200 – 1600 BCE) has often been neglected, with some exceptions. Important work at the transition from the Early Bronze Age has highlighted the movement of technologies like the potter's wheel or the expanded log-boat and/or the sail. Moreover, near the end of the period, very similar pottery types in some (possibly local) classes have been noted along coastal western Anatolia, central Greece, and northern Greece, implying complex connectivity. However, none of these observations have ever been tested through analytical techniques, and little evidence has been presented till now for connectivity between these regions in the intervening centuries. With the benefit of new results from large-scale analytical examinations of pottery provenance, and the initiation of two new major projects targeting the region to address lacunae, new datasets are being built which will help clarify regional networks with important implications for inter-regional models of connectivity.

1239. Tracing the Regional Provenance of Late Helladic IIA Ceramic Imports in Crete and Egypt: A Typo-Stylistic Approach

Authors: Louis Dautais (Ghent University) – Jeremy Rutter (Dartmouth College)
Format: Oral

It has long been assumed that most, if not all, Mycenaean ceramic vessels discovered in the eastern Mediterranean—especially in Egypt—were produced in the Argolid under the political influence of Mycenae. This view is largely based on a limited—and still insufficient—number of neutron activation analyses (NAA) of LH IIIA2–B vessels from these regions, which attribute their production to the Mycenae area (MYBE workshops). But is this identification of their production locales valid for a period more than a century earlier? This paper presents a precise, contextual, illustrated, and updated dual catalogue of LH IIA ceramic imports in Crete and Egypt, comprising 47 and 20 items, respectively. After examining their quantity and geographical distribution, we turn to their archaeological contexts, typologies, and functions, and then discuss the similarities and divergences between the Mycenaean imports from the two regions. Above all, this paper explores their provenances. Employing Furumark's typologies and Mountjoy's seminal works on regionalism, we identify the closest morphological and decorative parallels from the Mycenaean world to propose possible production zones for these imports and a map of hypothetical regional provenances. Although the LH IIA ceramic imports in Crete and Egypt can be attributed to a wide range of regions in Mainland Greece, we argue that the existing evidence suggests that most vessels were products of workshops in the southern Peloponnese, particularly in coastal locations of Laconia, Messenia, and Triphylia/Elis. This paper contributes to current scholarly trends advocating a reassessment of the links between Crete and the Peloponnese at the beginning of the Late Bronze Age. More broadly, by highlighting the previously underestimated role of the southern Peloponnese, this paper once again raises the thorny issue of Peloponnesian communities' direct or indirect involvement in eastern Mediterranean affairs in the earlier fifteenth century BCE.

1069. Egyptian, Syrian, or Aegean? Entangled Iconographies of the Eastern Mediterranean in the Second Millennium BCE

Authors: Veronika Verešová (Institute of Oriental Studies, Slovak Academy of Sciences)
Format: Oral

It is widely acknowledged that the iconography of the Aegean Bronze Age was, in many respects, inspired by Egypt and the ancient Near East. Similarities between these regions and specific iconographic motifs have long been employed to interpret Aegean imagery, religion, and social structures—particularly in light of the limited availability of written sources. Such comparisons have often relied on the assumption that motifs were transferred together with their original meanings. The same interpretative framework has frequently been applied to the adoption of Egyptian and Near Eastern imagery in Syria. Closer analysis of individual motifs across these cultural regions and within different historical contexts, however, demonstrates that the processes of adoption, adaptation, and use were neither linear nor uniform. Whether in the glyptic traditions of Syria, Anatolia, and the Levant, or in the Aegean world, we observe selective appropriation, conscious rejection, and creative transformation of visual motifs. These processes point to complex dynamics of cultural entanglement rather than simple models of diffusion or influence. This paper explores the extent to which such transformations were shaped by the agency of individuals, the agency of images themselves, religious concepts, and strategies of elite self-representation. Through selected case studies focusing on divine figures, fantastic beings, and their hybrid combinations, and by tracing their "biographies" across regions and media, the paper aims to identify the factors that likely governed their use and reinterpretation. In doing so, it seeks to shed light on what these entangled iconographies reveal about their producers, users, and audiences in the Eastern Mediterranean of the second millennium BCE.

820. 'Asiatic' Aegeans in Egyptian tombs: The interconnectivity of the Aegean and Levant, through the Egyptian record (ca.1479-1352 BCE)

Authors: Christian Lindesay (University of Wales, Trinity Saint David)
Format: Oral

The zenith of the Egypto-Aegean relationship, between the reigns of Hatshepsut to Amenhotep III (ca.1479-1352 BCE (Shaw 2001)) is marked by a paroxysm in textual references to kftjw - geographically understood to be Crete (Vercoutter 1956; cf. Dautias 2026, for definition Knossian-Crete) - and painted representations of Aegean peoples on Theban tomb walls. The latter can be categorised as follows; A.) Aegean in appearance, and labelled as coming from Crete and the Islands in the midst of the great green (Rekhmire TT100) B.) Aegean in appearance, and labelled as coming from the islands in the midst of the great green and/or northern Asia (phw.w stt) (Useramun TT131; Puymere TT39), C.) who are 'Aegean' in appearance but are without surviving text (Senenmut TT71) D.) labelled as coming from Crete but appear 'Asiatic' (Menkheperreseneb TT 86; Kenamun TT 93; Amenemhab TT85; Anen TT120). Vercoutter described these as the result of artisanal incompetence and stated that, after the reign of Amenhotep II, "…on ne trouve pratiquement plus de représentations originales de personnages ou d'objets égéens" (1956: 367). These representations have opened many debates: Their historicity (Panagiotopoulos 2001; cf. Matic 2012, 2014); the transferences and chronological synchronism of sociopolitical developments, and cultural emphasises by way of clothing (particularly TT100) (Rehak 1996, 1998; Matic 2012, 2014; Matic and Franković 2017), hairstyles (Matic and Franković 2022) and cultural geography via 'hybridised' figures (Vercoutter 1956; Wachsmann 1987; Pinch-Brock 2000; Banyai 2022). Aligned with Banyai, on an established Aegean presence in the Levant since the Middle Bronze Age (2022: 5-8), and Vercoutter, that Thutmose III's Asiatic campaigns brought Aegean-Levantine enterprises into sharper focus in Egypt (1956: 424-426), while simultaneously rejecting his notion of artisanal incompetence, we aim to clarify that the paintings of 'Asiatic' representatives of kftjw reflect Egyptians awareness of the kftjw-Phw.w stt relationship, within contemporary texts.

2570. Traveling magic: Mediterranean exchange of childbirth protection and legitimacy

Authors: Emma Bentley (University of Edinburgh) – Sarah Cox (San Jose State University)
Format: Oral

Considering the many technologies circulating in the Eastern Mediterranean during the second millennium BCE, the mechanisms by which ideas were selectively received and translated remain poorly understood. This paper asks what is moving when cultures share imagery of deities; are we seeing perceived equivalence in divine roles, shared ritual or bodily experience? Early scholarship assumed direct image diffusion from the pregnant-bodied hippopotamus-crocodile Egyptian goddess Taweret into the Minoan Genius. On Crete, the Genius gains leonine-limbs and is depicted bearing libation jugs and animals, but is stripped of Taweret's explicit female sexual attributes and, seemingly, her childbirth protection role. Whilst this gender re-allocation suggests conceptual transformation, the iconography may be more robustly linked to the underlying concepts being shared. Images of the Minoan Genius begin in the late Protopalatial, contemporary with the appearance of Minoan Beset, a female version of Egyptian leonine god Bes. At this time in Egypt, early precursors of Taweret (Ipy/Reru) and Bes (Aha) are shown aggressively wielding weapons and subduing serpents on apotropaic material protecting mothers and newborns. This is paralleled in the Levant by the aggressive goddess Lamashtu, whose imagery embodies the trauma and anxieties of child-bearing, and ultimately the newborn's legitimacy. Our study looks at how these deities' roles and imagery are linked, and how they may be involved in the translation of Taweret into the Minoan Genius, transmitted through Egyptian and Levantine networks. We use Network Theory to de-emphasise directionality between social variables (links) and shared 'origins' (nodes) to visualise where iconographical reconfiguration might take place. We suggest that the Cretan image of the Minoan Genius and Beset may articulate concepts of childbirth anxiety and legitimacy, indicating the use of magico-religious iconography in active negotiations of bodily experience and identity.

1376. Surfing the Entangled Mediterranean Web: If Water is the Network, Bronze is the Surfboard

Authors: Louise Hitchcock (Retired | Independent Researcher)
Format: Oral

This session distinguishes the diffusionist schemes aligned with Sir Arthur Evans, excavator of Knossos, from later mechanistic schemes of peer polity interaction and world systems theory. The theoretical pendulum, thus swings from tracing every innovation to an originary form to the processualist extreme of isolationist progress. Contemporary scholarship has refined our understanding of improved technologies in maritime travel, metallurgical activity, artistic production, textile manufacture, and new institutions in religion, heterarchical and deep state bureaucracies in Crete, and juridical texts for maintaining order in the east. Accordingly, we require more complex approaches for understanding the emergence, rise, and decline of the various (non-)state systems in the Aegean and its partners in an entangled and polycentric era, that included military entrepreneurship. Although I take the view that the Bronze Age Aegean was driven by the quest for copper and tin, intensified maritime trade generated numerous changes in Minoan Crete and Mycenaean Greece. These changes were technological, economic, social and diplomatic. For example, a byproduct of the metals trade was the Minoan acquisition of the deep hulled ship with mast from the Near East, competition for status motivated by increased desires for a new cultural aesthetic used by elites to advertise their status to their retinues, the acquisition of spices and other paraphernalia for provisioning of diacritical feasts as seen at Pylos, inspiring additional technological advances accompanying increased cultural interactions. These activities were accompanied by accelerated flows of peoples including the temporary gifting of skilled workers to paint Aegean style frescoes abroad, manual laborers from Italy appearing in the Mycenaean world, and the movement of Minoan women spreading new weaving skills as they married into Theran families. It will be concluded that these interactions stimulated the development of infrastructures that survived the Bronze Age collapse, making the succeeding Iron Age possible.

514. Tanaya: A Discussion of Evidence or of Premise?

Authors: Olga Chatys (University of Warsaw)
Format: Oral

The Egyptian toponym Tanaya is attested in New Kingdom sources spanning the reigns of Thutmose III to Ramesses II, appearing in records of foreign tribute and in topographical lists. Three principal geographical locations have been proposed for it — mainland Greece, Rhodes, and Adana in Cilicia — and the debate among them has a long and shifting history. Positions have reversed, the same evidence has been read in various ways, and the topographical lists in particular have proven amenable to sharply opposing interpretations. This presentation revisits all known attestations of Tanaya and traces these turning points in the discourse, asking why the evidence has so consistently resisted consensus. The case is also instructive methodologically: it illustrates how readily ambiguous evidence can be bent to serve a predetermined conclusion, and how difficult it becomes to revisit a question once a dominant identification has taken hold. Ultimately, the presentation raises the question of whether the persistent difficulty in locating Tanaya on a map reflects a problem not of evidence, but of premise.

99. Ancient Egyptian toponym Mnws-Kingdom of Pylos?

Authors: Uros Matic (University of Graz)
Format: Oral

Ancient Egyptian toponym Mnws has been variously interpreted and localized in different places of the eastern Mediterranean (Mallus in Cilicia, Crete, Amanus mountain in southeastern Turkey i.e., Manuzija in Kizzuwatna). It is attested for the first time in ancient Egyptian sources during the reign of Amenhotep II. Despite the association with Keftiu (Crete), islands of the great green (Aegean or eastern Mediterranean) and the Aegean iconographic features of the bound prisoner from Mnws (Kenamun-TT 93), there is still no substantial evidence for its localization in the Aegean. The Egyptian sources indicate that it is north-west of Crete. Bearing this in mind, this paper suggests that Egyptian toponym Mnws derives from Linear B me-za-na, ancient Greek Messenia, through metathesis of the radicals. This interpretation fits the archaeological and historical context well since during the reigns of Thutmose III and Amenhotep II Messenia was the region in which one of the most powerful Mycenean kingdoms was located-the kingdom of Pylos.

457. Was Henti, Queen of Hittite Great King Suppiluliuma I, an Achaean Princess Named (χ)ʳΕνδηίς or (χ)ʳΗτις-(χ)ʷΗτεια?

Authors: Konstantinos Giannakos (EDABγT)
Format: Oral

The Hittite Text CTH 214.12.A, a Prayer of an anonymus King of the Land of Ḫatti, identified with King Muršili II -most likely- or Muwattalli II or Urhi-Teshub, records: §2' (rev. 3–6) "because (s)he [became hostile] to my mother, […] he dispatched him/her to the Land of Aḫḫiyawa". Suppiluliuma's first wife, Henti, was the mother of Suppiluliuma's five sons, including Muršili, but she was subsequently supplanted by a new chief-wife (Babylonian princess Malnigal), who assumed the name Tawananna as a personal name. The abrupt disappearance of the earlier Queen (Henti) from Hittite records has led to the suggestion that Suppiluliuma removed her from the scene to make way for his new wife, by banishing Henti to Aḫḫiyawa. The exile of a former Great Queen to a foreign Country is justified, if that Country is her homeland. Therefore, Suppiluliuma (1350-1322BC) returned Henti to Aḫḫiyawa, most likely to her father's House; besides, another queen's return/exile to her homeland is recorded in archives. Was Henti princess of an Aḫḫiyawan Dynasty and did she become -before-1350BC- Queen at Ḫattuša after a diplomatic marriage? If this is valid, then (Oracle Report, CTH 570.1, §24':ii:57'–64') the "invitation and transfer of the foreign gods of Aḫḫiyawa to Ḫatti, for the Hittite King, 'the Hittite Gods' agent and representative on earth'," is justified: half-Achaean Muršili, Henti's son, invited the gods of his mother's homeland to pray to them and be healed by them. This leads us to search the Linear B texts for a word phonetically related to Henti; indeed, a name w d y = e-ti-wa was read in the archives of Knossos (ca.1400-1300(+)BC). This word was pronounced "(h)e-(n)ti(s)", attributed the name(s) (χ)ʲΕνδηίς [=(h)Endeis] [or (χ)ʲΗτις-(χ)ʲΗτεια = (h)e-(n)t(e)i(s)] and -obviously- the Hittite scribes transliterated it as Henti.

167. Seas Apart? Differences and Similarities in the Use of Kraters in the Second Millennium BCE Aegean and West Anatolia

Authors: Laetitia Phialon (University of Fribourg) – Filip Frankovic (University of Heidelberg)
Format: Poster

Feasting practices and their associated material culture played a central role in the creation, affirmation, and negotiation of social identities in the Late Bronze Age (c. 1600–1100 BCE; hereafter LBA) Aegean and West Anatolia. These practices constituted commensal activities involving the consumption of wine and highly ritualised social events through which relations of power were established and reproduced. Ceramic kraters represent the most recognisable vessel type associated with such practices. Although kraters are commonly attested in both settlement and funerary contexts across the two regions, systematic studies remain relatively limited for

the Aegean and are almost non-existent for West Anatolia. This poster examines similarities and differences in the use of ceramic kraters in funerary contexts across successive phases of the LBA on both sides of the Aegean. It argues that kraters played a dynamic role in multiple spheres of social life from the beginning of the LBA onwards. Furthermore, it suggests that the intensification of interregional interaction from the 14th century BCE resulted not simply in the transmission of objects or practices, but in the reinterpretation of established traditions and the emergence of new funerary expressions in the East Aegean–West Anatolian region. By moving beyond simplified narratives that attribute change primarily to population movement or external influence, this study foregrounds local responses to interregional connectivity and highlights how such engagements actively shaped social, cultural, and political realities during the Late Bronze Age.

223 REEXAMINING PREHISTORIC SOCIAL STRATIFICATION IN SETTLEMENT CONTEXTS THROUGH INTERDISCIPLINARY AND NON-TRADITIONAL APPROACHES

Theme: 1. Widening perspectives in material culture studies
Organisers: Edi Grabar (University of Cyprus) – Jaris Darwin (Leiden University)
Keywords: Settlements, Material Culture, Social Structures, Prehistoric Archaeology, Global Archaeology, Interdisciplinary Methods
Format: Regular session

SESSION ABSTRACT

In recent decades, contemporary social archaeology has increasingly embraced non-traditional, theoretically informed, contextual, and holistic approaches, alongside an expanding suite of interdisciplinary analytical tools. Our proposed session aligns with this broader movement by acknowledging and building upon these established advances. However, it seeks to extend current research in two keyways. Firstly, while many existing studies apply innovative methods to individual sites or categories of material, this session emphasizes the need for comparative, cross-contextual synthesis within settlements. By bringing together evidence from diverse spatial zones (public, residential, productive, ritual, and funerary), we aim to highlight how social differentiation is expressed across the whole settlement composition rather than in isolated contexts. Secondly, although reflexivity is now more common in social archaeology, there remains a tendency to rely, implicitly or explicitly, on traditional hierarchy indicators or long-standing typological assumptions. This session explicitly encourages contributions that interrogate inherited interpretive frameworks, identify persistent biases, and propose alternative readings grounded in multi-scalar contextualization. By positioning itself at the intersection of methodological innovation, theoretical critique, and contextual integration, this session aims to stimulate a renewed dialogue on how prehistoric social stratification can be understood more rigorously and creatively. It complements existing research and ongoing archaeological debates while pushing for broader comparative thinking and deeper methodological reflexivity. Furthermore, we emphasized intra-spatial analyses in our session proposal, even though this could be expanded to include an inter-spatial perspective, examining the settlement in relation to its surrounding landscape, comparing it with the surrounding area, topography, other settlements, etc. Alongside the intra-spatial analyses of settlements, it might be interesting to add a "glocal" perspective that shows how external influences or broader patterns were assimilated into the settlements. In this way, intra-spatial analyses could help reveal these "glocal" impacts.

CONTRIBUTION ABSTRACTS

693. Compositional Grammar and Visual Hierarchies in Uruk Seals

Authors: Tolga Kıyak (Hacettepe University)
Format: Oral

Seal impressions from the Uruk Period are an important group of materials for understanding early administrative practices and visual communication. Glyptic literature has generally focused on motif repertoire and stylistic differences, but the positioning of figures on the scene and the hierarchical relationships between them have not been systematically examined. This study treats the seal surface as a measurable "compositional grammar" field and analyzes the scenes based on the level of importance of the motifs (primary/secondary/filler) and their spatial position (center, upper-lower-lateral zones, periphery, entire surface). A motif-based dataset was created by compiling 654 seals and 1,786 iconographic elements from a broad geographical framework stretching from the Levant to the Iranian Plateau, and Correspondence Analysis was applied to compare periodical and regional variations. The findings show that although geometric motifs are frequently seen in compositions, they mostly serve a secondary or filling function, while rare anthropomorphic figures tend to be placed at the center of the scene. Four design logics defined as "Multi Figurative," "Single Figurative," "Divided Geometric," and "Repetitive Geometric" reveal that a common iconographic repertoire is processed in different ways. This analysis approaches Uruk seals not as a single-centered stylistic narrative, but as a multi-centered communication system in which a shared visual grammar is processed with varying intensities in different geographical centers.

2454. Crete in a Transitional Period: Interaction, Identity, and the Emergence of Social Complexity in

Pre-Palatial Seal Use

Authors: Ane Dybkjaer (Independent researcher)
Format: Oral

Recent scholarship has demonstrated that social complexity in Bronze Age Crete emerged prior to the construction of the first palaces (EM II–MM IA). Among the material indicators of this transformation are seals, which have often been interpreted primarily as markers of administrative control or elite authority. This paper instead explores how seal production and use structured interactions between communities and contributed to the gradual formation of social complexity. Drawing primarily on funerary contexts from central Crete, this study combines similarity network analysis with Least Cost Path modelling to reconstruct patterns of interaction, mobility, and shared iconographic traditions among pre- and early proto-palatial sites. The distribution of motifs and production styles reveals multiple interacting seal production centres embedded within regional networks of exchange and emblematic affiliation. Seals functioned simultaneously as markers of group identity and as means through which emerging elites articulated and consolidated influence. Rather than viewing complexity as the product of centralized authority alone, the evidence suggests that sustained inter-site interaction, shared symbolic expressions, and competitive display practices facilitated increasingly structured social organization. By integrating spatial modelling with contextual funerary analysis, this paper highlights how relational networks and material group-representation contributed to the emergence of social complexity in transitional Minoan Crete.

2110. Topography, Environment, and Settlement Variability in Prehistoric Pile-Dwelling Sites of Albania: A Comparative Interdisciplinary Approach

Authors: Adrian Anastasi (National Institute of Archaeology - Academy of Sciences of Albania) – Krist Anastasi (Laboratory HiSoMA, University Lumière Lyon 2)
Format: Oral

Recently, archaeological and interdisciplinary research conducted in the three lakes of southeastern Albania, (Ohrid, Prespa and Maliq), has renewed the interpretative framework of prehistoric pile-dwelling sites, providing new evidence for a reevaluation of settlement forms and the social structures associated with them. This contribution proposes a comparative analysis of six pile-dwelling sites, LIN 1, LIN 3, Udënisht, Prespa 1, Dunavec, and Maliq, approached as a complex and diversified settlement system that has not previously been considered as an integrated whole. The main objective is to re-examine the residential typology of these sites and the opportunities and constraints imposed by specific topographic, geomorphological, and hydrological conditions, integrating archaeological data with spatial analysis, paleoenvironmental reconstructions, and models of climatic variability. While sites such as LIN 1, LIN 3, Udënisht, and Maliq display a settlement configuration developing directly from the shoreline, a typology generally regarded as "classical" for pile-dwelling settlements, new evidence points to different scenarios in other contexts. Based on recent geomorphological and spatial analyses, Dunavec appears to represent a settlement established on a lacustrine island, while Prespa 1 reflects a pattern of progressive topographic relocation closely linked to fluctuations in lake levels. By comparing shared factors and structural differences, this contribution discusses how settlement choices reflect not only environmental adaptations but also distinct social, economic, and organizational strategies. In this sense, intra-spatial analysis of the sites, integrated within a "glocal" perspective, allows exploration of how local environmental dynamics and large-scale processes contributed to the formation of settlement models and pre-religious forms of social organization in Balkan prehistory.

1903. Rethinking the settlement organisation of the Middle Copper Age Great Hungarian Plain through the Hunyadihalom culture's sites

Authors: Zsuzsa Hegedus (Hungarian National Museum Public Collection Centre Hungarian National Museum)
Format: Oral

The Copper Age of the Great Hungarian Plain was marked by profound changes in social organisation and settlement patterns. Neolithic tell settlements were replaced by smaller-scale sites associated with increasingly mobile communities, which became integrated into extensive exchange networks circulating copper objects across Central Europe. Deeply rooted in local traditions and shaped by eastern and southern influences, the Middle Copper Age Hunyadihalom culture (4000–3700 BC) shows a particular settlement structure. A certain duality appears at first glance: numerous small sites consisting of only a few pits often interpreted as short-lived hamlets coexisted with the large and complex, palisade-surrounded settlement of Tiszalúc–Sarkadpuszta, likely used for several generations. This contrast might suggest a hierarchical system with a central settlement and a network of smaller, peripheral sites – closer examination, however, challenges this interpretation and suggests a far more complex picture. This research explores the diversity through detailed, site-level analysis of multiple Hunyadihalom settlements. Rather than applying rigid typologies or hierarchical models, the study approaches settlements as components of a complex system, defined by their roles, perceived functions, and interconnections. The methodological approach integrates pottery analyses, lithic and faunal studies, radiocarbon dating, and the spatial study of the settlements' structure. This enables a nuanced interpretation of individual sites, which then can be contextualised relative to one another. From hunters' camps to hamlets focusing on animal husbandry, the results reveal a highly dynamic and multifaceted settlement system in which morphologically similar sites had fundamentally different functions. This diversification appears to have been primarily driven by social relations and subsistence strategies, rather than by increasing centralisation or rigid hierarchies. The settlements thus formed interconnected "micro-worlds" within a broader system shaped by human decision-making, sociocultural frameworks, and environmental constraints.

833. Spatial Distribution of Bronze Age Settlements in Southeastern Iran

Authors: Setareh Ebrahimiabareghi (University of Bern)
Format: Oral

This presentation examines early urban and proto-urban settlements in southeastern Iran during the Bronze Age. Despite challenging climatic conditions, the region supported early complex societies whose settlement patterns were closely tied to rivers, deltas, and alluvial fans. Using published archaeological data integrated with satellite imagery and Geographic Information Systems (GIS), with a regional comparative approach, this study analyzes settlement distribution in key areas such as Shahdad, the Bampur Valley, and the Sistan Plain. The results show that settlements were concentrated in small ecological niches near reliable water sources, including the Helmand and Bampur rivers and the Halil Rud. Water availability strongly influenced settlement location, hierarchy, and continuity, while hydrological instability contributed to settlement decline in the early second millennium BCE. This research highlights the central role of water and geomorphology in shaping early urbanism in southeastern Iran and contributes to broader discussions of human–environment interaction in arid regions of the ancient Iranian Plateau.

843. Let's value plants! Plant commodification and emerging social complexity in Northern Mesopotamia

Authors: Karolina Joka (Centre for Modern Interdisciplinary Technologies, NCU Toruń)
Format: Oral

This presentation focuses on the important yet largely overlooked role of plant commodification—both annuals and perennials—as a major catalyst in the growth and diversification of social complexity. It draws on archaeobotanical, archaeological, and spatial data from two sites in Iraqi Kurdistan: the Late Ubaid settlement of Gurga Chiya and the Early Bronze Age site of Kani Shaie. The central concept of this study is the commodification of plant resources (both annual and perennial), and the ways in which this process emerged, developed, and gained significance within past economic systems. Here, commodification is defined as the process through which value is assigned to resources. This process is closely linked to investment agriculture, a form of land use that requires long-term labor input and an acceptance of delayed returns between planting and harvest, and the cash crops—plant species that do not directly contribute to subsistence but either for craftmanship or trade. The process of commodification is also closely tied to food surpluses, an economic shift that emerged with the development of agricultural societies. These surpluses led to the rise of non-farming specialists and the development of professions like metallurgy, textile production, administration, and trade. The commodification of plant resources intensified during the transition from the Late Neolithic to the Early Bronze Age, marking a shift from small-scale crop production aimed at local subsistence toward the cultivation of surplus-oriented and exchange-driven crops. The analysis of materials from Gurga Chiya and Kani Shaie allows for the reconstruction of the diachronic trajectory of plant commodification and situates this process within its broader social and economic contexts, both at the level of individual settlements and within the wider regional framework.

875. Architecture, Space, and Social Organisation in the Roman Period Settlement of Migūčionys, Southeastern Baltic

Authors: Ieva Vengale (Lithuanian Institute of History)
Format: Oral

In recent years, the expansion of large-scale archaeological excavations in Lithuania has significantly increased the available evidence not only for settlement finds, but also for buildings as a key component of settlement organisation. Although individual building remains were known from earlier research, their interpretation was often uncertain and they rarely became the subject of systematic analysis. Large-scale excavations at settlement sites such as Migūčionys, Skudeniai, and Bakšiai have made it possible to move beyond individually identified structures toward an integrated analysis of buildings and settlement organisation. This presentation focuses on a systematic analysis of the Roman Period settlement at Migūčionys. The site is unique due to the large number of identified building remains—approximately 30 structures—including several longhouse-type buildings that have not previously been clearly recognised in the Lithuanian archaeological record. The analysis draws on variation in building size, form, and spatial layout, evidence for reconstruction and repair, the distribution of finds, and other contextually relevant settlement data. An intra-spatial approach is employed to examine relationships between buildings within the settlement and their role in the overall settlement structure, while an inter-spatial perspective places the Migūčionys evidence within a broader environmental context and allows comparison with other Roman Period settlements in the southeastern Baltic region. This approach enables discussion of potential indicators of social differentiation, activity organisation, and differences in building status within the settlement, as well as consideration of architectural traditions in a broader regional and international context. The Migūčionys case highlights the value of extensive settlement-scale datasets for addressing social questions, showing how buildings—often poorly preserved or absent from the archaeological record—can serve as an important source for interpreting social organisation.

763. Land, Power, and Volcanism: LiDAR-Based Settlement Patterns of the Kingdom of Chalchuapa, El

Salvador

Authors: Carlos Flores Manzano (Yale University)
Format: Oral

This talk presents new insights into the settlement patterns of the Kingdom of Chalchuapa through the application of high-resolution LiDAR (Light Detection and Ranging) data. By penetrating dense vegetation and revealing subtle topographic features, LiDAR allows for a systematic reconstruction of Chalchuapa's landscape through the modern El Salvador Territory. The analysis identifies previously undocumented architectural features, which were affected by the eruption of Ilopango Volcano eruption (circa 431-539 CE). Spatial patterning suggests a hierarchically structured settlement system articulated through clusters of domestic architecture linked to ceremonial and administrative centers, reflecting strategies of political integration and territorial control. Rather than an isolated ceremonial center, Chalchuapa emerges as a complex, integrated kingdom, connected within regional networks of interaction across western El Salvador and southeastern Mesoamerica. By combining LiDAR analysis with existing archaeological data, this study contributes to broader debates on low-density urbanism, landscape governance, and early state formation in Mesoamerica. The results demonstrate how remote sensing technologies, groundtruthing and excavation can transform our understanding of ancient political landscapes and challenge traditional narratives based solely on surface visibility and excavation.

224 EDGES OF EMPIRE: CONTINUITY, CHANGE, AND LANDSCAPE IN LATE ANTIQUITY

Theme: 7. Interaction, connectivity and mobility
Organisers: Andreia Arezes (CITCEM - Centro de Investigação Transdisciplinar "Cultura, Espaço e Memória" | Faculdade de Letras, Universidade do Porto) – Tomás Ruiz (IEM - Instituto de Estudos Medievais | Nova/FCSH - Universidade Nova de Lisboa) – José Quaresma (CHAM - Centre for Humanities | NOVA/FCSH - Universidade Nova de Lisboa) – Teresa Ponte (CEAACP - Universidade de Coimbra) – Victoria Ruiz (Instituto Universitario de Investigación en Arqueología y Patrimonio Histórico | Universidad de Alicante)
Keywords: Late Antiquity, Landscapes, Material culture, Continuity, Transformation, Connectivity
Format: Regular session

SESSION ABSTRACT

In Late Antiquity, the edges of the Roman Empire became dynamic zones of interaction and transformation. Across Europe and the Mediterranean, territories once defined by imperial structures turned into areas where inherited traditions met emerging political and cultural identities. Urban and rural landscapes evolved unevenly—through contraction, adaptation, or reinvention—creating a mosaic of experiences that defy any simplistic notion of decline. Archaeological and environmental research over the last decades has reshaped how we understand these frontier and peripheral regions. Integrating spatial analysis, bioarchaeological data, and digital modelling enables a deeper reading of the interplay between human agency, ecological dynamics, and political reconfiguration. These approaches demonstrate that the so-called "margins" often functioned as centres of innovation, where resilience, connectivity, and local initiative redefined the relationships between people and landscape. The recent improvement of societal analysis and dating strategies became possible through the refinement of typologies (mainly ceramics) and excavation methodologies. The studies of fine wares, amphorae, and coarse wares, both in local/regional frameworks, but also in the long-distance commercial networks, have demonstrated a much more complex reality than suspected by the archaeologists of the early 20th century. This session invites contributions that explore how Late Antique communities engaged with changing political, social, technological, and environmental conditions. We particularly welcome studies addressing settlement patterns, resource management, territorial organisation, material culture transformation, and theoretical or methodological reflections on how archaeological evidence can illuminate diverse pathways of continuity and change across the Late Antique world. By combining archaeological, environmental, and historical perspectives, the session aims to foster a comparative and interdisciplinary dialogue on how the edges of Empire contributed to shaping the social and cultural landscapes of Late Antiquity. Ultimately, it encourages discussion on the multiple scales and rhythms of transformation that defined this complex and creative period.

CONTRIBUTION ABSTRACTS

2451. Multi-proxy insights into (dis-)continuity at the north-western periphery of the Late Roman World

Authors: Claudia Gerling (University of Basel) – Margaux Depaermentier (University of Vilnius) – Cornelia Alder (University of Basel) – Irka Hajdas (ETH Zurich) – Joscha Gretzinger – Zuzana Hofmanová – Johannes Krause (MPI Leipzig) – Peter-Andrew Schwarz (University of Basel)
Format: Oral

The Late Antique period in Basel (NW Switzerland), located at the north-western periphery of the former Roman Empire, is marked by complex political, cultural, and economic entanglements. This study investigates continuity and discontinuity in mobility patterns, subsistence strategies, and communication networks in the Basel area, a region that shifted from a Late Antique Roman frontier zone to a melting pot of Early Medieval interaction spheres. Drawing on an integrative, multi-proxy approach, we analysed burials dating from the 4th to the 8th centuries CE using AMS radiocarbon dating, archaeological, anthropological, isotopic and genetic analyses, combined with high-resolution environmental and climatic modelling. The study results challenge large-scale population income from the 4th/5th centuries onwards and point to predominantly regional mobility embedded within far-reaching communication and exchange networks. The study also highlights the crucial role of bioarchaeological approaches in revealing unexpected dimensions of social dynamics in Late Antique Basilia and early medieval Bazela.

1056. An Atlantic coarse ware: E ware

Authors: Ian Doyle (The Heritage Council of Ireland)
Format: Oral

This paper looks at E ware or Class E which has been described as one of the 'céramiques communes' from the Bordeaux area of western France. This is an unremarkable but distinctive range of jars, beakers, bowls, lids and jugs which were traded to northern Spain, Ireland and western Britain during the sixth to seventh centuries AD. Its current known distribution will be set out as well as its association with Mediterranean amphorae and finewares. From excavations in Bordeaux it now appears that the dating of E ware in western Britain and Ireland of c. AD 550-700 may be a narrow range within a broader time frame of production in the Bordeaux area. Despite recent progress on this subject there still remain outstanding questions about why this class of ceramics was traded extensively and almost exclusively from Bordeaux to Ireland and western Britain, and questions also include how was it used and what did it represent outside of the Gallo-Roman world?

639. Narbonne and Arles. Two harbour systems on the frindges of Mediterranean states (5th - 7th c. AD)

Authors: Lyubomir Malinov (Nantes Université/UMR 6566 CReAAH-LARA)
Format: Oral

From the beginning of the fifth century, the major Gallic harbour systems of Narbona/Narbo Martius (Narbonne) and Arelate (Arles) once again occupied – much as they had in Republican times – a peripheral position within an essentially Mediterranean Roman Empire. Having lost overall control of continental Gaul, the Western Roman state nevertheless remained strongly structured around connectivity between North Africa, Spain, Gaul, and Italy. The successor kingdoms of the Visigoths and Ostrogoths partially redefined this geography, yet the fundamentally liminal position of the two major ports of southern Gaul and their surrounding provinces remained largely unchanged. At the same time, ceramic evidence and written sources strongly suggest the continued activity of Arles and Narbonne as key nexuses of maritime commerce. On the basis of a recent extensive topographical survey of settlement patterns, together with a synthesis of interdisciplinary scholarship, this paper aims to outline several hypotheses for interpreting the topographical evolution of these two major harbour systems in the context of political and economic change. We argue that, although operating on a different scale than during the Early Empire, harbour activity in both case studies remained one of the principal drivers of urban and coastal settlement dynamics. In this perspective, the loss of political unity with the continental interior is better understood as a basis for quantitative and qualitative transformations in commercial activity rather than as a trigger of decline.

1932. Livestock expansion, transhumance and landscape change in the Eastern Pyrenees during Late Antiquity: shaping high mountain cultural landscapes

Authors: Josep Maria Palet – Valentina Pescini – Arnau Carbonell Puigventós – Lídia Colominas – Jesús Martínez Fernández (Institut Català d'Arqueologia Clàssica ICAC)
Format: Oral

Since 2005, an integrated archaeological and environmental research programme has been carried out in Ter and Segre High Mountain Valleys (Eastern Pyrenees) where livestock husbandry and transhumance have shaped the landscape for millennia. The project aims to understand both the origins and chronology of seasonal transhumance and to clarify the role of livestock management in the creation of high mountain cultural landscapes. The research integrates archaeological survey, test pits and extensive excavations, radiocarbon dating, and a wide range of bioarchaeological analyses (including anthracology, palynology, and archaeozoology). Numerous pastoral structures—such as enclosures, huts, milking installations, and related features—have been identified and dated from the Middle Neolithic through to modern and contemporary periods. Cross referencing archaeological evidence with bioarchaeological data has made it possible to reconstruct fuelwood use and the selection of specific tree taxa. Alpine and subalpine vegetation communities (dominated by mountain pine, birch, and willow) characterized the Neolithic period, whereas an increase in juniper has been recorded during Roman times, Late Antiquity, and the early Middle Ages. Roman times, particularly from the 3rd-4rd centuries AD and especially during Late Antiquity, show clear evidence of a major expansion in livestock farming. A further expansion took place from the early Middle Ages (9th–10th centuries), marked by the reuse of Roman period structures and the construction of new, more specialized facilities (notably orris for cheese production). Livestock management practices—including fire driven forest clearance, grazing pressure, and systematic forest exploitation—played a decisive role in lowering the timberline, particularly throughout Late Antiquity, the medieval period, and the post medieval centuries.

1916. Burial contexts in the borderlands of Late Antique Gallaecia: architectures, materials, and identities in a changing landscape

Authors: Andreia Arezes (CITCEM | Faculty of Arts and Humanities, University of Porto)
Format: Oral

The north-west of the Iberian Peninsula, part of the Roman Empire, and fully integrated in its Atlantic trade networks, retained several specificities and remained on the sidelines of the profound penetration of Roman culture and worldview, in contrast with other Hispanic regions. It was only in the 4th century AD that Gallaecia established itself as a province, with Bracara Augusta as its capital and a metropolitan episcopal see. During the following century, as the Empire underwent administrative fragmentation and shifting political and economic conditions, other agents gradually gained prominence. In fact, in the 5th century, Bracara Augusta became the core of a new entity, the Suevic kingdom of Gallaecia, based on the power of 'barbarian' elites of Eastern origin that, at some levels, tried to emulate Roman canons. In contrast, ecclesiastical hierarchies strove to conform communities' beliefs, counteract heterodox practices, mitigate the spread of heresies, and, especially from the 6th century onwards, establish a network of territorial organisation. However, communities found ways to resist and escape some of the constraints imposed from the top down. The plurality of economic and settlement strategies indicates the possibility of offering variable responses to different contexts, some of which reveal persistences, while others indicate ruptures with previous models. The diversity of solutions spreads to the mortuary spaces mapped in the incipiently known territory of Gallaecia. Based on two case studies, this presentation aims to reflect on the factors that may have determined the creation of both burial areas, on the variability in the architectural options revealed by the tombs, and on the choice of artefacts they included. Similarly, it will address the potential and limits of the archaeological record for understanding the strategies used to construct the identities of the buried individuals and the meanings of the items that compose the mortuary scenario.

2631. Imitations in coarse ware of African cooking ware prototypes at Olisipo in late-antiquity (4th-6th centuries AD)

Authors: Martim Lopes (University Rovira i Virgili | CHAM - Centro de Humanidades)
Format: Oral

This presentation aims to present recent developments in the research of imitations of African cooking wares prototypes at Olisipo and its territory, taking for this crono-stratigraphical data from the excavations of the sectors "Armazéns Sommer" and "Rua da Prata 88-114". African cooking wares are a frequent presence in Lusitanian contexts since the 2nd century and until the 4th century AD. The studies have mainly focused its attention on the African products, frequently being silent in relation to coarse ware that mimic the typological characteristics of the African originals. Some advancements were made in a recent synthesis of the commerce of African cooking ware commerce at Olisipo, yet the importance of this new evidences allow for a new interpretation and analysis of this type of coarse ware. Based on the contexts of Rua da Prata 88-114 and Armazéns Sommer, from which we have a long diachrony that spans from circa 350 AD until 500+ AD, with some hundreds of fragments of ceramic and low residuality, we aim to present and discuss the importance and meaning of the types that are imitated, with emphasis on a form that appears to evolve directly from the type Hayes 23B.

330. Coarse ware evolution between the 5th and the 8th centuries in southwestern Hispania

Authors: José Carlos Quaresma (CHAM - Centre for Humanities | Universidade Nova de Lisboa - NOVA/FCSH) – Teresa Ponte (Universidade de Coimbra. CEAACP)
Format: Oral

The next step within the research undertaken in Lusitania should be the recognition of contexts dated to chronologies posterior to c. AD 575, in order to extend the analysis of the ceramological evolution into the central and Late Wisigothic period of the Atlantic façade of Hispania. In what direction does coarse ware evolve, concerning not only slow wheel/hand-made vessels, but also oxidising/reduced firings. So far, the technological percentages related to coarse ware from Lisbon's consumption match those from Madrid. The middle of the 6th century is a turning point with the consolidated beginning of the hand-made pottery, while light surfaces remain very important. Casseroles and ollae were balanced in the first half of the century, but now, casseroles are scarce, demonstrating the possible end at this phase, while mortars have finished their life around AD 525. This paper intends to discuss the transition from Graeco-Roman morphologies and functionalities into the Early-Medieval facies, in the present-day southern Portuguese territory, using a stratigraphic, statistical and archaeometric approach.

1334. Change and Continuity: Key Concepts in Settlement Models of Southwestern Lusitania in Late Antiquity and the Emirate Period

Authors: Teresa Nunes Da Ponte (CEAACP, Universidade de Coimbra) – José Quaresma (CHAM - Centre for Humanities Universidade Nova de Lisboa)
Format: Oral

This work aims to be a reflection on the different settlement patterns detected in rural and urban areas during the period between the 5th-6th centuries and the 8th/9th centuries, using specific case studies and the study of artefacts obtained through the use of intrusive methodologies - excavation, contextually and stratigraphically inserted remains, and data obtained through non-intrusive methodologies: site prospecting using georeferencing of remains, focusing on south-western Lusitania, more specifically the current coastal and inland regions of Alentejo. Chronologies and typologies will be tested, as well as their evolution in the context of changing societies, as will their dynamics and models of occupation.The settlement patterns appear to be highly condicioned by factors sucht appear to be conditioned by factors such as the abundance of water and the existence of nearby ancient settlements sources of building materials and in which we can also consider the conservation of field organization structures or agricultural parcels.

2465. To be on the edge: the Kvarner region in the Late Antique and Early Byzantine Periods

Authors: Andrej Janeš (Croatian Conservation Institute) – Marija Marić (University of Novi Sad, Faculty of Philosophy)
Format: Oral

During the Late Antique period, the northern sector of the eastern Adriatic littoral (Bay of Kvarner) became a highly militarized zone, primarily due to the fragmentation of centralized imperial authority. Concurrent with the reinforcement of defensive installations along the principal routes toward Italy, urban centers underwent additional fortification, both coastal settlements such as Tarsatica and insular towns including Curictum and Apsorus. The escalation of instability in the Pannonian provinces, precipitated by internecine conflicts and Germanic tribal incursions, resulted in the increased strategic significance of insular communities, as evidenced by the construction of substantial early Christian architectural complexes correlating with demographic influx. Following the formal disintegration of the empire, the Kvarner region became a liminal zone between Ostrogothic and Byzantine spheres of influence. This period witnessed the emergence of semi-autarkic settlements, predominantly on the islands, clustered around arable land and major urban nuclei. During the 6th century CE, consequent to the Byzantine triumph in the Gothic War, the region underwent systematic refortification, thereby becoming a frontier zone of the Eastern Roman Empire. Material culture assemblages, particularly ceramic and glass production, demonstrate active commercial networks with eastern Mediterranean and North African regions. The region exhibits intensive construction activity during the sixth century CE, which, based on indirect textual evidence such, has been attributed to Emperor Justinian I and his policy of imperial consolidation. Nevertheless, this area had already experienced fortification construction in earlier periods of the Roman Empire, primarily driven by the need for defense against external threats and for maintaining control. Local production demonstrates strong ties to manufacturing centers in proximate Ravenna, the seat of the Byzantine Exarchate, indicating economic and political integration with the Eastern Roman Empire. This study will demonstrate the economic, political, and identity-based continuity of communities in the Kvarner region on the eve of the Middle Ages.

1308. Rituals of Legitimization: Hun-Period Structured Deposits in the Late Antique Landscape of Pannonia

Authors: Krisztina Marczel (Eötvös Loránd University | Hungarian National Museum)
Format: Oral

From the late 4th century onward, Pannonia emerged as one of the most dynamic frontier regions of the late Roman world. Situated along the principal migration routes activated by the arrival of the Huns in Europe, the province functioned both as a place of refuge and as a strategic hub. From the beginning of the 5th century onward, the region underwent profound transformations. These changes were not limited to the movement and mixing of population groups; rather, they reflect a period of major social reorganization, during which earlier structures disintegrated and new elites emerged, establishing new social and power relations. Among the most significant archaeological phenomena of this period—the early Migration Period and the Hun period—are structured deposits. The effects of the aforementioned processes are also evident in depositional practices. The composition of the assemblages changed at this time, and the focus shifted from the safeguarding of valuables toward the performance of new ritual acts. Although this mainly involved the adoption of customs with steppe roots, reflecting the origin of the newly arrived groups, the performers of these new rituals did not ignore the late antique landscape. On the contrary, in several cases these assemblages were deliberately buried in the immediate vicinity of still standing late Roman structures, such as forts, settlements or communication routes. In my research, I focus on these deposits to examine how they relate to the surrounding landscape and to late Roman infrastructure, and what conclusions can be drawn from these relationships regarding ritual practice, cultural and social change.

1580. Public Lighting Infrastructure at Nysa ad Maeandrum in Late Antiquity: Social Function and Destruction along the Colonnaded Street

Authors: Tanju Dönmez (Mediterranean Civilizations Research Institute, Akdeniz University) – Serdar Öztaner (Ankara University, Faculty of Language Hıstory and Geography)
Format: Oral

Late Antiquity was a period of profound transformation for the cities of Western Anatolia, marked by earthquakes, fires, possible Sasanian invasions, and later Arab raids that reshaped urban space and infrastructure. Among the systems most affected by these disruptions was public lighting, a key element of urban life that ensured security, enabled nocturnal activity, and reinforced social organization in late Roman cities. This paper examines the public lighting infrastructure of Nysa ad Maeandrum through the oil

lamps and associated suspension elements uncovered during excavations along the city's Colonnaded Street (Plateia), the main urban axis of the city. The study focuses particularly on the Eastern Spaces (ES-3) at the intersection of Street 1 and Street 4West, where a remarkable concentration of Late Antique lamps, bronze suspension rings, and in situ fixing points was documented. typological and stratigraphic analyses indicate that these lighting devices remained in use until the final phases of Late Antiquity. By contextualizing the lamp assemblage within its architectural setting, this contribution explores the social function of street lighting as part of a coordinated public infrastructure rather than isolated domestic practices. The condition, distribution, and depositional context of the finds are further evaluated in relation to the seventh-century destruction layers identified along the Colonnaded Street. Comparative evidence from cities such as Ephesos, Aphrodisias, Sardis, and Laodikeia is used to situate Nysa within broader regional patterns of urban lighting and infrastructural decline. The paper argues that public lighting systems in Nysa not only reflect Late Antique urban resilience but also provide a sensitive archaeological indicator for understanding the processes of urban contraction and collapse in Western Anatolia during the early seventh century CE.

560. Neighborhood Nucleus and Material Reservoir. Fate and Transformation of a Roman Bath and its Surrounding Area in Late Antique Miletus

Authors: Fabian Sliwka – Nadia Cahenzli (University of Hamburg)
Format: Oral

Increased flexibility in the function of spaces is a widespread phenomenon in Late Antiquity all across the Mediterranean. In an architectural and functional sense, it includes dynamic processes of transformation, re-use, and adaptation. The city of Miletus in modern Turkey is a fruitful site for analyzing such processes both on a small scale, centering on individual building complexes, and on an urban level. Thanks to its long and rich settlement history, the city offers multiple known case studies for ancient building structures being incorporated into the transformed urban scape of the Late Antique city. During a current project investigating neighborhoods in Miletus ("Geiton") in Miletus, light has been shed on a new example of Late Antique transformation and re-use processes. In summer 2025, our research centered on a monumental bathing complex that was built in the 2nd century AD. The building underwent multiple renovations until it went out of use in the 3rd or 4th century, probably due to the collapse of its roof. Subsequently, the ruins of the bath served as an architectural base for a Late Antique house. Herein, existing architectural components and building materials from the interior architecture were re-used, while the structure and assemblage were adapted to its new function. Given the aim of our current research project, this contribution first seeks to outline the transformation process that occurred in the bathing complex and its surrounding neighborhood towards Late Antiquity, especially highlighting the aspects of re-use and transformation. On a broader scale, we would like to discuss the role of ancient ruins as building spaces and material reservoirs in Late Antique urban communities such as Miletus.

1338. Transformed Landscape with a New Rule: The Construction and Continuity of Identity in Byzantine Cappadocia (Asia Minor)

Authors: Ezgi Yaşar – Ali Büyükkarakaya (Hacettepe University, Department of Anthropology) – Nilüfer Peker (Nevşehir Hacı Bayram Veli University, Department of Archaeology)
Format: Oral

One of the most important aspects of the Late Antique period is undoubtedly the Byzantine Empire and the development of Christian institutional structures across a significant portion of Southwest Asia under its rule. In this context, Cappadocia (Central Anatolia), with its geographical structure providing an environment conducive to monastic life, was an important region for Christianity during the Late Antique and Byzantine periods. Particularly with imperial investments made in the Late Antique period, the region became a major center for monastic life, seclusion, and monasticism, and played a significant role in shaping Christian theology and social identity. Recent surveys conducted in the region and excavations carried out over the past five years have led to the discovery of the ancient city of Mokissos, mentioned in historical texts. Mokissos, with its widely dispersed building complexes, civil architectural features, and religious structure characteristics, is not only the best-preserved and largest city in the Cappadocia region that has been identified to date, but also the only known Late Antique metropolis. Since 2023, excavations have uncovered nearly 100 graves inside and around the main church, as well as in other churches and sacred areas adjacent to it, most of which have been excavated. These initial findings from the sacred spaces and associated graves uncovered in this newly discovered ancient city are examined comprehensively in this study. The presentation aims to discuss how social identity was constructed and maintained on the periphery of the Empire based on an integrated evaluation of historical, archaeological, and bioarchaeological data.

1622. Ringfort logics in early medieval Ireland

Authors: Jonathan Murray-Gillott (School of Arts, English and Languages, Queen's University Belfast)
Format: Oral

The early medieval Irish ringfort, a settlement form with a construction period largely between the 7th and 10th centuries AD, is one of Europe's most numerous upstanding archaeological monument types, with anywhere between 40,000 and 60,000 spread throughout the island. Attempts to understand the logics of ringfort settlement have largely focused on how far we can use the 7th and 8th century Irish law tracts to explicate their social resonance. Alternatively, scholars have argued that the material complexity of the settlement record is not easily related to the idealised law tracts, but without attempting to demonstrate what might be involved in these dominant settlement processes. The formal evocation that is explicit in the architecture of the early Irish ringfort – an evocation that is integral to the dynamics of early Irish landscapes in a way that appears less widespread in the rest of early medieval western Europe – provides one route into investigating the strategies involved in the production of early Irish social formations. By reconsidering the long-recognised logics of hierarchy produced through degrees of vallation on ringforts, this paper will examine the intersection of different kinds of stratification, particularly through spatial relations and recent hints of chronological nuance in the emergence of the ringfort type. Through this it becomes clear that the production of ringforts of differing degrees of vallation is only effective as a differentiating social technique in various localities by virtue of their being aspects of a common, universalising settlement form. Foregrounding these basic material statements regarding hierarchy, and using degrees of vallation as a means of considering the qualitative and quantitative dynamics of labour, for which they are a proxy, opens up further possibilities for investigating the integration and confusion of different processes of social hierarchy as they operated in early medieval Ireland at different scales.

225 LIFELINES AND FRONTIERS: FORTIFICATIONS IN RIVER LANDSCAPES

Theme: 7. Interaction, connectivity and mobility
Organisers: Timo Ibsen (Leibniz-Zentrum für Archäologie) – Audronė Bliujienė – Gintautas Zabiela (Klaipėda University, Institute of Baltic Region History and Archaeology) – Ladislav Rytíř (University of Hradec Králové Department of Archaeology)
Keywords: fortifications, river landscapes, interaction, communication, mobility
Format: Regular session

SESSION ABSTRACT

Europe is crisscrossed by a dense network of large rivers and countless smaller tributaries, forming lifelines that have shaped human settlement, mobility, and communication since prehistoric times. Rivers functioned as arteries of exchange and transport, connecting distant regions and facilitating cultural interaction — yet at the same time, they also served as natural boundaries, obstacles, and strategic frontiers. Given this dual role, it is hardly surprising that numerous fortified sites and hillforts were deliberately positioned to exploit the strategic potential of river landscapes. From elevated promontories overlooking river crossings to enclosures controlling fords, harbours, or trade routes, fortifications along waterways reveal much about how past communities understood and harnessed their fluvial surroundings for defence, control, and communication. Fortified sites along rivers were often not isolated strongholds but elements of broader, sometimes contemporaneous systems of communication and defence. Their spatial relationships, visibility, and chronological overlap suggest coordinated patterns of settlement and interaction that transcend local contexts. This session seeks to explore how rivers shaped the placement, structure, and function of fortified sites from Prehistoric to Modern times across Europe. We invite papers that: (1) examine fortifications situated along rivers and their tributaries; (2) compare their spatial, functional, and chronological relationships with waterways; (3) examine their roles in systems of defence, communication, and mobility; and (4) present case studies or broader comparative approaches to understanding the interplay between water, landscape, and fortification. Through comparative and interdisciplinary perspectives, the session seeks to reassess fortifications in river landscapes as integral nodes within Europe's long-term networks of interaction, communication, and mobility.

CONTRIBUTION ABSTRACTS

2379. The Role of Rivers in the Location of Iron Age Hill Forts in Estonia

Authors: Heiki Valk (University of Tartu)
Format: Oral

Most Iron Age strongholds in continental Estonia were situated along rivers, their tributaries, or smaller creeks flowing into them during the 1st millennium AD. Although these minor waterways may appear unsuitable for transportation from a modern perspective, they were sufficiently navigable for small boats. During winter, when frozen, rivers and creeks functioned as winter roads. A close association with waterways is particularly characteristic of hill forts in northern and eastern Estonia—regions that constituted the hinterlands of the Viking Age Austrvegr and its important southern branch, the waterway connecting the Gulf of Finland with Pskov via the Narva River and Lake Peipus. However, proximity to a river or stream had already been a prerequisite for the establishment of hill forts prior to the Viking Age. Access to a water route was important even for hill forts that did not directly control major communication corridors but were located at the headwaters of smaller creeks. The location of hill forts along waterways indicates their role as local centres within extensive trading and communication networks, particularly during the Viking Age, when they functioned as sites of small-scale, grassroots-level exchange. In this context, it is noteworthy that beaver bone pendants—apparently associated with the beaver fur trade—have been found at riverside hill forts in Estonia. Following the end of the Viking Age, many small riverine hill forts in the forested regions of eastern Estonia were abandoned, having lost their primary economic foundation: participation in long-distance fur trade networks.

2652. Medieval Castles in the Network of Rivers of Estonia

Authors: Villu Kadakas (Tallinn University)
Format: Oral

Unlike most of the European countries, Estonia lacks large navigable rivers; only three rivers were passable even for small sailing vessels. Nevertheless, inland waterways functioned effectively through Lake Peipus, one of Europe's largest lakes. Situated on the eastern border, it enabled waterborne connections to the Principality of Pskov, a Hanseatic trade destination often overshadowed by Novgorod. Two waterways led to Pskov. One ran through South-Estonia via the Rivers of Pärnu and Emajõgi, also Lake Võrtsjärv, and gave rise to the castles and Hanseatic towns of New-Pärnu, Viljandi and Tartu. The other waterway started from the Gulf of Finland and ran along the River Narva which flows out of Lake Peipus, situated on the historical border and gave rise for the castle and City of Narva. Among these on can find a castle protecting the sea harbour in the estuary, castles protecting reloading sites near rapids or crossings with a landroad, also some small castles built as peculiar outposts to protect the waterway in the frontier areas. However, no continuous boat traffic was possible because of rapids and narrow tributaries, in some parts roads had to be used even at high water levels. Although most of the rivers of Estonia were not navigable for sailing boats, often even for small rowing boats, the northern climate enabled extensive winter transport. Frozen rivers and lakes formed smooth ice roads, reloading was not necessary and much quicker speeds could be reached than with boats. Even if the land lacked snow, the rivers were frozen. Possibly even greater cargo volumes were carried on the ice than water. Even minor tributaries, too narrow or shallow for the boats, became usable, possibly explaining why nearly all medieval inland castles were located near tributaries of the larger rivers, facilitating efficient winter transport to sea harbours.

1490. Is a Hillfort an Essential Component of an Archaeological Complex?

Authors: Gintautas Zabiela (Institute of Baltic Region History and Archaeology, Klaipėda University)
Format: Oral

The Baltic lands are characterized by a high density of hillforts. In some cases, these sites, together with nearby archaeological features, form archaeological complexes. One such complex is located at Seredžius in Central Lithuania, on the right bank of the Nemunas (Memel) River. Due to limited data regarding the hillforts within such complexes, the interrelationships between their individual components remain unclear. Establishing whether the constituent parts were contemporaneous is therefore crucial, as this would allow links between the hillfort and its surroundings to be identified. This issue is examined through the Seredžius archaeological complex. The Seredžius archaeological complex consists of settlement sites, burial grounds, and a hillfort used during the same or similar periods in prehistory. The hillfort has been known since the eighteenth century and, in the fourteenth century, served as an important Lithuanian castle in the struggles against the Teutonic Order. Within a 2 km radius of the hillfort, four Iron Age burial grounds have been identified and investigated between 1936 and 2017. Their chronology has been established with century-level precision, spanning periods from the Iron Age to the Middle Ages. In 2025, drilling of the rampart enabled the collection of samples to determine the hillfort's chronology using radiocarbon dating. The available data allow a chronological analysis of the links between the hillfort and its surroundings. The results indicate that fortifications were not a constituent part of this archaeological complex during all periods. Discrepancies in the construction of fortifications have also been recorded in other extensively researched archaeological complexes containing hillforts, as well as within the hillforts themselves. Explaining this phenomenon requires further detailed investigation of the entire complex.

1017. Fortified Settlements and Inter-Basin Connectivity in Northeastern Lithuania (1000 BC–200 AD)

Authors: Vytenis Podenas (Lithuanian Institute of History)
Format: Oral

Fortified sites in river landscapes are commonly interpreted as promontory strongholds controlling waterways and crossings. In contrast, northeastern Lithuania presents a distinctive inland variant of the fortified settlement phenomenon, concentrated not directly on major rivers but within a small zone where the drainage basins of the Daugava, Lielupe, and Šventoji–Neris–Nemunas systems converge. This paper explores how such locations functioned as connective nodes between river networks rather than as riverine promontory forts. The paper draws on recent excavations (2016–2021) at three hillforts — Antilgė, Garniai 1, and Mineikiškės — representing securely dated Late Bronze Age and Early Roman Period fortified settlements. Integrated analyses of topography, stratigraphy, structures, material culture, radiocarbon dates, and bioarchaeological datasets demonstrate that these sites were permanently inhabited enclosures combining domestic space, craft production, and complex defensive systems. All three settlements are situated on inland kames, offering naturally defensible positions between major river corridors. Evidence for dwellings, storage and refuse pits, multi-phase fortifications, bronze casting, and household-based agrarian economies indicates that these were not temporary refuges but stable community centres. Zooarchaeological, archaeobotanical, and organic residue data point to subsistence based primarily on animal husbandry and cereal cultivation, complemented by limited fishing and gathering. Metallurgical remains and imported stylistic traits link these communities to wider Eastern Baltic and Scandinavian exchange networks. Rather than controlling single waterways, the fortified settlements of northeastern Lithuania structured overland connectivity across watersheds, mediating interaction between major river systems. This case study highlights an alternative relationship between fortification and fluvial landscapes, refining broader models of how prehistoric communities integrated defence, mobility, and communication within river-dominated regions.

723. Hillfort Development and Environmental Change in the Neris River Valley: The Case of Kernavė, Lithuania

Authors: Rokas Vengalis (Lithuanian Institute of History) – Piotr Kittel (University of Lodz) – Gintautas Vėlius (Vilnius University)
Format: Oral

The Neris, Lithuania's second largest river, was an important axis of the settlement system throughout prehistory. This is evidenced by the dense settlement of various periods in its wide terraced valleys. The Neris retained its special significance also at the dawn of historical times – this is where the earliest urban centers of Lithuania, Kernavė and Vilnius, were established. This presentation discusses the case study of Kernavė. The Kernavė fortification system reflects the entire period of hillfort existence in Lithuania from 800/400 cal BC to 1400 cal AD. Archaeological research on Kernavė hillforts shows a change in their function – fortified settlement, fortified household, military fortifications and a ducal castle. The function of the Kernavė fortifications is integral to the settlement that developed around them. It has also been extensively excavated, and it is possible to say approximately where and when people lived there. However, the natural environment is no less important to this understanding, as it strongly influenced both the structure of the settlement and the need for fortifications. Research into the palaeoenvironment of Kernavė has only begun in recent years. Even preliminary studies have shown that the natural conditions in prehistory were completely different from those of today. Geoarchaeological studies show that a large part of the valley was occupied by a lake, which gradually turned into peat. Lacustrine sediments indicate that the valley was occasionally flooded by rising river waters, and from the 13th century onwards, more intense geodynamic processes began at the foot of the hillforts – colluvial fans began to accumulate in the valley, indicating increased erosion processes on the slopes of the hillforts. Thus, geoarchaeological and paleoecological studies allow us to better understand the function of the fortifications, their development, and their relationship with the settlement.

987. Resolving the Emergence and Development of Hillforts in Lithuania at the Confluence of the Nemunas, Šešupė, and Jūra Rivers

Authors: Timo Ibsen (Leibniz-Zentrum für Archäologie - LEIZA) – Audronė Bliujienė – Gintautas Zabiela (Klaipėda University, Institute of Baltic Region History and Archaeology)
Format: Oral

Rivers have structured human settlement by acting both as natural borders and as communication corridors linking distant regions. Their ambivalent role, as connective routes and potential conflict zones, created conditions in which fortified sites became essential for controlling movement, securing territories, and asserting social or political dominance. The confluence of the Nemunas, Šešupė, and Jūra rivers in south-western Lithuania represents such a strategically significant landscape, whose archaeological record is marked by an unusually dense concentration of hillforts. At this river confluence along the present-day Lithuanian–Russian border, more than 25 hillforts are known, 18 of which are still preserved. Their close spacing, often only 5–10 km apart, underscores the importance of this micro-region as a critical crossroads for north–south and east–west traffic and communication. In particular, the Nemunas corridor connected the Baltic Sea and the Curonian Lagoon with inland river systems reaching as far as the Pripyat and Dnipro basins, making the area a key passageway during several archaeological periods. Despite the region's apparent strategic relevance, systematic research on these hillforts remains limited. Only a small number have been revisited since their initial documentation during the German research period, and a few new sites have been identified in recent decades. Chronological data exist for some hillforts; however, only four provide substantial typological material, and just three have been radiocarbon dated so far. This highlights gaps in understanding the emergence, development, and temporal dynamics of the Nemunas defensive network. This paper presents a project that aims to clarify the chronology and development of selected hillforts in the aforementioned micro-region using minimally invasive methods, especially coring of ramparts followed by radiocarbon dating. The project investigates the chronological and spatial relationships between hillforts and surrounding archaeological sites, ultimately enabling a reconstruction of settlement patterns and socio-political organisation in the region.

2703. Hillforts and river landscapes: GIS-based insights from the Latvian Daugava Valley

Authors: Anna Maria Garstka (Doctoral School of Humanities, University of Łódź) – Piotr Kittel (Faculty of Geographical Sciences, University of Łódź) – Małgorzata Luc (Institute of Geography and Spatial Management, Jagiellonian University in Kraków) – Jacek Szmańda (Institute of Geography and Spatial Organization, PAS, Toruń) – Jens Schneeweiß (Leibniz-Zentrum für Archäologie, Schleswig) – Timo Ibsen (Leibniz-Zentrum für Archäologie, Schleswig) – Artur Ginter – Jerzy Sikora (Faculty of Philosophy and History, University of Łódź)
Format: Oral

The area of present-day Latvia includes approximately 482 hillforts dated to different chronological periods. Many of these sites are located along rivers, where natural defensive conditions were combined with good access to routes of movement, communication, and exchange. These factors contributed to the long-term use of numerous hillforts, both by the same communities and by successive groups, as well as to the reuse of earlier abandoned fortifications. Since the twentieth century, hillforts in Latvia have been the subject of continuous archaeological research. Special attention has been given to sites situated along the Latvian section

of the Daugava River. During the construction of hydroelectric power plants in the 1960s, several hillforts were flooded. In recent decades, the development of non-invasive and low-impact methods has opened new perspectives for the study of these sites. LiDAR data, combined with archaeological field surveys and geological coring, make it possible to document the present-day morphology of hillforts, identify stratigraphic sequences, and explore long-term environmental and climatic changes. These datasets also provide a basis for spatial analyses that help clarify the relationship between hillforts and their surrounding landscapes. The Latvian stretch of the Daugava River and the hillforts located along it are currently being investigated within the INHILLDAUGAR project. The project aims to compile an atlas of archaeological sites and topographic features connected with the Daugava communication route. This work is carried out through a combination of non-invasive and minimally invasive archaeological research and paleoenvironmental analyses. The paper builds on these activities by using Geographic Information Systems (GIS) to reconstruct the landscape of the lower Daugava River section. A series of spatial analyses—including viewshed, slope, and aspect analyses—are applied to Iron Age hillforts.

2269. "They go to the watery meadows." The ring-fort in Spycimierz and the early medieval fortifications of Central Poland

Authors: Jerzy Sikora (Institute of Archaeology University of Lodz) – Piotr Kittel (Departament of Geology and Geomorphology University of Lodz) – Jacek Szmańda (Institute of Geography and Spatial Organisation Polish Academy of Sciences)
Format: Oral

The ring-fort in Spycimierz is located in central Poland, at the bottom of the Warta River valley. This valley was the main transport route of the Piast State, which was established in the 10th century. Recent dendrochronological analyses have revealed that the earliest defensive structure here was built from wood cut in 1038 AD, during the crisis of the first Piast monarchy. While the political circumstances surrounding its construction remain unclear, written sources confirm that it constituted an important element of the state administration system from the second half of the 11th century onwards. This is evidenced by successive renovations and extensions to the structure that took place during the 11th, 12th and 13th centuries. These were not only due to the need to maintain the fortifications, but also due to the fortress's specific location at the bottom of a river valley, partly on a sequence of layered sediments recording successive episodes of flooding. We were able to record traces of flooding laso during the fortress's existence. Unlike other ring-forts from this period in the region, which were usually built on slightly elevated terrain in river valleys to ensure flood safety, this location required particular determination to maintain the functionality of the fortification and can only be justified by the exceptional needs of the Piast monarchy's political organisation.

714. The Oder river as the strategic axis of Silesia: evolution of medieval fortifications in a fluvial landscape

Authors: Maria Legut-Pintal (Wrocław University of Science and Technology)
Format: Oral

The Oder River, one of Central Europe's primary waterways, served as the historical backbone of Silesia - a region of vital strategic importance at the crossroads of Poland, Bohemia, and Germany. This study analyzes the landscape of fortifications within the historical borders of Silesia, from the Early Middle Ages to the Early Modern period. It treats the river and its tributaries as a dual system: both a formidable natural barrier and a vital communication artery. To reconstruct the evolution of these defensive structures, an interdisciplinary approach was employed. The analysis of written sources and archaeological data was integrated with Geographic Information Systems. This spatial analysis allowed for a precise understanding of the relationship between site placement and the strategic command over a dynamic riverine environment. A central focus of the research is the impact of environmental factors on military architecture. The study examines how fluvial dynamics - including periodic flooding driven by soil erosion in piedmont areas - determined the location, durability, and structural adaptations of fortifications. A key element is the interaction between hydrology and the landscape, specifically regarding the control of fords and the protection of trade routes. The research documents the continuity and development of the defensive structures from early medieval Slavic strongholds to fortified chartered towns and sophisticated modern bastioned fortresses. The findings redefine the Oder system not merely as a defensive line, but as a dynamic nodal network. It demonstrates that the region's defensive architecture was inseparably linked to environmental challenges, creating a unique system where water was a central element of both military and economic strategy.

679. The Elbe River and Its Role in the War of the Bavarian Succession (1778–1779)

Authors: Petr Hejhal – Pavel Drnovský (Univerzita Hradec Králové)
Format: Oral

During the War of the Bavarian Succession, a system of field fortifications known as the Lacy Line was built in the border area between the Kingdom of Prussia and the Austrian Empire (now the Czech Republic) (Peters 1902; Hejhal and Hornik 2017; Drnovský, Hejhal and Rytíř 2019; Hejhal, Drnovský and Holas 2024). This fortified line measured approximately 90 kilometers and consisted of at least 160 fortifications. The Elbe River played an important role in the construction of these fortifications, as its course defined the location of most of them. Important points in the fortified line were places where roads crossed the river. This raises the question of whether these locations—bridges or fords—were fortified in a significant way and, if so, what form these fortifications took. Using the example of Lacy's Line, this paper examines how a major watercourse influenced military operations in the eighteenth century.

Ultimately, the fortifications linked to the Elbe River played a key role in determining the outcome of the conflict.

151. The Late Byzantine Fortifications of Tiberias: The Lakeside Extension of the City Wall

Authors: Emmanuel Nantet (University of Haifa)
Format: Oral

The city wall of Tiberias constitutes one of the most significant architectural achievements of the Byzantine period in the city. The fortification, however, enclosed the settlement on only three sides, leaving the lakeshore unprotected and necessitating the construction of an extension in the form of a jetty that prolonged the line of the wall into the lake. Archaeological excavations carried out at the extremity of this fortification have provided a rare opportunity to document this lakeside extension, conceived as a defensive response to Sasanian and early Muslim threats. The investigation combined stratigraphic excavation, architectural analysis, and the systematic recording of construction materials and techniques in a highly dynamic context, alternately submerged by the lake or exposed, requiring constant methodological adaptation. Excavation of the jetty revealed a construction technique based on the use of hydraulic mortar poured into wooden formworks. Substantial remains of these formworks were uncovered during the 2025 excavation season, allowing for a detailed reconstruction of the building process. Recorded for the first time for the Byzantine period, this evidence offers direct archaeological documentation of a specialized method for underwater construction, expanding knowledge of well-known techniques employed in early Imperial maritime harbour works.

2222. A Fortress on the Edge of a Tidal Creek: The Borgsumburg Fortress on the North Frisian Island of Föhr

Authors: Kirsten Hüser (Lower Saxony Institute for Historical Coastal Research)
Format: Oral

The Borgsumburg, with its 8-metre-high circular earthen rampart, still rises prominently above the surrounding moraine and marsh landscape. With a diameter of almost 100 m, the inner area now stands about 4 m higher than the exterior due to substantial accumulation. Since 2021, a project conducted by the Lower Saxony Institute for Historical Coastal Research in Wilhelmshaven, Germany, has investigated the rampart and its surrounding landscape. Of particular significance is the location of the fortification at the edge of a network of navigable tidal creeks meandering through the marshes, which ensured waterborne connections to the maritime trade routes of the North Sea coast. The investigations have produced numerous new findings regarding the chronology, significance, and function of the stronghold in the North German Wadden Sea. The preservation conditions are exceptional: textiles, eggshells, feathers, and fish bones have been recovered. While the first phase dates to around AD 900, the final phase of the fortress, around AD 980, reveals a dense, strictly organised settlement of rampart-oriented sod houses, suggesting a connection to the fortresses of Trelleborg and Kovirke, built at the same time by Harald Bluetooth. The refurbishment of an already existing circular rampart in a maritime area populated by Frisians and Danes appears to have been favoured over the construction of a new one in order to enforce and protect the south-western border of the Danish realm during a period of significant social transformation.

792. Rediscovered in the fields – the lowland castle of Sottrum

Authors: Sebastian Messal (Lower Saxony State Office for the Preservation of Historical Monuments)
Format: Oral

Near Sottrum, immediately west of the river Nette, an aerial photograph taken in 2021 revealed the complete layout of a high medieval castle site. This site was previously unknown to the Lower Saxony monument preservation authorities, but not to local historians. As early as 1887, school inspector F. Günther identified the site as Woldenbruch Castle, which was founded around 1200 by the historical Count Lüdiger II of Wöltingerode-Wohldenberg. What is astonishing in this context is the proximity of the lowland castle to the hilltop castle on nearby Wohldenberg, which was built in 1150 and was also founded by the Counts of Wöltingerode-Wohldenberg. The aerial photograph reveals numerous details of the site, such as the extensive rampart and moat, as well as several buildings leaning against the wall. In the inner courtyard of the oval complex, further building structures can be assumed to lie beneath the rubble. In the southwest of the site, a separate donjon with rampart and moat is recognizable. On the outside, there is a rectangular structure attached to the ring wall, the function of which is not yet clear. Since 2021, the State authorities has been conducting initial surveys at the site, primarily using metal detectors and geomagnetic surveys. The numerous and, in some cases, high-quality metal finds from the High and Late Middle Ages in particular attest to the importance of the complex; the first coins actually also indicate that the site was in use around the year 1200. The lecture will present the initial archaeological and historical results of the project on the Sottrum castle and also shed light on the relationship between the Sottrum lowland castle and the contemporary Wohldenberg castle.

485. Waterscapes, Movement, and Spatial Practice: Epigraphic and Toponymic Markers in Roman Istria and Liburnia

Authors: Peter Štoka (Central Library Koper, Local History and Book Heritage Department)
Format: Oral

This paper contributes to landscape archaeology and practice-based approaches to human–environment relations by examining how waterscapes structured movement, orientation, and place-making in the northern Adriatic. Focusing on Roman Istria and Liburnia, it treats epigraphic monuments and persistent place-names not primarily as textual or "religious" data, but as durable material interventions embedded within hydrologically differentiated landscapes. The study integrates a small, provenance-controlled corpus of votive inscriptions with toponymic distribution and hydrological context to investigate socio-ecological transitions across contrasting water regimes. It distinguishes between fluvial waterscapes with continuous, visually legible surface flow and karst waterscapes where water is intermittent, subterranean, and frequently apprehended indirectly. Across three case studies—(1) a route-associated altar to Seixomnia Leucitica near Karojba, (2) clustered dedications to Sentona in eastern Istria and Liburnia, and (3) the long-term persistence of river- and spring-linked toponyms—the spatial signal is consistent: inscriptions and toponyms align with movement corridors and hydrological transition zones (springs, wells, resurgences, karst margins, and route junctions) rather than with civic centres or areas of continuously accessible water. This pattern is interpreted as evidence of anthropogenic engagement with water at points where access, predictability, and navigation were constrained—places where practical knowledge of water and routes had to be stabilised through repeated encounter and durable marking. By foregrounding hydrology as an active structuring force in spatial practice, the paper offers a transferable framework for reading small epigraphic and toponymic datasets as indicators of waterscape-based interaction, relevant to broader Eurasian discussions of water management, water ecosystems, and long-term socio-ecological change.

1936. The Border Fortifications of the Kyivan Rus' in the 11th–12th Centuries on the Ros' River, Central Ukraine

Authors: Jens Schneeweiss (Leibniz-Zentrum für Archäologie LEIZA | Cluster of Excellence ROOTS) – Viacheslav Baranov – Artem Borisov – Olga Manigda – Vsevolod Ivakin (National Academy of Sciences of Ukraine, Institute of Archaeology)
Format: Oral

This paper focuses on the fortifications of the Kyivan Rus' along the Porossia frontier in central Ukraine. These defensive works form a river-oriented belt of over 60 fortifications, supplemented by the elongated so-called "snake ramparts" (Zmiyivy Valy), whose exact function remains not fully understood. Together, they represented a strategic response to the threat posed by nomadic steppe peoples. The paper examines how these structures related to water and land routes, fords, and nearby settlements. Results of previous investigations reveal the complexity and diversity of Rus' society shortly after Christianisation and emphasise the multi-ethnic mobility that shaped frontier defence. Central research questions include the military organisation and operational function of the Porossia fortifications, their chronology, the role of fords, communication and warning systems, and the spatial logic underlying stronghold location. The methodological approach combines minimally invasive investigations, laboratory analyses, and LiDAR-assisted landscape reconstruction and spatial analysis. The border fortifications of one of Eastern Europe's major river frontiers influenced mobility, frontier regulation, and the emergence of centralised defence networks within the Kyivan Rus'.

2608. The Long-Term Reuse of Belligerent Landscapes at the Bilhorod-Kyivskyi Hillfort along the Irpin River

Authors: Oleksandra Ivanova (National University of Kyiv-Mohyla Academy) – Ivan Zotsenko (Institute of Archaeology of the NASU)
Format: Oral

The surroundings of Kyiv are marked by a dense concentration of fortified sites from different periods, constructed for various defensive purposes. While some of these fortifications were intended to protect the city directly, their placement was consistently shaped by the surrounding landscape. Topography and river valleys played a key role in determining where settlements and defensive structures were established and how they functioned over time. One such example of a belligerent landscape is the hillfort of the medieval city of Bilhorod-Kyivskyi (modern Bilohorodka, Kyiv region). The site is located on elevated terrain above the Irpin River valley, a right-bank tributary of the Dnipro, and historically controlled the western approaches to Kyiv. Following Russia's full-scale invasion of Ukraine in 2022, the hillfort once again acquired strategic importance. Modern defensive trenches were excavated at the same location, as the elevated position allowed control over the river crossing, bridge, and road across the Irpin River. This repeated use of the site for defensive purposes reveals the persistence of belligerent landscapes shaped by similar strategic objectives across different historical periods. Rescue excavations conducted after the withdrawal of military units showed that the modern trench had been cut directly into the defensive structures of the medieval hillfort. Within the remains of the contemporary trench, elements of Kyivan Rus fortifications were documented, including sections of an earlier defensive ditch, a dwelling structure, and a stove, as well as remains of a nineteenth-century building. The physical overlap of medieval and modern fortifications within a single defensive line demonstrates how fortified sites along rivers continue to function from the medieval period to the present.

1160. Zemplín - Stronghold on the Bodrog River (Slovakia)

Authors: Martin Pristáš (Pamiatkový úrad SR) – Tibor Lieskovský (STU BA)
Format: Poster

Zemplín is a former Celtic oppidum and, from the eleventh century onward, one of the centres of castle administration in the medieval

Kingdom of Hungary. It is located in southeastern Slovakia on an important trade and military route linking the Danube region with the Carpathian Mountains and extending toward present-day eastern Poland, western Ukraine, and the Baltic region. Today, the site survives as a clearly visible feature of the historical landscape in the form of a massive elliptical rampart, reaching up to 20 m in height in places. This structure represents several phases of wood-and-earth fortification, probably dating from the Late Bronze Age to the thirteenth century. Its strategic position on a slight elevation at a historic ford across the Bodrog River, at the foot of the Zemplín Mountains, enabled near-continuous settlement from the Neolithic period to the present day. The river both protected the fortified settlement and provided resources and transport connections. The Zemplín stronghold and its surroundings are therefore protected archaeological sites of European importance and form an integral part of the cultural heritage of the Slovak Republic.

1354. The Slovak Gate on the River Hron: Corridor to the Resources of the Western Carpathians

Authors: Martin Mino – Peter Bisták – Petra Kmeťová (Monument Board of Slovak Republic) – Peter Paudits – Martina Moravcová (State Geological Institute of Dionýz Štúr) – Tibor Lieskovsky (Slovak University of Technology in Bratislava, Faculty of Civil Engineering) – Martin Kvietok (Slovak Academy of Sciences, Institute of Archaeology)
Format: Poster

The River Hron rises in the heart of the Western Carpathians and flows to its confluence with the Danube, tracing a corridor rich in key prehistoric and medieval raw materials. Its natural course suggests that it may have functioned as a prehistoric artery transporting metals into the Carpathian Basin. Most hillforts in the region—particularly in the middle Hron—are situated along the river, in some areas forming dense clusters where ancient routes intersect. Even the military camp where the roman emperor Marcus Aurelius has written his Meditations amid Marcomannic wars is according to his words located "apud Granua" – the river Hron. The most prominent archaeological site lies upstream from the presumed location of this camp, at the point where the river exits a canyon incised into the volcanic zone of the Carpathians and enters the open lowlands of the Carpathian Basin—the so-called Slovak Gate. This strategic position is protected by an elaborate fortification system gradually developed since the Chalcolithic. Although parts of these fortifications have long been known, the full extent and context of the system have only recently been revealed through high-resolution airborne laser scanning (ALS). The broader role of the site in long-distance trade along the river remains under investigation. However, recent analyses indicate the import of quartzite for the construction of sections of the ramparts. At least some traded commodities may have been transported by river, as suggested by the earliest written references to the locality. While the river functioned as a communication route, it also posed a barrier. Integrated analysis of ALS data and fluvial geomorphology has helped to identify potential solutions to this obstacle. The poster presents the results of combined archaeological and geological survey, supported by ALS analysis, of the Slovak Gate hillfort system on the River Hron.

227 KNOWLEDGE TRANSFER IN CRAFTS IN THE ANCIENT MEDITERRANEAN: PRACTICE, THEORY, AND CONTEXTS

Theme: 7. Interaction, connectivity and mobility
Organisers: Jean Vanden Broeck-Parant (UCLouvain) – Ann Brysbaert (Katholieke Universiteit Leuven) – Alexis Gorgues (Université Bordeaux Montaigne | CNRS UMR 5607 Ausonius) – Helle Hochscheid (University College Roosevelt | Utrecht University)
Keywords: knowledge/skill networks, craft cognition, Ancient Mediterranean, chaîne opératoire, knowledge/skill transfer
Format: Discussion session

SESSION ABSTRACT

This session looks at the practical and theoretical aspects of knowledge transfer in crafts in the Ancient Mediterranean (2nd-1st millenia BCE), considered at various scales of analysis, from cross-cultural exchanges to apprenticeship within communities and families. The social, political, and economic contexts are addressed as factors both enabling and constraining human agency, in order to shed light on the processes by which forms, skills and techniques can be adopted and adapted by new users. Approaches such as labour costs or social network analysis help model raw data, allowing to conceptualize knowledge transfer at the stages of production, distribution, and consumption, or at any stages of the chaîne opératoire. In doing so, salient aspects of knowledge transfer can be highlighted for a specific class of material culture, as well as practices common to different types of production. This is achieved by considering a wide variety of crafts such as sculpture, ceramics, architecture, metalwork, textile and fiber art, etc. Overall, knowledge transfer is regarded as a fundamental aspect of human lives (past and present), both shaped by and shaping social interactions and structures. We welcome contributions dealing with the following themes, to the exclusion of funerary contexts: • Theoretical approaches to studying the transfer of knowledge across crafts • Spatial, temporal and socio-economic contexts of knowledge transfer • Cognitive, behavioural and cultural aspects underlying such processes • Methodological tools and concepts to identify, collect, refine and interpret relevant data in the archaeological record We particularly encourage papers with innovative approaches to these questions and/or addressing types of crafts and contexts that have traditionally been less studied under these lenses. Through the discussions, we aim to identify current and future lines of research that can reinforce the dialogue between crafts, periods and regions of the Mediterranean within the field of knowledge transfer studies.

CONTRIBUTION ABSTRACTS

40. Analysing Movement and Touch in Knowledge Transfer

Authors: Willeke Wendrich (Polytechnic University Turin | University of California)
Format: Oral

Knowledge transfer is central to understanding both the tangible and intangible aspects of ancient practices of making. Knowing how to speak and understand (language); how to make (crafts, cuisine); how to be (social values, religion) and what to do (rituals, behaviour) are invisible and yet perhaps not entirely intangible. An important communal aspect is learning how to move and touch. A teacher who tries to convey an action, might say "Let me show you", while in fact what (s)he says is "Let me make you feel what it should feel like". It requires the transfer of body knowledge, which inseparably integrates physical and mental activities, experience, memory, dexterity, skill, endurance and social values. Recording movement and touch is the starting point of understanding body knowledge, the integrated body-mind experience that is transferred in ancient, as well as modern apprenticeship. By analysing video recordings of skilled and un-skilled present-day makers it has proven to be possible to relate the level of skill with the end product, not by considering "badly made" objects as being the work of an apprentice, but by recording micro-variables in the present-day products that can also be recognized in ancient materials. Part of the current research project is to use VR techniques, haptic suits and eye-tracking visors to record the process of skilled makers for elements of movement and touch that cannot be analysed through video and audio alone. Through video it is possible to record the moments and intensity of work-eye contact, while VR headsets have greatly refined this with eye-tracking. Video allows for gauging working rhythm, while a high-end haptic suit records the (dis)similarity of repetitive movements, amount of pressure, shifting of body weight, and coordination of the entire body.

1664. Practice, execution, implementation - what we can learn from handling textiles and clay, based (mostly) on evidence from the Aegean

Authors: Agata Ulanowska – Monika Kaczmarek (Faculty of Archaeology, University of Warsaw) – Magdalena Przymorska-Sztuczka (Archaeological Museum in Biskupin) – Kinga Winnicka – Katarzyna Żebrowska (Faculty of Archaeology, University of Warsaw)
Format: Oral

Textile imprints on clay provide new important evidence for textiles and textile consumption in settlement contexts, particularly in the earliest periods with the most limited textile finds, and in all regions where environmental conditions inhibit the survival of organic materials. My long-time studies of textile imprints are currently being expanded through two research projects: "TEXTile digitisAtIon tooLs and mEthodS for cultural heritage" [TEXTaiLES], and "Exploring Textile Imprints on Clay from the 3rd and the 2nd Millennia BCE" [ExplorTIC]. In both projects, textile imprints on clay are understood as important testimonies of the versatile handling of textiles in everyday life, including the combined, cross-craft use of both textiles and clay. In this paper, we aim to discuss a range of skills required to handle both materials effectively, illustrated by examples that extend beyond the Bronze Age Aegean. We focus on how to evaluate the level of craft skills reflected in simple products, such as threads and cords; how to describe their physical properties, including mechanical strength; and how to assess whether and to what degree, practical knowledge of both crafts – textile and pottery manufacture – was essential in the cross-craft use of technically and functionally different products. The presented observations are supported by a series of archaeological experiments conducted in collaboration with the Biskupin Archaeological Museum in Poland and the Fraunhofer-Institut für Techno- und Wirtschaftsmathematik ITWM in Germany.

2686. Peopling the Past: Crafting Textile Communities of Practice in the Late Bronze Age Aegean

Authors: Jennifer Marks (Johns Hopkins University)
Format: Oral

Not only are the physical remains of textiles from the Aegean Bronze Age invisible in the archaeological record, but so too are the women who crafted these textiles. While studies have focused largely on textile tool typology and textile iconography, very little research has focused on the women behind the craft. Shelmerdine and Bennet (2010: 308) rightfully point out, "Though we know some of the work they did, we have no clear idea of where they spent their lives, under what conditions, and what else they did when not carrying out tasks for palatial authorities." Therefore, in order to better make visible the lives of these women, their craft, and the textiles they produced, my research interrogates the non-palatial domestic (household) textile craft activities that were integral to the social and economic underpinnings and interactions of Minoan/Mycenaean Late Bronze Age communities that inhabited Crete, mainland Greece, the Aegean islands, and western Anatolia. Who were these female textile workers? How was the textile chaîne opératoire carried out in these communities and what can be interpreted from the spatial and temporal data based on material culture and textual (Linear B) evidence? How did mobility influence their craft? Preliminary investigation of textile craft activities within this framework reveals that spatial and temporal analyses are key to identifying continuity and change amongst communities of practice. It is here, over time, in these very spaces and places of production, that knowledge (memory work) and skill transfer networks (apprenticeships and cross-cultural interaction) survived and thrived. Therefore, my aim is to reconstruct a narrative that sheds light on the lived experiences of textile craftswomen, specifically the microscale contexts that occurred in the course of day-to-day textile production activities within and between communities of practice.

2797. Networks of practice: knowledge transfer and the diffusion of innovations in ancient Greek monumental construction (4th century BCE)

Authors: Jean Vanden Broeck-Parant (Université catholique de Louvain)
Format: Oral

While the study of ancient Greek architecture relies largely on the assumption that architectural features (be they formal, technical, or both) can be indicative of communities of practice as well as of dynamic processes such as architects' and craftsmen's mobility and interaction, the actual contexts and practicalities of knowledge transfer in the field of monumental construction have been somewhat of a blind spot. This paper argues that the combined study of technical and formal features of architectural remains, on the one hand, and epigraphic sources, on the other, can shed light on specific contexts in which knowledge transfer may have happened. Large building programs in sanctuaries of the 4th century BCE, by hiring contractors from various regions, set the stage for knowledge transfer, while the system of allotment of work contracts itself made it possible to happen on the construction site. Such transfers, it is argued, were probably not planned and rather were the result of the "ad hoc collective work" (Turnbull 1993) that must have characterized most building programmes in ancient times, where communication happened not only verbally, but also through 'knowledge in action' or 'tacit knowing'. In this sense, it is also argued that the knowledge transfers, while elicited by the system of contracts, must have been most efficient when operating outside of their remit, and more specifically at the interface between distinct, yet adjacent work allotments that required to be articulated to one another. The necessary collaboration between different actors (contractors, architects, building commissioners, etc.), as well as between craftsmen belonging to different (but sometimes overlapping) communities of practice must have participated in the construction and constant reshaping of multi-layered 'networks of practice'. These social networks in turn created the channels for knowledge transfers, with 'cliques' of 'early adopters' and 'weak ties' facilitating and accelerating them.

228 NORDIC CONFLICT ARCHAEOLOGY: PLURAL PASTS, INDIGENOUS PERSPECTIVES, AND HERITAGE GOVERNANCE

Theme: 1. Widening perspectives in material culture studies
Organisers: Britt Baillie (Aarhus University) – Oula Seitsonen (University of Oulu) – Torgrim Guttormsen (NIKU)
Keywords: Conflict, War, Nordics, Indigenous, Climate Change, Securitization
Format: Regular session

SESSION ABSTRACT

Over the past two decades, conflict archaeology has developed into a professionally recognised and socially engaged sub-discipline within European archaeology. In the Nordic region, however, the material traces of twentieth- and twenty-first-century conflicts have struggled to garner archaeological attention. Although these conflicts may appear thoroughly documented, archival records are often fragmentary, have been deliberately destroyed, or were penned by proponents of narrow institutional or national perspectives. Archaeology can expose forgotten or silenced histories, offering pluralised understandings of conflict and its aftermath. Yet this potential unfolds amid significant challenges: precarious funding, institutional marginalisation, tensions between research and heritage management, and growing demands to reconcile critical inquiry with community sensitivities and political agendas. Shifting demographic patterns and the renewed visibility of marginalised Indigenous concerns further complicate this landscape, urging archaeologists to engage with decolonising heritage discourses that foreground Sámi, Inuit, and Greenlandic rights, Indigenous sovereignty, collaborative knowledge production, and inclusive stewardship whilst furthering the recognition of Indigenous epistemologies in shaping narratives of northern conflict legacies. At the same time, shifting geopolitical interests in the Nordic region are transforming heritage politics, as debates over sovereignty, resource extraction, climate change, and environmental security increasingly intersect with archaeological research and the management of military and colonial sites. These dynamics reveal how Nordic heritage has become a stage on which competing narratives of identity, belonging, and territorial control are negotiated. This session invites contributions that explore how Nordic conflict archaeology can confront the entanglements of climate change, renewed militarisation, and social polarisation to revitalise and reorient contemporary archaeological practice in the region and beyond.

CONTRIBUTION ABSTRACTS

383. Bordered Memories: The Geographies of Soviet WWII Soldier Memorials from the Cold War to the Present

Authors: Torgrim Guttormsen (Norwegian institute for Cultural Heritage Research)
Format: Oral

This presentation examines the changing memory politics of Soviet soldier memorials erected after the Second World War, with emphasis on their contested meanings across shifting political landscapes from 1945 to today. While these monuments were originally established as expressions of gratitude for the Red Army's role in liberating parts of Eastern and Northern Europe, their

significance has never been static. Through the Cold War, they became spatial markers of ideological alignments, instruments of symbolic diplomacy, and sites where local to geopolitical narratives intersected. In the post 1991 era—especially following renewed tensions between Russia and Europe—their meanings have been renegotiated, often becoming focal points for debates over occupation, liberation, sovereignty, and historical responsibility. The Liberation Monument in Kirkenes, located only a few kilometers from the Russian border in Northeastern Norway, provides a compelling case study for exploring these dynamics. As the northernmost Soviet liberation memorial in Western Europe, it embodies the complexities of Norwegian–Russian historical entanglements, the unique wartime experiences of Finnmark, and the region's long-standing cross-border connections. The monument's postwar commemorative traditions, its Cold War diplomatic functions, and more recent controversies related to Russia's foreign policy all reveal how borderland memory cultures are shaped by, and respond to, broader geopolitical shifts. Drawing on archival sources, monument biographies, and fieldwork in the border region, the presentation traces how the Kirkenes monument has been alternately celebrated, instrumentalized, marginalized, and reinterpreted over eight decades. By situating the Kirkenes case within a wider European map of Soviet WWII memorials, the paper highlights how these sites serve as barometers of political change and how border geographies in particular condition the resilience, vulnerability, and transformation of wartime commemorative landscapes. The talk contributes to broader discussions on transnational memory, contested heritage, and the role of monuments in mediating historical narratives during periods of geopolitical tension.

2212. Nordic Conflict Archaeology – A Norwegian Perspective

Authors: Marek Jasinski (NTNU Norwegian University of Science and Technology | Falstad Center for Human Rights)
Format: Oral

In his seminal 1994 volume, Eric Hobsbawm characterized the period 1914–1991 as the "Age of Extremes", a century defined by two world wars, the atrocities of the Holocaust, numerous other genocides, recurrent civil conflicts, and the eventual collapse of European Communism. Regrettably, the Age of Extremes did not conclude in 1991. In its immediate aftermath, the Yugoslav Wars erupted, marked by systematic violence and mass killings, and the contemporary world continues to be profoundly affected by persistent armed conflicts. The two most consequential European conflicts of the 20th century—World War I and World War II—have exerted, and continue to exert, a substantial influence on the formation and negotiation of Norwegian national identity. Norway's involvement in WWI remains comparatively underexplored and demands considerable scholarly reinvestment. By contrast, archaeological research relating to WWII is relatively more developed. Given that collective experiences of warfare frequently shape communal identity narratives, the Second World War occupies a central position within Norway's collective memory and its hegemonic national discourse. Scholars have even argued that the memory of WWII functions as a contemporary national founding myth, foregrounding values such as resistance, solidarity, and egalitarianism across the Norwegian population. Despite this, the cultural landscapes and material vestiges of the war have historically received limited scholarly attention. This situation improved significantly during the second decade of the 21st century, when several Norwegian institutions initiated archaeological investigations focusing on the German occupation (1940–1945) and the immediate post-liberation period. These projects increasingly include research on the Sámi population and their interactions with German occupying forces, thereby contributing to a more comprehensive and inclusive historical understanding. This paper examines the current state of research and emerging perspectives within the field of conflict archaeology in Norway, with particular emphasis on the First and Second World Wars.

2788. Forgetting, memorializing and re-remembering the mass graves of Soviet soldiers and prisoners-of-war in the Arctic front

Authors: Oula Seitsonen (University of Oulu)
Format: Oral

Mass graves and war memorials are always material reminders of human aggression and deaths at the hands of others. At the same time, they can have myriad other political and cultural meanings and interpretations attached to them. For instance, the choice of sites to be commemorated or ignored fluctuates over time and is influenced by numerous factors, such as nationalism, world politics, communal memories, and changing perspectives on heritage. (War) memorials can be seen as visual representations of the dark legacies of difficult pasts and of the grim consequences of (super)modernity. Military graves and installations left in other countries can be perceived as an orphan heritage with ownership and origin separated from their spatiality, and the significance of these can be potentially ignored or questioned by the local population. This paper focuses on the transnational, orphaned material legacy of the mass graves of Soviet soldiers' and prisoners-of-war who fought and died on the Second World War Arctic Front in northern Finland. These have been through the postwar decades varyingly ignored, rediscovered, and re-remembered. I explore both the Russian and Finnish efforts to memorize and mark these graves, which were officially forgotten and silenced for decades, throughout the Cold War, but perhaps surprisingly often remembered and maintained by the local rural population.

2303. The Road Ahead. Absence, displacement and the Afterlives of a Refugee Camp in a Nordic Conflict Landscape

Authors: Julie De Vos (Museum Skanderborg)
Format: Oral

This paper examines archaeological investigations in Skanderborg Dyrehave, Denmark, where former installations of the Luftwaffe's Danish headquarters were repurposed as closed refugee camps after the end of the German occupation in 1945. During the final months of the war, approximately 250,000 German civilian refugees — predominantly women and children — arrived in Denmark and were confined to former military sites. Despite this scale, both archival records and the archaeological record are marked by striking absences. Written sources privilege military and administrative perspectives, while material remains that can be directly attributed to refugee lives are scarce, fragmented, or unrecognised. Rather than treating this absence as a methodological failure, the paper approaches it as a historically produced condition shaped by practices of containment, regulation, and post-war forgetting. Archaeological investigation thus confronts not only what is present in the ground, but what has been systematically removed, neglected, or rendered illegible. Through an analysis of reused structures, ambiguous material traces, and industrial by-products within a managed forest landscape, the paper explores how militarised infrastructures continued to structure civilian displacement without leaving clear material signatures of care, domesticity, or everyday life. This challenges conventional expectations of evidence in conflict archaeology and raises questions about whose experiences become archaeologically visible. Situating the case within debates in Nordic conflict archaeology, the paper argues that engaging critically with absence enables a reorientation of the field toward the long afterlives of conflict, displacement, and marginalisation. In a contemporary context of renewed militarisation and polarised refugee debates, such an approach underscores archaeology's potential to confront uncomfortable histories and contribute to more humane understandings of conflict landscapes.

2789. Wrecks under Troubled Waters: Ethics, Alliances, and Archaeological Loss in Danish Maritime Contexts

Authors: Britt Baillie (Aarhus University) – Christan Heiberg Rosenberg Thomsen (Moesgaard Museum)
Format: Oral

This paper examines the heritage tensions that arise when allied nations pursue fundamentally different priorities in the recovery of human remains from wrecks. Focusing on a current case in Danish waters, the United States has sought recovery operations primarily on emotive and commemorative grounds—particularly the moral imperative to repatriate fallen servicemen. Danish heritage authorities however are legally obliged to protect listen archaeological contexts, and previously unknown contexts uncovered when such operations may cause irreversibly damage. These divergent approaches expose competing ethical frameworks within maritime archaeology: one privileging humanitarian recovery and patriotic national memory, the other prioritising contextual integrity, long-term research potential, and the management of underwater cultural heritage as a non-renewable resource. The paper situates these heritage debates within the broader geopolitical relationship between Denmark and the United States, longstanding allies whose cooperation has historically facilitated pragmatic solutions to heritage management challenges. However, this relationship has come under new strain in the context of the Trump administration's confrontational stance on Greenland, complicating diplomatic negotiations around cultural heritage, sovereignty, and jurisdiction. By analysing recovery practices, legal frameworks, and complicated stakeholder networks, this paper argues that maritime human remains become powerful symbols through which broader political tensions are negotiated. The study highlights how archaeology does not operate in isolation from geopolitics, and calls for more nuanced, collaborative frameworks that balance commemorative imperatives with the preservation of archaeological knowledge in politically sensitive contexts.

2793. Too Recent to be Heritage? Archaeology and the Material Legacy of the Cold War in Sweden

Authors: Adam Andersson (University of Gothenburg)
Format: Oral

In Sweden, the material legacy of the Cold War remains widespread yet only unevenly recognised as archaeological heritage. Thousands of civil defence shelters and defensive installations were constructed during the mid-twentieth century as part of Sweden's preparedness system, embedded within apartment buildings, urban infrastructures, and defensive landscapes surrounding major cities. Despite their scale and continued presence, many remain legally unprotected and are rarely treated as archaeological sites, occupying an ambiguous position between contemporary infrastructure and future heritage. Drawing on Modern Conflict archaeological investigations of Cold War shelters integrated within Swedish residential architecture alongside the documentation of bunker and aerial defence remnants at Änggårdsbergen in Gothenburg, this presentation examines how archaeologists might engage with material that represents an emerging historical period. These sites demonstrate how Sweden's Cold War preparedness strategy permeated both everyday urban life and surrounding defensive landscapes, reflecting broader policies of neutrality and civil defence planning. Recent geopolitical developments, including Sweden's accession to NATO, have renewed interest in these infrastructures and reframed them as material reminders of shifting security narratives. The presentation, therefore, addresses the heritage-management challenges of sites that lack legal protection and are often perceived as insufficiently historical. It argues that archaeologists must spread awareness of Cold War materialities before they disappear through redevelopment, neglect, or continued assumptions that they do not yet constitute heritage.

229 RECONSTRUCTING THE HERM-LANDSCAPES OF THE GRECO-ROMAN WORLD: MATERIALITY, REGIONALITY, CONTINUITY AND TRANSFORMATION FROM ARCHAIC GREECE TO IMPERIAL ROME

Theme: 1. Widening perspectives in material culture studies
Organisers: Regina Hanslmayr (University of Zurich) – Caterina Schorer (Universites of Heidelberg and Zurich)
Keywords: herm (herms), Greco-Roman world, ancient sculpture, typology, iconography, continuity and transformation
Format: Regular session

SESSION ABSTRACT

Herms rank among the most persistent and versatile artefact types of the Greco-Roman world. Originating in archaic Greece as pillar-shaped monuments crowned with an anthropomorphic head of Hermes, they quickly became a widely used and firmly established feature of the archaic and classical environment. Their inherently adaptable form supported continued use and reinterpretation, resulting in a rich variety of iconographic, typological, and formal possibilities, ranging from shoulder-herms to full body-herms, inscribed herms, and portrait herms. This diversity reflects shifting aesthetic, social, and religious concepts across time and space. Yet, despite these transformations, herms retained a distinctly traditional character throughout the Hellenistic and Roman periods, preserving archaic associations even as their design, material, and functions changed. How this image form, unlike any other sculpture type developed in Archaic Greece, prevailed in the ancient visual and textual cultures over the following eight centuries, is a question that consequently requires examination. This session is dedicated to reconstructing the herm-landscapes of the ancient Mediterranean. It draws on the material evidence of herms from the ancient Greek and Roman world as its primary basis of analysis. Focusing on their typologies, iconography, inscriptions, and regional variations, we aim to identify both continuity and innovation in their production, placement, and meaning. How did different communities adapt the herm form to local social and religious frameworks? Which settings — public, domestic, funerary, or sacred — favoured specific types? By integrating archaeological, epigraphic, and art-historical perspectives, this session invites contributions that shed new light on the distribution, function, and reception of herms across the Mediterranean world—from Greece to Italy, Asia Minor, and North Africa. Interdisciplinary and comparative approaches are especially welcome. Bringing together diverse scholars and regional case studies, the session aspires to build a comprehensive, contextualised understanding of herms in the ancient Greek and Roman world.

CONTRIBUTION ABSTRACTS

325. The 'hermscape' of the Archaic Acropolis of Athens: material autopsy, formats and contexts of display

Authors: Pelayo Huerta Segovia (Universidad Autónoma de Madrid)
Format: Oral

This paper builds on my recent research on Attic and Athenian herms. Its primary aim is to partially reconstruct the herm landscape — here termed 'hermscape' — of the Archaic Acropolis of Athens through an integrated analysis of material evidence and spatial contexts. The first part of the contribution offers a detailed material autopsy, description, and identification of fragmentary Archaic herms (heads, shafts, and phalloi) preserved in the Acropolis Museum, the Epigraphical Museum, and the National Archaeological Museum of Athens, supplemented by the presentation of unpublished material housed in the storerooms of the Acropolis Museum. The reconstruction of the original dimensions of each piece, combined with a discussion of iconographic evidence of herms in Attic vase painting, allows for the definition of different typologies and possible display formats of herms in the sanctuary during the Archaic period. The second part focuses on identifying areas of the Acropolis where the herms may have been set up, with particular emphasis on their modalities of display. This investigation draws not only on the documented provenance of individual fragments, but especially on archaeological and topographical studies on the Acropolis regarding specific contexts, as well as relevant literary sources. In particular, focus is devoted to Pausanias' testimony on the wooden herm in the Temple of Athena Polias, as well as to his references to other statues of Hermes along the topography of the sanctuary (Paus. 1. 22.8; 1. 24.3; 1. 27.1), which have been overlooked in modern historiography. Pausanias' account (second century AD) provides evidence for the continuity and primordial significance of this distinctly Athenian image within the space of the Acropolis into Roman times that needs reconsideration.

544. Kouroi, Korai, Horoi and Hermai – On Directed Perception and Oriented Movement with Inscribed Archaic and Classical Works of Stone

Authors: Caterina Schorer (University of Zurich | University of Heidelberg)
Format: Oral

The first stone herms we know come from the Region of Attica in Ancient Greece and date to the early 6th century BCE, with the herm of Sounion being the first of its kind. From the second half of the 6th century, these hybrid sculptures – combining a shaft with cubic arm attachments with a figurative head and genitals – start carrying inscriptions on their abstract shaft body. This paper will return to the origins of the inscribed herm, focusing regionally on finds from Attica, Euboea, and Boeotia. Following an introduction to the possible types of inscribed herms during the Archaic and Classical Periods, – waymarker, dedication, and liminal monument oscillating between dedication and honorific pillar – the paper will move to a more specific analysis of chosen case studies. Here, it will examine how herms were inscribed: where texts were positioned, whether their placement was planned or spontaneous, and with what specific aesthetic qualities they were executed. The questions of how the experience of viewing the sculpture and reading the text was shaped by the intertwinement of figurative, abstract and inscriptional features and, whether the inscriptions themselves enable us to reconstruct options of movement will be addressed in this section. To situate these findings in a broader material and medial context, a comparison with other inscribed works of stone typical for the period – Kouroi, Korai, Horoi – will conclude the paper, investigating in what ways the herm as carrier of inscription was materially, medially, and kinaesthetically distinct, or, if it was at all: could one not inscribe the body of a kouros like a body of a herm? Concluding remarks will discuss the specific medial qualities of the herm, with an outlook on how modes of inscribing herms prevailed or changed into the Hellenistic and Roman Imperial Era.

172. Reconstructing the Herm-Landscape of Delos

Authors: Regina Hanslmayr (University of Zurich)
Format: Oral

On the island of Delos, an exceptionally large number of herms has been preserved. Most of them date to the Hellenistic period, a phase during which the island benefited economically from its central position in the Aegean Sea and its duty-free harbors. These conditions provide an ideal framework for a case study examining transformations of the Archaic and Classical herm in the Hellenistic period, both from an art-historical perspective (iconographic and typological) and in terms of meaning and function. The paper will address the following questions: Do we still encounter herms following the Archaic and Classical types of the bearded shoulder-herms of Hermes guarding crossroads and entrances at Delos? Which mythological figures, besides Hermes, were adapted into herm form, and what was their purpose? Did herms continue to retain a religious significance in the Hellenistic period, and in which locations were they set up? What role did herms with youthful heads play in the furnishing of the gymnasium and the palaestra, as well as other structures associated with athletics and ephebic training? This paper presents observations of the ongoing study of the herms at Delos that address the questions outlined above. On this basis, a sketch of the rich and complex herm landscape of Delos will be proposed.

1365. The Alleged Portrait of Ptolemy III in the Archaeological Museum of Sparta and the Herms of Beardless Hermes in Gymnasia

Authors: Natalia Kazakidi (Academy of Athens)
Format: Oral

The paper examines a marble head preserved with its neck, now housed in the Archaeological Museum of Sparta (inv. no. 5366). Slightly smaller than life-size, the sculpture is generally dated to the 3rd century BCE. Since its publication by Rumpf in 1963, the head has been interpreted as a royal portrait, identified as either Ptolemy III Euergetes or Ptolemy V. This attribution was based primarily on the assumption that a band encircling the head represented a diadem and that two protrusions at the temples should be understood as horns. This interpretation has remained largely unchallenged in subsequent scholarship. A close re-examination of the sculpture, however, reveals that the protrusions are more convincingly identified as wings rather than horns. When considered alongside the strictly frontal orientation of the head and other formal and stylistic features, this observation argues against an identification as a royal portrait. Instead, the evidence strongly supports the interpretation of the sculpture as a depiction of Hermes in the form of a herm. It is highly plausible that the herm originally belonged to an Hellenistic gymnasium, a context in which herms of Hermes commonly functioned as markers of space, protection, and athletic ideals. Within this framework, the paper situates the Spartan head within the broader corpus of herm pillars of Hermes Enagonios and discusses their iconography, function, and significance in Hellenistic gymnasia.

929. Roman Herms in Hispania: an overview and state of the art

Authors: Julio Ruiz (National University of Distance Education, UNED)
Format: Oral

The territory of the former Roman provinces of Hispania, encompassing the Iberian Peninsula and the Balearic Islands, has yielded a substantial number of Roman herms belonging to different typological groups. On the one hand, there are portrait herms, consisting of herm pillars, generally with smooth surfaces and provided with inscriptions, although four examples depicting clothed female figures are also preserved. In none of these cases has the head survived. The find contexts indicate that they were preferentially displayed in domestic settings, usually placed on either side of the entrance to the tablinum, and represented the owners of the house. Herms depicting divinities are also attested, generally of life-size or over life-size dimensions, and were used as balustrade finials. A similar function can be assumed for the double herms, of which a limited but significant number of examples has been recovered. Other specimens correspond to the so-called Hüfthermen, which in Hispania predominantly represent Herakles wrapped in the lion skin (leonté). However, the majority of the herms recovered in Hispania belong to miniature types of small format, mainly representing Dionysos/Bacchus or members of his thiasos. These examples, most of which display a flat back, most probably served as ornamental attachments on table legs in the form of herm pillars, a function confirmed in some cases by monolithic execution together with the supporting pillar. This paper provides an overview and a state-of-the-art assessment of current research on Roman herms from Hispania.

1585. Pompeian herms depicting Bacchus

Authors: Ilkka Kuivalainen (University of Helsinki)
Format: Oral

Pompeian herms are one of the largest collections in the Mediterranean area, and one of the largest among Pompeian sculpture. The herms depicting Bacchus, i.e. Roman Liber, are versatile, as most of them contain masculine features, but some are androgynous or even feminine. There are double herms and herms containing another figure, shoulder herms and hip herms, but sometimes only heads are preserved. The diversity of the god's character is clearly visible: the most common type being the bearded Bacchus, whose character is based on the archaic Greek Dionysus. Old source material, such as 19th-century excavation reports, often refers to the Indian Bacchus. The double herms were a group in which Bacchus could be portrayed both as a bearded and a beardless young man. This practice may have been based on the idea of continuity, of incarnation, in which the young follow the old. The young Bacchus could also be depicted with horns, e.g. in the house of Marcus Lucretius (IX 3, 5.24). As the figure of the young Bacchus was often androgynous, the figure has also been interpreted as Ariadne or Libera. In Pompeii, Bacchus portrayed as a child was more common in wall paintings than in herms, whose rare child motifs also include a table leg with Silenus carrying the young Bacchus (VI 15,7-8). Herms used as table legs were a common feature, although ordinary freestanding herms were of course more common. Many of them were found in gardens and were smaller than life-size. They were certainly also a relatively inexpensive way to acquire sculptures to decorate Pompeian domus. The shafts of the herms do not often depict genitals. In Pompeii the possible religious significance of these herms needs clarification.

1275. Figuring herms in Roman landscape painting

Authors: Stephanie Wyler (Université Paris Cité | UMR 8210 Anhima)
Format: Oral

Herms are frequently displayed in "sacro-idyllic landscapes" paintings adorning late-Republican and Imperial Roman houses and tombs. Their number allows us to establish a varied typology, with differences in scale that reveal an interest either in the anonymous form of the hermaic pillar or, on the contrary, in specific identifying details conceived as attributes. Their study raises the question of the relationship between painted images and their actual referents, whose status oscillates between decorative sculptures and markers of space (a bridge, the entrance of a sanctuary), and that of their contextual insertion into partially or totally anthropized natural environments, which explains a visual discourse on their nature. I will analyze some compositions in which the herms complement visual systems formed with other statues, questioning their semantic status of markers at the crossroad between different ontological spaces. This issue intersects with the question of ambiguity concerning the identification of the god meant to be embodied by the incomplete form of the herm. It is particularly striking on scenes that depict characters adorning and worshipping herms, which then appear as mirrors of these ordinary people whose daily life they share.

1367. On the Missing Herm from the Pons Fabricius

Authors: Robert Wagman – Andrew Nichols (University of Florida) – William Bruce (University of Kansas)
Format: Poster

One of the most cherished monuments of Rome, the Republican-era Pons Fabricius owes much of its visual charm to the two quadrifrontal herms set along its parapets. As argued by Louise Holland (1961), these sculptures formed part of an original group of four that once stood outside the bridge's entrance, probably supporting the enclosure of a small open-air precinct. Of the two remaining herms from this ensemble, one is preserved in the Museo Nazionale Romano, while the other is generally identified with the herm incorporated into the monument to the poet Gioacchino Belli in Trastevere. Carved from the same Luna marble as the other herms, the latter stands out within a monument otherwise constructed entirely of travertine. Other details, from the weathered features of the heads to the architectural cuttings on the shaft, are likewise closely comparable to those of the bridge herms. These similarities have prompted both early and more recent archaeologists (Holland 1961; Conticello de Spagnolis 1993) to regard the herm on the Belli monument as an ancient original reused within a new setting, in keeping with a time-honored practice attested by countless examples in Rome alone. The repurposing of antiquities in later architectural and sculptural contexts undoubtedly lends itself to fascinating object biographies; as we demonstrate in our presentation, however, in this case the narrative rests on mistaken grounds. A closer examination of the Belli herm shows that it is not a Roman original but a well-crafted copy by the monument's sculptor, Michele Tripisciano (1860-1913), who sought to enliven his portrait of Rome's most beloved poet with a whimsical touch of antiquarian realism. By offering a new analysis of the herm's toolwork, our presentation introduces a little-recognized variant within the traditional plotline of spolia histories, namely the deliberate fabrication of copies designed to simulate reused antiquities.

230 PLANT FIBRES AND PERISHABLE MATERIALS: APPROACHES, METHODS, AND RESEARCH

Theme: 1. Widening perspectives in material culture studies
Organisers: Nysa Loudon (University of Glasgow) – Camila Alday (University of Cambridge) – Margarita Gleba (University of Padova)
Speakers: Alain Bourmaud (Université de Bretagne Sud) – Nofar Shamir (Ben-Gurion University of the Negev) – Jenni Suomela (University of Helsinki) – Sheahan Bestel (University of Glasgow)
Keywords: plant fibres, textile analysis, basketry, perishable materials, material studies
Format: Workshop

SESSION ABSTRACT

The aim of this workshop is to share current research, methodologies, and knowledge, and to promote interdisciplinary discussion focused on the use and technology of plant fibres and related perishable materials. The importance, function, and broader roles of plant-based fibres and plant materials in the daily lives of past peoples are only beginning to be fully appreciated. However, due to their poor preservation under most archaeological conditions, these materials require highly specialised analytical and interpretive approaches. This workshop will provide a platform for archaeologists, archaeobotanists, textile researchers, conservators, and experimental practitioners to exchange perspectives and discuss recent advances in the identification, analysis, and interpretation of perishable materials. By fostering dialogue across disciplinary boundaries, the session aims to build stronger connections within the EAA community and encourage collaboration between members of the ComTex EAA Community and the emerging International Work Group for Palaeoethnobotany (IWGP) Research Group for Fibres and Perishable Materials. Workshop Themes: Experimental Programmes: Exploring how experimental archaeology contributes to our understanding of fibre technologies, production processes, and material properties. Preservation, Collections, and the Degradation of Organic Materials: Examining challenges and opportunities in the study and conservation of fragile fibre artefacts, including museum curation, storage conditions, and taphonomy. Microscopy and Identification Methods: Showcasing cutting-edge techniques and analytical tools for identifying and characterising plant and fibre materials, from microscopy to biochemical and imaging methods. Beyond Analysis – Ethnographic, Practitioner, and Indigenous Knowledge: Highlighting the value of ethnographic studies and traditional knowledge in interpreting the cultural and technological significance of perishable materials.

231 REGULATING ARCHAEOBOTANY IN EUROPE: PRACTICES, CHALLENGES AND PERSPECTIVES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences | University of Sofia "St. Kliment Ohridski") – Djurdja Obradovic (Institute of Archaeology, Belgrade) – Tjasa Tolar (ZRC SAZU, Institute of Archaeology, Ljubljana)
Keywords: Archaeobotany, Europe, Regulation
Format: Regular session

SESSION ABSTRACT

A wide range of environmental archaeological subdisciplines are actively employed in both research-oriented and development-led archaeological investigations across Europe, among which archaeobotany represents a particularly prominent field. The discipline exhibits considerable heterogeneity in its regional development: in certain countries, archaeobotanical research possesses a long-established tradition, whereas in others it remains relatively marginal, sometimes regarded as an exotic or insufficiently informative line of inquiry. These contrasting conditions both limit the scientific knowledge and contribute to difficulties in recognising archaeobotanical materials as components of tangible cultural heritage. Such challenges often arise from the liminal nature of the material itself—sediment-based archaeobotanical samples may fall under geological jurisdiction, while preserved plant remains are frequently treated as biological specimens. Consequently, the entire operational sequence—from field sampling, through sample processing, to laboratory analysis—frequently encounters inconsistent, overlapping, or entirely absent regulatory frameworks. In this context, our session aims to bring together both archaeobotanists based in the eastern and western European countries and those conducting research within the region, with the objective of fostering a discussion on how archaeobotanical materials might be more effectively recognised and regulated. We invite contributions that address best practices and methodological frameworks, as well as papers that present specific challenges encountered in the management, regulation and structuring of research in line with the regulations in place or needed, and interpretation of archaeobotanical materials within different national contexts across Europe. We intend to address, though not be limited to, the following themes: strategies of sampling and sample processing; approaches to on-site and laboratory research; the role of archaeobotanical input in decision-making during archaeological fieldwork; and the presentation and curation of archaeobotanical materials within museum contexts.

882. From Personal Archives to Open Data: Integrating Archaeobotanical Research Datasets at the National Level

Authors: Bine Kramberger – Edisa Lozić – Tjaša Tolar (ZRC SAZU, Institute of Archaeology)
Format: Oral

Archaeobotanical research produces large quantities of primary data that are essential for understanding past environments, subsistence strategies, and the everyday life of past societies, yet a substantial part of these results remains unpublished and difficult to access. This includes data from plant macroremain analyses such as seeds, fruits, charcoal, and wood, which are often archived outside formal publication channels due to ongoing archaeological interpretation, small or non-representative sample sizes, or methodological limitations of earlier studies. Although such datasets may not always meet current publication standards, they nonetheless represent an important scientific resource. In Slovenia, for example, archaeobotanical results accumulated over more than twenty years are currently preserved in personal digital archives and in printed form within the Archive of the Institute of Archaeology at ZRC SAZU. This situation clearly illustrates the need for systematic digitisation, long-term preservation, and structured data management within a broader archaeological framework. The long-term objective of this initiative is to digitise these datasets and provide controlled access by integrating archaeobotanical data into the national archaeological database ARKAS. ARKAS is already well advanced as a comprehensive information system for archaeological sites and heritage in Slovenia and offers an appropriate infrastructure for incorporating natural-scientific research results alongside archaeological documentation. The paper will demonstrate how archaeobotanical data can be embedded within a unified national e-database and address questions of data standardisation, authorship protection, and accessibility. Such integration significantly enhances the potential for comparative studies of plant remains, regional and supra-regional analyses of species distribution, and interdisciplinary research. Many research institutions in the region south of the Alps face similar challenges regarding the long-term storage and accessibility of bioarchaeological data. The ARKAS model therefore offers a transferable framework for coordinated data management and future regional and international collaboration.

917. BARB: Balkan ARchaeoBotany group

Authors: Maja Andric – Tjaša Tolar (ZRC SAZU, Institute of Archaeology) – Barb Barb (Balkan ARchaeoBotany group)
Format: Oral

Balkan ARchaeoBotany group (BARB) is a voluntary non-profit collective initiative founded in October 2025 with the aim of furthering the research on past human-plant interactions in the mainland Balkans. Its mission is not to conduct research as such, but to support and accelerate research progress by creating a platform for collaboration of scholars working in different parts of the region, strengthening existing and developing new personal and institutional connections, and inspire or facilitate new collaborations. BARB members possess a range of expertise; we are archaeobotanists (dealing with carpological remains), anthracologists, palynologists, phytolith and starch specialists, micromorphologists, ecologists and plant isotope researchers. While the array of skills available is very wide, the distribution of expertise is rather uneven across the region and the scholars often struggle not only to stay on track with their own work but also to harness the potential of archaeobotanical archives outside their specialism (and, along the way, meet expectations of the archaeologists and their projects). Therefore, BARB is also concerned with encouraging exchange of expertise and knowledge, especially among younger scholars from the region, and is fortunate that many of them are indeed among its members. One of BARB's chief priorities is conversations about (standardisation of) methods and protocols, and the ways of making them compatible and suitable for data integration and data mining across the region. After briefly introducing BARB, its aims and actions, this paper describes the group's work on formulating practical field and laboratory advice to be recommended and applied region-wide while accounting for the highly varied levels and conditions of research in different parts of the region.

932. Archaeobotanical research in Serbia: ups, downs and emerging perspectives

Authors: Djurdja Obradovic (Institute of Archaeology, Belgrade) – Ana Smuk (Independent researcher) – Amalia Čupić Sabanov (University of Belgrade | German Archaeological Institute, Berlin) – Dragana Filipović (University of Algarve | University of Bucharest)
Format: Oral

This paper reviews past and current developments in archaeobotanical research in Serbia and outlines its future prospects. First analyses were conducted in the early 1970s, within international projects investigating early farming in the Balkans. The research was conducted primarily by foreign specialists and, while some participated in field campaigns, most analyses were carried out in their home laboratories, where the plant material has been curated ever since. Although this early work generated much-needed information on Neolithic agriculture, its contribution to the development of the discipline in the region was limited. A notable step in building local capacity was the training provided by Helmut Kroll to two local scholars. Disrupted during the 1990s, the research was revived and broadened in the 2000s thanks to the local scholars who, despite the lack of training locally, found a way to specialise – by combining degree courses abroad, self-teaching, and mutual and external collegial support. The knowledge has been substantially enlarged but major obstacles to becoming an officially recognised, regulated and systematically applied scientific practice in the region remain: absence of institutionalised archaeobotanical training; limited infrastructure; non-standardised,

disparate methodologies; absence of formal, state-stipulated regulation to collect and process archaeobotanical samples and thus lack of dedicated funding; absence of recognition of archaeobotanical remains as bioarchaeological heritage. Local archaeobotanists have worked to address these issues by, for instance, querying museums for 'forgotten' samples or collections and liaising with archaeologists to secure sampling and processing. Formal upgrade (by administrative bodies) of archaeobotanical research and materials to the level equal to other forms of evidence is not on the horizon, so an awareness of the existence and importance of plant materials is limited, particularly among decision-makers and lay audience. To counter this, local archaeobotanists have engaged in presenting and promoting this bioheritage through public outreach.

2462. The spread of agriculture to the Northern Black Sea: Summarizing the state of research

Authors: Marta Andriiovych (School of Archaeology, University of Oxford | Laboratory of prehistoric archaeology and anthropology, University of Geneva)
Format: Oral

The most prominent feature of the Neolithic period is the development of a new type of lifestyle through the domestication of the main grain crops and animals. But apparently, the definition of the Neolithic period became quite wide, and in some cases, the first characteristic of the period was associated with the development of stone processing technologies and pottery making, as it took place in the research institutions in the post-Soviet Union territory. This approach makes the transition period from the Mesolithic to the Neolithic less apparent. Despite the limited evidence of macro archaeobotanical remains, we are going to present the spread of agriculture to the Northern Black Sea according to the available data obtained over the last several decades. The goal is to collect statistical data from the archaeological research in the region, together with the C14 database, geospatial analyses, and distribution maps to summarize the latest concepts. In this talk, we discuss the development of agriculture at so-called Neolithic cultures such as Bug-Dniester, Azov-Dnieper, and Donetsk cultures, versus the Linear Band pottery culture and Eneolithic Tripillya culture on the territory of Ukraine. As well as clarifying the meaning of the terms Mesolithic, Early and Late Neolithic, Chalcolithic/Eneolithic, and their transitions.

2647. Scanning the Seeds: Towards a 3D Digital Reference Library for Archaeobotanical Identification

Authors: Chris Motz – Laura Motta (University of Michigan)
Format: Oral

We introduce a project to produce a reference library of 3D models that will facilitate identification of archaeobotanical specimens in a way not possible with 2D representation, thus addressing a significant shortcoming of existing reference materials. Archaeobotanical remains are a window into ancient environments and agriculture. Identifying plant remains is the crucial step between recovery in the field and interpretation. The basis of identification is morphological, i.e. comparing known materials with unknown. It is time consuming and based on specialized skills to recognize nuances in shape and texture that are hard to describe. Comparative collections of modern specimens and reference manuals are used to check for variability in shape and to identify diagnostic features. It is not possible for each archaeobotanist to assemble a complete comparative collection, so the discipline makes use of identification atlases containing two-dimensional drawings or photos. Digital technology has improved the quality of reference images and the availability of these resources. While there are now good atlases, they remain reliant on 2D images to represent 3D objects. In the framework of curating the Kelsey Museum of Archaeology's collection of desiccated crop remains from the Roman site of Karanis (Egypt), we developed a workflow for creating detailed 3D models of small botanical specimens. 3D models are much closer to a physical comparative collection, allowing users to rotate the specimen, assess the full shape, and zoom in to see small features and texture, all crucial steps in the identification process that are not possible in 2D. The project is also recording metadata/paradata and producing a public archive of all files used to create the models, which will enable researchers to re-analyze the raw data and confirm the accuracy of the 3D resources, enhancing their utility as reference materials.

1773. Inspired by field practice at Çatalhöyük: the 'heavy fraction' and its processing in Serbia

Authors: Djurdja Obradovic (Institute of Archaeology, Belgrade) – Dragana Filipović (University of Algarve | University of Bucharest) – Slobodan Mitrović (Public Archaeology Laboratory, Pawtucket) – Milena Vasić – Jovana Tripković (Independent researcher)
Format: Poster

Archaeology of Çatalhöyük featured prominently during our studies, and some of us had the privilege of working at this multifaceted site. The knowledge and practice learned there we carried onwards, to many or all of our subsequent archaeological engagements. Inspired by our work at Çatalhöyük, we established flotation at the site of Vinča-Belo Brdo in the 2000s and thus enabled archaeobotanical investigations there, while we also encouraged, or ourselves instituted, this practice at a number of other sites in Serbia. Besides our contribution to re-inaugurating and nurturing archaeobotanical research in Serbia via flotation and post-flotation work, our effort in tending to the 'heavy fraction' of flotation samples, both at Çatalhöyük and at sites in Serbia – the primary sorting and classifying, and then also studying and publicising – has significantly benefited archaeological practice and discipline. Theses (including ours), chapters and papers have been written that used the materials extracted from heavy residues, and more are possible, as we highlight on this poster. Heavy residue processing is tedious and time- consuming; it is a form of excavating away from the trenches, even when done on-site, since the materials recovered are not recorded in the field and they complement the finds

retrieved in the trenches. It is also a form of rescue work, because many of these materials (microliths, small beads, macrofaunal remains, plant remains) are too small to be spotted during the excavation and would be lost without heavy residue sorting. This poster illustrates and emphasises the importance of recovering and analysing the materials from heavy residue both for the sake of the study of the materials themselves and for the study of past daily activities, their spatial and temporal dimensions, including the nature of the process of accumulation of different material remains.

1800. Archaeobotany in Romania: Structural Challenges in Funding, Infrastructure and Data Integration

Authors: Ciuta Beatrice (1 Decembrie 1918 University from Alba Iulia)
Format: Poster

Across Europe, archaeobotany shows markedly uneven development, reflecting broader structural differences between western and eastern research environments. In Romania, archaeobotanical work is rarely embedded in routine archaeological practice due to limited and inconsistent funding, and is most often conducted only within externally funded research projects. In contrast, in many western European countries archaeobotanical analyses are standard components of development-led archaeology, supported by stable regulatory frameworks, dedicated infrastructure, and technical staff. These disparities result in fragmented and sparse datasets in Romania, hindering diachronic and regional synthesis and limiting broader interpretative potential. Additional constraints include restricted access to advanced laboratory equipment, such as high-resolution microscopy and SEM, and the absence of trained flotation technicians, which places excessive pressure on a small number of specialists. Using Romania as a case study, this poster highlights how structural inequalities across Europe affect data production, integration, and long-term disciplinary sustainability, underscoring the need for more balanced regulatory and funding frameworks.

2046. Archaeobotanical practice in Portuguese Development-led Archaeology: a case study from Silves and Loulé (Algarve, Portugal)

Authors: Maria Cravo (Universidade do Algarve) – Patrícia Monteiro (Património Cultural, I.P. – Laboratório de Arqueociências | ICArEHB) – Roxane Matias (ICArEHB)
Format: Poster

This poster examines the implementation of archaeobotanical sampling and recovery methods in development-led archaeological excavations in the Algarve region (southern Portugal), focusing on the municipalities of Silves and Loulé between 2001 and 2017. Based on a systematic review of excavation reports, the study challenges the common assumption that the limited number of archaeobotanical studies resulting from development-led projects is primarily due to the unfavourable preservation conditions of plant remains in the archaeological record. Instead, it argues that this scarcity largely reflects methodological limitations. The results show that although archaeobotanical macro-remains are frequently present in excavated contexts (61%), their collection is not consistently attempted (24%). When recovery does occur, the methods employed are often heterogeneous and arbitrary, even in contexts with high archaeobotanical potential. Notably, none of the reviewed interventions resulted in formal archaeobotanical analysis. This poster invites a discussion on how the current legal framework applicable to both archaeobotanical materials and methodological practice may contribute to the marginalisation of Archaeobotany within the analysed excavations. It also encourages a critical reflection on how Portuguese archaeology could benefit from a legal mechanism that formally integrates archaeobotanical practice into development-led archaeological excavations.

2184. An archaeological seed bank and xylarium. The archaeobotanical and reference collections at the Institute of Archaeology, University College of London

Authors: Ayelen Delgado Orellana (Institute of Archaeology, University College London) – Sue Colledge (Institute of Archaeology University College London) – Dorian Fuller (Institute of Archaeology, University College London)
Format: Poster

The archaeobotany laboratory at the UCL Institute of Archaeology has a been centre for research and teaching for just over 60 years. Over the decades, building an extensive reference collection has been a continuous effort. Along with seeds, pollen and phytoliths, today the Institute of Archaeology hosts a significant reference collection of wood blocks, thin sections of wood, wood charcoal and herbarium specimens of modern woody plants. These collections provide valuable material, for both identification and for teaching practical archaeobotany. It is also available as research material, including legacy archaeobotanical collections for reinvestigation. Archaeological plant samples include assemblages from U.K., Syria, Sudan, India, Southeast Asia and the U.K. Many modern comparative materials are also unique and represent crop varieties no longer likely to be grown, such as emmer and einkorn wheats collected by Gordon Hillman in central Turkey in the 1970s. In the case of woody plants, legacy materials donated to our collection such as European and near eastern species collected in the 1960's and 1970's by Cecilia Western are unique and part of the developmental history of the discipline. As part of the Advancing Access to the UCL Archaeological Reference Collections (A3RC) grant, part of the RICHeS programme, funded by the AHRC through the UKRI Infrastructure Fund, we have updated the catalogues of the reference collections and archaeobotanical collections, making these available for restudy by researchers who wish to visit our laboratory and use its microscopy and photography facilities.

2383. Regulating Archives and Archaeobotanical Archiving: Challenges from Bulgaria

Authors: Hanna Aleksandrova (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences | Department of Archaeology, Sofia University "St. Kliment Ohridski")
Format: Poster

Archaeobotanical materials from Bulgaria have expanded rapidly through intensive – often rescue – excavations, producing datasets of considerable scientific value. Yet much of this evidence remains invisible/underused due to, inconsistent documentation and accessibility standards, insufficient infrastructure, and the lack of standardised protocols for long-term storage. Small or limited assemblages for example, often remain invisible to other specialists, as they are only briefly noted or summarised in annual reports; moreover, decisions by excavation directors strongly influence whether archaeobotanical data are presented or how they are presented, resulting in uneven reporting practices and fragmented data sharing. Arhive materials in museums are frequently inadequately curated, and access for academic research remains poorly regulated, this - further restricting its scientific circulation. Possible solutions, addressing these challenges require the establishment of centralised digital databases, standardised recording and storage protocols, transparent and regulated access policies, and coordinated conservation and publication strategies to ensure long-term visibility, comparability, and sustainable research development. Strengthening institutional collaboration, mandating comprehensive reporting standards, and investing in professional training and conservation infrastructure would enhance data visibility and integration, ensure sustainable preservation, and facilitate broader comparative and analytical research.

232 ARCHAEOLOGIES OF RURAL SUSTAINABILITY: RECLAIMING KNOWLEDGE, PRACTICE, AND BELONGING IN CHANGING LANDSCAPES

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Anna Maria Stagno (Università di Genova, Laboratory of Environmental Archaeology and History) – Despina Catapoti (University of the Aegean)
Keywords: Rural archaeology, Archaeological theory, Heritagisation processes, archaeology and sustainability, archaeology of commons
Format: Discussion session

SESSION ABSTRACT

Across Europe, rural territories are currently reimagined as spaces of sustainability and resilience in response to climate change, economic instability, and social fragmentation. However, most of these places are approached through the lens of touristification and heritagisation, which often celebrates rural "authenticity" while overlooking the deeper genealogies of work, care, and adaptation that shaped these landscapes. This session embarks upon an investigation of how the discipline of archaeology can engage differently with rural areas—not as heritage products to be consumed, but as living, dynamic environments imbued with ecological knowledge and social meaning. Archaeology has a unique capacity to reveal long-term practices of collective and shared forms of environmental management that speak directly to the challenges of our own time. For the purposes of this session and in an attempt to bring forward a vision of archaeology that not only studies but also participates in the ongoing life of rural landscapes, we invite contributions that explore how local communities and social groups in the past and present have understood, managed, and reactivated their environments through everyday practices (cultivation, grazing, sylviculture, fire use, and other forms of resource stewardship). We are especially interested in studies that combine archaeological sources with other ones (archaeobotanical, historical-ecological, documentary evidence, oral sources..) to reconstruct the social and ecological cycles of rural life across different historical contexts. Possible topics include: - Archaeological and historical perspectives on agro-sylvi-pastoral systems and practices to manage, reproduce and activate environmental resources; - The material and environmental traces of abandonment, reoccupation, and transformation in rural landscapes; - Critical reflections on heritagization and sustainability discourses in rural development; - Collaborative and community-based approaches that bring together local voices and scientific knowledge; - Conceptual and methodological approaches for studying environmental knowledge as a living cultural practice.

CONTRIBUTION ABSTRACTS

2800. Sustainability and landscapes: addressing continuities from archaeological perspectives

Authors: Anna Maria Stagno (University of Genova - Laboratory of Environmental Archaeology and History)
Format: Oral

This paper aims to promote a discussion on the problem posed by continuities. The theme will be discussed in relation to mountain spaces, where it is now clear that abandonment is generating changes, whose full scope was not yet fully perceived 40 years ago. The paper will address some of possible key questions: the visibility of continuity and the multiple meanings of the archaeological evidence and their relation with current heritagisation processes. The idea is to reflect on the possibility of studying continuity in

archaeology, as a central topic on the investigation of sustainability, considering, as key elements, the impermanence of things, their need to be maintained and cared for, and their role in generating social relations. Caring for something is possible when access rights or ownership of that thing are maintained, for this reason the maintenance of access rights is one of the prerequisites of continuities.

316. Land-use Transformations in Gemer (Slovakia) Under the Influence of Geopolitical Shifts from 13th - 20th century

Authors: Josef Petráš – Filip Vološin (Archaeology Institute of Slovak Academy of Sciences)
Format: Oral

The paper presents the results of interdisciplinary research into the long-term transformation of the cultural landscape of the Gemer region in eastern Slovakia. The study focuses on the dynamics of subsistence, settlement, and economic exploitation at altitudes ranging from 300 to 1,000 metres above sea level. The methodological framework integrates airborne laser scanning (LiDAR) with archival written and kartographic sources analysis, followed by systematic field surveys to verify identified features. This approach was supported by targeted pedological probing and Geographical GIS-based landscape modelling. Stratigraphic layers were analysed using XRF measurements, and charred macro-remains were used for taxonomic identification and radiocarbon dating. A key contribution of the study is the spatial analysis of relict field systems in currently forested upland areas. Contrasting these findings with historical data on marginal grain yields reveals unexpected agricultural intensification prior to a significant socio-economic turning point in the 2nd half of the 16th century. This milestone was characterised by Ottoman expansion and changes in land ownership, leading to the restructuring of the landscape through Valachian colonisation and the development of metallurgy. The analysis provides a detailed case study of the ironworking site in Drnava. Research into the forge (hammermill), recorded as deserted in 1569 and throughout the 17th century, confirmed its reactivation in the 18th century. Charcoal kilns identified across the region disturb earlier field system relics stratigraphically, providing irrefutable material evidence of a total shift in land use from agro-pastoral to industrial. These results enhance our understanding of human adaptability in mountain ecosystems under geopolitical pressure and offer an innovative model for studying relict industrial landscapes in Central Europe.

2040. Filling the Blanks: Agrarian Blueprints and Rural Knowledge in Medieval Brittany

Authors: Gerard Matser (CReAAH Rennes UMR 6566)
Format: Oral

The agrarian foundations of Breton society during the Early Middle Ages remain largely overlooked, despite agriculture constituting the core of subsistence, social organization, and environmental knowledge. This paper examines early medieval Brittany as a lived rural landscape shaped by long-term practices of cultivation and adaptation, rather than as a marginal or static periphery. Building on recent shifts toward the archaeology of everyday life, it foregrounds agrarian practices as forms of collective engagement with local environments. The study first reassesses carpological evidence from thirty-two sites dating between the seventh and eleventh centuries. While these data reveal coherent patterns of cultivation and settlement and demonstrate Brittany's participation in wider agrarian transformations across early medieval Europe, they remain spatially uneven and strongly shaped by the logic of preventive archaeology, concentrating on urban centers and infrastructure corridors. To address these absences, the paper adopts an interdisciplinary and collaborative methodology that combines environmental data (climate, soils, topography, and available plant species), material evidence (agricultural tools), and the experiential knowledge of contemporary local farmers. These collaborations provide insights into crop/soil relationships and viable cultivation strategies, enabling the reconstruction of agricultural "blueprints" for rural territories otherwise absent from the archaeological record. By mobilizing both archaeological and living environmental knowledge, this approach highlights rural landscapes as dynamic systems of work, care, and adaptation, offering a long-term perspective on sustainability grounded in everyday agrarian practice.

2362. The potential of archaeological finds in intensely cultivated agricultural fields: lost or found past?

Authors: Martti Veldi (Estonian University of Life Sciences | Tallinn University) – Tuuli Kurisoo (Tallinn University) – Maria Smirnova (University of Tartu) – Ulla Kadakas (Estonian History Museum) – Valter Lang (University of Tartu)
Format: Oral

Since metal detecting was legally regulated in Estonia in 2011, tens of thousands of finds have been reported and handed over to the National Heritage Board by hobby enthusiasts. Most of these finds originate from fields that have been intensively cultivated for centuries, suggesting that the context of most discoveries is too fragmented for systematic scientific analysis. Consequently, such finds have often been dismissed by professional archaeologists as unsuitable research material. Metal detecting as a hobby also continues to carry a contested reputation among archaeologists due to its perceived association with the black market in antiquities. This paper examines how the knowledge accumulated through metal-detected finds can broaden our understanding of the past when approached through landscape archaeology, historical GIS, and diverse fieldwork techniques, including engagement of hobby detectorists and local landowners. We analyse concentrations of stray finds within their landscape context and seek to understand their position within settlement patterns in relation to other archaeological sites. The paper focuses on three main site types commonly associated with finds from cultivated fields: graves, settlement sites, and hoards. We aim to demonstrate that, despite their disturbed contexts and fragmented documentation, both the finds and the sites themselves contain valuable information about

the past. Such material should not be disregarded as research data, as it continues to form an essential part of landscape history and the archaeological heritage.

233 SOCIAL FOODWAYS IN ARCHAEOLOGY AND BEYOND

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Ester Oras (Archemy Lab | University of Tartu | Swedish Collegium for Advanced Study) – Alice Toso (Bonn Center for ArchaeoSciences | University of Bonn)
Keywords: Social foodways, Diet, Biomolecular archaeology, Bioarchaeology, Material culture studies, Archaeological theory
Format: Regular session

SESSION ABSTRACT

Food has long been central to archaeological and anthropological investigations. Traditionally, diet has served as evidence for past economies, subsistence practices, and environmental change. Increasingly, however, foodways are recognised as embodied cultural practices through which individual and collective identities are made and contested. Age, sex, social status, religion and provenance can dictate what people eat at both individual and group levels. Food fulfils basic physiological needs, yet also carries social meanings, distinguishing everyday staples from special-occasions' consumption. Personal preferences, metabolic needs, and life histories further contribute to the dietary patterns beyond economic context or environmental constraints. This session brings together multiple ways of analysing and understanding social foodways - across material culture studies, bioarchaeology, biomolecular research - anchored in theoretical reasoning. We particularly encourage synergetic cross-disciplinary and -conceptual frameworks that integrate diverse datasets and proxies (e.g. archaeobotany, zooarchaeology, ceramic use-wear and residues, isotopes, proteomics), methodologies, and that operate across scales from molecules to meals to meanings. We invite contributions from archaeology, natural sciences, history, anthropology and ethnography from any region and period.

CONTRIBUTION ABSTRACTS

1059. Beyond Subsistence. Bone Breakage as a Cultural Foodway Practice in Cantabrian Magdalenian Societies

Authors: Rodrigo Portero Hernández (Universidad de La Rioja)
Format: Oral

Research on Magdalenian subsistence in the Cantabrian region has traditionally emphasised hunting strategies, carcass transport and nutritional optimisation. However, zooarchaeological and taphonomic analyses reveal that the systematic fracture of red deer bones for fat and marrow extraction constituted not only an economic behaviour but also a culturally embedded culinary practice. This paper explores bone breakage patterns from several Lower Magdalenian levels in northern Spain, focusing on the spatial distribution of percussion marks, the recurrence of specific technical gestures and the selection of skeletal elements with high medullary value. Quantitative data show a strong correlation between anatomical representation and marrow utility index, suggesting deliberate selection, transport and delayed consumption of fat and marrow rich elements. The repeated use of hammerstone and anvil techniques, the presence of counterblows, and the consistent localisation of impact notches on long bones indicate a shared operational sequence that endured over time. These behaviours, visible at the macroscopic and microscopic scales, reveal more than technological efficiency. They point to the embodied culinary knowledge of Magdalenian groups, who transformed animal carcasses into food resources and long-term energy reserves through systematic practices that followed shared sociocultural patterns. Interpreted through the lens of social foodways, these bone fracture patterns reflect learned practices, collective traditions of handling animal resources and subtle forms of social organisation around food processing. This study thus situates marrow extraction within a broader cultural framework, showing how Magdalenian communities shaped their dietary choices not only according to environmental constraints but also through socially transmitted culinary behaviours that structured identities and routines.

47. From Mammoth to Berries: Reconstructing Foodways in central Alaska over the last 15,000 years through Isotopic, Zooarchaeological, and Paleobotanical evidence

Authors: Briana Doering – Cinthia Campos-Hernandez – Haley Purifoy (University of Wyoming)
Format: Oral

Archaeologists have long focused on the role of large game in the diets, daily lives, and traditions of past North Americans. These animals not only leave large bones at archaeological sites, they are also associated with projectile point technology that is easily identified, and glorified, by archaeologists. Traces of plants and small game, such as fish and birds, are comparatively difficult to find, thus archaeologists have overlooked these resources, particularly in the Arctic. Traditional knowledge and ethnographic accounts both highlight the importance of resources such as salmon, migratory waterfowl, and berries to traditional foodways. Through an analysis of 30 central Alaskan cooking features or hearths from museum collections, we consider how a mixed-methods approach that combines archaeo-faunal, botanical, and isotopic data can reveal detailed changes in traditional cooking practices among past

Dene Athabascans. Changes in fuels can be related to resources cooked, and these data can in turn be compared to climatic and demographic change in the region. Expanding the potential "menu" in this way can help archaeologists to better understand how food relates to broader social and environmental shifts in the past.

2188. Faunal Remains from the Middle Neolithic Site of Luadisht (Albania): Subsistence and Animal Exploitation

Authors: Viktoria Fries (University of Cologne) – Edlira Andoni (Albanian Institute of Archaeology) – Jana Anvari (Flinders University) – David Orton (University of York) – Patrick Willett (Vrije Universiteit Brussel)
Format: Oral

The Korça Plain in eastern Albania is a fertile intermontane basin whose proximity to Lake Ohrid, Lake Prespa, and the palaeolake Maliq has made it an attractive settlement area throughout prehistory. The Middle Neolithic site of Luadisht, excavated by the Korça Neolithic Project in 2023 and 2024, has yielded a diverse assemblage of material culture, including pottery, figurines, lithic tools, botanical remains, and faunal material. Archaeological features identified at the site include a ditch which probably surrounded the settlement, building debris, and several pits. Faunal remains from archaeological sites highlight the importance of animals as resources for the diet of prehistoric people. Despite significant preservation issues resulting in a highly fragmented assemblage and a limited number of identifiable specimens, the faunal remains provide valuable insights into subsistence strategies at the site. Preliminary results indicate a strong reliance on livestock herding in the immediate vicinity of the settlement, with ovicaprines and cattle playing a central role, alongside domesticated pig. The presence of dog remains further suggests a close relationship between humans and animals beyond economic exploitation. Wild mammals such as red deer, wild boar, hare, and fox are present but occur in considerably lower frequencies, suggesting a secondary role for hunting. In addition to dietary practices, the assemblage attests to the use of animal bone as a raw material, evidenced by several worked bone artefacts. The identification of turtle remains and water birds further points to the exploitation of wetland and lacustrine environments associated with the palaeolake Maliq. Given the limited zooarchaeological research on Neolithic sites in this region, the analysis of the Luadisht faunal assemblage contributes important new data on herding practices, resource exploitation, and human–environment interactions in the Neolithic Balkans.

1044. A multidisciplinary approach to reconstructing prehistoric cheese-making in the Alpine region

Authors: Luise Tiemann (Ludwig-Maximilians-Universität)
Format: Oral

Early research on prehistoric dairying in the Alps often relied on analogies with modern mountain pastoralism, as Alpine cheese today forms an important part of cultural identity in this region. In my talk, I distinguish between these recent perceptions and the narratives revealed by the archaeological record. To develop a concept of prehistoric cheese-making, a multidisciplinary approach is required in order to address the various aspects of this practice. Dairying and dairy consumption were integral to the economy, culture, and social organisation of the prehistoric Alps and must therefore be considered as part of a broader, interconnected system. Although most people were lactose intolerant in prehistoric times, multiple lines of evidence attest to the considerable investment involved in dairying. Archaeozoological evidence allows for the identification of the animal species exploited and their significance for milk production. When combined with isotopic analyses and archaeobotanical data, it also enables inferences about herding strategies and their social organization. Finally, the identification of milk residues in specific vessel types and archaeological contexts allows the reconstruction of differences in access, use, and consumption of dairy products within society. All of these approaches converge within the archaeological context, where they can be interpreted in relation to the technical, economic, and social dimensions of prehistoric cheese-making. This talk presents current research questions and offers new insights from Alpine case studies by integrating multiple methods and interdisciplinary perspectives.

915. Broomcorn Millet Introduction into Bronze Age Central Europe: Insights from Paleoproteomics Analysis of Dental Calculus

Authors: Marine Morvan – Giedrė Motuzaitė Matuzevičiūtė (Vilnius University)
Format: Oral

Paleoproteomics enables the identification of consumed food items through the analysis of dental calculus, offering a direct window into past diets. While milk proteins have been extensively investigated, plant proteins have so far received comparatively limited and often opportunistic attention. Here, we present a novel interdisciplinary methodology applying paleoproteomics to explore the occurrence of broomcorn millet (Panicum miliaceum) proteins in dental calculus from Bronze Age populations in Central Europe, including individuals with and without isotopic evidence for C4 plant consumption. Biological sex was also assessed through paleoproteomics analysis of sex-specific proteins in dental enamel, allowing dietary patterns to be explored in relation to individual biological profiles. This approach allows the investigation of millet consumption at the individual level and complements multi-isotope analyses alongside contextual archaeological evidence. Our results provide new perspectives on the introduction and adoption of millet in Central Europe and support the reconstruction of dietary practices at both individual and community scales. Paleoproteomics represents a minimally destructive analytical approach that contributes to the preservation of archaeological material, while emphasizing the need for further research into protein taphonomy and dietary representativeness. When integrated with other archaeological and biomolecular methods, this approach offers a robust interdisciplinary framework for exploring Bronze Age

foodways, particularly in contexts where millet consumption was limited, episodic, or isotopically undetectable.

1779. From Grains to Porridge: Interdisciplinary Archaeobotanical Evidence from a Late La Tène Domestic Context at Șimleul Silvaniei (Romania)

Authors: Ciuta Beatrice (1 Decembrie 1918 University from Alba Iulia)
Format: Oral

This paper presents an interdisciplinary archaeobotanical analysis of processed cereal food remains recovered from a Late La Tène domestic context at Șimleu Silvaniei (north-western Romania). The material consists of compact, amorphous charred lumps found in association with a domestic fireplace and interpreted as the remains of a cereal-based porridge rather than baked products. This interpretation is based on the integration of archaeobotanical observations with microstructural and compositional analyses, including high-resolution digital microscopy and SEM–EDS. The remains display a dense cereal matrix with fragmented caryopses, lack vesicular porosity, and show no evidence of crust formation, features consistent with boiled cereal preparations. By combining micro-scale analytical data with archaeological context, this study moves from molecules to meals, reconstructing everyday food preparation practices within a Late La Tène community. Rather than addressing diet solely as a subsistence indicator, the paper situates cereal porridge within broader social foodways, highlighting routine domestic consumption and embodied culinary practices. The results demonstrate the value of interdisciplinary approaches for identifying processed plant foods and contribute to discussions on daily food practices in later prehistoric Europe.

2229. Insights into culinary practices at Stare gmajne pile-dwelling site (Slovenia, late 4th millennium BC): A multi-methodological study of organic residues

Authors: Ines Nabernik Bošnjak – Lara González Carretero – Oliver Craig (BioArCh, University of York) – Elena Leghissa (Institute of Archaeology, ZRC SAZU) – Alexandre Lucquin (BioArCh, University of York)
Format: Oral

The waterlogged site of Stare gmajne (Ljubljansko barje, Slovenia), dated to the second half of the 4th millennium BC, represents an exceptionally well-preserved archaeological context that has enabled extensive investigation of organic material. This paper presents the results of a state-of-the-art analytical approach applied to selected ceramic vessels with preserved foodcrust remains. The case study combined high-resolution digital microscopy and scanning electron microscopy (SEM) with biomolecular approaches, including lipid residue analysis and bulk stable isotope analysis. Both absorbed organic residues from the internal ceramic matrix and charred organic deposits adhering to vessel surfaces were analysed to reconstruct vessel use and culinary practices. The results indicate that the main components processed in the analysed vessels were mixtures of freshwater and plant-based resources, particularly cereals and underground storage organs. Possible evidence for dairy processing was identified in only a single vessel, while a small number of samples revealed the presence of ruminant adipose fats. Microscopically analysed foodcrusts showed a strong presence of plant remains, confirming the fundamental role of domesticated and wild vegetal resources in food preparation, whilst freshwater fish oils dominated the lipid profiles. Comparisons between absorbed residues and foodcrusts also reveal differences in vessel use over the lifespan of the vessel. Notably, this study provides the first evidence for the use of coniferous resin at a pile-dwelling site in Slovenia. These findings contribute new insights into food processing, resource exploitation, and pottery use among Copper Age lakeshore communities in the southeastern Alpine region.

1901. Creolisation and Cuisine: Multi-Proxy Evidence of Dietary Variability and Cultural Mixing at the Romano-Byzantine Fortress of Ibida, Romania

Authors: Mackenzie Masters (University of York | Vrije Universiteit Brussel) – Andrei Soficaru (Romanian Academy) – Malin Holst (University of York | York Osteoarchaeology Ltd.) – Jane Evans (British Geological Survey) – Michelle Alexander (University of York)
Format: Oral

This study presents the largest (n=119) multi-isotopic analysis (C, N, S, Sr, O, Pb) of any Roman period site from the region and a novel approach to integrating multi-proxy evidence (archaeothanatology, osteology, isotope analysis, bioarchaeology) to investigate variable dietary practices evident across three unique mortuary contexts. The mortuary landscape at the Romano-Byzantine (1st-7th c. CE) fortress Ibida (Romania) is extensive, comprising a commingled high-status tomb (MNI=39), a general necropolis (n=161), and M141, a commingled secondary multiple burial representing a suspected 'massacre of outsiders' (MNI=37). This site offers the opportunity to investigate coalescing populations and how this manifests in dietary practices along the lowest extent of the Danube Limes frontier. Funerary practices across the site represent both Romano-Christian and Pagan traditions as well as variable social status representation. This, coupled with the presence of individuals with artificially modified crania suggest a highly creolised community. Isotopic analysis identifies distinct dietary histories, suggesting distinguishable subsistence strategies and/or cultural identities between mortuary groups, with the M141 individuals consuming C4 foods (millet), contrasting the C3-dominant diet of individuals in the high-status tomb and necropolis. Further, lead isotope concentrations present a possible cultural divide with the high-status group presenting elevated anthropogenic values (ppm>0.5), suggesting long-term Roman cultural influence. While sulphur, strontium and oxygen isotopes identify potential non-locals across all contexts, suggesting an intermixed local and non-local community. The assessment of the different contexts exposes a range of dietary, mobility, and funerary practices at Ibida,

underscoring the fluid human experiences of the Roman frontier and how these can be observed via foodways.

1381. Foodways and Craft Production – Zooarchaeological and Isotopic Insights on Social and Political Strategies at Sialupe, Peru (900-1100 CE)

Authors: Aleksa Alaica – Luis Manuel Gonzalez La Rosa (The University of British Columbia) – Izumi Shimada (Southern Illinois University—Carbondale)
Format: Oral

Andean foodways were influenced by a range of ecozones. Moving between coastal and highland regions, communities have been sharing resources up and down the "vertical archipelago" for millennia facilitated by long-distance kinship networks. Even in arid environments, biodiverse landscapes allow for the management of a range of animal species. On Peru's arid north coast, during the Middle Sican period (900-1100CE), communities were dedicating daily and long-term tasks to the care and husbandry of camelids, dogs, and guinea pigs. In addition, wild species such as deer, marine birds, and Pacific fish were contributing to subsistence strategies through hunting and opportunistic collection. In this paper, we mobilize zooarchaeological and isotopic datasets to shed light on the population structures for wild and domesticated species. We employ these datasets to elucidate the social and political strategies involved in the acquisition, distribution, and access of food sources. As a key site of multi-craft production (pottery making and metalworking), we interpret preliminary results from Sialupe through the perspective of flexible subsistence and management practices in place during a pivotal time in the Andean past, when shifting social relationships demanded nimble strategies to mitigate local community interactions and nonlocal pressures from Moche and Wari political spheres.

2301. From Status to Staples: Diet and Inequality in Medieval Flanders, First Results from Ypres

Authors: Patxi Ramallo (AMGC Research Group, Vrije Universiteit Brussel | SHOC Research Group, Vrije Universiteit Brussel | Max Planck Insitute of Geoanthropology, Jena) – Antonio Delgado-Huertas (Andalusian Earth Sciences Institute, CSIC and Universidad de Granada) – Martijn Jacobs (AMGC Research Group, Vrije Universiteit Brussel | SHOC Research Group, Vrije Universiteit Brussel) – Barbara Veselka (AMGC Research Group, Vrije Universiteit Brussel) – Charlotte Van Riet (AMGC Research Group, Vrije Universiteit Brussel | SHOC Research Group, Vrije Universiteit Brussel) – Lucy Koster (AMGC Research Group, Vrije Universiteit Brussel) – Nicole Pouliart (Faculty of Medicine and Pharmacy, Vrije Universiteit Brussel, Brussels Belgium | Department of Orthopaedics and Traumatology, Universitair Ziekenhuis Brussel) – Steven Provyn (Faculty of Medicine and Pharmacy, Vrije Universiteit Brussel, Brussels Belgium) – Christophe Snoeck (AMGC Research Group, Vrije Universiteit Brussel) – Bart Lambert (SHOC Research Group, Vrije Universiteit Brussel)
Format: Oral

Re-urbanisation in western Europe from the 11th century onwards reshaped medieval society, generating new legal categories, privileges and forms of status. Across the following centuries, expanding towns concentrated labour and differentiated social strata in ways that also produced pronounced inequalities in wealth, rights and access to food. Medieval Flanders, one of the most densely urbanised regions of western Europe after northern Italy, offers a powerful laboratory to explore how rapidly growing cities provisioned themselves, and how social difference was embodied in everyday diets. Yet the written record is socially and gender biased, privileging elites and institutions; this project therefore sets isotopic evidence against historical narratives, testing what documentary sources imply and what they leave invisible. Diet is used as a key proxy to investigate inequality and adaptation through time, by status, sex, age and health, with particular attention to the 14th century crisis marked by famine and successive plague waves. We present stable isotope analysis of bone collagen (δ13C, δ15N and, crucially, δ34S) to reconstruct the balance between terrestrial and aquatic proteins and refine the detection of marine provisioning. A central aim is to assess whether isotopic signals are consistent with an expanding contribution of marine resources from the late 11th-12th centuries onward, and whether access to fish functioned primarily as prestige consumption or as a scalable alternative beyond elites. Focusing on a wider Flemish urban network, this paper presents first results from Ypres, discussing temporal shifts together with preliminary patterns by sex, age and archaeological context, as a first step toward reconstructing resilience and vulnerability in medieval urban foodways across a long chronological frame.

585. Weaning, childhood diet and inequality in Medieval Estremoz (Portugal)

Authors: Ana Curto – Anne-France Maurer (HERCULES Laboratory, University of Évora)
Format: Oral

Recent bioarchaeological research on the medieval population of Estremoz (13th–15th centuries, Portugal) has documented relatively low frequencies of skeletal indicators of physiological stress, homogeneous adult dietary patterns, and no clear evidence of differential treatment of individuals with physical impairments at the population level. While these findings suggest favourable living conditions and sustained access to resources, they are based primarily on adult skeletal and isotopic data. This study aims to investigate childhood dietary patterns in Estremoz, from which we already have adult diet data, with particular attention to potential differences related to sex and to physical impairment. Such differences may reflect differential care, gendered practices, or early-life inequalities that are not detectable through adult data alone. The study integrates incremental stable isotope analysis ($\delta^{13}C$ and $\delta^{15}N$) of dental tissues with osteological indicators of childhood stress, including linear enamel hypoplasia and growth disruption,

to reconstruct early-life dietary trajectories. By extending the analytical focus to infancy and childhood, this research provides a necessary complement to existing studies of health, diet, and impairment in medieval Estremoz. More broadly, it contributes to discussions on early-life conditions, care, and social organisation in past populations, highlighting the importance of childhood dietary evidence for understanding long-term health outcomes.

801. Elucidating Childhood in Late Medieval Vilnius: Diet, Sex, and Identity

Authors: Ruta Brindzaite – Jorūnė Sakalauskaitė (Vilnius University) – Rytis Jonaitis – Irma Kaplūnaitė (Lithuanian Institute of History)
Format: Oral

Our study presents an integrated bioarchaeological and archaeological analysis of nonadult individuals from the Bokšto Street 6 burial ground, the earliest known urban Christian cemetery in Vilnius (13th-15th centuries). The paper explores how childhood diet intersected with age, sex, and identity in the Grand Duchy of Lithuania. Stable isotope analysis of carbon and nitrogen, palaeoproteomic sex determination, palaeopathological assessment, and contextual analysis of grave goods are combined to examine dietary practices as embodied experiences shaped by social and cultural factors. We present the first application of palaeoproteomic methods for determining the biological sex of non-adult individuals from this region and period. By targeting enamel proteins, the focus was on amelogenin peptides (AMELX and AMELY). It was applied to deciduous and permanent teeth of individuals under 18 years of age, enabling reliable sex identification when osteological methods were inconclusive. These results were assessed alongside associated grave goods, revealing patterns that challenge normative sex-based expectations. Stable isotope data further indicate variability in plant consumption, with at least two individuals exhibiting dietary patterns distinct from the rest of the population during childhood or adulthood. These differences point to non-uniform childhood foodways and highlight the role of individual life histories and social differentiation within the early urban Christian community. Overall, the study contributes to broader discussions of understanding diet, identity, and childhood in late medieval urban contexts.

2738. Cacao and Chocolate as Living Heritage in El Salvador

Authors: Kathryn E Sampeck (University of Reading) – Estelle Praet – Danny Zborover – Rebecca Stacey (British Museum)
Format: Oral

Chocolate is now a global commodity for which increased demand leads to unsustainable cacao production practices, posing ethical and environmental threats for cacao growing areas. Domesticated in South America and widely used across Mesoamerica for at least 4000 years, cacao was used and processed in many diverse ways across space and time, mirroring distinct cultural traditions. In addition, three different cacao species (Theobroma cacao, Theobroma bicolor, and Theobroma grandiflorum) have been used and consumed across the Americas, sometimes even prepared together, as in the Izalcos region in El Salvador. The area is historically known for its original chocolate recipe which represents an intangible living heritage for Izalcos communities. However, archaeological evidence of cacao has often been reduced to the identification of theobromine as the ultimate biomarker of chocolate, masking the complexity of different recipes. This paper will present: 1) results from organic residue analysis (ORA) of an ethnographic chocolate pot from a Chontal community in Oaxaca (Mexico) and of vessels from archaeological contexts in Rio Ceniza Valley (El Salvador), revealing the complexity of identifications, and 2) interpretations derived from community engagement workshops in Izalcos on cacao growing, harvesting and processing to make the original chocolate recipe. The paper ultimately offers a reflection on the role of ORA in reconstructing diverse Indigenous food traditions, while advocating for the need multiple lines of evidence to grasp the nuance and complexity of cacao-based and chocolate recipes in Mesoamerica in the past and the present.

960. Plants, Animals, and Lagoon Resources: An Integrated Study of Etruscan Badia Vecchia

Authors: Claudia Moricca (Sapienza University of Rome) – Mirko Fecchio (University of Padua) – Eleonora Cerafogli – Elena Villani (Sapienza University of Rome) – Valerj Del Segato (University of Pisa) – Camilla Colombi (German Archaeological Institute, Rome)
Format: Poster

This paper presents an integrated archaeobotanical and zooarchaeological study from the Etruscan site of Badia Vecchia, near Vetulonia (Grosseto, Italy), conducted within the framework of the Prile Project. Although the recovery of charred plant remains was limited, the combined application of carpology, anthracology, and zooarchaeology provides a nuanced reconstruction of human–environment interactions in a lagoon-influenced landscape. Archaeobotanical evidence suggests the central role of cereals in the diet, while charcoal analysis reveals the exploitation of fruit-bearing and riparian trees, informing on both subsistence strategies and fuel selection. Zooarchaeological data indicate a well-structured animal economy dominated by sheep, primarily exploited for secondary products, alongside cattle used for traction and pigs raised for meat. Hunting and fishing activities, documented through wild fauna and aquatic species, further underline the diversified exploitation of local resources. Crucially, the integration of faunal and botanical datasets highlights consistent signals of humid environmental conditions linked to the nearby Prile lagoon. To address the limitations posed by the scarcity of macroremains, recent coring campaigns for palynological analysis aim to contextualize the site within its broader paleoenvironmental framework and to trace landscape dynamics over time. This case study demonstrates how interdisciplinary protocols and complementary datasets can overcome taphonomic biases and enhance the interpretative potential of archaeobotanical research, offering a model for studying complex coastal and wetland environments in protohistoric contexts.

1410. Dining at the Great Settlement Shang: Everyday Meals, Ordinary People and Urbanism at Yinxu, Late Shang China (ca. 1250-1046 BC)

Authors: Mengyang Wu (Institute of Archaeology, Chinese Academy of Social Sciences)
Format: Poster

Scholarly understandings of Yinxu, the last Shang capital, have long concentrated on elite narratives, with the everyday lives of its non-elite population largely overlooked. This study recenters ordinary people by examining the daily practice of eating at the neighborhood level, arguing for a more integrated model of early urbanism that acknowledges the dynamic interaction between bottom-up, generative processes and top-down, institutional forces. Through stable carbon and nitrogen isotope analysis of human skeletal tissues with contrasting turnover rates, this work shifts the focus from static dietary reconstruction to a life-course perspective, capturing both intra-population variation and dietary persistency. Our results reveal a stable, intensifying millet-based food system as the emergence of the Late Shang. Crucially, we demonstrate significant dietary variation linked to social identity, providing the first isotopic evidence for distinct nutritional patterns among sub-adults and specialized individuals. Sampling bones with fast and slow turnover rates offers novel insights into dietary changes during the often-neglected life stage of emerging adulthood. Furthermore, the differential diets of identified artisans and soldiers underscore the role of esoteric knowledge and skill mastery in shaping identity, with discussions of sex and burial evidence illuminating the interplay between craft specialization and gender inequality.

1465. Feeding the Garrison: Isotopic and Zooarchaeological Evidence from the Military Hospital at the Castle of São Jorge (17th-18th centuries, Lisbon)

Authors: Jéssica Manuel Paes – Nelson Almeida (University of Évora) – Carina Leirião (CIAS) – Anne-France Maurer (HERCULES Laboratory) – Susana Henriques (Cidehus) – Liliana Carvalho – Sofia Wasterlain (CIAS) – Ana Curto (HERCULES Laboratory)
Format: Poster

This study presents dietary data from 50 individuals buried in the military hospital of the Castle of São Jorge (Lisbon, Portugal), dating to the 17th and 18th centuries. This site represents a key landmark in post-medieval Lisbon, closely associated with the Restoration War (1640 – 1668). The main objective is to estimate the diet of the soldiers, prisoners, and hospital workers buried in the hospital necropolis, while also exploring meat consumption practices and possible differences in diet based on age at death. Preliminary faunal results show an assemblage of over 14.000 remains, composed largely by malacofauna with a prevalence of common cockle. Nonetheless, mammals likely represented the primary contribution to dietary protein intake, mainly caprines, followed by cattle and pig. Additional food resources included fish and avifauna, where chickens are well represented. Rib samples from 50 human individuals were analysed for carbon (δ13C) and nitrogen (δ15N) isotopes using Isotope Ratio Mass Spectrometry (IRMS). The human isotope results were compared with those obtained from faunal remains to provide a comprehensive picture of the animal resources exploited for consumption. These data were further integrated with the zooarchaeological and taphonomic analysis of food refuse associated with the hospital kitchen area.

1893. What the food? Isotopic insights into early medieval Dobrovíz (Central Bohemia)

Authors: Nicol Polakovičová – Lucia Krnáčová (National Museum | Department of Anthropology and Human Genetics, Charles University) – Zdeněk Vytlačil – Sylva Drtikolová Kaupová (National Museum) – Jan Frolík (University of Pardubice)
Format: Poster

Rescue excavations at Dobrovíz (Central Bohemia) uncovered 15 graves dated between the 9th and 12th centuries AD. Concentration of ceramic vessels, animal bones, and heating stones in the ditch accompanying the cemetery suggests a connection with the food-related activities, including commemorative or post-funerary gatherings, as well as a potentially significant role of food at the site. As the overall archaeological record provides only limited insight into the community represented at the site, a complex bioarchaeological approach was employed Long-term dietary patterns and variability within the group were assessed through stable carbon and nitrogen isotope analysis performed on bone collagen from 14 individuals, further supported by mobility analysis using 87Sr/86Sr ratios from their tooth enamel and a thorough osteological assessment. Of a particular interest is a distinctive individual, characterised by exceptional stature and robust skeletal features indicative of high physical activity, who also shows evidence of compromised health, reflecting a combination of physical stress and disease. This combination of archaeological, isotopic, and osteological analyses highlights how a multidisciplinary approach can deepen our understanding of the social identity of an individual from the past, particularly in unusual contexts with limited archaeological data.

1906. Embodied Diets: Physiological Stress, Chronic Disease, and the Biocultural Interpretation of Stable Isotope Data

Authors: Lucia Krnáčová – Nicol Polakovičová (National Museum | Department of Anthropology and Human Genetics, Charles University) – Zdeněk Vytlačil – Sylva Drtikolová Kaupová (National Museum)
Format: Poster

Stable isotope analysis is widely used to reconstruct past diets, yet interpretations often assume a direct relationship between consumed foods and isotopic values in human tissues. The potential effects of chronic illness and long-term physiological stress on these biochemical signals, however, remain insufficiently explored, posing challenges for bioarchaeological approaches that seek to understand foodways as embodied and socially differentiated practices. Using a documented skeletal collection from 19th-21st century Bohemia, this study investigates intra- and inter-individual variability of δ13C and δ15N values in relation to disease and physiological imbalance. Using data from 100 individuals, isotopic signatures of short- and long-term metabolic changes are investigated through differences between skeletal elements (rib and femur bone) with different turnover rates. A potential relationship between certain conditions (such as metastatic cancer) and bone isotopic values is suggested, which emphasises the need for increased caution when working with skeletal material from affected individuals. This perspective frames foodways as biocultural processes, where the physiological condition of the body may shape how biomolecular evidence of diet is formed and interpreted.

1989. Mobility, Meals, and Millet: Isotopic Insights from Migration Period Mušov (Moravia)

Authors: Sylva Drtikolová Kaupová (National Museum) – Nicol Polakovičová – Lucia Krnáčová (National Museum | Charles University) – Zdeněk Vytlačil (National Museum) – Zuzana Loskotová (Institute of the Archaeology of the CAS Brno)
Format: Poster

Transient Lombard occupation of South Moravia (CZ) during Migration period represents a particularly interesting episode. Nevertheless, the study of the major burial site at Mušov, uncovered during a rescue excavation between 2022 and 2024, is severely hindered by recurrent waterlogging resulting in extremely poor preservation of skeletal remains. This substantially limits the potential of traditional bioarchaeolgical logical analyses, making isotope analysis one of the few viable approaches for reconstructing individual life histories. The comprehensive sampling of the site resulted in a total of 132 samples for strontium isotope analysis and 115 samples for dietary analysis using stable carbon and nitrogen samples. The mean δ15N value was 9.3 ± 0.8‰, while the mean δ13C value was –19.2 ± 1.1‰. These values, and their comparison with a local faunal baseline dataset, suggest a predominantly terrestrial diet with no substantial contribution of millet at the population level. However, several outliers indicate a marked dietary input of C4 plants. Additionally, apart from multiple non-local outliers, measured 87Sr/86Sr ratios display unusual grouping hinting at potential mobility obscured within the estimated local range. The results are discussed in relation to known biological and social parameters of the buried individuals, as well as within the broader chronological and geographical context of the site.

2507. Of salt, meat, and grave goods: Proteomic investigations of ceramics from Halstatt, Upper Austria

Authors: Manasij Pal Chowdhury (Department of Evolutionary Anthropology, University of Vienna) – Georg Tiefengraber (Naturhistorisches Museum Wien) – Leila Afjehi-Sadat (Research Support Facilities- Mass spectrometry Unit, University of Vienna) – Katerina Douka (Department of Evolutionary Anthropology, University of Vienna)
Format: Poster

Over the last three decades, organic residue analysis has played an important role in the investigation of ancient diet, mostly via the identification of lipid remains trapped in unglazed ceramic vessels. On the other hand, proteins, although able to provide improved taxonomic specificity as compared to lipids, as well as being better suited for identifying important lipid-poor resources like cereals, have been relatively underexplored in this context, due to them being more liable to degradation as compared to lipids. Indeed, only a handful of reports of protein extraction from archaeological ceramics exist, with a majority of the reports focusing on sites with exceptional preservation. However, more recently, proteins have been identified from ceramic fragments belonging to more typical burial environment, and novel and improved extraction techniques focusing on protein extraction has been introduced. The present work analyses archaeological ceramics obtained from the famous salt-mining site of Halstatt in Upper Austria, which also includes an eponymous Iron Age burial ground containing over 2000 burials. In the mine, the salt has resulted in excellent preservation of a large number of organic materials, including textiles, wood, and leather. The ceramics, which included graphite clay pots presumably involved in the preparation of a concentrate from the residue left after salting of meat products, and grave goods from the Iron Age burial ground, were subject to protein extraction using a urea-GuHCl deep eutectic solvent (DES), and the resultant proteins were analysed using liquid chromatography- tandem mass spectrometry (LC-MS/MS) after enzymatic digestion. The proteins thus identified allowed us to directly determine the usage of the ceramic vessels and identify their contents, furnishing us with valuable information regarding the exploitation of various resources by humans in one of the most important Bronze and Iron Age sites in Central Europe.

234 MATERIALITY AND MEANING OF WOMEN'S CRAFTS IN PRE-MODERN SOCIETIES: A DIACHRONIC DISCUSSION ABOUT AGENCY, IDENTITY, AND PRACTICES

Theme: 1. Widening perspectives in material culture studies
Organisers: Ludivine Capra (Université de Strasbourg) – Alexandre Beaudet (Université Laval) – Julia Fileš Kramberger (University of Zagreb) – Ana Senar Sarrat (Universidad de Salamanca)
Keywords: Crafts, Women, Materiality, Identity, Agency, Mediterranean worlds
Format: Regular session

SESSION ABSTRACT

In recent historiography and archaeology, there has been a marked interest in craftspeople and their identities and socio-economic realities. This trend is combined with the progress of studies on gender and women, which has allowed us to consider women's craft activities and, more broadly, their presence and roles in this socio-economic sphere. Despite recent progress, particularly in funerary and textile archaeology, it is a field of research in which we still have many areas to explore and enrich our understanding of ancient societies. However, this is a difficult subject to approach due to the nature of material evidence and it's relation with craftspeople. We therefore propose this session to bring together researchers examining women's craft practices and to deepen our understanding of their identities and agency through the materiality and meaning of these activities, including artefacts and gestures. Our research questions should consider, but are not limited to, craft representation, tools and their context, waste, but also workspaces, as well as traces on objects and traces on human remains (work-related illnesses, for example). These objects should be regarded as valid testimonies of past societies, as they carried their own biographies, reflecting local traditions, movement of people and ideas, and social relationships. For example, tools offer insight on their production, but also on their symbolic meaning when deposed in graves or posthole or wrought in prestigious material. We thus seek to analyze any form of female artisanal activity across a wide variety of archaeological settings. The purpose of this session is to review the current state of research on this topic, share questions, difficulties, and advances. We deliberately encourage an interdisciplinary and diachronic approach to enrich the dialogue with comparisons and methodological exchanges. Accordingly, we would like to invite papers focusing on women and their relation to crafts in pre-modern societies.

CONTRIBUTION ABSTRACTS

1106. A day in the life of a loom-weight

Authors: Janja Mavrovic Mokos – Julia Fileš Kramberger – Franka Ovčarić (Faculty of Humanities and Social Sciences, University in Zagreb)
Format: Oral

Loom-weights found in burial contexts are often seen as symbols of femininity and textile craft, and their number in such highly staged closed contexts does not necessarily reflect their use during the everyday life of a certain community. Nevertheless, finds of loom-weights within settlements imply their direct utilisation on a daily scale, giving depth to everyday women's activities. The nuance in the interpretation of such finds comes from closed, settlement contexts where rows of in situ weights imply the exact position of a weaving loom, while several groups of loom-weights in a single structure reveal organised production and possible specialised workshops. The picture is further broadened by large quantities of singular loom-weights found in settlement layers, but outside of closed contexts, and by objects traditionally interpreted as loom-weights found in contexts not associated with weaving, such as hearth surfaces. This paper discusses several examples of mostly pyramidal loom-weights of varying sizes found in different closed contexts within Late Bronze Age and Early Iron Age settlements in north-western Croatia. Among the more intriguing are different loom-weights found on hearths, in refuse pits and post holes, or on a smithing hearth. Also, the aim of this contribution is to show that traditional interpretation of such tools can be strengthened, or possibly questioned, based on the position of their discovery. Further examination, analysis and comparison of such finds in contexts helps distinguish societies' habits of daily improvised use, recycling, and discarding of every-day (weaving) tools. If weaving is viewed as a mainly female craft, and textile production implements as women's symbols, different find locations of loom-weights in archaeological contexts may shed light on how women might have interacted within a certain community and how their everyday life, activities and crafts might have left a mark on settlement remains in archaeological contexts.

2775. Activity-Related Skeletal Changes, Spindle Whorls, and Needles in Classic Maya Burials

Authors: Alizé Lacoste Jeanson (Universidad Nacional Autónoma de México)
Format: Oral

This communication presents the results of an analysis of more than 300 individuals buried at ancient Palenque-Lakamha' (Chiapas, Mexico), a major center in the Classic Maya Northern Lowlands. The study explores the relationship between activity-related skeletal changes (ARSCs)—understood as osteological consequences of biomechanical loading—and social identity as expressed in mortuary treatment. Classic Maya funerary practices display considerable variability, including differences in decomposition environments, container types, skeletal articulation, type of deposit, grave goods, and body position. Much of this diversity has been interpreted as representing distinct stages within broader mortuary sequences, in which the living re-entered burial contexts to perform post-inhumation rituals. In several burials, spindle whorls and needles were recovered. In contemporary Highland Chiapas communities, it remains customary to inter individuals with objects associated with their daily activities, such as tools linked to gendered labor like textile production. This ethnographic parallel raises questions about the meaning of such artifacts in Classic Maya mortuary contexts. By examining the distribution of ARSCs potentially associated with repetitive movements related to backstrap loom weaving and traditional embroidery, and comparing these patterns with the presence of textile-related implements in burials, this study evaluates whether such objects reflect ritual symbolism or habitual labor and socially constructed identities. Integrating osteological and contextual data provides a more nuanced understanding of the relationship between embodied labor, material culture, and mortuary practices in ancient Maya society.

852. Women and Craft Service in the Frankish World (6th–10th Centuries): A Transdisciplinary Approach

Authors: Alexandre Beaudet (Université Laval | Université du Québec à Chicoutimi)
Format: Oral

Early medieval charters and polyptychs frequently depict women in contexts of unfreedom, owing services related to textile production. This is particularly evident in regions where the manorial system was more highly developed. Law codes likewise often refer to unfree women as textile workers or as being attached to various forms of domestic service. The historiography on this subject is substantial; however, recent archaeological research has shed new light on the material conditions associated with unfreedom and personal service. Burial practices are especially revealing. Graves are frequently found outside formal necropolises and cemeteries, often in connection with farms or manorial courts (curtes). These funerary patterns point to a range of social dynamics, frequently linked to family structures and land-use practices. However, in some cases the burial groups appear to correspond to service communities with a marked overrepresentation of women and young individuals. This pattern is particularly evident when graves are located in artisanal zones or near storage concentration. A few sites even suggest evidence of violent treatment and work-related illnesses among these individuals. This contribution therefore aims to compare what can be learned about the condition of women engaged in craft service through a comparative analysis of three distinct corpora: charters, legal texts, and funerary archaeology.

397. Mediterranean signature and technological crossroads: an example of the singular textile assemblage of Early Iron Age Salamanca

Authors: Ana Senar Sarrat – Juan Padilla Fernández – Antonio Blanco González (Universidad de Salamanca) – Cristina Alario García (Independent researcher) – Carlos Macarro Alcalde (Salamanca City Council)
Format: Oral

The Early Iron Age settlement of Cerro de San Vicente (Salamanca, Spain) represents a pivotal node for understanding the socio-economic dynamics of the Northern Iberian Plateau and the westernmost end of the Mediterranean. This contribution explores the site's role in articulating exchanges between Atlantic and Mediterranean spheres, focusing on its specialized textile industry and the circulation of technical know-how. The archaeological record reveals a singular assemblage of textile tools, notably bone spindle whorls and crescent-shaped ceramic loom weights. These typologies indicate tangible links with Mediterranean influences, including the Valencian Bronze and the Argaric periphery. We argue that these items signify not just the trade of commodities, but the mobility of artisans and the transmission of specific crafting techniques. A central thesis of this presentation is that such interactions were facilitated by a multi-modal connectivity network. Beyond Phoenician maritime influence via Atlantic enclaves like Santa Olaia (Portugal), we emphasize the role of fluvial corridors—specifically Duero-Ebro axis—as primary arteries for inland penetration. Combined with transhumance routes, these waterways allowed Cerro de San Vicente to emerge as a dynamic hub where technological hybridity catalyzed a textile industry fundamental to the region's economic development.

1380. Spindles and Steeds: Craft, Mobility, and Cultural Networks in Early Iron Age Veneto

Authors: Ronak Alburz (University of Melbourne)
Format: Oral

Weaving tools deposited in female burials of Early Iron Age Padua reveal more than textile production: they indicate forms of ritual and social authority, positioning women as holders of symbolic power across the Upper Adriatic and western Pannonian regions. The occasional presence of grave goods signaling long-distance connections alongside these tools further points to women's role as mobile agents in the transmission of techniques and broader cultural practices. Given the underrepresentation of men in Padua's funerary record and the absence of warrior or elite male graves, these patterns raise questions about the social mechanisms through which new cultural forms—including the emergence of horse-related practices—were introduced. Drawing on a case study from Veneto, this paper explores how female mobility associated with textile production may have intersected with the circulation of horses, as horse burials appear contemporaneously with textile-associated female graves. By analyzing the spatial and material contexts of textile tools alongside objects of foreign origin, the study uses weaving as an interpretive lens to investigate broader processes of cultural change, linking craft production, human mobility, and the circulation of animals in Early Iron Age northern Italy.

2764. Women, Textiles, and Social Display in Bronze Age Southwest Asia: Agency from Workshop to

Wardrobe

Authors: Zahra Kouzehgari (CNRS – Université Lumière Lyon 2, Archéorient)
Format: Oral

Textiles were among the most consequential commodities of Bronze Age Southwest Asia (ca. 3300–2000 BCE), yet the archaeological visibility of textiles themselves is limited. This paper reconstructs the materiality of women's textile crafts through a synthesis of administrative texts and iconographic evidence, asking how women's labor in textile production shaped economic structures and how clothing practices materialized gendered status and identity. From Late Uruk and Jemdet Nasr seal imagery of female groups engaged in spinning and weaving to Ur III archives documenting large-scale institutional workshops, the evidence consistently associates textile manufacture with women's labor—organized in teams, hierarchies, and, in some cases, supervised by women holding administrative authority and seal use. At the same time, visual representations of dress (smooth mantles, kaunakes, striped/pleated textiles, tasselled and crossed-back garments) reveal how crafted textiles operated as technologies of social display within temple and court settings. By bringing together production records and the visual grammar of garments, the paper argues that textiles functioned as a medium through which women's craft practices were embedded in political economy and transformed into visible markers of role, rank, and belonging. The study contributes a diachronic perspective on women's agency as both producers and socially significant users of crafted textiles in pre-modern societies.

2774. Tangled Webs: Craft, Women's Labor, and Economy Agency in the Textile Industry of Classical Greece

Authors: Katherine Harrington (The University of North Carolina at Greensboro)
Format: Oral

Ancient Greek women engaged in myriad forms of labor throughout their lives, yet most studies of the ancient economy ignore or downplay the social and economic importance of that work, much of which was unpaid. This paper argues that the reliance of scholars of the ancient economy on traditional approaches to the modern economy—which strongly emphasize the role of the market—have contributed to the continued downplaying of the importance of women's roles in activities like care work, household management, craft production, and food production. Feminist economists, in contrast, have long sought to expose the importance of various forms of "invisible labor" that often fall to women in the modern world. This paper calls for a similar rethinking the ancient economy by recognizing the economic value of women's labor, its potential to scaled up to generate income, and the widespread participation of ancient Greek women in the market economy. I argue that the particular trajectory of the development of Classical Archaeology has "invisibilized" the critical social and economic contributions of women's craft production in ancient Greece. I will focus in this paper on textile production because of its strong association with women in the textual and visual records. In particular, I assert the critical role of material and archaeological evidence in illuminating women's economic agency in this craft by examining change through time in several case studies from Athens, Olynthos, and Nisi-Eleutherna.

2342. Women and Lead Craft in the West of the Roman Empire (1st-3rd centuries A.D.)

Authors: Ludivine Capra (Université de Strasbourg)
Format: Oral

Aurelia Vernilla, the only woman whose name is associated in her epitaph with the profession of plumbaria, lived in Dalmatia between 300 and 600 AD. In the western provinces of the Early Roman Empire, there is no mention of any plumbaria, yet several dozen women's names were stamped, once or several times, on lead pipes in Italy and Roman Gaul. Modern researchers do not all agree on how to interpret the presence of these feminine names on the craft products. What roles did the women in question play in the production of lead items? Were they plumbariae, i.e. manufacturers, or workshop managers supervising production, or were they workshop owners with a purely financial role? We will also look at the identity criteria of the women whose names have been found stamped on lead pipes through onomastic studies. Thus, through the analysis of known stamps and the comparison of our corpus with stamps bearing male names, as well as with other types of sources (literary, legal and archaeological), our objective will be to identify the different craft practices that women may have been involved in during lead production. This approach based on the remaining material evidence of these activities will permit us to better understand Women's Agency in Roman crafts.

2782. Representations of feminine technai in Italiote ceramics: musicians, acrobats, and weavers

Authors: Maiwenn Tonna (University Paris-Nanterre)
Format: Oral

Although largely confined to the roles of wife and mother, women also participated in various crafts and performing arts. Numerous vases produced in Magna Graecia between the late fifth and late fourth centuries BCE depict technai associated with the female sphere of activity, particularly music and acrobatics. While the art of weaving is not explicitly represented on this pottery—unlike on Attic vases—it is subtly evoked through significant details such as spindles, kalathoi, and embroidered fabrics. Certain objects discovered in archaeological contexts further attest to these activities. The depiction of these technai also enabled vase painters to display their own artistic skill and to develop a form of visual reflexivity. Several aesthetic principles are shared between the potter-vase painter and these feminine technai, particularly the pursuit of precision. This concern is evident in the meticulous rendering of embroidered textiles, musical instruments, and the carefully articulated gestures of the women portrayed. Moreover, certain arts are conceptually linked through shared tools, such as the potter's wheel. The evocation of feminine technai is likewise common in the figurative arts and contemporary poetry. In poetic discourse, motifs such as weaving and braiding frequently carry metaphorical meaning: weaving is associated with cunning, while braiding evokes the interlacing of words to compose verse. Major female poets engaged directly with these themes, including Erinna in the fourth century BCE in her poem Ἠλακάτη ("The Distaff") and Nossis of Locri in the early third century BCE in her epigram dedicated to Hera, both of whom foreground spinning and weaving in their works. This paper examines representations of musicians and acrobats, as well as motifs alluding to weaving, in order to better understand the vase painters' sustained interest in these feminine technai.

1860. Spinning stars: Rethinking star-shaped spindle whorls in the Sava river valley and further

Authors: Julia Fileš Kramberger (University of Zagreb)
Format: Poster

Star-shaped spindle whorls are a rare and typologically unusual group of textile related tools in prehistoric Europe, and their function and meaning are still subject to speculation. In Iron Age Donja Dolina in Northern Bosnia and Herzegovina, as many as 17 such objects were found, which is a relatively unique situation in the region, where such finds are much more uncommon, if existent at all. Although similar finds have been recorded in archaeological collections in Bosnia and Herzegovina, Croatia, Slovenia, Italy and further afield in Europe, their bigger number and concentration in Donja Dolina would imply a local production center at this settlement, while the finds from neighbouring sites could be interpreted as reflections of communication and exchange networks. Additionally, similarities to star-shaped glass and amber beads in the broader region might suggest further stylistic and symbolic dimensions of such objects. Finally, the star shape, although visually appealing, might not have been strictly decorative or symbolic – and further functional interpretations of the shape while spinning are discussed in this paper. Such layered interpretation of star-shaped whorls transforms these objects into active elements of social and cultural processes in Iron Age Europe.

235 UNTIMELY DEATHS: CHILDREN'S BURIALS IN EARLY AND LATE ROMAN PERIOD

Theme: 1. Widening perspectives in material culture studies
Organisers: Marko Jankovic (University of Belgrade - Faculty of Philosophy, Department of Archaeology) – Lujana Paraman (Trogir City Museum)
Keywords: Burial customs, Roman and Late Roman burials, Archaeotanatology, Bioarchaeological analyses, Children burials
Format: Regular session

SESSION ABSTRACT

More often than not, burials of the children are different than those of the rest of the population. Special treatment of children is well documented in the Roman-era necropolises across the Empire. However, in the Late Roman period, especially with the emergence of Christianity and the changes in practices that accompanied it, our knowledge of burial customs becomes somewhat unclear. Children's burials, especially infant ones, are documented more rarely in the Late Roman period than in previous ones. Reasons for this vary; sometimes infant burials, simple as they are, are not recognized in the archaeological record, and in many cases, they are damaged while the necropolis is still in use. Finally, plain burials with no grave goods are rarely fully published, and we are often denied information about their archaeological context or bioarchaeological data. When it comes to interpretations, that is where the situation becomes even more complicated. Different customs and beliefs (Roman or Christian) are usually interpreted on the basis of similar archaeological situations occurring at the same time. If we are to understand the reasons behind such treatment of the youngest members of the population, we need to obtain more information. Bioarchaeological data, analyses of archaeological contexts, and archaeological or ethnographic analogies can give us only a glimpse of a solution, if done separately. The archaeotanatological approach, increasingly used in recent years, could be a useful path for understanding issues of special treatment in death, but it should be understood solely as a methodological tool, not as interpretation itself. The session is planned to bring together different approaches to children's burials and to initiate a discussion among scholars addressing these issues in various contexts, all with the aim of proposing the best possible solution for understanding burial customs in the Roman, Late Roman, and/or Early Christian period.

CONTRIBUTION ABSTRACTS

440. Mors Immatura – Continuity and Change in Burial of Children in Southern Liburnia

Authors: Zrinka Serventi (University of Zadar)
Format: Oral

Roman burials relied heavily on superstitions and common beliefs and various social structures and cultures approached death in different ways. However, among them children were often treated differently, both in life and in death. Death of a child was in Principate period considered to be mors immatura, an early death of a person not reaching its full potential, and rites for such burials were adapted accordingly. Indication of a different approach towards children can be detected for the Iron Age as well, with different types of burials, rituals and locations, while in Late Antiquity children were perceived in a new way, they were more often buried in graves and locations of greater significance, which can, among other reasons, be connected to religious changes. This special approach to children has been attested in many territories, and Liburnia, the territory spanning from rivers Raša to Krka in the Eastern Adriatic, was no different. Therefore, this paper shall present Roman burials of children in the territory of Southern Liburnia, area which is often regarded as the heart of the autochthonous Iron Age population of Liburni. Those burials will be analysed in the context of changing political, religious and social circumstances and compared to the Iron Age burials, which predated them, in order to define patterns, variations and continuities in burial rituals present in the transition period. These finds, with particular focus on one of the most important necropolises in Southern Liburnia, that of Iader, will also be compared to the relevant Late Antiquity contexts. The analysis will also be articulated within the research conducted for the interdisciplinary scientific project "Transformation of South-Liburnian Territory in Early Antiquity".

2511. A Glimpse into the Life and Death of Young Children in Roman Tragurium (Central Dalmatia, Croatia)

Authors: Lujana Paraman (Trogir City Museum) – Anna Osterholtz (Mississippi State University) – Mario Novak – Mario Carić (Institute for Anthropological Research, Zagreb)
Format: Oral

The modern city of Trogir (ancient Tragurion/Tragurium) is a UNESCO World Heritage Site located on the eastern Adriatic coast in present-day Dalmatia. During the Roman period, Tragurium was an urban settlement administered by the neighbouring provincial capital of Salona. The city flourished as a trading centre, relying on salt and stone production, as well as agricultural output from the Roman villa system within the centuriated territory of the Tragurium agglomeration. Rescue excavations conducted over the past two decades have yielded more than 150 Early to Late Roman period burials (both cremations and inhumations) from two sites within the city proper: the communal necropolis of Tragurium (50 BCE–600 CE) and a nearby private cemetery associated with a Roman villa (50 BCE–400 CE). Both cemeteries contain an unusually high proportion of non-adult burials, with a predominance of infant and perinatal individuals exhibiting exceptionally high frequencies of pathological changes consistent with metabolic diseases such as rickets and scurvy. These findings prompted an ongoing interdisciplinary research project employing multiple analytical approaches. This presentation explores the archaeological and pathological context of these burials, alongside results from genetic and isotopic analyses and elemental lead testing, which together begin to illuminate patterns of life and death in Roman Tragurium. The integration of archaeological evidence with non-destructive palaeopathological and chemical analyses provides unique insights into childhood health, mortality, and changes in burial practices associated with young individuals throughout the Roman period in Tragurium.

1088. The children of the island – A multi-analytical study of Roman period subadult burials from Cres Island, northern Adriatic

Authors: Mario Novak (Centre for Applied Bioanthropology, Institute for Anthropological Research | University of Primorska) – Matija Makarun – Dalibor Branković (Arheo Kvarner) – Katarzyna Talarczyk (Poznan University of Medical Sciences) – Mario Carić (Centre for Applied Bioanthropology, Institute for Anthropological Research)
Format: Oral

In 2022, the protective archaeological excavations of the Miholašćica settlement agglomeration on the island of Cres revealed the presence of architectural remains of a Roman period building dated to the 1st/2nd century CE. The purpose of the building, either commercial or residential, has not been resolved with certainty, but it probably represents a Roman villa rustica. Two inhumation burials were discovered in the immediate vicinity of the object, and it seems that the individuals were buried after the building lost its primary function. Grave 1 contained the remains of two subadults (3.5-4.5 years and 8-10 years of age) while grave 2 contained the remains of two adolescents (12-16 years and 16-18 years of age). By using a multi-analytical approach consisting of direct AMS dating, conventional bioarchaeology, C/N stable isotopes analysis as well as ancient DNA analysis we aim to reconstruct the general health, diet and genetic affinity of the individuals from Miholašćica. The comparison with similar contexts from wider Adriatic and Mediterranean areas will shed more light on the issue of subadult burials from the Roman period, especially those from insular contexts, but will also provide more information about everyday lives of children, the most vulnerable group in Roman society.

1140. Untimely deaths at Jagodin Mala Necropolis: Children burials from 2023 excavation campaign

Authors: Marko Jankovic (University of Belgrade - Faculty of Philosophy, Department of Archaeology) – Gordana Jeremić (Institute of Archaeology, Belgrade) – Aleksandar Aleksić (Institute of Protection of the Cultural Monuments of the City of Niš)
Format: Oral

The necropolis of Jagodin Mala was the urban necropolis of the Roman city of Naissus (southeastern part of modern-day Serbia), used during the period of the 2nd-6th century CE. The first burials were detected in the second part of the 19th century, and

archaeological excavations have been conducted since the 1930s. In more recent times, the part of the city where the necropolis once stood is under massive construction of new buildings and city infrastructure, so the protective excavations at the necropolis are way more common than ever before. In 2023, a plot of land has been prepared for constructing a new building, and protective excavations were underway, documenting 122 burials at the place. The remains of 85 deceased individuals were excavated and analyzed, and more interestingly, 38 % of the total number of the buried were remains of the subadults (up to 15 years old). For the purpose of this paper, the four youngest burials (<1yo) will be addressed. Previous archaeological analyses show different treatment of newborn and young children in the Late Roman Period – they are usually buried in a shallow pit, rarely with objects, and sometimes close to each other in what could be understood as a "child-areas" at necropolises. It is our intention to scrutinize those burials from Jagodin mala in order to detect potential differences with the rest of the burials and to try to give an explanation why they deserved such treatment in death and how that was connected to how they lived.

1538. Some remarks on the burials of children in Naissus (Niš, RS)

Authors: Gordana Jeremic (Institute of Archaeology, Belgrade)
Format: Oral

The necropolises of Roman and late antique Naissus, an economically and strategically important city in the interior of the Balkan Peninsula, represent one of the best-researched areas to date. However, much data on burial forms and the deceased themselves is missing due to the unavailability of the material. Analysis of human osteological materials from city necropolises has only been carried out since the 2000s, whereas research conducted from 1932 until then has at our disposal incomplete field and technical documentation, as well as the inventory of graves in the museum depot. Bearing in mind all the challenges that incomplete, sometimes unverifiable data from the excavations of the Naissus necropolises offer, we will attempt, by establishing a preliminary methodology, using researchers' notes on preserved skeletal remains, photographs, drawings, small-sized jewelry belonging to deceased, to reconstruct the dynamics of child burials, especially in the area of its eastern city necropolis of Naissus in Jagodin Mala. The available material, although insufficient, nevertheless provides insights into the different forms of burial of deceased children in Naissus, the treatment of their bodies, as well as social expression. Among the burial forms, isolated burial areas within a necropolis, individual or group burials, family graves and tombs have been recorded. A special variant consists of burials within the largest cemetery basilica, where both material (lead children's sarcophagi) and epigraphic evidence of child burials are present. Archaeological data provide insight into the equal treatment of deceased children with other buried persons. Although the arranged city necropolises in Naissus, mainly along the main roads, were in use from the second half of the 1st century to the beginning of the 7th century, most of the data comes from the period of the 4th and 5th centuries, at a time when the Christianisation of the city population were noticeable.

1934. Bioanthropology of children's burials at the Late Roman Site of Remesiana–East Necropolis

Authors: Tamara Sarkic (Center of Bone Biology, School of Medicine, University of Belgrade)
Format: Oral

Archaeological excavations conducted between 2018 and 2023 at the Late Roman necropolis of Remesiana–East Necropolis (province of Dacia Mediterranea, present-day Serbia) provide important insights into childhood, family structure, and health in Late Antiquity. The necropolis is dated to the 4th century AD, and its funerary architecture predominantly reflects family-based burial practices. A striking feature of the site is the exceptionally high mortality rate among children: more than half of the documented graves belong to individuals who died in early childhood. Children's remains were identified in a variety of burial contexts, including simple inhumations directly in the soil, burials within brick or stone-built tombs, and double burials with adults in monumental tomb constructions. The diversity of burial treatments suggests differentiated funerary practices for children, potentially reflecting age, familial relationships, or social considerations. This study adopts a bioarchaeological and archaeothanatological approach to examine childhood at Remesiana, focusing on the spatial distribution of child burials within the necropolis, body positioning, and funerary treatment, with particular emphasis on double burials involving adults. Bioanthropological analysis addresses demographic structure and paleopathological conditions, revealing numerous macroscopic indicators of infectious and dental diseases. In addition, the paper will discuss preliminary aDNA analyses providing new data on the biological sex of children and patterns of kinship across the cemetery, offering valuable insights into family organization. Together, these data illuminate the biological findings, social positioning, and mortuary representation of children in the Late Roman provincial context at Remesiana.

2687. Untimely Ends: Decapitation and Fragmentation Treatment among Non-adults in Western Late Roman Britain

Authors: Shaheen Christie (Terracon Consultants, Inc.)
Format: Oral

Archaeological studies of Romano-British mortuary practices demonstrate significant temporal and regional variation across in Roman Britain (1st – 5th centuries CE). The nuanced body of literature produced in the past twenty years has identified alternative funerary practices associated with the disruption of the integrity of the body and its position or placement, and location of the burial at differing stages of the Roman funerary process. This research explores bioarchaeological, taphonomic, and mortuary data from Late Roman period (2nd – 5th centuries CE) sites in central-western Britain where decapitation burials were recorded, totaling 122

decapitation (8%) and 1,424 (92%) non-decapitation burials. While the majority of the dead in Late Roman Period Gloucestershire and Oxfordshire were of adult age, non-adults experienced the rite as well. Results show both age groups were treated similarly to the non-decapitated population. These findings challenge interpretations that frame the application of decapitation or other alternative burial rites as evidence for social marginalization, and suggest instead that decapitated individuals, including non-adults, were more likely regarded as community members with identities similar to those of the wider population, and more broadly, communities across Roman Britain regarded select elements of the body with special significance as salient objects in the management of the dead.

236 GEOARCHAEOLOGY OF DOMESTIC CONTEXTS

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Cristiano Nicosia (Università di Padova) – Manuel Arroyo-Kalin (University College London) – Federico Polisca (Università di Padova | Università di Bologna)
Keywords: geoarchaeology, domestic contexts, household archaeology, daily practices
Format: Regular session

SESSION ABSTRACT

Archaeologists excavate the material remains of houses (i.e., the "dwelling units" of household archaeology), engaging themselves with past individuals, their practices, and their day-to-day domestic lives. Houses embody fundamental social, economic, and ritual aspects that reflect the life of communities, possessing a life history – a "biography" – that is a direct reflection of the life histories of their inhabitants. The geoarchaeology of domestic spaces offers a powerful means of investigating the material traces of everyday life through the study of sediments found within houses. The artefactual assemblage of domestic contexts, in fact, often provides a picture of the abandonment or post-abandonment scenarios, rather than of the life phases of a house. On the contrary, the domestic stratigraphic record is the result of the prolonged sedimentary accretion within a house, as it derives from the continued build-up of construction debris, hearth rake-out, waste, food processing residues, excrements and bedding for animals, floors, backfill, trample imported from outside, etc. Even when domestic surfaces are maintained, as for example by periodic sweeping, the study of waste heaps or rubbish pits provides essential information on the activities and, ultimately, the palimpsest of practices that were performed in the domestic space. This session welcomes contributions from any geographical region that employ the methods and approaches of geoarchaeology in the field and in the laboratory. From micromorphology to spatial analysis, from biomarker analysis to geochemistry this session will favour presentations that adopt a multi-proxy approach and that feature a strong link between the field/excavation scale and the microscale.

CONTRIBUTION ABSTRACTS

2124. Tracing daily routines across the floor of the Late Hallstatt Building 24 at Pungrt Hillfort, Slovenia: an integrated geoarchaeological study

Authors: Luka Gruškovnjak – Agni Prijatelj – Petra Vojaković (University of Ljubljana) – Jaka Burja – Barbara Šetina Batič (Institute of Metals and Technology, Slovenia) – Manca Vinazza (University of Ljubljana) – Rok Brajkovič (Geological Survey of Slovenia) – Tjaša Tolar (Institute of Archaeology ZRC SAZU) – Helena Grčman – Matija Črešnar (University of Ljubljana)
Format: Oral

Since the development-led excavations in 2020 and 2021, the proto-urban hillfort of Pungrt above Ig, located in the vicinity of the Slovenian capital, Ljubljana, has rapidly gained recognition as one of the most important Early Iron Age sites in Slovenia. The largest excavation of any hillfort settlement in Slovenia was accompanied by extensive geoarchaeological sampling of various buildings, with clearly discernible floor sequences, as well as open-area surfaces across the best-preserved areas of the site. The two sampling strategies employed at the selected buildings included vertical micromorphological sampling of exposed sections and horizontal grid sampling for micro-refuse and physico-chemical analyses. In this paper, we examine insights into daily activities and the structured use of space provided by an integrated geoarchaeological approach in one of the buildings studied, namely Building 24. In this case study, we will present the results of a detailed analysis of a single house floor level. The geoarchaeological methods employed include micromorphology, physico-chemical analyses (multi-element analysis, magnetic susceptibility, soil parameters), and micro-refuse analysis. The latter involved several analytical techniques, including petrography, metallography, multielement analysis, and SEM-EDS, coupled with metallurgical, geological, zooarchaeological, and archaeobotanical analyses. The results of micro-refuse and physico-chemical analyses of samples collected across the floor surface were then subjected to spatial analysis using kriging interpolation and complemented by micromorphological and physico-chemical analyses of samples collected from the exposed floor sections. This approach enables a detailed reconstruction of domestic and craft activities, floor maintenance practices, and the structured use of space within the building. Based on the results, we will compare and contrast, on the one hand, the data from macro- and micro-archaeological approaches and, on the other hand, the data from different micro-archaeological approaches employed in the studied household context.

2349. Bronze age domestic contexts in northern Italy: an inter-disciplinary approach

Authors: Cristiano Nicosia (Università di Padova) – Federico Polisca (Università di Padova | Università di Bologna) – Elisa Dalla Longa (CNR - Istituto di Scienze del Patrimonio Culturale) – Maria Sofia Manfrin (Università di Milano) – Francesco Breglia (Università di Padova)
Format: Oral

Research on selected domestic contexts dating to the Bronze Age was carried out in the framework of the ERC-funded GEODAP project (Geoarchaeology of Domestic Practices). Of all the context studied across several European countries by this project, we focus our attention on two sites: Oppeano - Via Isolo '4D' and 'La Muraiola' di Povegliano Veronese. Both sites are located in the Verona province in NE Italy (Veneto region) and date to the Middle Bronze Age. An inter-disciplinary research protocol was applied to these sites, in which excavation data were integrated with micromorphological, archaeo-botanical, geochemical and archeo-zoological analyses. Detailed information was gathered on both domestic activities and on animal husbandry techniques. These two forms of space use appeared to be very intimately connected in the daily life of two Bronze age site. This presentation aims at stimulating discussion on how such an interdisciplinary approach can change our perception of everyday life, of human-environment interactions, and of daily repeated gestures in two excavated sites of the Bronze Age.

2464. The microstratigraphy and micromorphology of houses in the Gumelnița tell settlement at Bordușani Popină, Romania

Authors: Constantin Haita (National Museum of Romania History)
Format: Oral

The stratigraphy of tell-type settlements from south-eastern Romania, attributed to the Kodjadermen - Gumelnița - Karanovo VI complex, is characterized by a succession of multiple layers of occupation (up to 12 meters at Hârșova Tell) and a well-organized area of occupation. The site from Bordușani Popină is located in the floodplain of Balta Ialomiței, in the form of a mound with about 9 meters of Eneolithic deposits, dated to the second half of the Vth millennium BC. The microstratigraphy consists of sequences interpreted as built spaces, passage areas, and waste zones. The micromorphological analysis, consisting of thin-section interpretation at the microscopic scale of sediments and soils in an undisturbed state, was performed on the same principles as the microstratigraphic study and allowed the interpretation of the identified sedimentary facies in terms of formation processes and anthropogenic activities. The house structures are characterised by thin-layered floors and very fine plasterings and units of accumulation and transformation, interpreted as construction-fitting-out-occupation sequences. Areas with a specific mode of occupation were identified in some dwelling structures, interpreted as zones for everyday activities, passage, or resting. In this paper, the dwelling structures recorded on the stratigraphic profile of the site's complete sequence and their interpretation, in terms of construction materials, mode of preparation, fitting out, and anthropic activities, are presented in correlation with studied cases from other tells in Romania. The detailed stratigraphic and chronological framework is correlated with possible natural and anthropogenic factors of human-environment co-evolution.

2794. Soil field and laboratory analyses as an approach to early medieval houses in Northern France

Authors: Kai Fechner (INRAP Hauts-de-France | CNRS/ UMR 7041 ARSCAN Archéologies environnementales) – Frederic Broes (INRAP Hauts-de-France) – Clara De Clercq (INRAP Hauts-de-France)
Format: Oral

Since 2007, soil scientists have investigated several hundred medieval domestic structures — including houses and sunken-featured buildings (so-called pit dwellings) — across northern France. Both in situ pedological observations and laboratory-based analyses, including portable X-ray fluorescence (pXRF) measurements, have contributed to the development of a more systematic and rational methodological framework for the study of these archaeological contexts. This communication presents, for the first time, a comprehensive synthesis of our results, with the aim of refining the functional interpretation and typological classification of these architectural units. Macro- and micromorphological observations deliver rare occasions to compare the soil science approaches with results from bioarchaeology, especially by the study of phytoliths, spheruliths and to a certain extent, parasite eggs. Although cases of clear in situ pollution with animal dung (Marnay-sur-Seine, …) are rare, they do not exclude the possibility of external input, for example by accumulation of dung away from the actual stabulation area. In some cases (e.g. Pfettisheim or Mericourt), a detailed synthesis with all the intervenants even shows clear cases of strictly post-depositional pollution.

1617. Kition-Bamboula: Micromorphological insights into the use of space during the Classical period (Cyprus)

Authors: Pantelitsa Mylona (Department of Antiquities, Republic of Cyprus) – Sabine Fourrier (CNRS-HiSoMA, MOM, Lyon | Archaeological mission of Kition) – Pauline Maillard (University of Basel | Archaeological mission of Kition) – Alexandre Rabot (CNRS-HiSoMA, MOM, Lyon)
Format: Oral

The ancient city of Kition (modern Larnaka), on the south-eastern coast of Cyprus, was founded at the end of the Late Bronze Age (13th century BCE) and it thrived as the capital city of a major Cypriot kingdom throughout the Iron Age. The site of Bamboula, located to the west and south of a natural harbour basin, experienced major transformations during the Classical period (5th-4th centuries BCE), especially linked to the construction of the shipsheds of the military harbour. Recent excavations on the western site of the basin (Sondage 11) revealed an intricate occupational history, with a series of pits and trenches, which document a succession of refuse, levelling and refilling processes in a short time span (4th century BCE). The interpretation of these levelling operations, of their relations with the former constructions in the area, as well as the provenance of the refuse materiel (among which a remarkable series of administrative Phoenician ostraca) are of primary importance to understand the nature and extension of the transformations experienced by the site in the Classical period. In order to answer the questions related to the use of space and the site formation processes, a geoarchaeological study was applied using soil micromorphology. Five thin sections from five sampled areas within Sondage 11 were analysed. The results indicate an environment predominantly shaped by human activity, including the destruction of earthen architectural features and the intentional deposition of sediments and hearth-related refuse. Trampling features are expressed across several microstratigraphic units, with varying intensity throughout the sequence. A constructed formal floor was identified in the southwestern area, exhibiting at least six distinct phases of maintenance.

1035. A soil micromorphology approach to early Neolithic pit-dwellings at Međureč, Serbia

Authors: Lyndelle Webster (Austrian Archaeological Institute) – Aleksandar Milekić (University of East Sarajevo) – Slaviša Perić (Institute of Archaeology, Belgrade)
Format: Oral

The nature of the dug-in structures or pit-houses typical of early Neolithic Starčevo settlements has long been a subject of debate. One avenue to improve our understanding of how this architecture was used, re-used and abandoned, is to apply a geoarchaeological approach, aimed at unlocking the micro-scale evidence held within the sediments. Međureč is a small Starčevo site near the Middle Morava valley and comprises just a few structures (as indicated by geophysical survey), of which one pit dwelling was excavated in 2007. As part of new excavations, resumed in 2025, we are using thin section micromorphology, integrated with other microarchaeological techniques, to study the deposits associated with the construction and use of the pit-dwellings, as well as the post-depositional processes that followed abandonment. In this paper we discuss our methodology and present initial results. The study forms part of a larger project ("NEOSOL") that seeks to elucidate lifeways within multiple large and small early Neolithic settlements along the Vardar-Morava river corridor using soil micromorphology.

239 DEPOSITION ON BRONZE AGE AND IRON AGE SETTLEMENTS

Theme: 1. Widening perspectives in material culture studies
Organisers: János Gábor Tarbay (Hungarian National Museum, HNM Public Collection Centre) – Kamil Nowak (Austrian Academy of Sciences) – Florin Gogâltan (Romanian Academy Institute of Archaeology and Art History) – Ondřej Chvojka (University of South Bohemia in České Budějovice)
Keywords: Bronze Age, Iron Age, Settlements, Hoards, Space, Built environment
Format: Regular session

SESSION ABSTRACT

During the Bronze Age and the Iron Age, deliberate deposition within settlements manifests in many forms. The built environment could serve as a setting for metal hoards, carefully arranged sets of ceramic vessels, animal and human remains, foundation offerings in post-holes, deposited raw materials and by-products from specific workshops, stored food and collections of tools from various craft activities, among others. These are all archaeological remains of various activities and events in the settlement's life cycle left by its inhabitants who often cohabited and likely interacted with the hoarded environment. But why did this happen? How does deposition within settlements appear, if it appears at all, across different periods, cultural groups and areas of Europe? To what extent do flat settlements differ from fortified hilltop centres in terms of hoarding practices? Can we reliably distinguish settlement waste from deliberately deposited hoards? How many forms could it take and how can we interpret them? Are there preferred zones for specific depositional activities? What methodologies should we use to research these phenomena? The session invites papers on new discoveries, as well as theoretical and methodological presentations, especially those with multidisciplinary approaches, that discusses deposits within the context of settlements dated between the European Bronze Age and the Iron Age.

CONTRIBUTION ABSTRACTS

2406. A Middle Bronze Age bronze hoard from the settlement of Szakáld–Testhalom

Authors: András Gömöri (University of Miskolc, Institute of Geography and Geoinformatics) – Vajk Szeverényi (University of Miskolc, Department of archeology) – Klára P. Fischl (ELTE Research Centre for the Humanities, Institute of Archaeology) – Alexandra Gavan (Institute of Archaeology and History of Art of the Romanian Academy Cluj-Napoca) – Tobias L. Kienlin (University of Cologne,Department of Prehistoric Archaeology)
Format: Oral

Within the framework of BORBAS (Borsod Region Bronze Age Settlement) international project investigating the Middle Bronze Age settlement network of the Southern Borsod Plain, research has revealed a dense network of settlements characterised by a complex internal structure. The central parts of these sites consist of multi-layered tells or tell-like mounds, surrounded by horizontally organised settlement zones separated by ditches. Systematic metal-detecting surveys have been conducted at all elements of this settlement network in order to determine the precise locations of metal finds and material remains associated with metal production. During these investigations, the bronze hoard presented here was discovered on the outer periphery of the horizontal settlement part at Szakáld–Testhalom. The assemblage contains elements of female attire as well as prestige weapons. In addition to a brief comparative analysis of similarly composed deposits from Middle Bronze Age tell and fortified settlements, the presentation focuses on the methodology of metal-detecting surveys at OFCC sites and presents the results of scientific analyses of the Szakáld hoard, including GC–MS analysis and the examination of textile remains.

941. Depositions on Bronze Age settlements in South Bohemia

Authors: Ondrej Chvojka – Tereza Šálková – Libor Vobejda (University of South Bohemia, České Budějovice)
Format: Oral

South Bohemia represents a region rich in Bronze Age deposits, especially hoards of metal artefacts, of which 182 have been documented to date. These deposits are usually located in an open landscape, outside contemporary settlements. Nevertheless, several assemblages have been found in settlement contexts. Only seven cases represent deposits within flat settlements, while ten hoards were found in hilltop settlements or hillforts. Do these settlement-related deposits differ in character and composition from hoards found outside contemporary settlements? Do deposits within settlements show links to particular areas of the settlement or to specific settlement features? Can archaeobotanical data recovered from corroded metal surfaces or from their immediate surroundings help to reconstruct depositional events? Were the hoards deposited in settlements that were occupied at the time, or is their association with earlier or later settlement activity merely accidental? This study seeks to address at least some of these questions through an analysis of Bronze Age hoards from South Bohemia (2000 – 800 BC).

1433. Intra-settlement deposition on the Late Bronze Age Somló Hill

Authors: János Gábor Tarbay – Bence Soós – Tamás Péterváry (Hungarian National Museum, HNM Public Collection Centre)
Format: Oral

The Somló Hill (Veszprém County, Hungary) is a recently re-investigated central hilltop site of the Transdanubian Urnfield and Hallstatt cultures. New field research has yielded thirteen hoards and more than a thousand individual metal finds dated to the transitional phase between the Late Bronze Age and the Early Iron Age. At the centre of the present study stands Hoard V, a small assemblage of heavily used metal objects carefully arranged inside a ceramic jug. The site is not located in a remote, marginal, or otherwise special place far from settlements; rather, it lies within the settlement itself. Based on the finds, activities well known from everyday life in Late Bronze Age communities, such as weaving, stone-tool knapping, and other domestic practices took place here. A trench excavation indicates that the hoard was deposited within an inhabited area dated to the Ha A–Ha B phases, in the vicinity of potential house structures. The other Somló hoards excavated so far also fit into the same contextual pattern. This raises the question of what might have motivated the deposition of lavish, intentionally arranged "mega-hoards" within a settlement that remained undisturbed and reached the Early Iron Age without the retrieval of these assemblages.

1678. Deposit finds, deposit habits in the Zala and Mura rivers regions (Hungary, Western Transdanubia) in the late Bronze Age

Authors: Csilla Száraz (Thúry György Museum)
Format: Oral

In the area of Western Transdanubia in Hungary (Zala and Mura rivers region) six fortified settlements located at high altitudes can be found, which were used in the late Bronze Age period. These were established on the plateau of the hills and made use of the natural protection, but they were artificially fortified intensively inhabited settlements. Compared to other regions of the Transdanubia, the settlements located at high altitudes in the region of the Zala and the Mura form a separate microregion. The six settlements located at high altitudes, among which 5 were definitely fortified, had a dominant settlement position in the landscape and in connection with the plain area surrounding it. Research is lucky because we have most information on the biggest fortified Bronze Age settlement (160 ha) of the Transdanubia. On the basis of the 14 bronze treasures and 2 golden finds as well as the dispersed bronze finds from the surroundings of the site it was the economic-social-religious centre of the region. Concerning their functions, the fortified settlements located at high altitudes are different. The Várvölgy-Nagyláz-hegy is the biggest and it may have been a centre with resident population, industrial bronze casting and representative treasures. The settlement of Várvölgy may have controlled the foreground of Lake Balaton as it was an important commercial and transportation junction. In this presentation, I intend to analyze the role of depots located within fortified settlements in the structure of the settlement and to define the individual deposition zones.

1396. Pottery depositions in Bronze Age settlements in the eastern Carpathian Basin

Authors: Florin Gogaltan (Romanian Academy, Institute of Archaeology and History of Art Cluj-Napoca | Babeș-Bolyai University)
Format: Oral

This paper builds on earlier and more recent contributions by Clemens Eibner, Fritz Horst, Ina Czybbora, Andrea Stapel, Hana Palátová, Milan Salaš, and others concerning so-called Gefässdepotfunde. In 2014, this category of deposits from Bronze Age settlements in Transylvania was systematically analyzed, leading to the definition of pottery deposits as intentional and irreversible depositions of one or several complete or restorable vessels, placed simultaneously and predominantly related to drinking practices. These deposits occur in contexts that do not constitute funerary inventories, do not belong to other clearly defined ritual settings (such as sanctuaries or metal hoards), and cannot be interpreted as evidence of proven domestic use (e.g. wells or household pottery assemblages) (F. Gogâltan, Drinking with the gods? The problem of Bronze Age pot deposits in Transylvania. Studia Universitatis Babeș-Bolyai 59, 1, 2014, 52). Recent discoveries from the eastern Carpathian Basin further expand this category of ritual depositions within settlement contexts. They include additional hoards of drinking vessels, vessels deposited as foundation offerings for domestic structures, assemblages associated with food remains, as well as deposits containing non-metallic objects. The paper presents several case studies considered particularly relevant for refining the interpretation of these practices. Taken together, these finds enrich our understanding of the Bronze Age spiritual universe and point to ritual practices documented across wide areas of Europe during the 2nd millennium BC. They reflect diverse communal rituals—such as commensality, foundation rites, and libations—aimed at negotiating relationships between communities and the divine.

1819. Semi-buried ceramics within Late Bronze Age settlements

Authors: Polett Kósa (Hungarian National Museum, National Archaeological Institute)
Format: Oral

In Late Bronze Age settlements, ceramic vessels are frequently found standing in pits of various sizes, typically with a relatively large capacity. One possible explanation is that, following their primary use, these vessels served for grain storage. Owing to their considerable weight, partial or complete burial would have been necessary to ensure stability. At the well-excavated site of Poroszló-Aponhát, however, vessels of much smaller capacity were identified that were likewise sunk halfway into the ground in an upright position. A notable characteristic of these vessels is their apparent association with houses. The excavation documentation does not always clearly indicate whether they were located inside or outside the buildings, although in several cases they cut into the yellow layer interpreted as the floor level. This raises the question of the function of these small, pot-type vessels with a capacity of approximately 1.5–2 litres. Were they part of domestic cooking assemblages used within the house? Could their partial burial have served to keep their contents cool? Alternatively, might they have played a role outside the house, for example as incense burners or small storage containers? Given the limited archaeological evidence, it is worth considering ethnographic parallels – such as practices observed in rural farming households from 100–150 years ago – in order to propose hypothetical interpretations of their possible functions.

2412. Depositional Practices at Late Bronze Age Settlements in Southwestern Poland: An Overview

Authors: Kamil Nowak (Austrian Archaeological Institute, Austrian Academy of Sciences) – Radosław Kuźbik (ISKANDER Archaeological Services: Wrocław)
Format: Oral

During the Late Bronze Age (1350–800 BC), the deposition of artifacts at settlements in what is now Poland assumed a diverse and complex character. Objects placed in pits, foundation trenches, and vessels share a common feature: they were intentionally removed from circulation and everyday use. This presentation examines the nature of these depositional practices. We discuss the most frequently deposited artifact types, the materials from which they were made, and the archaeological contexts in which they were recovered. We also identify potential regional patterns and broader connections shaping depositional behavior. In addition to metalwork deposits, we consider assemblages composed of other materials. Particular attention is given to ceramic and stone deposits, which are systematically characterized here for the first time in this region. Drawing on several case studies, the paper aims to provide a clearer understanding of settlement-based deposition and its cultural significance within the temporal and spatial framework of the Late Bronze Age in southwestern Poland.

1067. The Character of Early Iron Age Deposition Practices in Eastern Hungary Based on Several Recently Discovered Assemblages

Authors: Csaba Nagy – Gábor V. Szabó (Institute of Archaeological Sciences, Eötvös Loránd University)
Format: Oral

Over the past decade, we have conducted metal-detector surveys at several sites in eastern Hungary, predominantly fortified settlements, where we succeeded in discovering Early Iron Age deposit assemblages in closed contexts. The composition and find contexts of the deposits identified during our research fundamentally changed our view of the interaction networks of Early Iron Age communities in Eastern Hungary and outlined a much more differentiated picture of the character of deposition than previously assumed. In the presentation, we display the changing and diverse deposition practices of the period through the example of three sites. We present and analyse the first Hungarian pre-Scythian hoard assemblage unearthed in a documented context from Szilvásvárad. We also mention the pre-Scythian composite bridle uncovered at the fortified settlement of Cserépfalu-Mésztető, as well as a deposit containing glass beads and iron bracelets that was likewise uncovered there. A significant part of the presentation focuses on the analysis of thirty-five deposit finds uncovered at the site of Dédestapolcsány-Verebce-bérc. At this fortified settlement, dated to the late 7th and early 6th centuries BC, several types of deposits can be identified: we unearthed hoards containing gold ornaments, as well as a hoard containing gold, bronze, and amber objects, and numerous deposits containing weapons, tools, horse harness, and iron blooms. Our most exceptional find was a hoard containing more than one hundred bronze and iron objects, as well as textile and leather remains. The three case-study sites provide an opportunity to differentiate deposition strategies between the 9th and 6th centuries BC and to develop new narratives regarding the phenomenon.

276. Depositing in the House: Regional Choices in Iron Age Domestic Architecture in the Low Countries

Authors: Maël Benallou – Guy De Mulder (Ghent University)
Format: Oral

Structured or ritual depositions within settlement contexts have long been recognised in Iron Age archaeology, yet detailed information on their specific architectural contexts and material characteristics often remains limited. In the Iron Age Low Countries, domestic depositions are generally understood to consist of ceramic-filled pits and postholes, but studies addressing depositional context alongside detailed analyses of object typology, use, and alteration at a regional scale are rare. This paper presents an in-depth analysis of settlement depositions based on a combined study of grey and published literature, macroscopic analysis of ceramic assemblages and lipid residue analysis. By integrating contextual and object-focused approaches, the study aims to clarify both the formation processes and possible motivations for these depositional practices. The results show clear regional differences in the placement of structured depositions. Within the Meuse–Demer–Scheldt region, deposits occur in the postholes of dwellings, whereas elsewhere in the Low Countries such depositions are restricted to ancillary structures, namely granaries. Despite this spatial divergence, macroscopic and lipid analyses indicate a consistent focus on common household ceramics associated with culinary use, with use traces and residues confirming repeated exposure to food preparation. These findings suggest regionally distinct choices in the architectural setting of deposition, combining similar material practices with different spatial emphases. This raises important questions about how domestic space and ritual practice were conceptualised within Iron Age settlements in the Low Countries.

1765. Moment of a transformation. Ceramic deposition and intra-site dynamics at the Early Iron Age settlement near Mernye

Authors: Bence Soós (Hungarian National Museum Public Collection Centre, Hungarian National Museum)
Format: Oral

Between the 8th and the mid 6th century BC, Hallstatt communities in the western part of the Carpathian Basin were characterized by their efforts to maintain hilltop settlements that served as centres in various respects, as well as by the construction of monumental burial mounds for prominent individuals. The 6th century BC, however, appears to have brought significant changes. On a broader scale, both the signs and consequences of this transformation are evident. On the one hand, the custom of building barrows declined, and several major hilltop settlements were abandoned. On the other, Hallstatt communities began to establish closer contacts with populations in the eastern Carpathian Basin, leading to a partial hybridization of material culture. How this transformation unfolded on a local scale has, however, rarely been investigated. In recent decades, an increasing number of Early Iron Age (EIA) settlements have been uncovered in the western Carpathian Basin, offering detailed insights into the everyday lives of Hallstatt communities. In this paper, I focus on one of the so called "lowland" settlements of the Hallstatt Period. I argue that the site of Mernye Rézdomb enables the reconstruction of an EIA community's responses to this period of upheaval, and that both the discard of certain pottery types and the intentional deposition of vessel sets can be understood as local practices embedded within broader processes of social transformation.

1144. Intramural deposition of human remains in Middle Bronze Age Southern Mesopotamia

Authors: Kamilla Kersánszki (Eötvös Loránd University, Doctoral School of History, Institute of Archaeology)
Format: Oral

Intramural or house burials have been in practice in the region of modern Iraq and its neighbours since the Neolithic and until pre-Islamic times; and continued in some specific cases, like the case of stillborn children, until recently. For ancient Mesopotamians, this close contact with the dead meant a symbiotic relationship with the ancestors' spirits and a unity of the household which transcended the line between life and afterlife. The places of family remembrance and the ancestral cult known from several texts were rooted this way in the fabric of everyday household tasks. The identification of specific room functions based on both archaeological and philological sources offers a unique insight into the spatiality of these depositional practices in the Old Babylonian period, revealing a preference for the more private, inner parts of the houses, in the so called "main halls" or "family rooms" and its accompanying "living rooms". Additionally, a connection to the archives is considered, uniting family history written in clay with family history physically embodied by the remains of the ancestors in one shared location, a place that serves as the focal point of the

collective social memory of the kinship group.

241 SHADES OF RED: FROM CHARACTERIZATION TO PROVENANCE STUDIES AND CONSERVATION OF RED PIGMENTS AND COLOURANTS IN ANCIENT POLYCHROME ARTEFACTS

Theme: 1. Widening perspectives in material culture studies
Organisers: Alessia Coccato (University of Oxford) – Hilary Becker (Binghamton University, SUNY) – Simone Dilaria (University of Padova)
Keywords: archaeometry, Fe-pigments, As-pigments, cinnabar, Pb-pigments, contextualizing color
Format: Regular session

SESSION ABSTRACT

Since prehistory, red color has long served as a fundamental chromatic component in ancient polychromy, widely employed not only in wall paintings but also in the decoration of statues, reliefs, and a broad range of artefacts. The sources of red pigments were multiple, encompassing naturally occurring iron-rich earths, mineral ores such as cinnabar and arsenates, and artificial lead-based compounds including red lead and massicot. Each of these materials imparted distinct optical, textural, and durability characteristics to the resulting surface layers—qualities that were well understood in antiquity. Historical sources (such as Pliny the Elder, Dioscorides, Theophrastus, Vitruvius, etc) provide information on both the economic and symbolic values of ancient red pigments, and provide technical details on their extraction, preparation and application. This session seeks to investigate the multifaceted use of red pigments across diverse contexts, from their adoption in wall-paintings and mortar stratigraphies to their use in the applied polychromy of statuary, architecture and other organic or inorganic artefacts. Particular attention will be devoted to studies of pigment characterization, the provenance of raw materials from mineral deposits or trade networks, technological and applicative aspects, and the long-term stability and conservation behavior of red pigments on different supports and within varying depositional environments.

CONTRIBUTION ABSTRACTS

1549. Cinnabar in the Early Bronze Age Mortuary Practices in Northern Balkans (semantic and symbolic)

Authors: Stefan Alexandrov (National Archaeological Institute with Museum, Sofia) – Rositsa Manova (Institute of Information and Communication Technologies, Sofia) – Piotr Włodarczak (Institute of Archaeology and Ethnology, Krakow)
Format: Oral

Due to its unique qualities, beauty, and intensity, cinnabar has become a sacred color for many civilizations. Its extraction and production are also a sign of the development of early societies. On the other hand, the cult activities are not easy to understand on their own. It is precisely in cults that symbols are hidden, which often have no form or image. They can be related to ideas, but they can also be the result of life experience and knowledge. In Northeastern Balkans, up to 2024 no use of cinnabar prior to 1st millennium BC was attested. In 2024 - 2025, analyses were made on red pigments found in three graves discovered in an Early Bronze Age barrow near Kriva bara village, North-West Bulgaria. The first analysis was made of a lump of red pigment placed near the left shoulder of a 5-6 years old infant (feature no. 7). The second group of analyses were focused on the pigments on the endo- and exocranial parts of the skull of a male individual (feature no. 5) and on the tibia of another male individual (feature no. 4). SEM and Raman analyses showed that the pigments investigated are composed of hematite (Fe2O3) mixed with cinnabar (HgS) in a very low concentration. The third group of analyses was concentrated on the red staining of the cancellous long bones of the individual from feature no. 4. The staining contains hematite with microelement titanium (Ti) and cinnabar (HgS). The Kriva bara results are the first documented evidence for the use of cinnabar in EBA Northern Balkans. The three graves discussed date to 2900 – 2500 BC period, which corresponds to the "Late Yamna" chronological horizon in Lower Danube region.

1985. 'I am wrapped in a red cloak of terror against you': The Materiality of Red Pigment in Assyro-Babylonian Ritual Practice

Authors: Anastasia Tchaplyghine – Mathilde Touillon-Ricci (British Museum)
Format: Oral

Neo-Assyrian and Neo-Babylonian (ca. 9th-6th c. BCE) clay figurines of protective divine beings that were buried beneath the floors of palaces, temples, and priestly houses, often preserve varying amounts of pigment – especially red, black, and white. By contrast, the more widely occurring female clay figurines of the same time period – whose meaning and function have remained enigmatic – do not usually retain any traces of pigment (perhaps because they were actively used rather than intentionally buried). While the protective figurines are associated with specific ritual texts and have been identified with named deities and composite creatures,

this is not the case for the female figurines. This talk will focus on two such distinct examples in the British Museum's collection that are both coated in red pigment: the upper half of a nude woman with hands clasped at her waist; and a dog, inscribed with its name 'Catcher of the enemy', that was found buried beneath a palace doorway. Scientific analysis of the substance(s) covering these two figurines will inform how the colour red and its materiality contributed to, or directed, their functionality, allowing for a comparative look at official, royal ritual practices and those of the broader population. Considering the female figurine in the greater context of magico-medical texts and the more understood protective figurines, will contribute to our understanding of this seemingly anonymous figurine-making tradition. For example, the colour red appears in rituals against illness, demons, and witchcraft. Akkadian red pigment names have been tentatively identified with cinnabar (HgS), minium (Pb3O4), and red ochre/haematite (Fe2O3)—minerals often found in ancient Mesopotamian archaeological contexts.

2283. Identification and provenance studies on the red pigments used by Iron Age Scythians of the Ukrainian Steppe

Authors: Aj Lamm – Margarita Gleba – Simone Dilaria – Gilberto Artioli (University of Padova)
Format: Oral

The Scythians of the Iron Age (7th-4th centuries BCE) inhabited the Pontic Steppe north of the Black Sea as a nomadic empire well versed in warfare with their neighbors. Having no written language of their own, all knowledge of them is filtered through the sources of their contemporaries, who were none too eager to paint their rivals in a flattering light, or through their archeological finds, where researchers can attempt to reconstruct some of the intricacies surrounding their trade and cultural exchange. Funerary goods from the burial mounds (kurgans) of the Scythians are no strangers to rich decoration, both in prized metalwork and what remains of vivid color. This study focused on the characterization of primarily red pigments from various perishable goods (leather fragments, wooden arrow shafts, and bone spindles) from kurgans across the southern territories of modern-day Ukraine. Using a multi-faceted approach comprised of Scanning Electron Microscopy coupled with Energy Dispersive Spectroscopy (SEM-EDS), Raman spectroscopy, X-Ray Diffraction (XRD), and visual analysis with Optical and Confocal microscopy, mercury sulfide (∞-HgS, cinnabar) and hematite (∞-Fe2O3, red ochre) were identified on the surface of twenty samples. Cinnabar, a popular pigment in antiquity, traces its usage back to the Neolithic period, found within the ceramics of the Vinča culture in the Balkans and the complex of Çatalhöyük in Türkiye. The usage of cinnabar persisted into the times of the Scythians, as evidenced by numerous finds within their funerary goods, but the provenance remains unclear. Further research seeks to identify the origin of this cinnabar, using isotopic analysis to determine whether the pigment was obtained through long-distance exchange from the nearest known mines in Almadén or Ephesus, or mined locally from yet-unevidenced sites within the Donbas region or the Carpathian mountains.

1026. The Tale of a Terret: New Data on Late Iron Age Glass in Britain

Authors: Courtney Nimura (University of Oxford) – Mary Davis (National Museums Scotland) – Susan Nehzati (Diamond Light Source)
Format: Oral

On display in the European Prehistory gallery in the Ashmolean Museum in Oxford is a small and unassuming terret, made to guide the reins of a horse. The label tells us it comes from Lakenheath, Suffolk, and is broadly dated to the Late Iron Age (likely 1st century CE). Upon inspection, one can see that this piece of Iron Age horse gear is exquisitely decorated in a classic 'La Tène-style', ornamented with crescents, incised lines, and small cells of coloured glass. The red glass can be visually characterised as 'sealing wax' red glass typical of the period, but different shades of dark, translucent blue are also present and are less well understood. As part of the LINXS Institute of Advanced Neutron and X-ray Science theme 'Heritage Science', our team analysed the terret at Diamond Light Source, the UK's national synchrotron light source science facility. This paper presents new data on the dating, production, and chemical composition of the glass resulting from X-ray fluorescence imaging (XRF) and X-ray absorption spectroscopy (XAS) analyses. With these new data, we can not only write a more detailed object biography of the terret, but we can also explore the broader sociocultural context of glass trade, production, and use in Late Iron Age Britain.

2721. An Investigation of the Melting and Forming Properties of a Red Fifteenth Century German Forest Glass

Authors: Annika Blake-Howland – Doris Möncke (NY State College of Ceramics at Alfred University)
Format: Oral

A citizen-driven archaeological excavation from 2001 to 2005 in the Taunus Mountains of Germany uncovered a mid-fifteenth century CE glass workshop along with more than 25 kg of glass shards, production waste, and vessel fragments. The glass is particularly unusual in that it is significantly opaque and deep red in color with striations of various shades of red and teal blue. Previous research into the Unterhalb Dornsweg glass determined that the primary colorant in the glass was copper, specifically copper(0) nanoparticles, and the opacity was due to copper(I) oxide crystals. Generally, copper(I) oxide crystals can form at temperatures greater than 700°C, whereas the copper(0) nanoparticles form between 500 and 800°C. Additionally, to create a copper red glass the copper ions must be in a significantly reducing environment with controlled temperatures over extended periods of time, with the oxygen partial pressure within the furnace being exceedingly important. While the color and opacity of the glass are well understood, the melting and forming conditions are not. Previous researchers have noted unusual melting behavior and the difficulty of

blowing a glass-ceramic. The melting and forming properties of the glass were explored though thermal and spectroscopic analysis, both of samples of the glass and through the creation of surrogates. Through this varied approach, it was possible to understand the conditions under which this interesting historic glass can be made.

1978. The reds of Northern Etruria: the use of cinnabar and red ochre in Roman contexts from Tuscany

Authors: Massimiliano Puntin (Sapienza, University of Rome) – Ilaria Benetti (SABAP Pisa Livorno)
Format: Oral

The proposal presents a diachronic study of the red pigments ochre and cinnabar applied in a series of archaeological sites from Roman northern Etruria. The study investigates a broad chronological range, through the entire Roman period, focusing on the coastal and insular zones of northern Etruria. The primary aim is to examine the decorative styles, the application methods and the mixing of pigments, aiming to identify the strategies adopted to achieve specific tones. The contexts are analysed from a stylistic perspective, highlighting an evolution in decorative motifs consistent with Roman taste during the early Imperial period. In contrast, from the 2nd AD onwards, a progressive loss of artisanal and technical skills that can be observed, reflected in decorative schemes that increasingly appear as a synthesis of earlier models, rather than as fully innovative or technically refined compositions. The materials, then, have been investigated through an integrated approach combining analytical methods (pXRF, Raman, ATR-FTIR, FORS, HIS, SEM-EDS), technological observations, spatial and functional considerations. Importance is placed on the chromatic associations, such as mixtures of pigments to obtain specific hues. The study also explores possible connections between the nature of the pigments and the spatial location of the decorations, referenced to cinnabar and its presence in spaces exposed or not exposed to light, a condition that, as widely known from Roman times, may influence this hue. From a technological perspective, an apparently regional association between specific minerals and pigment application techniques, in connection with overpainting, is highlighted. Overall, this contribution aims to demonstrate that the use of red ochre and cinnabar reflects deliberate and complex choices, in which decorative, technological, spatial, economic, and symbolic factors are closely interconnected.

2307. The colours of Tridentum: wall paintings and pigments at the northern fronter of Roman Italy

Authors: Emma Donisi (University of Trento, Department of Physics) – Cristina Bassi (Superintendency for Cultural Heritage, Archaeological Heritage Office of Trento) – Paolo Chistè (University of Trento, Department of Humanities) – Paolo Ferretti (MUSE - MUSEO DELLE SCIENZE, Research and Museum Collections Office) – Barbara Maurina (Superintendency for Cultural Heritage, Archaeological Heritage Office of Trento) – Fabio Santaniello (University of Trento, Department of Humanities) – Marco Zanatta (University of Trento, Department of Physics)
Format: Oral

In our common imaginary, Roman cities are plain white. However, there is nothing further from the truth: buildings were often painted in bright, vibrant colours, and red played a major role in their palette. The city of Tridentum, founded in the second half of the 1st century BC in Northern Italy, is no exception. This work presents an archaeometric analysis of the pigments used for wall paintings in Tridentum, from its foundation to the late Roman Empire. We aim at determining the receipt of the pigments, possibly highlighting the presence of local production centres by correlating composition and colour rendering. Calibrated pictures of the specimens were analysed with colorimetric algorithms to determine the absolute coordinates in the LAB and XYZ colour spaces. The elemental analysis was assessed through SEM and XRF measurements, whereas minerals were studied by microRaman spectroscopy. Results show that pigments were obtained by combining locally sourced raw materials with more expensive ones, imported from all over the Empire. Among them, cinnabar and haematite stand out for their abundance, making reds, oranges, yellows and pinks the most common hues among the fragments. Conversely, blue and green were obtained by mixing simple colour bases with Egyptian blue and lazurite to enhance their brightness. The presence of such expensive materials shows how the newborn city of Tridentum was rapidly integrated in the Roman social, cultural and economical network.

620. Red in Roman Nijmegen

Authors: Luc Megens (Cultural Heritage Agency of the Netherlands) – Lara Laken (Independent researcher)
Format: Oral

In this paper we investigated the red pigments which were used for painting the plastered walls in different Roman settlements within the borders of modern-day Nijmegen. After discovering that varieties of red ochre on the painted walls of a first-century house in Oppidum Batavorum could be distinguished chemically, it was found that various types of this pigment were used at other locations as well. One type of red ochre was without characteristic trace elements, while other varieties contained respectively high and low trace amounts of arsenic, some contained barium sulphate as a trace mineral, and others had varying trace amounts of lead. The red ochre with barium sulphate was not only found on the walls of the house in Oppidum Batavorum and contemporary plaster remains found at a different location, but also on second-century plaster fragments from Ulpia Noviomagus. Two types of red ochre with arsenic as trace element, lead-containing red ochres, and ochres without trace elements were present on the plaster fragments from both Oppidum Batavorum and Ulpia Noviomagus. Therefore, no relationship was found between a specific type of ochre and a period or location of use. The chemical characteristics may help in determining the origin of the pigment, but much work is still needed to draw definitive conclusions.

2382. Red in Polychromy of Stone Monuments in Croatia from Roman Times to Romanesque Period

Authors: Miona Miliša (University of Split, Arts Academy)
Format: Oral

It is often forgotten that Medieval stone sculpture and architectural decorative elements were originally painted. However, the original polychrome layers have survived only on rare artifacts, since pigment layers are far less durable than stone and many were damaged through cleaning procedures in the past. This paper will present rare examples of surviving polychromy on preRomanesque and Romanesque monuments, mostly from the Eastern Adriatic with just one known example from continental Croatia. The research of presented monuments applied multiple documentation methods, including macro photography, microscopy, FTIR and XRF chemical analyses, and classification of samples. Pre-romanesque reliefs were typically painted in three dominant colours: blue, red, and yellow, with yellow often replacing gold. Although surviving traces of polychromy along the eastern Adriatic coast are scarce, scientific analyses have identified key pigments and enabled the reconstruction of the probable original appearance of several monuments. Based on analytical results, digital reconstructions were created to visualize the likely original polychrome surfaces. The rare Romanesque example is famous Rudina Heads (stone heads dated in 12th century) which were sampled and analysed only last year. For medieval sculpture, comparisons with the Early Christian mosaics and manuscript illumination suggest continuity in motifs, compositional principles, and colour choice across media. The production of these works involved collaboration among patrons, clergy, designers, sculptors, and painters, within a cultural environment shaped by limited literacy and Catholic liturgy. The successful preservation and professional treatment of surviving pigment traces is of crucial importance, as the remaining polychromy may provide crucial insight into the symbolic meaning of individual motifs, because colour in this context held not only decorative but symbolic meaning, since most of the stone monuments were initially installed in sacred spaces.

1688. Painting the Dead: Cinnabar, Mortuary Practice, and Social Hierarchy in Northern China during the Warring States Period

Authors: Shuxin Kong – Quanchao Zhang (Bioarchaeology Laboratory, Jilin University | Jilin University)
Format: Poster

The Warring States period (475–221 BCE) was a transformative era characterized by intense sociopolitical upheaval and expanding cross-regional interactions in early China. This study presents archaeological findings from the Lijiazhuang Cemetery in Yu County, Hebei Province, associated with the "Dai" culture and situated at the frontier zone of interaction between the Central Plains cultural sphere (including states such as Yan and Zhao) and northern nomadic groups. Notably, evidence of post-mortem red pigmentation was observed on human skeletal remains recovered from select high-status burials. To elucidate this phenomenon, a multi-analytical approach was employed, including X-ray fluorescence (XRF), Raman spectroscopy, X-ray diffraction (XRD), scanning electron microscopy with energy-dispersive spectroscopy (SEM-EDX), and Fourier-transform infrared spectroscopy (FT-IR). The results indicate that the red pigment consists of natural cinnabar mixed with a possibly proteinaceous organic binder, suggesting that the pigment was applied in the form of a prepared liquid compound rather than as dry mineral powder. This finding not only demonstrates a relatively sophisticated level of processing and application technology but also suggests that communities in the northern frontier were able to acquire and utilize valuable, non-local mineral resources. Such evidence attests to the existence of extensive trans-regional exchange networks over two millennia ago. Importantly, this specific ritual treatment was applied not only to high-status elites but also to their sacrificial retainers, thereby reinforcing social stratification beyond death. The practice materially transformed the deceased body and, within the context of mortuary ritual, served to reaffirm and reproduce social hierarchy. In this sense, the application of red pigment constituted an integral component of funerary practice through which social order was materially and symbolically reproduced.

242 RECONSTRUCTING CLOTHING, ORNAMENTATION, AND THE SENSES IN PREHISTORY

Theme: 1. Widening perspectives in material culture studies
Organisers: Emanuela Cristiani (Sapienza University of Rome) – Barbara Cvitkusic (Institute for Anthropological Research, Zagreb)
Keywords: Clothing, Ornaments, Use-wear traces, Residues, Body, Identity
Format: Regular session

SESSION ABSTRACT

Prehistoric communities expressed their sense of identity and belonging through the gestures, materials, and sensory experiences involved in making, wearing, and modifying the body. However, reconstructing these bodily practices and technologies—such as clothing, wrapping, and self-decoration—remains challenging, as most of the evidence is perishable. Recent advances in use-wear and residue analyses, combined with detailed contextual and archaeothanatological studies, are opening new possibilities for identifying clothing and other forms of bodily ornamentation, modification, and augmentation in prehistory. We invite contributions

that explore how people engaged bodily with materials through the making and use of objects during the Palaeolithic and Mesolithic periods. This session highlights the potential of integrating microscopic and chemical analyses with experimental and ethnographic approaches to illuminate practices related to clothing, ornamentation, and the symbolic construction of the body. Case studies may address tools for hide- and fibre-working, ornaments and trinkets, sound-producing artefacts made from stone, shell, or bone, or other objects that connect craft, performance, and identity. Ultimately, the session aims to foster a creative and collaborative dialogue on how we can move from microscopic traces to vivid reconstructions of gestures, skills, and sensory worlds.

CONTRIBUTION ABSTRACTS

710. Tooth ablation in Japan between the Early Jōmon and Middle Yayoi. A new perspective

Authors: Claudio Pelloli (No affiliation)
Format: Oral

Tooth ablation, i.e. the removal of perfectly and healthy teeth, is considered a typical, autochthonous aspect of Jōmon period. For a long time, archaeologists focused their researches on teeth extraction, looking for a reason why someone should have removed healthy teeth. Social, food or gender motivations were proposed, and someone proposed the binomial: different types of tooth ablation-different human groups (however this last theory has been disapproved). In particular, archaeologists believe this custom was widespread and became a common practice between the Late and Final Jōmon. The rapporteur's speech raises two main issues: was tooth ablation during the Jōmon period truly widespread in the Japanese archipelago? Or did the ablation cases increase significantly later, after the beginning of the Yayoi period in Kyūshū? Secondly, was tooth ablation practice widespread due to "internal factors" or is it the "fossil guide" to prove the presence of newcomers from current China teritories, the only ones who could have introduced also the wet rice in the Japanese archipelago.

759. Threads of Meaning: Reconstructing the Lespugue String Skirt with implications for Gravettian Taskscapes

Authors: April Nowell (Univeristy of Victoria) – Aurora Skala (University of Victoria)
Format: Oral

Knowledge of textile production in the Upper Paleolithic derives from a number of sources including stone, bone and ivory tools, possible spindle whorls, imprints on bone and fired clay, and images of garments on depicted on figurines. Of all the items of clothing identified on figurines, perhaps the most enigmatic is the singular string skirt depicted on the Gravettian "Venus" of Lespugue (France). Precursor to the better known Neolithic string skirts, this Paleolithic version was comprised of individual cords plied around a base cord which may have served as a belt despite the fact that the skirt hangs below the figurine's buttocks. In order to manufacture a string skirt, Upper Paleolithic peoples must have possessed a deep knowledge of the shifting availability of the necessary resources, the affordances of the materials at their disposal and the symbolic meaning of each of their decisions from the initial selection of the plants from which to make their fiber to the choice of whether or not to dye the garment. Drawing on experimental archaeology, ethnographic data, a close reading of fabric imprints from the Gravettian and clues from the figurine itself, we report on our work in progress to recreate the string skirt with implications for how the many facets of textile production may have been integrated into broader social and economic taskscapes in the Gravettian.

1437. Hooked with a buckle: bone hooks from elk premaxilla in the forest zone of prehistoric Eastern Europe

Authors: Ekaterina Turina – Ekaterina Kashina (—)
Format: Oral

In this talk, a rare category of bone artifacts from Late Stone Age settlements of semi-sedentary hunter-gatherer-fishers in the East European forest zone is examined: large hooks (8–16 cm) made from elk premaxillae. These artifacts were found in central Russia, Belarus, and Lithuania and are dated to the mid-4th to 3rd millennium BC. The current study synthesizes the results of use-wear analysis and discusses probable changes in garment. The natural form of the premaxilla required minimal modification. Use-wear analysis reveals hafting traces along the side edges, intense polish and fine striations near the hook's bend. Such wear could have been caused by friction with hide or fibers. Similar objects were found among hillfort materials of the Middle Volga basin Early Iron Age and in one chronologically corresponding female burial, where an item was located near the hip. Most probably, these artifacts served as belt buckles in both forest communities. There is little archaeological data on prehistoric clothing in the Eastern European forest zone. According to ethnographic data from Arctic and taiga hunter-gatherer-fisher communities, specialized belt buckles were not necessary elements of costume. However, such items appeared in the specified territory and time period. The 4th millennium BC was a time of major changes in the Eastern European forest zone and the Circum-Baltic area. Ceramic, lithic, and bone industries experienced significant transformations. This trend may also be relevant to shifts in bodily practices. The emergence of standardized premaxilla bone buckles in the mid-4th millennium BC and later may be related to changes affecting garments. The choice of this particular elk bone (premaxilla) was seemingly determined not only by its engineering suitability but also by symbolic or magical considerations, as the elk was the main hunting prey and one of the dominant images in Late Stone Age rock and portable art.

1576. Cord-Impressed Vessel Decoration and Bodily Ornaments in Late Neolithic and Early Bronze Age Funerary Contexts in Poland

Authors: Kinga Winnicka – Monika Kaczmarek (Faculty of Archaeology, University of Warsaw) – Magdalena Przymorska-Sztuczka (Archaeological Museum in Biskupin) – Marek Truszkowski – Agata Ulanowska (Faculty of Archaeology, University of Warsaw)
Format: Oral

Pottery decorated with cord impressions is a recurring feature of Late Neolithic and Early Bronze Age funerary assemblages in Central and Eastern Europe, but its relationship to other forms of bodily ornamentation in graves has not been examined systematically. This paper explores the material and symbolic relationship between corded decoration on funerary vessels and ornaments deposited with the dead, particularly strings of beads made into pendants, belts, and similar items that once relied on cordage, thread, or other textile structures. A combined imaging, analytical and experimental approach to cord-impressed pottery fragments allowed us to reconstruct the fibre technologies and gestures involved in producing these impressions. The results are then related to the organisation of ornaments on the body and the indications of wrappings, bindings, and other textile elements in the grave. Building on A.P. Kowalski's insights into the Indo-European symbolism of cords and knots - associated with binding, continuity, protection, and the life-thread - the study explores whether encircling cord motifs on vessels mirror the encircling ornaments placed on the body. By examining funerary contexts culture by culture, we evaluate whether there are any correlations between specific cord patterns and particular forms of bodily adornment, like e.g. multi-string bead necklaces. The results suggest that corded decoration may not be only stylistic, but part of a constellation of perishable technologies and symbolic actions that shaped identity, continuity, and the sensory experience of funerary rites.

1080. More Than Beads: Wearing and Meaning in Upper Palaeolithic Ornaments from northern Spain

Authors: Daniel Pérez (IIIPC, Universidad de Cantabria) – David Cuenca-Solana (IIIPC, Universidad de Cantabria | Centre de Recherche en Archéologie, Archéosciences, Histoire CReAAH, UMR 6566) – Borja González-Rabanal (Facultad de Filosofía y Letras, Universidad de Valladolid | Grupo I+D+i EvoAdapta, Universidad de Cantabria) – Ana Marín-Arroyo (Grupo I+D+i EvoAdapta, Universidad de Cantabria) – Elsa Duarte-Matías – Marco De La Rasilla-Vives (Facultad de Filosofía y Letras, Universidad de Oviedo)
Format: Oral

One of the most compelling and methodologically challenging aspects in the study of prehistoric personal ornaments concerns the ways in which these elements were used, including the parts of the body that were adorned, the arrangement of beads, and the criteria or order governing their disposition. In funerary contexts, the spatial position of beads often allows these aspects to be inferred with a relatively high degree of precision; however, when ornaments are recovered from habitation contexts not associated with burials, such reconstructions become considerably more complex and rely exclusively on usewear and residue analyses. This study focuses on the assemblage of personal ornaments from Llonín cave (northern Spain), one of the largest and most diverse in the region, comprising more than 250 elements distributed across a long chronological sequence spanning from the Upper Solutrean to the Azilian (21.8– 11 ka cal BP). Microscopic analysis of these materials has, in many cases, made it possible to reconstruct the suspension modes according to which the ornaments were organized, revealing a wide range of practices, from freehanging beads to embroidery and the possible use of certain elements as buttons. The integration of these results with biometric, taxonomic, and other analytical approaches has further enabled the association of different suspension modes with potentially differentiated social uses at both diachronic and synchronic scales.

1230. The Gravettian ornamental assemblage of El Palomar rockshelter (Yeste, Albacete): A new perspective on cultural connectivity and social networks

Authors: Oriol Montero-Buch (I.U. d'Investigació en Arqueologia i Patrimoni Històric, Universitat d'Alacant) – Paloma De La Peña (Departamento de Prehistoria y Arqueología, Universidad de Granada | Evolutionary Studies Institute, University of the Witwatersrand) – Javier Fernández-López De Pablo (I.U. d'Investigació en Arqueologia i Patrimoni Històric, Universitat d'Alacant | Dp. Prehistòria, Arqueologia, H. Antiga, F. Grega-Llatina, Universitat d'Alacant)
Format: Oral

Personal ornaments are considered key elements for the study of cultural identity during the Early Upper Palaeolithic on a pan-European scale. For the Gravettian of the Iberian Peninsula, two distinct cultural affiliations have been proposed based on ornamental assemblages. However, these cultural groups have been characterized primarily from ornaments recovered from sites near the Mediterranean and Cantabrian coasts, as well as the Atlantic seaboard. Consequently, there remain regions that are insufficiently studied, such as inland Iberia and much of the south. As a result, the mechanisms underlying the distribution of personal ornaments at regional and cross-regional scales within settlement networks are still poorly understood. Here, we present an analysis of the ornamental assemblage from the Gravettian levels (III, IV and V) of the El Palomar rockshelter (Yeste, Albacete). This site is located in the upper basin of the Segura River, within the Baetic mountain system, situated more than 180 km from the MIS 3 Mediterranean coastline. It has yielded evidence of ornaments made from both fluvial and marine mollusks, with a notable presence of marine gastropods such as Littorina obtusata/fabalis, Tritia reticulata, and Trivia sp. In this work, i) we will discuss the

chrono-stratigraphic association of these findings with the Gravettian lithic assemblages; ii) we will report the results of the technological and functional analyses; and iii) we will discuss their implications in the context of human mobility patterns and social networks during the Gravettian in Europe.

1453. Procurement and patterns of preference of fossilized mollusc shells in the Epigravettian Danube Bend area

Authors: Csaba Bálint (Eötvös Lóránd University | Dobó István Vármúzeum)
Format: Oral

The find material of various Epigravettian sites of Central Northern Hungary's Danube Bend area contain sizeable amounts of mostly unmodified, fossilized tertiary mollusc shells. At most of these sites shells were found scattered throughout the habitation surface, and moreover at the site of Szob-Ipolypart they were arranged into piles, and are classically interpreted as storage deposits. A small number of the shells were modified to be used presumably as personal ornaments. The shell assemblages present at the sites show distinct preferences of mollusc shells mainly focusing on one to three different genera. These tendencies hint at conscious selection during the procurement process. The Danube Bend area possesses numerous exposed sediments bearing tertiary marine fauna that were possibly available as sources during the Epigravettian. This presentation focuses on the question of selection and the preference of certain mollusc genera during the procurement phase. By highlighting the availability of certain genera within specific, probably utilized geological sources, we can hopefully ascertain if selection of specific molluscs was based on convenience or a more focused effort of acquiring desired forms of shells.

2258. Multiproxy Microscopic and Functional Approaches to Perishable Bodily Technologies: Evidence from Shell Tools

Authors: Barbara Cvitkusic (Institute for Anthropological Research, Zagreb) – Emanuela Cristiani (Sapienza University of Rome, Rome) – Dario Vujevic (University of Zadar)
Format: Oral

Reconstructing prehistoric clothing is challenging, primarily because organic materials rarely survive in the archaeological record. Consequently, research requires a multidisciplinary approach combining material culture, paleoclimatic data, genetics, and other forms of evidence. Within material culture studies, particular attention has been paid to lithic tools used for skin and plant processing, and more recently to bone tools, which document hide-working activities. However, the functional role of some tool categories remains poorly understood. In this contribution, we present the results of our research on the shell industry from the Late Upper Palaeolithic site of Vlakno in Croatia. Although these artefacts are generally interpreted as ornaments, our functional analysis indicates their involvement in a range of daily-life activities. We highlight the potential of combining use-wear analysis with histological staining and residue analysis to investigate perishable bodily technologies. In particular, we report on the potential of Picrosirius Red (PSR) staining to detect and characterise hide processing residues in experimental and archaeological bivalve shell tools. The resulting microscopic and histological data were integrated with use-wear analysis, enabling more robust functional interpretations. This combined approach provides new insights into clothing-related technologies, as well as the gestures and technical practices associated with hide and skin processing at Vlakno, contributing to broader reconstructions of Upper Palaeolithic bodily technologies. By bridging microscopic, experimental, and functional perspectives, the study highlights the value of residue-based methods for accessing subtle traces of craft activities that are otherwise archaeologically elusive.

885. Personal Ornaments and Embedded Production: Jewelry Manufacture within Elite Households at Chaco Canyon, New Mexico

Authors: Hannah Mattson (University of New Mexico, Department of Anthropology)
Format: Oral

Pueblo Bonito (850-1140 CE), located in Chaco Canyon in the U.S. Southwest, contains the largest assemblage of personal ornaments of any site in the Ancestral Pueblo region and more turquoise jewelry than any site north of Mexico. There is also abundant evidence for the presence of high-status individuals, concentrated in certain portions of the structure, and centralized ceremonial activity. Almost all previous research on Chacoan ornament manufacture, primarily conducted in the 1970s-1990s, has focused on smaller sites located throughout the canyon. These investigations yielded evidence for widespread ornament-making at small sites, including possible workshop-level production at two locations. Given that consumption of finished jewelry items is clearly concentrated at large sites ("great houses"), the accepted narrative is that lapidary production was part of a larger corporate political strategy, in which goods produced in surrounding small farming hamlets were used to sustain communal events related to construction activities and ritual performances at great houses. However, until now, evidence for in-situ jewelry manufacture at great houses has not been systematically considered. I build on my previous research on jewelry and social identity at Pueblo Bonito and present the results of an examination of lapidary tools from the site. I find abundant evidence for on-site ornament production, a significant portion of which is concentrated within elite domestic contexts, suggesting embedded production. This requires us to reconsider our models for the organization of production in the canyon and the role of jewelry in Chacoan political economy.

1411. From product to process: reconstructing the adorned body in pre-Roman Italy

Authors: Tayla Newland (The University of Cambridge)
Format: Oral

The transformation of bodily surfaces is a cultural universality, enduring as a system of non-verbal communication from antiquity to the present day. For ancient communities, personal ornamentation played a central role in this dynamic process, allowing individuals to fashion personal identities, to signal belonging, and to engage with the social and material worlds of which they formed part. As artefacts that were worn during life before their deposition with the dead, ornaments also preserve unique sensorial properties, allowing archaeologists to reconstruct the daily performance of identity and its construction in the funerary sphere. However, researchers have been slow to recognise the interpretive potential of ornamentation, particularly in the context of Iron Age southern Italy. Though the women of southern Italy were buried with rich ornament assemblages, past studies of their jewellery have often proven superficial, and the evidence supplied by their adorned bodies has yet to be fully articulated. The following paper fills this lacuna through a case study of indigenous necropoleis from Iron Age Apulia and Basilicata. It aims to shift attention from the passive outcome of ornamentation to the process of becoming via adornment, situating the body as nexus for the interplay of human and material agency. This argument is underpinned by a Social Network Analysis of diverse burials, which ties together computational modelling and Actor-Network Theory to produce similarity networks of jewellery. Analysed in GEPHI and R, the resulting networks visualise patterns of consumption and exchange amongst indigenous communities, shedding light on social and material systems of exchange engendered by women, and embodied via adornment. Ultimately, this paper seeks to reconstruct the ways in which individuals engaged with ornaments in their daily lives, in order to trace shifts in identity and agency across time and space.

2433. Dressed for Burial? Visual Disply of Ornaments Assessed through Use-Wear and Residue Analysis: The Epigravettian Burial of Romito 9 (Italy)

Authors: Emanuela Cristiani (DANTE-Diet and Ancient Technology Laboratory/Sapienza University of Rome) – Barbara Cvitkušić (Institute for Anthropological Research, Zagreb) – Domenico Lo Vetro (University of Florence) – Fabio Martini (Museo e Istituto Fiorentino di Preistoria, Florence)
Format: Oral

Personal ornaments are among the most intensively studied categories of Upper Palaeolithic material culture and are commonly interpreted as markers of identity and social communication. However, their functional integration within clothing systems remains difficult to assess, as interpretations have largely relied on typology and spatial distribution rather than on physical interaction with the body and perishable materials. This study presents a functional and use-wear analysis of the ornament assemblage from the burial of Romito 9, discovered at Grotta del Romito (Calabria, southern Italy), one of the most important Upper Palaeolithic sites in the Mediterranean. The burial is stratigraphically dated to 16,129 ± 100 uncal BP (ca. 19,800–19,100 cal BP) and belongs to the Evolved Epigravettian, a key transitional phase between Gravettian funerary traditions and less elaborated burial practices of the Final Epigravettian. The analysis explores whether the ornaments were freely suspended, attached to a loose cover, or sewn directly onto garments. Combining microscopic use-wear analysis, experimental archaeology, morphological data about shells, and contextual data, we assess attachment modes, degrees of mobility, and movement constraints on shells and deer canines. Microscopic use-wear and residue data reveal recurrent and standardized wear patterns consistent with limited mobility and prolonged use in stable positions, suggesting that these ornaments were likely integrated into clothing. The results indicate that most ornaments found in situ were sewn directly onto garments, forming part of body clothing. This interpretation supports the view of clothing as an active "second skin" for visual communication in Epigravettian funerary practices and highlights the role of dress in the continuity of complex symbolic traditions at the end of the Last Glacial Maximum.

2712. Disguise, Mimicry and the Meaning of Clothing

Authors: William Buckner (Durham University)
Format: Oral

Discussions of clothing use in prehistory often focus on its use for thermoregulation, a function which was particularly salient during the colder climates of Paleolithic Europe. This point of emphasis can obscure broader practical, social, and symbolic uses of clothing in human societies. Notably, even in warm climates, among present-day hunter-gatherers who often wear little-to-no clothing during their daily activities, clothing still plays an important role in both social and subsistence life. Here I discuss these patterns of clothing use among contemporary hunter-gatherers, with a focus on the importance of costumed performances. Costumes worn in service of impersonating other agents, such as animals, spirits, and mythical creatures, are frequently worn in the hunt, in ritual contexts, and for entertainment. Costumed impersonations are frequently used as tools of social control by initiated adult males and directed towards women and children. Patterns among contemporary foragers suggest that clothing in prehistory involved similarly complex symbolic uses of clothing outside of thermoregulatory needs.

244 URBAN ARCHAEOLOGY FOR DEMOCRACY: HOW CAN WE USE ENGAGEMENT WITH THE PAST TO DRIVE FUTURE PROSPERITY AND WELLBEING?

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Paul Belford (Heritage Innovation) – Jeroen Bouwmeester (Cultural Heritage Agency of the Netherlands)
Keywords: urban archaeology, development, society, heritage management, wellbeing, social value
Format: Regular session
Affiliation: Community for Urban Archaeology

SESSION ABSTRACT

Urban places were the first spaces where people could engage outside conventional social hierarchies and develop awareness of places beyond their own locale. They were hubs for the exchange of materials, ideas and identities, and melting pots which led to modern democratic societies. This session will look at how we can enhance the value of urban archaeology to help create sustainable legacies for future generations. Urban archaeology faces many challenges: Preserving archaeological remains in situ Competing with other demands on resources Developing new techniques, approaches and syntheses Pressures from stakeholders to deliver wider public engagement There is a need to advocate for urban archaeology as a discipline, both within and beyond archaeology, and to politicians and the wider public. Questions that this session seeks to explore include: Definition: what do we mean by urban archaeology today? Chronology, materials, structures, concepts, methods. What value does urban archaeology bring to society? Case studies where urban archaeology has added value (or not) — positive and negative consequences of using urban archaeology to inform development, or is it just 'set dressing'? What is the economic value of urban archaeology? How is it able to contribute to the wider 'heritage' economy, and what benefits does urban archaeology bring to the general economy? How does urban archaeology contribute to mental wellbeing? We want to consider alternative concepts of value, and the social gains which derive — both to individuals and communities — from the actions and outcomes of urban archaeology. Who are, and should be, stakeholders for driving urban archaeology forward as a 21st century discipline? We welcome papers from across Europe and beyond, from any area of the discipline (commercial, academic, heritage management) to consider these questions, and the contributions that urban archaeology could and should make to safeguarding and renewing democracy in challenging times.

CONTRIBUTION ABSTRACTS

1784. On the value of urban archaeology for future generations

Authors: Paul Belford (Heritage Innovation)
Format: Oral

This paper provides an introduction to the session on 'urban archaeology for democracy', by exploring some of the questions we might consider to help maximise the legacy which urban archaeology can deliver for the future. Archaeological knowledge of past urban environments is made up of a mixture of physical remains — archaeological structures and features, as well as artefacts — together with the intangible web of information derived from more than 100 years of archaeological and historical investigations of urban places. One of the key challenges which archaeologists face is how to articulate that knowledge to deliver public benefit. Archaeologists have become quite good at telling stories to the general public. We have also made many advances in embedding archaeology into processes for urban renewal. Those processes recognise that archaeology is a 'finite and non-renewable' resource that has to to be managed. We have developed mechanisms for assessing significance and survival, and we can influence discussions around conservation. However archaeologists are rarely the decision-makers, nor are we always able to take advantage of our unique 'deep time' perspective to inform planning decisions. How can we move towards using the archaeological resource as a raw material for creative and dynamic change in urban environments? Is there scope to challenge some of the existing paradigms around archaeological preservation and interpretation? Can we make archaeology central to how urban centres deal with modern challenges — immigration, climate change, gentrification — all of which are reflected in the archaeological record? Indeed, what contribution can urban archaeology make to safeguarding and renewing democracy itself?

1260. Producing Democratic Subjects: Urban Archaeology, and Governance in Nordic Cities

Authors: Visa Immonen (University of Bergen)
Format: Oral

Urban archaeology is increasingly framed as a democratic practice: a means of engaging publics with the past, strengthening civic identity, and contributing to wellbeing and inclusive urban futures. Yet in many European – particularly Nordic – contexts, decisions about excavation, preservation, and reburial remain embedded within representative planning systems and heritage management institutions. Public participation is widespread, but typically takes place after key decisions have already been made. This paper asks not whether urban archaeology is democratic, but what kind of democratic subject it produces. Drawing on cases from Nordic cities where substantial urban archaeological remains have been excavated, documented, and subsequently reburied or built over, it examines how publics are positioned in relation to archaeological decision-making. It argues that urban archaeology commonly produces an informed, engaged, and affectively invested public, while simultaneously limiting opportunities for direct influence over outcomes. Conceptually, the paper draws on analyses of cultural governance that treat participation as a technique through which civic conduct, expectations, and legitimacy are shaped, rather than as a straightforward transfer of decision-making power. Empirically, it develops a typology of recurring configurations – such as archaeology as mitigation, symbolic stake, and post-hoc heritage – to show how democratic engagement is structured and contained within urban development processes. Rather than presenting this as a democratic failure or success, the paper argues that urban archaeology is highly compatible with representative democratic models, while sitting uneasily with participatory ideals increasingly invoked in heritage discourse (like the Faro Convention). Recognising this tension allows for a more precise understanding of the political work urban archaeology performs in contemporary cities.

913. From Demolition to Preservation: How Urban Industrial Archaeology Can Shape Civic Debate

Authors: Hynek Zbranek (Masaryk University Brno | Brno City Museum)
Format: Oral

The city of Brno (Czech Republic) is characterized by a high concentration of former factory complexes and industrial buildings located in the wider city center. This pattern stems from early industrialisation, driven above all by the wool industry and its supporting infrastructures. Industrial archaeology in Brno therefore rarely takes place only in peripheral "brownfields"; instead, it is conducted within a living, rapidly transforming urban organism where former factories are under strong pressure from demolition, reconstruction, and functional change. This presentation show the archaeological, methodological and cultural challenges created by this setting—and how archaeological work can shift the debate from inevitable loss towards informed preservation. The pace of redevelopment demands rapid yet scientifically reproducible recording: building-archaeological documentation of standing structures; systematic capture of technological traces (machine bases, channels, service runs and distribution systems); mapping of infrastructural linkages; and explicit integration of field evidence with archival sources (plans, inventories, personnel documentation, and others). Subsequent excavations may also reveal the earliest "factory layers"—phases of early industrialisation often obscured by later rebuilding. All of this unfolds within broader urban transformation, as manufacturing sites become places of memory and cultural heritage. Industrial heritage is thus a negotiated field involving communities, owners, developers and local government: it can unite the city through shared narratives of work and identity, or polarise actors if perceived as an obstacle to development. Using recent examples from Brno, the presentation shows how negative scenarios—demolition followed by archaeological research and public outreach—helped catalyse later positive cases in which civic and professional mobilisation contributed to preserving selected industrial buildings. In conclusion, urban industrial archaeology—working with local communities and interdisciplinary experts—can help create the conditions for the preservation, documentation, and meaningful presentation of industrial heritage. By turning field evidence into shared knowledge, it can mobilise society to safeguard urban history in rapidly changing cities.

577. Layers of the City: Urban Archaeology and Public Access to the Past in Bucharest

Authors: Elena Gavrila – Dan Pîrvulescu (Bucharest Municipality Museum)
Format: Oral

Archaeological research in Bucharest, particularly urban investigations carried out in the context of large-scale infrastructure rehabilitation projects, has revealed a wide range of buildings, cemeteries, and public and private structures dating to the medieval and modern periods. Some of these remains are well documented, while others have largely faded from view. Taken together, they trace the complex process of the city's emergence and long-term development. This process was shaped over time by repeated transformations and destructive natural events such as fires, earthquakes, and floods, as well as by systematic demolitions during the communist period and the pressures of continuous urban expansion. A number of these discoveries were proposed for conservation and integration into the public urban space. However, only a limited selection has been preserved in situ and made visible to the public, most often through display under glass pavements, largely due to financial constraints. In these rare cases, the reaction of both residents and visitors is striking: the hidden archaeological layers beneath the modern cityscape generate curiosity, surprise, and a renewed awareness of the city's historical stratigraphy. By examining selected case studies, both successful and unsuccessful, we reflect on the challenges of in situ conservation of archaeological remains, the pressures exerted by various stakeholders involved in urban planning and development processes, and the competition between heritage and other priorities of the contemporary city. In this context, the presentation examines the extent to which urban archaeology is genuinely integrated into development processes as a tool for knowledge production, decision-making, and public dialogue, or whether it is often reduced to a symbolic, decorative role, selectively employed to validate projects whose outcomes have already been determined.

1372. Archaeology of the Warsaw Ghetto - restoring history and rebuilding the identity of the place

Authors: Jacek Konik (Museum of Independence in Warsaw)
Format: Oral

After World War II, Poland's new communist authorities decided to rebuild Warsaw that was 90% destroyed. Intended to be the capital of the communist country, memory of its past had to be shaped accordingly. One of the methods was to settle people from different regions of Poland in Warsaw. For the new residents the city's wartime history, including the ghetto, was not part of their own memories. Thus, the authorities could more easily serve up a propagandistic, distorted version of the past. After the fall of communism in 1989 questions began to be asked about what had really happened in the city during the war. Attention was drawn not only

to the archival research but also to the archaeological excavations that were more and more frequently conducted in connection with the expansion of the modern city. This enabled the preparation of fully scientific archaeological projects on the Warsaw Ghetto, including the 2022 excavations near the famous Jewish Combat Organization bunker at 18 Miła Street. The relics of the basements of the former tenement houses were discovered, along with numerous artifacts from World War II and earlier. The research work was met with great interest from current residents of the area. For them it was crucial to see with their own eyes that their homes really stand on the ruins of the former buildings of the Jewish Quarter. Archaeological research has given the local residents a sense of significance and uniqueness of the place they live, as well as the connection with its past. This new awareness was visible in their desire to acquire knowledge, and in their support for the idea of commemorating former residents and preserving their heritage, including the initiative of entering the excavated remains into the national register of historical monuments.

1113. From the past to the future. Urban archaeology in 2040

Authors: Jeroen Bouwmeester (Cultural Heritage Agency of the Netherlands)
Format: Oral

The world has changed. From a marginal archaeological discipline, urban archaeology has advanced towards the frontline of society. The development of urban archaeology in the Netherlands is very representative in this respect. It has developed from emergency research after the war, followed by resistance from society against urban renewal in the 1960s and 1970s, the gradual erosion of the archaeological soil archive in cities in the 1980s, to a new position in society because of the Valletta Convention. But that was several decades ago. Meanwhile, the position in society of archaeology, and urban archaeology in particular, has changed. There is a clear trend from a focus on research towards a focus on meaning. Archaeology is no longer an obstacle but an opportunity. We are at the beginning of this exciting transformation. The challenge is to embrace this change without losing the scientific identity and integrity of the profession, but to interweave it with this change. The third science revolution has brought many benefits. It is also so specialised that it creates distance. The scientific side of urban archaeology is under pressure. However, when these circles of interests — society, scientific archaeological research, spatial planning, and public archaeology — overlap, something exquisite can emerge. Based on a reflection on the past, in this lecture I want to explore what it might look like: urban archaeology in 2040…

2058. The Interference of Contemporary Networks in the Interpretation Process of Occupation Sequences – The Case of Lisbon

Authors: Ana Rosa (Uniarq-FLUL/FCT)
Format: Poster

The adaptation of societies to new infrastructures and architectures transforms the urban fabric into a living, changeable entity. The ongoing processes of transformation, development, and expansion are often justified in the name of economic progress and social well-being, yet they have direct effects on archaeological heritage. Movements in the subsurface—excavations, trench openings, soil disturbance—affect and alter the strata, complicating the diachronic interpretation of sites. Like any metropolis, Lisbon is subject to human becoming. From the contrast of daily actions, "seven feetfrom the ground" reveal stratigraphies with intense levels of destruction and construction, evidence of an uninterrupted cycle of occupation. In fact, the chronological timeline extends from prehistory to the present day, a result not only of the favorable natural conditions but also of the ability to interact with the different communities that occupied its territory. This paper, therefore, aims to discuss the impact of contemporary infrastructure networks on sites, structures, and materials, focusing on specific interventions carried out in Lisbon.

245 PRODUCTION AND TRADE IN THE EASTERN MEDITERRANEAN FROM THE HELLENISTIC TO THE ROMAN PERIOD: FROM TECHNICAL KNOWLEDGE TO COMMERCIAL NETWORKS

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Nicolas Morand (Eveha international | Muséum national d'Histoire naturelle | CRAVO) – Mohga Abd El-Kawy (Ministry of Tourism and Antiquities) – Aude Simony (CEAlex CNRS)
Keywords: workshops, hard animal materials, ceramic production, trade networks, interconnections, Eastern Mediterranean
Format: Regular session

SESSION ABSTRACT

The productive capacities of ancient societies are well-attested by the abundance of artifacts recovered from archaeological contexts. While the organization of workshops and specialized production spaces remains a key scholarly debate, this session focuses on analyzing the dynamics of manufactured goods—specifically ceramics, metals, gemstones, glass, and hard animal materials—and their subsequent commercial distribution across the Eastern Mediterranean basin and beyond. Our chronological scope spans the Hellenistic through the Roman period (4th century BCE – 4th century CE), examining territories where long-distance trade was catalyzed by intense interregional connections. We specifically seek to understand whether the location of production centers was driven by proximity to essential raw materials, determined by their strategic position along major trade arteries and distribution hubs (urban centers, harbors), or established to satisfy specific demands. Understanding the process, from resource procurement (local or imported) to the chaîne opératoire, is crucial for defining the exploitation strategies and the resulting diversity of economic dynamics. A key objective is to evaluate the production capacities of territories and the subsequent dissemination of their products. An important research interest is to clarify the extent of change beginning in the Hellenistic and Roman periods, assessing whether craft activities represent a fundamental continuity, upholding regional traditions, or whether they signal a significant innovation and transformation of these practices. To analyze this potential, this session advocates for a holistic methodological framework. We particularly encourage contributions that bridge archaeometry, archaeology, iconography, and philology to trace the movement of goods and the transfer of production knowledge. Presenters are invited to submit studies that explore the mechanisms of production and the mobility of goods within micro- or macro-regional economic systems, ultimately shedding light on the underlying political and social dynamics that underpinned these commercial networks.

CONTRIBUTION ABSTRACTS

744. From Cult to Commerce? The Temple Bakery of Heliopolis during the Pharaonic–Ptolemaic Transition

Authors: Klara Dietze (German Archaeological Institute, Cairo)
Format: Oral

Excavations at the Temple of Heliopolis (Egypt) have revealed an economic quarter at the periphery of the main temenos, active from the 8th to the mid-2nd century BC. During the Late Period, this district produced perishable foodstuffs, initially for the temple's offering cult and subsequently redistributed to the wider population through the institutionalized cycle of offerings. Bakery installations, cattle stables, and associated waste deposits allow a detailed reconstruction of production mechanisms within a diversified economic regime combining baking with cattle husbandry and meat processing. This model collapsed under Achaemenid rule in the 5th century BC, when production sharply declined. A fundamentally different regime emerged during the transition from the Late Dynastic to the early Ptolemaic period (4th–3rd century BC), associated with a revival of the temple under Nectanebo I. The precinct was reorganized into a highly specialized, large-scale bakery, while all other production branches disappeared. Substantial changes in baking techniques, oven architecture, and spatial organization markedly increased efficiency—strikingly coinciding with the gradual contraction of cultic activity and the eventual abandonment of the Temple in the early to mid-Ptolemaic period, when its monuments and building materials began to be transferred to Alexandria. Ptolemaic bread production at Heliopolis thus stands at the intersection of technological tradition and innovation, with estimated capacities clearly exceeding the needs of a declining local cult. Adopting a diachronic perspective, this paper addresses the central interpretative problem: why did bread production intensify at Heliopolis precisely as the temple was approaching abandonment, and for whom was this bread produced if no longer primarily for the gods?

1286. Roman Pottery Workshop within an Integrated Insular Economy at Tabbet Metawah (Mariout, Egypt)

Authors: Mohga Abd El-Kawy (Ministry of Tourism and Antiquities, Egypt)
Format: Oral

The Tabbet Metawah site, an island approximately 20 km southwest of Alexandria on the southern coast of Lake Mariout, hosted a complex insular economy. Its eastern depression contained a substantial Roman pottery workshop, while other areas included a habitation zone, a hypogeum, and additional productive installations, reflecting a highly organized and multifunctional landscape. The workshop comprised three kilns, two of which featured a sophisticated design with divided firing chambers, possibly enabling simultaneous firing of distinct vessel types or dual pottery-lime functions, positioning these among the most intricate amphora kilns documented in the Mediterranean. Ceramic analysis confirmed AE3 amphora production, with post-firing resin treatment reducing porosity, likely to facilitate the transport of wine produced at the nearby press. Pottery wheel emplacements, pre- and post-firing hearths, and refuse deposits containing overfired, broken, and unbaked pottery provide an exceptionally complete view of the workshop's chaîne opératoire. Crucially, the pottery workshop functioned within a broader insular productive landscape encompassing viticulture, fishing, and textile-related activities. Together, these industries formed an integrated local economy oriented toward the packaging and circulation of agricultural surplus, particularly wine, within regional Mediterranean trade networks. Habitational evidence on the Kom's upper area, spanning from the early Ptolemaic to the late Roman periods, suggests seasonal or temporary occupation by workers associated with these industries, highlighting the dynamic interaction between craft production, resource exploitation, and socio-economic organization. These findings illuminate the technological expertise, spatial organization, and labor practices underpinning Roman craft production on Tabbet Metawah. More broadly, this study demonstrates how localized production hubs were interwoven with wider economic and commercial networks across the Eastern Mediterranean, offering valuable insights into the circulation of goods, technical knowledge, and economic strategies in antiquity.

2288. Amphora production in Mareotic Region during the Ptolemaic and Roman periods

Authors: Aude Simony (CEAlex, UAR 3134, Cnrs) – Valérie Pichot (MSHE, UAR 3124, Cnrs)
Format: Oral

Since 2013, the Centre d' Études Alexandrines (CEAlex, UAR 3134, CNRS) has been conducting surveys southwest of Alexandria, in the western part of the Mareotic Region, with the aim of identifying and mapping archaeological remains, which are largely threatened by modern development work. This region, closely linked to the Ptolemaic capital as its agricultural hinterland, underwent significant development from the 3rd century BC onwards. During the Ptolemaic period and then the Early Roman Empire, amphora production workshops developed along the southern shore of the Mariout Valley, linked to large agricultural villas located on the lake's edge. The remains of these workshops, which are still partially visible today, bear witness to intense agricultural production, mainly focused on wine-making. The Ptolemaic period productions (AE1 and AE2 type amphorae), largely inspired by Aegean containers in circulation in the eastern Mediterranean, were succeeded by imperial productions of Egyptian or Mediterranean tradition (AE3 or AE4 type amphorae), which were produced on a larger scale. This paper aim at presenting amphora production in this region during the Ptolemaic and Roman periods, based on research conducted by CEAlex on the southern shore of Lake Mariout. It also examines Mediterranean influences on this production and the economic vitality of this region within Alexandria's sphere of influence.

2050. Material Networks in the Hellenistic Eastern Mediterranean: A Comparative Study of Faience from Maresha and Memphis

Authors: Ruth Jackson Tal (Israel Museum, the Hebrew University) – Nurith Goshen (Israel Museum) – Andrew Shortland (Cranfield University)
Format: Oral

The study of faience production provides a valuable lens for understanding the movement of materials, skills, and ideas across the Hellenistic Eastern Mediterranean. Memphis, a well-documented faience production center of the Hellenistic-Roman period, has yielded extensive published material that maps its manufacturing techniques and workshop organization. In contrast, Maresha presents a rich faience assemblage yet lacks clear archaeological evidence for local production activity. This project seeks to map for the first time the typology, context, production techniques, and composition of the Maresha assemblage. By comparing these results with the established data from Memphis, we aim to evaluate whether the Maresha material represents local manufacture or imported products. The comparative framework is designed to illuminate patterns of technological transmission, economic interaction, and interregional connectivity between Egypt and the southern Levant. More broadly, the study addresses the question of Ptolemaic influence on the material culture of the southern Levant under Seleucid and Hasmonean rule. By focusing on faience, a small craft tradition often overlooked in large-scale political narratives, the research highlights how seemingly minor artifacts can expose the entangled dynamics of cultural exchange, technical knowledge, and imperial power that shaped the region's political and economic landscape.

1940. Terracotta roof tiles from Ptolemaic Alexandria cross study, preliminary results

Authors: Patricia Abou El Nil (CEAlex)
Format: Oral

Although frequently remaining in the periphery of studies concerning the ancient Mediterranean economy, architectural terracotta offers vital insights into urban supply chains. This presentation reconsiders this artifact group based primarily on the collection of over one thousand terracotta roof tiles in the storerooms of the Centre d'Études Alexandrines (CEAlex). By cross-referencing comparative data from sites such as Delos, Thasos, Kom Bahig, and Taposiris Magna, we aim to provide this material with the academic attention it warrants. A significant assemblage from the CEAlex rescue excavations in modern Alexandria stands out due to its archaeological integrity; recovered from the Garden of the Former British Consulate, this group belongs to a Ptolemaic-era context identified as a primary deposit. Dating to the 3rd century BC, the finds consist exclusively of fragments of Corinthian-style roof tiles. Morphological observations reveal a diversity in typology, specifically regarding variations in the distance between the transverse ridge and the tile's edge. These variations appear directly related to the nature of the clay, and by extension, the provenance of the tiles. Supported by the findings from CEAlex's excavations, the present study investigates a hitherto overlooked connection through a comparative analysis of the fabric characteristics of roof tiles and amphorae from the same context. By focusing on the finds from Alexandria, we aim to demonstrate that amphorae and roof tiles were produced, stamped, and distributed within a unified organizational framework. Ultimately, this research explores the underlying economic and political motivations of this practice, clarifying how building materials were supplied to the capital of the Ptolemaic Empire within the broader Mediterranean trade network.

1332. Beyond Bone: Luxury Animal Materials in Trade and Craft Dynamics in Alexandria and its Hinterland (Late Pharaonic to Roman Period)

Authors: Nicolas Morand (Eveha International/MNHN)
Format: Oral

Archaeological excavations in Alexandria illustrate the major role played by this Mediterranean metropolis in Antiquity. The numerous remains of object production reveal the importance of exploiting hard animal materials within this urban center. Local and exogenous materials coexist in these production spaces, testifying to the diversity of supply sources. Elephant ivory, a symbol of prestige from the Horn of Africa, alongside materials from the Levant and Europe, such as red deer or fallow deer antler, and

mother-of-pearl from the Indo-Pacific, raise questions about the reality of these long-distance networks. Associated with these rare materials, domestic mammal bones (cattle, donkey, camel) were used as the primary resource, serving as a viable substitute for rare and costly ivory. This reliance on abundant and affordable material reflects the intensity of production demands. While the use of local resources (ivories, ostrich eggshell, mammal bone) follows a long Egyptian tradition dating back to the Predynastic period, the Hellenistic and Roman eras mark a continuity and a large-scale expansion within the productions of an expanded world, of which Alexandria is a prime example. This communication proposes to re-examine the role of hard animal materials in these production spaces, focusing on both the raw materials used and craftsmanship that blends tradition and innovation. We will analyze the evolution of artisanal practices within the urban fabric to identify the actors of production and customers in the city and determine whether they are associated with other chaînes opératoires. On a regional scale, fleeting evidence from other settlements in the Nile Delta dating from the Late Pharaonic to Roman period will be presented to illustrate broader global dynamics of production and exchange.

2572. A Roman Ivory Scabbard Chape from a Sarmatian Grave: Research Perspectives on Ivory Sword Fittings in the Pannonian Region

Authors: Zsófia Masek (Institute of Archaeology ELTE Research Centre for the Humanities, Budapest) – Anna Biller – Lóránt Vass (Budapest History Museum: Aquincum Museum) – András Gulyás (Jász Múzeum, Jászberény)
Format: Oral

A recent rescue excavation conducted in the Sarmatian Barbaricum of the Carpathian Basin—located approximately 65 km east of Aquincum, Pannonia—revealed a heavily disturbed Roman-period Sarmatian grave. It included an ivory scabbard chape, which likely reached the site as part of a provincial Roman spatha and its associated fittings. We present the results of the zooarchaeological analysis, which has identified the material as elephant ivory, excluding alternatives like narwhal or walrus tusks, whalebone, red deer antler, or hippopotamus ivory. This study examines the distribution, social implications, and interaction networks of ivory scabbard components within the Roman Empire and beyond its frontiers. Box-shaped chapes (Dosenortbänder) were primarily in use along the Rhenish limes (second quarter of the 3rd century AD until the end of the century, C1b–C2 periods). While representative specimens are typically associated with high-ranking military officials, a surprisingly high number of "barbarian" imitations have been identified in northern Europe, linked to elite warrior groups. Box-shaped chapes crafted from ivory are exceptionally rare; only about ten examples are known. The sole known site in the Barbaricum was the Vimose bog deposit in Denmark. Ivory carvers (eborarii) operated trans-provincial trade networks to procure raw materials and distribute manufactured products. Ivory objects arrived in Pannonia as finished goods. Only 1% of the processed bone artifacts from Aquincum are ivory, evidencing long-distance trade in urban centers. Within this small percentage, military equipment is even scarcer. This study explores whether the object's presence is linked to specific military trade networks and dispersal patterns or to the long-distance commercial distribution in Pannonia. While Roman weapons often crossed borders through trade, diplomatic gifting, or loot, the rarity of this military prestige item suggests a connection to individual mobility or elite interaction networks, serving as a significant source of personal prestige within Sarmatian society.

2468. Coral and Garnets in Byzantine Alexandria: Exploitation of Distant Resources for Intercontinental Trade

Authors: Nicolas Morand (Eveha International/MNHN) – Patricia Abou El Nil (Centre d'Études Alexandrines)
Format: Poster

Excavations by the Centre d'Études Alexandrines (CEAlex) have revealed an active artisanal district dating to Late Antiquity. In this area, butchery activities coexisted with a specialized sector for processing semi-precious stones. Over 3,000 objects made from 15 different materials sourced across the ancient world were discovered. Spatial analysis of these finds suggests the existence of organized workshops. This site illustrates the importance of craftsmanship in the city. This presentation focuses on two materials that perfectly illustrate the diversity of raw material sourcing and trade routes in the ancient world: garnet and red coral. Analysis of the garnet fragments allows for the reconstruction of the various stages of their transformation into thin plates, a morphology like the Merovingian "cloisonné" style. Chemical analysis and inclusion studies link these specimens to Type I and II garnets from India and Sri Lanka. In the same area, significant evidence of red coral processing, sourced from the Western Mediterranean, highlights an inverse supply chain. While ancient texts record a high demand for red coral in India during Antiquity, these finds confirm that Alexandria served as a key hub where stocks were processed into jewelry, such as beads and rings. These results demonstrate that Alexandria was a central interface for transformation and redistribution during Late Antiquity.

246 THE MEANING AND PRACTICE OF BRONZE METALLURGY IN PREHISTORY — DEDICATED TO HEPHAESTUS, THE DIVINE SMITH

Theme: 1. Widening perspectives in material culture studies
Organisers: Agne Civilyte (BRIAI) – Paolo Piccardo (University of Genoa)
Keywords: Bronze Age metallurgy, Alloy compositions, chaîne opératoire, Experimental archaeology, Hermeneutic
Format: Regular session

SESSION ABSTRACT

In recent years, the study of metallurgy and bronze production technology has become a particularly dynamic field. While much research has focused on the chaîne opératoire and the technological processes behind bronze artefact manufacture, the essential meaning and broader significance of metal in human life remain open questions. This session aims to explore both the practical, ethnographic, and aesthetic dimensions of bronze artefacts, emphasizing their importance within prehistoric societies. Dedicated to Hephaestus—the divine blacksmith and symbol of creative transformation—this session seeks to understand not only how these objects were made, but also why they were made in particular ways. Like the Platonic Demiurge, smiths transformed "ideas" into tangible objects and tools through the application of knowledge and skill to the resistant matter of copper alloys. Material, form, and composition thus embody meaning and value, where "value" encompasses both use and aesthetics. We aim to investigate how ancient metallurgists acquired, mastered, and transmitted their deep knowledge—creating objects that were simultaneously functional and beautiful. The properties and potentials of bronze artefacts depend on alloy composition and microstructural features shaped by thermomechanical history. Researchers from archaeology, chemistry, and metallurgical sciences contribute to this inquiry, with experimental archaeology serving as a crucial means of reconstructing metallurgical practices. These experiments, like a metallurgist's touchstone, test the quality of our hypotheses. We will also address bronze recycling as a form of prehistoric sustainability, exploring its traces in the archaeological record, and consider the health and environmental implications of ancient metal production. Finally, the session invites researchers who interpret metallurgical data through social, philosophical, and hermeneutic lenses, linking ancient craftsmanship with enduring reflections on materiality, form, and creation. Through these perspectives, we seek to decode the technological, aesthetic, and philosophical dimensions of bronze, illuminating the human experience of metal in prehistory.

CONTRIBUTION ABSTRACTS

1324. Bronze Age Metal Alloys: Innovation, Networks, and Health Impacts

Authors: Agne Civilyte (Klaipeda university, Institute of Baltic Region History and Archaeology)
Format: Oral

This paper examines prehistoric metal alloys from the fourth millennium BC onward, focusing on their technological, social, and environmental implications. It outlines the principal alloy types and their components from a practical perspective, emphasizing alloying as a key stage of the metallurgical cycle that shaped both the functional quality and visual properties of metal objects. The deliberate selection of metals and careful control of proportions reflect the high level of technical knowledge achieved by Bronze Age craftspeople. These innovations contributed to intensified inter-regional contact, exchange, and trade among prehistoric communities. The second part of the paper addresses an underexplored dimension: the impacts of heavy metal exposure on human health and the environment. Adopting a multidisciplinary framework that integrates archaeometallurgy, bioarchaeology, and environmental studies, this study highlights the long-term ecological and biological consequences of early metallurgical practices and encourages dialogue with modern industrial metallurgy to inform more sustainable and responsible approaches today.

323. The making of the Bronze Age dirk of Ommerschans: What can chemical analysis and imaging techniques tell us

Authors: Ineke Joosten – Luc Megens (Cultural Heritage Agency of the Netherlands) – Yueer Li (TU Delft) – Tonny Beentjes (University of Amsterdam) – Luc Amkreutz (Dutch National museum of Antiquities)
Format: Oral

In 1896 a remarkable hoard was discovered near Ommerschans in the eastern Netherlands that included a spectacular object: a giant bronze sword. The Bronze Age dirk of Ommerschans seems to be of an exceptional quality. Its extraordinary large dimensions and delicate working suggest that it was a one of kind object. However, five similar shaped dirks of this period have been found, suggesting that these were made in series. The exceptional nature of this dirk and the five other similar dirks found on the European continent and in Great Britain and the assumption that they were made for ceremonial purposes, led us to further investigate the production process and potential use of the Ommerschans dirk by means of non-invasive analytical and imaging techniques like digital 3D microscopy, X-ray radiology, MA-XRF and Neutron tomography. The following research questions were addressed: what can be said about the mould and the material that this mould was made of, how was the dirk cast, was the surface of the dirk worked afterwards and are there any traces of wear visible.

687. Hephaestus, bronze, and belief: metallographic evidence of technological choice in Hercules votive statuettes from Molise region (Central Italy)

Authors: Camilla Criaco (University of Genoa-Department of Chemistry and Industrial Chemistry, DCCI) – Davide Delfino (Museo Archeologico Nazionale di Campobasso | Parco archeologico di Sepino-Direzione Regionale Musei Nazionali Molise) – Enrico Rinaldi (Parco archeologico di Sepino- Direzione Regionale Musei Nazionali Molise) – Matilde Pedemonte – Caterina Lupi – Roberto Spotorno (University of Genoa-Department of Chemistry and Industrial Chemistry, DCCI) – Paolo Piccardo (University of Genoa-Department of Chemistry and Industrial Chemistry, DCCI | UMR 6034, Université Bordeaux Montaigne – CNRS, F-33607)
Format: Oral

In Greek and Roman thought, Hephaestus embodied not only the act of making, but the sequence of processes through which inert matter was transformed into meaningful form. Taking this perspective, this paper approaches bronze artefacts as repositories of technological memory, accessible through metallographic analyses. Focusing on votive bronze statuettes of Hercules from ancient Samnium, this study investigates how technological choices were embedded within the metallurgical chaÎne opératoire of regional craft tradition. Votive statuettes indeed represent a critical intersection between metallurgical practices and religious expression, where material choices directly shaped ritual efficacy. This research, combining p-XRF, SEM-EDS, Raman spectroscopy, and metallographic examination, represents the first metallurgical investigation of these archaeological findings housed at the National Archeological Museum of Campobasso (Italy). All statuettes are manufactured in ternary Cu-Sn-Pb alloys, whose controlled lead content was selectively modulated to enhance casting fluidity and mold filling in relation to morphological complexity. Metallographic observations reveal homogeneous as-cast microstructures characterized by α-phase dendrites, interdendritic eutectoid, and dispersed lead nodules, consistent with controlled solidification regimes tailored to small-scale sculptural casting. This study demonstrates that metallurgical choices in votive production were neither arbitrary nor purely economic, but represented informed decisions integrating technical capabilities, aesthetic intention, and ritual function. In this sense, the metallurgical practices of Samnite smiths resonate with the Hephaestian model of creation: a knowledge-driven transformation of matter through controlled technological action.

1862. Mould Thermal Effusivity and Microstructure of Cu-Sn-Pb Alloys: An Archaeometallurgical Study on San Casciano dei Bagni Bronzes

Authors: Jessica Catanzaro – Roberto Spotorno – Camilla Criaco – Matilde Pedemonte – Flavia Boragina – Liza Upman – Paolo Piccardo (University of Genoa)
Format: Oral

This study investigates the correlation between the thermophysical properties of casting materials and the microstructural characteristics of Cu-Sn-Pb ternary alloys, within the framework of research on the recent discoveries from San Casciano dei Bagni. The objective is to reconstruct the "technological biography" of the artefacts through a protocol aimed at creating an experimental comparative database. The methodology involved an initial non-destructive XRF screening of five votive statuettes, followed by targeted micro-sampling for internal structure analysis. Metallographic sections of the originals were examined via LOM and SEM-EDS to characterise their structural arrangement. The acquired data informed the experimental phase, during which specific metallic charges were prepared to replicate the identified nominal compositions. The alloys were cast into moulds with varying thermal effusivity, ranging from mineral refractories and binders (clay, sand, gypsum, gypsum plaster, steatite) to metallic alloys and carbonaceous materials (steel, brass, bronze, graphite) to simulate different cooling regimes. Characterisation was performed using LOM and SEM-EDS, focusing on the quantification of Secondary Dendrite Arm Spacing (SDAS), the formation of $\alpha + \delta$ phases, and lead segregation. The results demonstrate that the microstructure is directly correlated to the thermal effusivity of the mould. The resulting dataset constitutes a diagnostic atlas that allows for the indirect deduction of ancient foundry techniques, compensating for the frequent absence of physical mould remains. This work expands the understanding of the technological expertise of ancient workshops and provides essential data for proper conservation, enabling the prediction of long-term material behaviour based on specific structural genesis.

1771. Traces of Fire: Macroscopic Colour as a Marker of Composition and Non-Equilibrium in Cu–Sn Bronzes

Authors: Matilde Pedemonte – Roberto Spotorno (University of Genoa, Department of Chemistry and Industrial Chemistry) – Michele Magnozzi (University of Genoa, Department of Physics) – Camilla Criaco – Caterina Lupi (University of Genoa, Department of Chemistry and Industrial Chemistry) – Livia Sforzini (Istituto Centrale per il Restauro) – Paolo Piccardo (University of Genoa, Department of Chemistry and Industrial Chemistry | UMR 6034, Université Bordeaux Montaigne – CNRS, F-33607)
Format: Oral

The macroscopic color of archaeological copper alloys is often regarded as a qualitative attribute, strongly influenced by surface condition and illumination. However, it also reflects the intrinsic optical response of the alloy, which is related to its chemical composition and microstructure. In this study, binary Cu–Sn alloys with tin contents ranging from 1 to 16 wt.% were reproduced in both as-cast and homogenized conditions to investigate whether colorimetric measurements could reveal systematic trends in the CIE Lab* colour space. With respect to compositional variations, the results show that the a* coordinate exhibits a consistent trend with increasing tin content. To better characterize this relationship, ellipsometric measurements were performed to determine the wavelength-dependent optical constants (n and k), enabling the reconstruction of the spectral reflectance of the alloys and supporting the interpretation of the colorimetric data. A second experimental campaign focused on a bronze alloy with a fixed tin content of 11 wt.% cast into moulds with different thermal conductivities, producing distinct cooling rates and tin microsegregation patterns. In this case, non-equilibrium microstructures led to measurable variations in macroscopic color, primarily expressed as changes in the overall colour difference (ΔE). This indicates that colorimetric parameters are sensitive not only to composition but also to deviations from equilibrium conditions induced by microstructural heterogeneity. The aim of this work is to assess whether, under controlled surface and illumination conditions, colorimetric data combined with optical modelling can provide a semi-quantitative, non-destructive estimation of tin content and microstructural state in Cu–Sn bronzes. This approach offers new perspectives for

archaeometallurgical studies in which sampling is limited or not permitted and forms part of a broader project aimed at developing a protocol for the monitoring and conservation of metal objects from excavation contexts to museum storage and exhibition spaces.

1857. Recycling Ideologies – the case of the Bronze Age Viksø helmets

Authors: Heide Noergaard (Moesgaard Museum)
Format: Oral

The Viksø helmets have been the focus of a detailed craft technical examination revealing their operational sequence, their relationship to the material culture of the Late European Bronze Age and their place of origin. Thus, the complete craft biography of these unique horned helmets can now be revealed! This presentation will highlight the importance of ideologies in the crafting of cultural or religious items, to which the helmets should be counted. Based on the crafting history, this study highlights the interconnections among beliefs, rituals, and wealth, showing that the modern trend of upcycling and recycling also played a major role in Bronze Age society. In line with the session's topic to highlight symbols of creative transformation in Bronze Age metalwork, the here presented detailed operational sequence of the helmets will not just reveal their making but also give insights into why they were made and how it actually works to transform "ideas" into tangible objects. An excursion to the origin of the helmets will furthermore provide an opportunity to identify the makers, their networks, and the sources of inspiration. Having been seen as continental European imports, this presentation will show a completely new option for the origin of the helmets, adding valuable information to the discussion of mobility and knowledge exchange in Bronze Age Europe.

1869. Silver-plated bronze nummis from the Roman Period: reproduction of the plating methods

Authors: Liza Upman – Alberto D'Erba – Paolo Piccardo (University of Genoa) – Maria Pérez-Lopez – Fernando Poyatos-Jiménez (University of Seville)
Format: Oral

In Antiquity, various methods were used to coat bronze coins with silver, such as amalgamation or the production of monetae suberatae. However, most of these techniques were poorly suited for large-scale monetary production due to the technological complexity of the processes involved. Studies of ancient Roman silvered coins from the period of the Tetrarchy, have suggested that a different silvering method may have been employed, namely the selective depletion of a silver-containing bronze alloy. Despite the silver rich surface of the coins founded in the Misurata Hoard as well as in the Tomares Hoard , all of them are made of a Cu–Sn–Pb–Ag alloy, with silver content ranging from approximately 3 to 8%. The present study is based on the average values of the group of coins from the reign of Diocletian within this hoards. The alloy composition was CuSn5%Pb9%Ag5%, and quantitative analysis revealed a non-uniform distribution of silver from the core of the coin towards its surface, where it appeared as if it was a silver coin. This study aimed to experimentally replicate the observed features using materials and methods available in antiquity. By applying a combined approach involving chemical treatment (exposure to various solutions) and physical processes (temperature and striking), it was possible to reproduce almost exactly the characteristics of the coins described above. This method may be a key to understanding the technological features of ancient Roman coin production.

1752. Preliminary results on Aes Rude characterisation at Gonfienti (Italy): an integrated neutron and SEM-EDS approach

Authors: Caterina Lupi (University of Genoa | National Council of Research, Institute of Applied Physics "Nello Carrara") – Paolo Piccardo (University of Genoa | Université Bordeaux Montaigne) – Francesco Cantini (National Council of Research, Institute of Applied Physics "Nello Carrara" | National Institute of Nuclear Physics) – Roberto Spotorno – Camilla Criaco – Matilde Pedemonte (University of Genoa) – Arianna Vernillo – Pasquino Pallecchi (Soprintendenza ABAP Firenze e Prato) – Francesco Grazzi (National Council of Research, Institute of Applied Physics "Nello Carrara" | National Institute of Nuclear Physics)
Format: Oral

The term "aes rude" typically designates raw copper fragments frequently found in Etruscan contexts dated between the 6th and the 3rd century BC. Archaeological evidence suggests these objects had potential value in early exchange systems. However, their marked morphological and compositional heterogeneity creates a critical interpretative problem: distinguishing fragments potentially utilised in exchange from intermediate products of metallurgical production chain. Understanding this distinction is key to reconstructing the function of aes rude in archaic societies and to assessing the organization and skills of local metalworking practices. This study examines compositional and microstructural characteristics of twentyfive aes rude from Gonfienti (Tuscany, Italy), an Etruscan settlement occupied from the late 6th to mid-5th century BC. The analytical strategy integrates complementary approaches: Time-of-Flight Neutron Diffraction (ToF-ND) and White Beam Neutron Tomography (WB-NT), conducted at the large-scale facility ISIS Neutron and Muon Source (UK), and SEM-EDS. The comparison and integration of results will help establish a comprehensive analytical protocol for the complete characterisation of these metal artefacts, reducing as much as possible the need for sampling which is often unfeasible on archaeological finds. Preliminary results reveal that aes rude production was not governed by standardized manufacturing protocols. Instead, the observed compositional and microstructural variability reflects heterogeneity in ore sources and metallurgical operating conditions. Of particular significance, we identified a subset of highly ferruginous copper samples that would have proven unsuitable for artefacts production, whether via casting, hot-working,

or cold-working. This work is part of a wider research project that also includes the study of finite metal artefacts (tools and weapons) from the same site, with the aim of reconstructing the complete metallurgical process, from raw metal to finite objects, and assessing local technological expertise at the Etruscan settlement of Gonfienti.

2146. The symbolism of bronze objects and their relationship to other spheres of the material world

Authors: Klara Pusztaine Fischl (ELTE Research Centre for the Humanities Institute of Archaeology)
Format: Oral

In the Middle Bronze Age and Koszider-period (RBA-BB1) metalworking of the Carpathian Basin, decorative motifs appear primarily on bronze and gold prestige objects whose interpretation cannot be undertaken in isolation. These ornaments (spirals, waves, concentric circles) form part of a symbolic system that extends into other spheres of everyday life. Their understanding therefore requires consideration not only of ceramic and bone craftsmanship, but also of the internal spatial organisation of settlements. According to the observable repetitive elements and regularities, the recurring additional design elements must have possessed a certain mnemonic function, through which they were connected to an underlying concept or set of concepts. Although this symbolic system extends across broader spatial and chronological frameworks, the paper examines the identity-signalling role of motifs appearing on metal artefacts through connection with other phenomenon within the Otomani–Füzesabony cultural complex. The aim of the presentation is not to match symbols with modern concepts, but to place the symbol system in context.

1605. Bronze Age stone casting mould from the village of Drama, Yambol district, Bulgaria

Authors: Todor Valchev (Regional historical museum - Yambol)
Format: Poster

The archaeological visibility of the production and consumption of Late Bronze Age (1500 – 1100 BC) bronze items in the Balkan Peninsula, increased substantially. This is the period during which tin-bronze came into mass circulation. It was used for the production of a wide variety of weapons, tools, jewelry, and different ritual and prestige objects. Prehistoric smiths were able to copy any object, including imported ones, and to give it individual characteristics. The aim of this poster is to present a stone casting mould used. It's double and was used for the production of celt axe and of chisel. The casting mould was found in the prehistoric settlement mound near the village of Drama, in the area of the Lower Stream of the Tundzha River. Situated in present-day Southeastern Bulgaria, the valley of the Tundhza River represents a very important passage which connects the Aegean coast with the lands north of the Stara Planina Mountain and the Danube River Basin. During the Late Bronze Age at least one of the important casting centers was situated there.

2489. Standardized Metal Forms, Their Circulation and Processing: Toward a Shape-Based Metal Economy in the Late Bronze Age of Poland

Authors: Kamil Nowak (Austrian Archaeological Institute, Austrian Academy of Sciences)
Format: Poster

Recent archaeometallurgical research on the Late Bronze Age has increasingly focused on identifying the provenance of copper and other non-ferrous metals used in local production. The absence of confirmed copper ore exploitation within present-day Poland suggests that metal was acquired primarily through import. At the same time, characteristic raw material forms widely documented elsewhere in Central Europe – particularly casting cakes and their fragments, known from hundreds of finds in regions such as Austria, Czechia, and Hungary – are almost absent from Polish assemblages. This discrepancy raises a fundamental question: in what form did metal circulate into this area? Rather than assuming that imported ingots were routinely remelted and thus rendered archaeologically invisible, this poster explores the possibility that metal entered circulation in alternative, standardized shapes. Drawing on evidence from hoards containing both foreign and local axe types, I argue that the former may have functioned as standardized carriers of raw material intended for remelting and redistribution. These assemblages provide new insight into patterns of metal flow, processing, and resource management, pointing toward a shape-based organization of the metal economy during the Late Bronze Age.

2580. Krummesser – from stone to metal or vice versa?

Authors: Viktória Kiss (ELTE RCH Institute of Archaeology) – Viktória Kisjuhász (HNM Castle Museum of Esztergom) – Orsolya Mateovics-László (Archäologischer Dienst GesmbH) – Boglárka Maróti (HUN-REN Centre for Energy Research) – Nóra Szabó (ELTE RCH Institute of Archaeology) – Gábor Szilas (Budapest History Museum) – Szabolcs Czifra (Hungarian National Museum) – Gabriella Kulcsár (ELTE RCH Institute of Archaeology)
Format: Poster

At Budapest-Óbuda, Északi Városkapu site numerous small jugs and a unique metal knife were found in a scattered cremation burial of the Nagyrév culture. Based on non-destructive pXRF and prompt-gamma activation analysis the knife was made of copper. The shape of the copper object is similar to stone Krummesser (German: curved knife). Classic stone curved knives appeared at the Early Bronze Age in Romania, in assemblages of the Glina III–Schneckenberg complex and in the later, Epi-Schneckenberg period,

as well as in the Otomani, and Wietenberg culture during the Middle Bronze Age. In Poland, similar stone knives are associated with the Trzciniec culture or with the Otomani–Füzesabony culture. In Hungary the most characteristic stone Krummesser was discovered from an urn burial. This grave was identified as an unusual burial of the Füzesabony culture, since the deceased of this culture were usually buried with skeletal ritual. Several less characteristic stone pieces were found in other contemporaneous settlements of the Vatya and the Hatvan culture, and in the Copper Age Baden culture. Some researchers believe that the stone curved knives may have been influenced by early metal pieces. Based on the copper knife dating to the period of the Early Bronze Age Nagyrév culture, our presentation raises the possibility that the mentioned Early and Middle Bronze Age curved stone and metal knives were actually used contemporaneously with similar functions.

2776. From Furnace to Philosophy: Western Anatolian Metalwork and Early Aegean Understandings of Physics

Authors: Aziz Kayaalp (Charles University)
Format: Poster

Although the Aegean communities display a strong sense of interregional cohesion in both the Late Bronze and Early Iron Ages, their shared material culture has mostly been read through migration theories or solely trading activities in the past, obscuring the most important agents of circulation: humans. Rather than merely contextualizing the occurrence, understanding the human mind behind its locus is a crucial step in visualizing the whole picture. In this sense, metal findings in archaeological contexts provide a useful avenue: especially due to the developments in archaeometallurgical laboratory analyses based on their chemical compositions, the techniques behind metal findings are identifiable. By comparing the nuances between neighboring techniques, one can have a healthy perspective on certain choices. Many deliberate choices in production, implemented by the craftspeople, were related to the ancients' understanding of nature. The conception was mostly limited to the geographical and geological characteristics of their homeland, manifesting itself in folklore. The rich philosophical traditions of western Anatolia convey valuable clues into this epistemology. Especially Aristotle's compilation of Pre-Socratic knowledge, and later philosophers hailing from western Anatolia, transmit the ancient Aegean understanding of physics and chemistry, allowing us to reconstruct what ancient smiths would have known about the elements. As addressed in my Master's thesis "Western Anatolian Metalwork (and the Self-Image) of Metalworkers in the Later 1st Millennium BC: a Historical-Archaeometrical Approach", a closer look at ancient Lydian and Phrygian metalworking techniques reveals certain chemical understandings that found their display in later Ancient Greek metalwork and conception of mineralogy. This paper will present published data from Sardis, Dascylium and Gordion in comparison with Laurion, and also contain philological observations on Strabo and Herodotus.

247 BACK TO THE BEGINNING: WHAT PHILOSOPHY OF TECHNOLOGY AND ARCHAEOLOGY MAY LEARN FROM ONE ANOTHER

Theme: 6. Transient theories
Organisers: Karel Kuipers (Faculty of Archaeology, Leiden University | Erasmus School of Philosophy, Erasmus University Rotterdam) – Daniela Maio (ICArEHB- University of Algarve) – Hub Zwart (Erasmus School of Philosophy, Erasmus University Rotterdam)
Keywords: Philosophy of Technology, Epistemology, Archaeological Theory, Human Evolution, Human–technology relations, Technics
Format: Discussion session
Affiliation: Early Career Archaeologists Community - ECA, Palaeolithic and Mesolithic Community - PaM

SESSION ABSTRACT

Archaeology has traditionally always positioned itself in two ways. On the one hand it is a technoscience, studying the human condition by excavating sites and analysing material remains. On the other hand it is a humanities field and aims to deepen human self-understanding by addressing the question who we are and where we come from. A dialogue between philosophy and archaeology has a long history and has always been fostered by the fact that both areas of inquiry follow the same adagium: know thyself. This session invites critical reflection on our relationship with technology, past and present. On the one hand, technological practices have shaped the trajectory of human evolution; on the other, in today's archaeology, technological methods themselves increasingly drive research questions . How does this shift affect the epistemology of the field? What is gained and lost when technicity overtakes inquiry, especially with growing reliance on AI, which risks distancing researchers from ther material object of study? In contemporary philosophy, the question of technology has taken centre stage; not only in response to disruptive developments such as AI, but because human existence and thought have always been conditioned by technology. It is here that the philosophy of technology and the philosophy of archaeology meet, for archaeology explores the relationship between technics and human existence from its very beginnings. What is needed is an understanding of technology that treats technics not merely as a means or byproduct, but as a structuring aspect of what it means to be human. Drawing on the work of Gilbert Simondon, Bernard Stiegler, and André Leroi-Gourhan, this session seeks a shared framework where critical reflection takes precedence over purely technical approaches.

CONTRIBUTION ABSTRACTS

567. Technics and thinking in the deep past: towards a phenomenology of the Pleistocene spirit, Neanderthal research as case history

Authors: Hub Zwart (Erasmus University Rotterdam)
Format: Oral

In Phenomenology of the Spirit (1807) the philosopher Hegel aspired to capture the history of human thinking on its pathway towards comprehensive knowledge. In early writings, Hegel emphasises how human history is conditioned by technics from the very beginning and one of his early manuscripts entails an archaeological philosophy of technology (a philosophy of archaeology) emphasising the role of technics and labour. For Hegel, the history of thinking began twenty-five centuries ago, notably in ancient Greece, resulting in an intellectual daybreak, when early thinkers addressed the question of the primordial beginning (archè) of the world as we know it. Such a timeframe, however, as impressive as it may have been in the early nineteenth century, is far too limited. The journey of human thinking already commenced millennia ago, somewhere in the deep Pleistocene past. And precisely here, in the very long ago, the intimate entanglement of technics and thinking played a decisive role. What we know about early human history primarily concerns early human technics, e.g., the production and use of artifacts and art in the context of Pleistocene industries. My paper outlines how an intense collaborative dialogue between Pleistocene archaeology and philosophy of technology may allow us to explore in outline the development of human thinking in deep history, thereby broadening our temporal and spatial horizon, using Neanderthal research as my case history, while building on philosophers of technology such as Simondon and Stiegler who already emphasised the importance of a collaborative dialogue between archaeology and philosophy. For Hegel, philosophy and archaeology share the same objective: deepening human self-understanding (who are we and where we come from?). Is it possible for us to gain access into distant worlds of thinking, informed by an archaeology-philosophy dialogue on technics, knowledge and art in the deep past?

2363. Praxis as knowledge transmission: a critical assessment of concepts used in cultural transmission models

Authors: Astolfo Araujo (Museum of Archaeology and Ethnology, Universitu of São Paulo)
Format: Oral

Archaeology provides the only long-term record of human culture. Therefore, researchers interested in understanding cultural evolutionary patterns of long duration would greatly benefit from studying and incorporating data provided by archaeological materials. Cultural Evolutionary Theory (CET) postulates that one can approach cultural changes or stasis through evolutionary terms borrowed (and then adapted) from Biological Evolutionary Theory. Here we present a proposal to define concepts commonly used in the domain of CET, such as "information", "culture" and "cumulative culture" but whose meaning is often dubious or difficult to implemente in a long-term, evolutive rationale. We emphasize the need to distinguish between "information" and "knowledge", in addition to recognizing that "knowledge" can be divided into four distinct modes: doxa, sofia, technê, and episteme. We suggest that doing / performing (praxis) is the prime catalyst for ideas or mental constructions, being the main factor that allows the reliable transmission of knowledge over time. Lastly, we will discuss how some ideas espoused by Simondon, Stiegler, and Lero-Gourhan can be placed in this context.

1419. Mediating Narratives from Archaeometric Data: A Reflective multi-proxy Framework on Technicity for Interpreting Chalcolithic Ceramic Technologies in the Balkans

Authors: Sebastian Dumitrescu (ArchaeoSciences Platform ASp-ICUB, University of Bucharest | Interdisciplinary School of Doctoral Studies, University of Bucharest) – Bogdan Manea (ArchaeoSciences Platform ASp-ICUB, University of Bucharest) – Daniel Stoicescu (University of Bucharest) – Vasile Opris – Theodor Ignat (ArchaeoSciences Platform ASp-ICUB, University of Bucharest | Bucharest Municipality Museum) – Cătălin Lazăr (ArchaeoSciences Platform ASp-ICUB, University of Bucharest)
Format: Oral

This research examines the methodological challenge of integrating complementary archaeometric datasets to construct robust, human-centric narratives about the past. Using Neolithic-Chalcolithic white-paste inlaid ceramics as a case study, it interrogates how discrete observations—elemental data, micrographs, statistical clusters—become social narratives. The proposed case study highlights how laboratory choices and interpretive frameworks—shaped by available infrastructure, training, and disciplinary tradition—influence the narratives built from archaeometric data. This inquiry thus operates on two interrelated technological planes: the ancient technics of ceramic production under study, and the contemporary scientific instruments through which that past is reconstructed. The investigation is grounded in a complementary study of ceramics from multiple Neolithic and Early Chalcolithic traditions in Lower Romania (Starčevo-Criș, Dudești, Vădastra, Boian, Hamangia – c. 6000-4500 cal. BCE). A dual-method approach (pXRF & SEM-EDX) provided compositional and microstructural data. PCA analysis revealed three distinct paste groups—calcium-rich, silicon-rich, and mixed-composition—interpreted as distinct recipes. These recipes reveal a technological landscape utilizing both local resources and distantly-sourced materials. Each instrument offers a distinct lens: pXRF maps broad compositional choices while SEM-EDX reveals microstructural details of mixing and firing. Together, they constrain and enable

different facets of the technological narrative. The conundrum in many studies lies in modeling a functional, multi-proxy correlation of archaeometric results with other datasets and established narratives. This study maps a clear interpretative sequence: from compositional groups to material, from material to chaîne opératoire and knowledge, and from non-local provenance to evidence for procurement networks. Overlaying these interpretations onto cultural and chronological frameworks transforms data into powerful narrative constraints. An iterative, reflective multi-proxy methodology thus provides the empirical rigor necessary to construct plausible narratives about past technological practice.

2103. From Typology to Process: Rethinking Lithic Analysis through Technics and Material Inference

Authors: Karel Kuipers (Faculty of Archaeology, Leiden University | Erasmus School of Philosophy, Erasmus University Rotterdam)
Format: Oral

In recent years, the study of lithics has been shaped by developments from two directions. On the one hand, the biomolecular turn has increasingly positioned lithic analysis into a more supportive or auxiliary role, rather than as a primary mode of inquiry to study human behavior in the deep past. On the other hand, there has been sustained critique of how lithic typologies are constructed and applied, raising questions about their epistemic robustness. While typological and technological classifications are still operated in a consciously pragmatic manner, they are often epistemically underdetermined and tend to operate at the scale of assemblages and/or artefacts, limiting their explanatory or predictive power. Against this backdrop, this paper explores the potential of a dialogue between archaeology and philosophy of technology. More specifically, the paper combines a semiotic approach to material inference with Stiegler's theory of technics in order to examine how lithic analysis might be grounded in materially warranted inference and processual explanation. Semiotics is used to constrain inference from archaeological traces, restricting analysis to robust relations grounded in technical processes, and thereby avoiding appeals to meaning or mentalist explanations. Stiegler's account of technics, in turn, offers a way to think through how technical practices carry memory and generate historical continuity. Taken together, these perspectives suggest how technical lineages might be reconstructed as processual trajectories grounded in what had to occur for artifacts to exist, rather than as expressions of constructed cultural units.

248 ARCHAEOLOGY AND HISTORY OF WOODLANDS – HUMAN-TREE INTERACTION THROUGH TIME

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Oliver Nelle (Tree-ring Lab, Baden-Württemberg State Office for Cultural Heritage | Institute of Botany, University of Regensburg) – Aleksandra Fostikov (Institute of History Belgrade) – Dorina Moullou (Ephorate of Antiquities of East Attica, Hellenic Ministry of Culture | School of Applied Arts and Sustainable Design, Hellenic Open University) – Maria Ntinou (Department of Archaeology, Aristotle University of Thessaloniki)
Keywords: woodland, human-tree interaction, material and historical sources, interdisciplinarity, environmental archaeology, long-term perspective
Format: Regular session

SESSION ABSTRACT

Woodlands have evolved under human influence for millenia, with the availability of tree products playing a pivotal role in shaping the development of human societies. The interaction of humans with trees and woodland is a long and regionally diverse story. Although the topic has a rich history of research, it increasingly requires more detailed regional and synthetic investigations and truly interdisciplinary approaches, with innovative combinations of methods and archives. In this session, we focus on combining archaeological material and written or iconographic evidence, alongside oral history and ethnographic data. The complementation of archaeological finds and features -waterlogged wood, timber in historic buildings, charcoal, tar, carpological remains- with sources from historical sciences such as texts, maps, and iconography offers unique potential to explore the interrelatedness of woodland products, their uses and their analysis. Knowing the consequences of woodland use through time is essential for understanding current ecosystems and contributes to contemporary debates on biodiversity and climate change. After a session at the EAA 2024 on PoTaRCh (Network of Forest by-products Potash, Tar, Resin, Charcoal in Europe, EU-COST Action 22155) and the 2025 session focusing on the connection of wood and charcoal with metallurgy, we now stress the collaboration between archaeologists, historians and environmental scientists. This session expands the PoTaRCh network's initiative to promote transdisciplinary research on forest by-products across Europe. It aims to bring together researchers from different periods, regions, and disciplines to examine how human activities have shaped and been shaped by woodland ecosystems. We seek to identify long-term trajectories in woodland exploitation and perception by integrating archaeological, historical, ethnographic, and ecological perspectives. We welcome contributions on wood procurement and trade, management, charcoal and tar production, resin extraction, timber construction, palaeoecology, and the symbolic or ritual role of trees.

CONTRIBUTION ABSTRACTS

515. Let there be light?! The Late Iron Age Land Opening around the Oppidum Altenburg-Rheinau in Southwestern Germany

Authors: Lisa Holler (Prehistory, Early History and Medieval Archaeology, University of Tübingen) – Elena Marinova (Archaeobotany Laboratory, Baden-Württemberg State Office for Cultural Heritage) – Oliver Nelle (Tree Ring Laboratory, Baden-Württemberg State Office for Cultural Heritage) – René Wollenweber (Prehistoric Archaeology, Baden-Württemberg State Office for Cultural Heritage) – Martin Bartelheim (Prehistory, Early History and Medieval Archaeology, University of Tübingen) – Günther Wieland (Prehistoric Archaeology, Baden-Württemberg State Office for Cultural Heritage)
Format: Oral

The first major urbanization north of the Alps arose during the late pre-Roman Iron Age and resulted in fundamental cultural transformations. This process profoundly shaped the landscape and land cover, especially around early central places such as oppida. The significant shift is due to an increased demand for food and wood supplies of a growing and artisanal more specialised population. This study aims to gain a broader understanding of landscape changes and human-environment interactions based on the macro botanical evidence of the late La Tène oppidum Altenburg-Rheinau, which is situated on two strategically favourable peninsulas of the Rhine River (Swiss-German border region, east of Basel and west of Schaffhausen). Especially in southwestern Germany, but also vast parts of Central Europe, the combination of the carpological and anthracological subdisciplines is yet rarely conducted on late La Tène sites. Thus, information on vegetation shifts often derives from carpological and palynological perspective only, restraining potential evidence of silvicultural practices or wood import. So far, the carpological results from Altenburg-Rheinau (peninsula Schwaben), attest to a clear presence of open and grassland vegetation, which supports the idea of land opening. Interestingly, the outcomes of the anthracological investigations indicate no bottlenecks in high quality wood supply. The duration and spatial extent of activity of the oppidum suggest a high wood demand and it is likely that the resource was first locally exploited. This would have extensively affected the surrounding forest. This paper intends to investigate reasons for the predominant presence of high-quality fuel and timber (oak and beech). Thus, the potential of sustainable silvicultural practices is explored through tree ring analysis. Furthermore, other possible supply systems are posed in a theoretical approach. Finally, the results will be presented in a diachronic framework, and an outlook on possible future research will be given.

1457. Layers of Change: Human–Forest Interactions and Landscape Transformation in the Šumava Mountains (18th–20th Centuries)

Authors: Tereza Blažková (Center for Theoretical Study, Charles University)
Format: Oral

The Šumava Mountains form a densely forested border range in the southwest of the Czech Republic. Their role as a wooded frontier landscape has been recorded since the Middle Ages and even earlier. Until the late 18th century, however the region remained almost untouched—a true primeval forest—despite the existence of several trade routes and some local-scale forest use. Major transformations began with the rise of noble-controlled timber trading at the turn of the 18th and 19th centuries. This paper presents the results of an interdisciplinary study focusing on the transformation of this landscape under the influence of intensive human interaction with forest . The large-scale exploitation of forest resources—particularly the extraction of firewood for industry in Vienna and Prague— initiated profound ecological changes that continues to affect the region today (forest clearance, soil degradation, bark beetle outbreaks, and increased vulnerability to windthrow). In addition to the massive logging also special trees were extracted for their rare, healthy wood for example resonant wood for the production of musical instruments. Forestry led to settlement development, as previously uninhabited mountain regions became places for people to live is villages and seasonal dwellings. Further profound transformations occurred during the 20th century due to wars, political upheavals. These events deeply impacted the landscape, ecosystems, and patterns of human settlement. After the Second World War, most of the local population was expelled or relocated, and the region became a restricted border zone where military activity continued. My research integrates archival documentation, historical maps, oral histories, and non-destructive archaeological field survey to reconstruct long-term trajectories of human–forest interaction. By combining material traces of woodland use with written and cartographic evidence. the study reveals both visible and hidden traces of two centuries of human–environment interaction that continue to shape the now protected Šumava region.

1492. Woodlands of Macedon: Macedonian wood and pitch

Authors: Maria Ntinou – Ioanna Vasileiadou (Department of Archaeology, Aristotle University)
Format: Oral

In the historical period, the woodlands of Northern Greece have been a major attraction for rulers from the East and settlers from the South. Ancient authors (Herodotus, Euripides, Theophrastus, Thucydides) praised the richness and biodiversity of the forests of Mounts Olympus, Cholomontas, and especially Pangaion (Daton), while charcoal and palynological studies confirm the wealth of Macedonian woodland environments. Since prehistory, local communities possessed the technical knowledge required to exploit forest resources of their natural environment. In historical times, and specifically during the 4th century BCE, timber from Mount Pangaion, which was in high demand, and Chalkidiki timber were integrated under the label of Macedonian timber and became

a highly competitive commercial product, distributed to markets throughout Greece, as evidenced by both epigraphic and literary sources. Ancient Macedonia was an invaluable source of timber for shipbuilding, which was often included in inter-city state treaties of ancient Greece and used as diplomatic leverage to achieve key political and military objectives. Alongside timber, the production and trade of Macedonian pitch was an inconspicuous yet particularly important economic resource. Herodotus' "Pierian pitch" of 5th century BCE constitutes the earliest literary reference to pitch production in ancient Macedonia. During the reign of Philip II, pitch produced by the community of Chalkidiki appears to have been incorporated into Macedonian pitch – the "pitta" mentioned in inscriptions. Fiscally, pitch was treated in the same way as timber. At the microeconomic level, both timber and pitch had various applications (resin/pitch coating, funerary practices, resinous wine-type of ancient "retsina", etc.). Archaeological residues of resin and pitch from sites across ancient Macedonia attest to its widespread use. In this presentation, we examine the exploitation and management of the woodlands of ancient Macedonia from an interdisciplinary perspective, combining historical and epigraphic sources with an emphasis on archaeological data and laboratory analyses.

2030. Wooden Artefacts from a Late Antique Hillfort Cistern at Ajdovski Gradec: Dendrochronological Evidence

Authors: Daša Pavlovic (National Museum of Slovenia) – Maks Merela – Daša Krapež (University of Ljubljana)
Format: Oral

In 1977 - 1978, a cistern was excavated within one of the defensive towers of the Late Antique hillfort settlement of Ajdovski Gradec above Vranje (Slovenia). Owing to its exceptional construction quality, the structure remained water-tight for approximately 1,400 years. A total of 271 wooden artefacts were recovered, including elements of the roof structure, roofing components, gutters, ceiling elements, a trough, a ladder, and various smaller utilitarian objects. Such an extensive assemblage of well-preserved wooden material archaeologically attributed to the 6th century, is extremely rare in Slovenia and the wider south-eastern Alpine region. Most wooden objects were conserved with polyethylene glycol (PEG) in the 1980s, which substantially limits the reliability of radiocarbon dating. Consequently, dendrochronological analysis represents the most suitable method for establishing a precise chronology. This work presents the results of dendrochronological analyses conducted in late 2025 and early 2026 on 22 selected samples. Preliminary analyses indicate that all sampled timbers are oak (Quercus sp.) and are suitable for dendrochronological measurement and dating. The results contribute to a more refined chronological framework for the construction of the cistern, and associated settlement and provide new insights into climatic conditions and environmental changes during Late Antiquity in the south-eastern Alpine region.

1643. Forest use in medieval Serbia

Authors: Mirko Vranic (University of Belgrade, Faculty of Philosophy, Department of Archaeology) – Aleksandra Fostikov (Institute of History Belgrade) – Nemanja Pavlović (University of Belgrade, Faculty of Philosophy, Department of Archaeology)
Format: Oral

Forests were among the key natural resources of medieval Serbian society, given that the central Balkan region—excluding its Mediterranean areas—is rich in forest vegetation. The multifaceted role of wood is evident in construction (as a structural material), economic activities (mining and metallurgy, crafts, and manufacturing production), and everyday consumption. Data on tree species and terminology in connection to them as well as information on their usage, are drawn primarily from historical sources (charters, legal texts, and other documents), iconographic evidence, local toponymy, and modest but increasingly frequent archaeological (anthracological) analyses of samples from diverse contexts (fortifications, settlements, mine shafts, metallurgical remains, etc.). Environmental factors influencing forest use are also taken into account. This paper aims to provide a comprehensive overview of current knowledge and to highlight the potential of an interdisciplinary approach to the study of forest use in medieval Serbia. In this way, the study also opens possibilities for further comparison within a broader and better-researched European context.

2214. Woodland exploitation and selection in the prehistoric southwestern Balkans: insights from dendrochronology on waterlogged wood

Authors: Andrej Maczkowski – John Francuz (University of Bern) – Matthias Bolliger (Archaeological Service of Canton Bern) – Maxim Yermokhin – Albert Hafner (University of Bern)
Format: Oral

This study investigates diachronic woodland exploitation in the prehistoric southwestern Balkans through an integrated dendrochrono/archaeo/typo-logical analysis of waterlogged oak, juniper, pine, and other deciduous-tree remains spanning the 6th to 1st millennia BC. Oak was consistently the dominant construction timber (>50%), reaching almost 90% at Iron Age Vrbnik (Lake Ohrid). The vast majority of oak timber comes from subgenus Quercus taxa, and the near absence of Cerris-type oaks in the archaeological assemblages suggests either cultural preferences or ecological constraints. Diachronic comparison of ring-number/diameter, ring-number/growth-rate relationships, and site-specific average growth curves reveals subtle yet meaningful woodland-use patterns. At Neolithic Dispilio (6ht mill. BC, Lake Kastoria) predominantly young oak trees were used, whereas during the 45th–44th century BC occupation of Ploča Mičov Grad (Lake Ohrid) mixed-aged forests were exploited. Only the Late Bronze Age phases at Ploča show indications of targeted selection, including diameter clustering in the 15th-14th c. BC and a shift to older growth in the 14th-13th c. BC phase. The vigorous juvenile growth of oaks observed at Iron Age Vrbnik aligns with regional pollen evidence for widespread

forest thinning after 1150 cal BC. Juniper use, prominent in the 6th and 5th millennia BC, demonstrates early exploitation of these durable taxa, with Ploča specimens showing larger diameters and greater age than those from Dispilio, possibly indicating more open woodland stands. Pine species are mostly represented by P. nigra/sylvestrist-typa, but are less chronologically informative due to poor preservation of waney edges. Overall, the results underscore a remarkable continuity in woodland composition and sustainable exploitation across many millennia of human settlement, consistent with broader findings that long-term traditional land use maintained high biodiversity in the Mediterranean. The study also highlights the transformative potential of combining dendrochronology and targeted high-resolution radiocarbon modelling.

2319. Human-tree interactions through time on Vitosha Mountain, Sofia, Bulgaria: a charcoal-production sites' survey

Authors: Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences | Department of Archaeology, Sofia University "St. Kliment Ohridski") – Anani Antonov (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Borislav Grigorov (Department of Geology, Sofia University "St. Kliment Ohridski")
Format: Oral

Vitosha Mountain lies immediately adjacent to the modern Bulgarian capital, Sofia. Its natural resources have been intensively exploited by the inhabitants of the Sofia Plain from the Neolithic period through Roman and Late Antiquity, the Medieval period, and into the present day. Forestry resources, including wood and tree fruits, are well documented as having been sourced from Vitosha and utilised in the ancient city of Serdica. In contrast, much less is known about archaeological forestry by-products, such as charcoal, that may have originated from the mountain. Historical sources, however, attest to charcoal production on Vitosha, particularly in connection with metallurgical activities, as well as to the trade of charcoal. Other accounts describe the environmental consequences of these practices, including extensive deforestation and subsequent reforestation with selected tree species to stabilise eroded slopes. Drawing on this historical literature in combination with systematic land survey informed by charcoal-related toponymy, this study presents the first results of the pioneering survey of historical charcoal production sites on Vitosha. It further demonstrates the close interplay between present-day biodiversity patterns—such as the distribution of recent and old-growth forest cover—and evidence derived from written sources and field survey data.

2445. Wood charcoal production in round and rectangular upright kilns in southern Germany - a combination of dendroanthracology and written sources

Authors: Oliver Nelle (Baden-Württemberg State Office for Cultural Heritage)
Format: Oral

In south-west Germany, in the region of Baden-Württemberg, charcoal was produced in pits until late medieval times, and in round upright kilns thereafter. Now, thanks to LiDAR image analysis and ground proving, we found an ensemble of relics of round kilns together with rectangular kilns, in a forest near Ellwangen in the Ostalb region. The rectangular kiln type or Langmeiler is known from Scandinavia and Austria, but was so far not found in Baden-Württemberg. The charcoal assemblages are dominated by fir (Abies). In the region with a long iron mining and processing history, the need for charcoal was immense before the use of fossil coal. According to LiDAR data, thousands of charcoal production sites are still present and can be sampled for anthracological analysis. Tree-ring measurements are carried out to characterise the growing conditions of the trees, as well as date the time of usage of the sites. The operation of the kilns might be related to a big windfall event and the subsequent need to process the huge amount of fallen trees, as recorded in written sources of the 19th century.

683. Prehistoric textile production as possible evidence of forest management

Authors: Johanna Banck-Burgess (Textilarchaeology, Baden-Württemberg State Office for Cultural Heritage)
Format: Oral

Since the Neolithic period, settlers have lived continuously along the shores of lakes that are found in the Alpine lowland region. Due to the wetland conditions preservation of organic material is exceptional and textiles that have survived in the prehistoric wetland settlements are numerous and are providing evidence of the little understood importance of textiles in sedentary Neolithic lifestyles. Notably in the Hornstaadt IA settlement on Lake Constance in southwestern Germany, which seems to have been active between 3917 and 3909 B.C,, before it was destroyed by fire. The evidence from this settlement demonstrates the commonplace demand for textiles, which were practical and necessary for housekeeping, construction, food storage, fishing and mobility. As with other settlements of the same period, lime bast was predominantly the key material. Careful selection and processing of the raw materials used in the manufacture of these textile products is testimony to a high level of proficiency. Demand for lime bast probably far exceeded that which was available in the uncultivated environments surrounding of the settlements. There were probably several ways to meet the demand for raw materials, ranging from sourcing from further afield to adopting different forest management strategies. In this contribution the aim is to demonstrate that, in prehistoric times, textiles were directly linked to trees and therefore forestry. By providing an overview of the textile finds and their value and usage. Also to highlight some specific gaps relating to dendrology research.

1780. Between the Axe and the Crown: Resource Demand and Protection of Royal Woodland in the 17th-Century Białowieża Forest

Authors: Joanna Wawrzeniuk (Institute of Archeology, Cardinal Stefan Wyszyński University, Warsaw) – Bogumiła Jędrzejewska (Mammal Research Institute, Polish Academy of Sciences, Białowieża)
Format: Poster

Białowieża Primeval Forest (1,500 km2; located on the borderland of Poland and Belarus) has been the best-preserved woodland in the lowlands of temperate Europe and UNESCO's World Heritage Site. The status of a royal hunting domain of Polish kings and Lithuanian dukes from the late 14th to the late 18th century ensured the preservation of BPF's ecosystems and large game, including the European bison. In the 17th century, during the reign of the Vasa dynasty, the conflict between protection and exploitation of forest resources began to emerge. The measures undertaken by the monarchs to strengthen the protection of BPF included the construction of the new royal hunting manor in the center of the forest (as documented by archeological research), the strengthening of forest protection personnel to 281 people settled on the BPF's outskirts, and the issuing (in 1639) of the new chart of their rights and obligations ("Ordinatia of the Royal Forest of Białowieża"). Those measures were, however, moderately effective in the second half of the 17th century, after the period of devastating wars (1648-1667). The demand for income to the Crown Treasure and for economic recovery of the country justified the controlled exploitation of BPF based on contracts for forests products: potash, charcoal, and tar. It was only in the early 18th century that more stringent forest protection rules were reintroduced in BPF.

2395. Tracing the Historical Charcoal Production in Rudnik Mountain, Central Serbia: First Anthracological Results

Authors: Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences | Department of Archaeology, Sofia University "St. Kliment Ohridski") – Oliver Nelle (Tree-ring Lab, Baden-Württemberg State Office for Cultural Heritage) – Mirko Vranić (Faculty of Philosophy, University of Belgrade) – Aleksandra Fostikov (Institute of History Belgrade)
Format: Poster

This study presents preliminary results from anthracological material collected during a field survey of charcoal production sites conducted in 2025 on Rudnik Mountain, Šumadija District, Central Serbia. The Rudnik area has a long and well-documented history of metallurgical activity, extending back to the Roman, Medieval and Ottoman periods and up to the present. However, comparatively little is known about the wood charcoal resources that supported this industry. This knowledge gap provided the primary motivation for undertaking a targeted field survey as part of the COST action 22155 "EU-PoTaRCh" (Network for forest by-products charcoal, resin, tar, potash) and informed by historical and ethnographic sources. One of the surveyed localities, situated southeast of the village of Majdan, was identified as a former charcoal production area, as also indicated by the toponym Ćumurana (kömür for "charcoal"). The site features platforms interpreted as construction surfaces for round upright kilns that were likely used for charcoal manufacture. Trail trenching and sampling were carried out, charred wood remains - recovered and subjected to anthracological analysis. Preliminary results indicate a dominant exploitation of beech wood (Fagus sp.), represented by both large- and small-diameter material. Minor occurrences of willow (Salix sp.), poplar (Populus sp.) were also identified. These findings correspond to some of the contemporary toponymy of the region, which includes references to willow, as in Gornja Vrbava and Donja Vrbava, but also contrast to other, referring to Turkey oak (Quercus cerris), as in the locality Cerova, and birch (Betula sp.), as in Brezovica. This discrepancy opens a line of discussion regarding woodland exploitation strategies: whether low-altitude beech forests were preferentially selected for charcoal production due to the unavailability of oak resources, or whether oak became dominant through later reforestation following the exhaustion of beech woodlands.

249 MULTI-DISCIPLINARY, COLLABORATIVE APPROACHES TO THE EXCAVATION, ANALYSIS, AND CURATION OF BONE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Katie Zejdlik (The Ohio State University) – Jonathan Bethard (University of South Florida) – Carlos Carvalho (The Ohio State University)
Keywords: Osteoarchaeology, Mortuary, Archaeological science, Collaboration
Format: Regular session

SESSION ABSTRACT

Archaeology is unique for its breadth of potential, interdisciplinary collaboration; a trait that makes archaeological inquiry innovative, despite its inherent focus on the past. From collaboration with descendant communities and local stakeholders to application of stable isotopes in interpretations of diet and mobility, best practice in archaeological research seeks experts that can contribute distinct but complementary knowledge to a project. This symposium aims to collect traditional and avant garde collaborative works between scholars from the sciences and humanities, as well as applied fields like medicine, dentistry, museum studies, and descendant relations to showcase the breadth of creative problem solving in archaeological method and interpretation. In an effort to remain broad in approach but narrow in scope, we invite contributions to this session that focus on human or animal bones and/or mortuary landscapes. Such investigations could include everything from soil composition on taphonomic modification to proteomics or oral history in site location. Papers must be multi-authored and include two, distinct areas of expertise. Expertise includes perspectives of local stakeholders and descendant community members. Projects can be from any geographical or temporal context.

CONTRIBUTION ABSTRACTS

1674. Indigenous Knowledge as Expertise

Authors: Nicholas Passalacqua – Katie Zejdlik – Rachael Mccrary (The Ohio State University)
Format: Oral

This project argues for a re-evaluation of popular understandings of expertise, to more fully and equitably appreciate various forms of knowledge as inherently valuable. Contextualizing history is crucial, and anthropologists and archaeologists have long bridged institutionalized knowledge and training with information from informants and interlocutors to limit cognitive bias and gain a greater understanding of other people's worldviews and lifeways. Recent developments within anthropology such as the Decolonization and Radical Humanism movements argue for a less-extractive, more cooperative approach to working with individuals outside of the academy. Both approaches call for reshaping the role of the "Other" from exploitation to collaboration, aspiring for shared stewardship through acts of community engagement; co-authoring work with non-traditional scholars; and attempting to build a more inclusive approach to understanding humanity. One form of cultural expertise is from descendant community members, which is often referred to as Indigenous Knowledge. While the concept of Indigenous Knowledge is well intentioned, we argue that artificially categorizing forms of knowledge as "indigenous" could produce/reinforce stereotypes and bias towards this type of knowledge, placing it as a lesser objective or informed type of knowing. Instead, we argue that Indigenous Knowledge is Specialized Tacit Knowledge, a term coined by sociologists Collins and Evans (2007) within their Periodic Table of Expertises. Specialized Tacit Knowledge is a form of expertise not simply acquired through traditional Western academic structures, but rather a unique form of knowledge gained only through community membership, acculturation, accumulated practice of skills and understanding to the point of intuition. We suggest that by reconsidering Indigenous Knowledge as a hard-earned form of expertise along a spectrum of other forms of expertise creates a more inclusive model of understanding the achievement of knowledge and skills, which in turn makes expertise a holistic concept applicable to everyone regardless of background.

2294. Descendant community expertise and the excavation, interpretation, and general functioning of a Transylvanian bioarcheology project

Authors: Katie Zejdlik (The Ohio State University) – Zsolt Nyárádi (Haáz Rezső Museum) – Jonathan Bethard – Renee Reinman (University of South Florida) – Carlos Carlos Da Silva Carvalho (The Ohio State University) – Cameron Matheson (North Carolina State University) – Stephen Batiuk (ArchaeoTek Canada, LLC | University of Toronto)
Format: Oral

Collaboration with descendent communities is not new in archaeology; however, the degree of interaction and status given to local knowledge varies. This presentation provides a decade long perspective on the unique contribution of descendent expertise through discussion of failures associated with ignoring local expertise and benefits of broad perspectives from museum professionals to pastors, business owners, and community members. ArchaeoTek Canada, LLC has been working with the Haáz Rezső Museum (Odorheiu Secuiesc, Romania) since 2013 to excavate and analyze the remains of medieval Szekler-Hungarian churches and their associated mortuary landscapes. Led by a member of the Szekler descendant community and in collaboration with mostly American academics and a global team of field students, the project has been a successful, collaborative experience demonstrating a multitude of outcomes otherwise unachievable without descendant community knowledge and the experience of living and working within the community. The Hungarian-Szeklers are a marginalized cultural group in Transylvania despite their presence there since AD 1000. Mythic and documented origin stories deeply connect them to the perpetually, politically contested historic region of Transylvania. Separated from their political motherland by the Treaty of Trianon (1919), the Szeklers have found themselves socially oppressed and marginalized by many in the Romanian government and larger society. Disagreement over occupation and "ownership" of Transylvania has resulted in biased academic literature and nationally edited archaeological reports. While our work provides tangible, scientific evidence of Szekler presence in Transylvania, no amount of reading would have filled-in the blanks of daily minutiae and emotions important to understanding the archaeological record. Living with the descendant community and experiencing the pride of heritage, skepticism of politics, and steps of survival has allowed access to otherwise unknowable practices and emotions. It also shows that bioarcheological projects should only exist when acting for the community rather than for itself.

1682. Materiality and Meaning: Understanding the Context of Beaded Headbands of Transylvanian Child Burials

Authors: Lauren Reinman – Jonathan Bethard (University of South Florida) – Katie Zejdlik (The Ohio State University) – Zsolt Nyaradi (Haáz Rezsö Múzeum)
Format: Oral

Excavations of Szekler-Hungarian churches dating from the 12th to the 17th century in Transylvania, Romania have recovered beaded head adornments from children's burials (ages 3-12). Preservation was highly variable though most head adornments were placed on the crown of the head as indicated by bone staining and occasionally preserved materials including remnants of cotton thread, copper-alloy threading, and colored glass beads. Intentional styling and adornment of female hair was an important practice among historic Hungarians as a form of gender identity, village identity, and economic and marital status. Beaded headbands, called pártas, were historically associated with young women as part of their wedding traditions. Pártas functioned as material markers of a socially recognized life stage connected to feminine identity and reflected culturally rigid gender expectations. The presence of beaded head adornments in children's burial contexts presents a contradiction, as these adornments were strongly linked to young, engaged women rather than children. Furthermore, sex cannot be estimated from child skeletons, so while it is logical to assume the children were females, there was no way to be certain. To contextualize the ascription of gender to children within mortuary practices, this study investigated the relationship between burial adornment and biological sex. 53 child burials containing beaded headdresses were selected from across five Szekler sites and were analyzed for biological sex using proteomic analysis of tooth enamel. Sex was assessed through the detection of amelogenin protein markers (AMELX and AMELY). By using archaeological findings, historical documentation of pártas, and the scientific sex estimations, an interdisciplinary approach provides new insights into how gendered identities were ascribed to children in death. The results highlight the complexity of gender ascription in medieval and early modern mortuary contexts and challenges assumptions that gendered material culture directly reflects biological sex and age, particularly in the burial of children.

2392. Bones, graves, artifacts. Dating a medieval church trough cemetery excavation in Transylvania, Romania

Authors: Zsolt Nyaradi (Haáz Rezső Museum) – Lauren Reinman (University of South Florida)
Format: Oral

Archaeological excavations of medieval churches in Eastern Transylvania—within the former Udvarhely Seat—have produced significant results. Traces of the earliest Szekler settlers from the turn of the 11th–12th centuries have been identified and bioarchaeological analyses, including aDNA analyses, have revealed new information about this period. In several early graves, unique items of female attire have been recovered, including hairpins. The chronology of these finds has been augmented based archaeological artifacts from Arpadian age churchyards. Hairpins used throughout the 5–9th centuries in Western-Europe, particularly in the Anglo-Saxon area, formed a hairdress fashion that spread across Christian Europe in the12th century. Considering the Transylvanian artifacts, copper alloy hairpins with gilded globular head often appear together with S-ending lock rings. These artifacts are strongly associated with Christian mentality and fashions connected with the 'westernisation' of Hungarian state institutions. These artifacts do not represent the heritage of foreign people. In the 12thcentury, archaeological signs of 'westernisation' appear in all segments of life in the Transylvanian Basin, indicating that besides the migrations, the Hungarian Kingdom was integrated into Western culture. In 2025, at Tordátfalva (Turdeni), hair-dress elements were identified. In Grave no. 30, 9 – 10 hairpins were recovered and a hair ring was uncovered in another burial. Skeletal analysis of Grave 30 estimated that this individual was an older adult female. Based on artifact typology, the graves were reliably dated to the 12th-century. Brick fragments were found with a good-quality, whitish-grey mortar rich in lime in the fill of the graves indicating an early phase of the church. For the time being, no concrete traces related to this first phase have been observed, since they lie within the interior of the present church. The excavation from Tordátfalva reveal important details about early stylistic elements in Szekler communities.

406. A New Look at an Old Collection: Recent Results Interdisciplinary Studies on the Eneolithic Necropolis of Vărăști, Romania

Authors: Aurélien Tafani (ArchaeoSciences Platform, Research Institute of the University of Bucharest) – Robert Tykot (Department of Anthropology, University of South Florida) – Christophe Snoeck (Research Unit: Analytical, Environmental & Geo-Chemistry, VUBl | Multidiscipliary Archaeology Research Institute, Vrije Universiteit Brussel) – Cătălin Lazăr (ArchaeoSciences Platform, Research Institute of the University of Bucharest) – Mihaela Culea ("Francisc J. Rainer" Institute of Anthropology)
Format: Oral

Until a few years ago, the Eneolithic necropolis of Vărăsti, explored between 1956 and 1965, represented the largest site of its kind in Romania, with over 120 graves unearthed. A catalogue of the graves was published by the archaeologist in charge of the excavations in 1995. However, in spite of its importance, it remained largely understudied under the 2010s, when more modern approaches were applied to the study of the remains. More recently, interdisciplinary studies, combined with the consultation of the original archives, have sought to deepen our understanding of this unique site, while raising some challenging questions about the material held in the collections. This paper will present the history of the research dedicated to this site, together with the new information revealed by modern techniques such as radiocarbon dating and strontium isotopes analysis, emphasizing the necessity of revisiting older collections with the newer techniques currently at the disposal of archaeologists.

2529. Social Differentiation in an Emerging Medieval City: an Osteobiography of a Potential Elite Burial from 10th century Ypres, Flanders

Authors: Martijn Jacobs (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel | Social History of Capitalism, Vrije Universiteit Brussel) – Noah Gaens (Laboratory for Human Genetic Genealogy, Katholieke Universiteit Leuven) – Charlotte Van Riet – Lucy Koster – Patxi Pérez Ramallo (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel | Social History of Capitalism, Vrije Universiteit Brussel) – Nandy Dolman (BAAC Vlaanderen Archeologie – Erfgoed, Evergem) – Christophe Snoeck (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel) – Bart Lambert (Social History of Capitalism, Vrije Universiteit Brussel) – Maarten Larmuseau (Laboratory for Human Genetic Genealogy, Katholieke Universiteit Leuven) – Barbara Veselka (Archaeology, Environmental Changes and Geo-Chemistry, Vrije Universiteit Brussel)
Format: Oral

In 2022-2023, a large-scale archaeological excavation at Saint-Martin's Church in Ypres (West-Flanders, Belgium), uncovered nearly a thousand human skeletons, including the earliest medieval city-dwellers from the 10th century AD. Like other Flemish cities, Ypres underwent substantial urbanisation during the High and Late Middle Ages, becoming one of the largest urban centres of 13th-century Europe north of the Alps. The make-up of the city is still poorly understood and the large skeletal collection provides a unique opportunity to increase our understanding of early urbanisation processes. One burial in particular stands out: an adult male interred in an ironstone burial vault. His radiocarbon date (899-1032AD), suggests he lived prior to the oldest written record of Ypres from 1066AD, making him one of the first city-dwellers. An osteobiographical reconstruction was conducted of this individual, with the aim of exploring his life history and social position within an emerging urban context lacking contemporary historical documentation. He was subjected to a bioarchaeological study conducted by a multidisciplinary team, combining macroscopic osteological and palaeopathological analysis, palaeoradiology (CT&µCT), aDNA-analysis, forensic facial reconstruction and isotope analysis to detect potential patterns in mobility and diet. This paper will focus on the macroscopic osteological research carried out on the Ypres individual. This analysis revealed a combination of skeletal traits consistent with so-called horse rider's syndrome, suggesting prolonged and intensive horseback riding, a pattern associated with an elite lifestyle. The µCT-scans provided additional information on levels of activity and pathological anomalies, informing us further on the lived experiences of this individual. Together with complementary lines of evidence, this paper offers rare insight into potentially elite identity and lived experience in early medieval urban centres. The results contribute to broader discussions on social differentiation and the role of status in the emergence of medieval cities prior to the availability of written sources.

1467. When Fire Obscures Decay: The Problem of Identifying Bioerosion in Prehistoric Cremated Human Remains

Authors: Agata Haluszko (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin | Archeolodzy.org Foundation, Świdnica) – Fabian Kanz (Center for Forensic Medicine, Medical University of Vienna) – Stefan Tangl (Karl Donath Laboratory, Medical University of Vienna | Austrian Cluster for Tissue Regeneration, Vienna)
Format: Oral

Bioerosion is commonly treated as an important taphonomic indicator of post-mortem processes and depositional environments in archaeological and forensic research, particularly in the study of human skeletal remains. The identification of bioerosion in cremains is methodologically problematic because thermal alteration modifies bone microstructure and may obscure or mimic microbial traces. This paper addresses recognising bioerosion in prehistoric cremated human remains through histological analysis of material dated to the second millennium BC from southern Poland, associated with the Tumulus and Trzciniec Cultural Circles and the early Lusatian Urnfield culture, within an interdisciplinary framework integrating archaeological, anthropological and histological expertise. The study, funded by the National Science Centre, Poland (grant no. 2023/48/C/HS3/00020), focuses on the visibility and interpretive reliability of microstructural features linked to bioerosion in cremated bone and on the relationship between thermally induced changes and microbial degradation. Particular attention is given to the extent to which heat-induced transformations may alter or mask earlier taphonomic signatures relevant to analysis of cremated bone assemblages. As a comparative reference, two human bone samples displaying clear bioerosion were experimentally burned and analysed histologically to provide a baseline for interpretation, considered alongside published data on bioerosion and thermally altered bone. The paper examines the interpretive potential of histological analysis for discussions of pre-cremation treatment of the body, including burning of previously inhumed remains, and reflections on the interval between death and cremation or burial. It also addresses the role of microstructural observations in refining interpretations of funerary practices and post-mortem treatment in prehistoric contexts, demonstrating the value of collaborative approaches to study and curation of cremated human skeletal material. Rather than proposing conclusions, the contribution outlines the main analytical difficulties and uncertainties associated with identifying bioerosion in cremated human bone and highlights the need for cautious taphonomic inference in prehistoric cremation contexts.

125. Interdisciplinary research into osteoporosis today and in the past using archaeological remains: studies on age-related nanostructural deterioration of bone

Authors: Simon Mays (Historic England | University of Southampton | University of Edinburgh) – Gabriela Gonzalez – Michael Romanov – Ruby Schwieger – Zeel Sheth – Adama Daou – Leslie Gracia – Selly Altangerel – Kawkab Tarique (DePaul University) – Stuart Stock (Northwestern University)
Format: Oral

Innovative, interdisciplinary archaeological research projects not only advance knowledge but help demonstrate to policy-makers

the value of curated archaeological archives at a time when these are coming under increasing external pressures. This may be especially so when the research focuses not only on archaeological issues but also bears upon matters of direct contemporary relevance. This presentation describes one such study. It uses archived Mediaeval human remains to investigate an aspect of osteoporosis. The research team includes scholars in archaeology and medical physics. It demonstrates how archaeological studies can potentially make a contribution to a rapidly developing area of basic biomedical research. Osteoporotic hip and other fractures are a growing cause of morbidity and mortality in ageing populations, and are an increasing financial burden for healthcare systems. Osteoporosis involves loss of bone density, and it is established that this can be measured in ancient skeletons. Nanostructural alterations have recently been identified as another aspect of age related deterioration of bone that may contribute to fragility and propensity to fracture in osteoporosis. The purpose of our work is to explore whether nanostructural ageing processes can be viably studied in excavated archaeological bone. We apply small and wide angle X-ray scattering using the Advanced Photon Source at Argonne National Laboratory, Illinois, to assess patterning in bone lattice parameters with age at death, and to measure the potential effects of diagenesis on results. Preliminary findings (N=33 burials) suggest some diagenetic alterations, but an expected physiological patterning in bone crystallites with age at death is clearly evident, supporting the potential value of archaeological studies. We end by considering the strengths and weaknesses of multidisciplinary research using archaeological archives of human remains for contributing to contemporary knowledge of diseases like osteoporosis and how archaeology and biomedicine might best engage to advance knowledge of disease.

2501. From Head to Sternal End: Investigating Intra-bone Isotopic Variations Across Human Rib-Bone Sections from Medieval Papdomb, Transylvania

Authors: Michael Atogu (University of South Florida) – Katie Zejdlik (The Ohio State University) – Zsolt Nyárádi (Department of Archaeology, Haáz Rezső Museum) – Jonathan Bethard (University of South Florida)
Format: Oral

Human rib bones are invaluable osteological elements for reconstructing past foodways, given their rapid turnover rates, and may reflect dietary inputs less than ten years prior to an individual's death. However, standard sampling protocols in bioarchaeological studies often assume isotopic homogeneity of the rib, potentially overlooking variations driven by differential remodelling rates between the trabecular-rich ends and the cortical shaft. This study investigates intra-bone isotopic fidelity through high-resolution analysis of δ13C and δ15N values in the rib-bone collagen from individuals at the site of Papdomb, located in the Szekler region of Transylvania. To rigorously assess the impact of sampling location on dietary interpretation, we generated 54 discrete collagen samples from 17 distinct ribs. A multi-section strategy that accounted for rib morphology and preservation. Two ribs were sampled at two locations (head and mid-shaft), ten ribs were sampled at three locations (head and two mid-shaft points), and five ribs were sampled at four locations (head, two mid-shaft points, and sternal end). By systematically comparing these distinct skeletal loci, this research aims to determine whether the specific section utilized for analysis influences the resulting isotopic signature. Isotopic data from this study will either corroborate the reliability of current opportunistic sampling methods or establish a critical need for standardized localization to ensure data comparability, ultimately seeking to refine the precision of isotopic reconstructions of medieval Transylvanian subsistence patterns.

1534. Leveraging multidisciplinary tools to reconstuct past dietary practices: a case study from the Szekler region of Transylvania

Authors: Jonathan Bethard (University of South Florida) – Katie Zejdlik (The Ohio State University) – Zsolt Nyárádi (Haáz Rezső Muzeum)
Format: Oral

Archaeologists, historians, biological anthropologists, and other scholars in the natural and life sciences have a rich history of collaboration in their collective efforts of understanding the past. In addition, archaeological researchers routinely utilize methodological tools developed outside of the discipline to investigate questions across time and geography. Recent scholarship has even demonstrated how biomolecular humanities enhance archaeology. For over four decades, archaeologists have applied tools developed in isotope geochemistry to make inferences about subsistence practices and human migratory patterns in temporal and geographical contexts around the world. These contributions have demonstrated how subsistence practices have changed over time and provide insight into how social organization influences the ways in which dietary practices impact people and their communities. This presentation will review how isotopic analyses have been applied to the dietary reconstruction of archaeological contexts in medieval and early modern Hungary and synthesize how tools from isotope geochemistry have been applied in the Szekler region of Transylvania. Dietary isotopic data generated from a large sample of several hundred individuals from numerous Szekler archaeological contexts will be presented and potential interpretations of these data will be explored.

1507. Reconstructing Diet in a Medieval Transylvanian Mining Town Through Stable Isotope Analysis

Authors: Priscilla Mollard (University of Massachusetts Amherst | Central Connecticut State University)
Format: Oral

Research at Piață Cetății, a 14th-17th century cemetery from Baia Mare, Romania, aims to shed light on the biosocial consequences of living in a medieval Transylvanian mining town. Maramureș county, where contemporary Baia Mare is located, was the metallurgical

epicenter of Transylvania for almost 3,000 years. During the medieval era, Baia Mare was one of the most important Transylvanian mining towns in the Kingdom of Hungary, enjoying special privileges and social freedoms denied non-mining towns. The Piață Cetății cemetery therefor represents an incredible opportunity to study the biological consequences of mining and what the social ramifications of those consequences were within the larger community, particularly when that community is studied in light of skeletal collections from contemporaneous non-mining contexts. Living in the 14th-17th century mining town, regardless of whether each individual was working directly in the mines, would have impacted the biological and social lives of all the inhabitants of the town, in one form or another. These impacts would have included not only injury or death in the mines, but also diseases contracted through contaminated drinking water, environmental illnesses stemming from contaminated air, or congenital disorders resulting from maternal exposure to heavy metals. The research presented here aims to discuss paleopathological findings from Piață Cetății and supplement those data with carbon and nitrogen dietary isotope data that will suggest whether the social privileges enjoyed by the mining town resulted variable dietary practices.

2340. Living at the Ice Edge: Bears, Sea Ice, and Human–Animal Landscapes in Neoglacial Alaska

Authors: Catherine West (Boston University, Department of Anthropology and Archaeology Program) – Lillian Parker – Brittany Bingham (University of Oklahoma | Laboratories of Molecular Anthropology and Microbiome Research) – Katherine Reedy (Idaho State University, Department of Anthropology) – Courtney Hofman (University of Oklahoma, Department of Anthropology | Laboratories of Molecular Anthropology and Microbiome Research)
Format: Oral

The Unalaska Sea Ice Project uses zooarchaeological evidence from the eastern Aleutian Islands of Alaska to examine the dynamics of Bering Sea ice over the last 5,000 years. On temperate Unalaska Island, the archaeological record suggests that the Neoglacial climate phase (ca. 4700 - 2500 rcyr BP) was significantly colder and the region likely supported sea ice and ice-dependent animals, which were hunted by people as they moved with the advancing ice edge. Here, we draw on applied zooarchaeology, stable isotope chemistry, and ancient DNA to identify polar and brown bears outside of their current range, to examine their demographics, to interpret human use of the bears, and to assess the potential source populations for these novel taxa. The extension of sea ice in the Neoglacial phase likely facilitated their presence around Unalaska Island and this provides clear evidence of changing sea ice dynamics and human-animal relationships in the past.

2254. Life and Death in Greco-Roman Aswan: Evidence from the Aga Khan Necropolis

Authors: Alice Tomaino ("La Sapienza" Università di Roma | Università degli Studi di Milano) – Lucie Biehler-Gomez – Marco Cummaudo – Cristina Cattaneo – Patrizia Piacentini (Università degli Studi di Milano)
Format: Oral

The aim of this presentation is to reconstruct the context of the Aga Khan necropolis, located on the wester bank of the Nile at Aswan (6th century BCE–2nd century CE), through a multidisciplinary approach integrating anthropological analysis and archaeological context. The spatial organization within the necropolis, as well as the variability in tomb size, structure, and funerary practices, reflects chronological and socio-economic differentiation which will be integrated with anthropological data. To date, thirty-eight tombs have been excavated; however, systematic anthropological analyses have been conducted in detail on selected burials: AGH026 and AGH038, located on the cliff-top plateau; and five tombs located in north-west sector of the necropolis, which AGH032, a large tomb with a possible cult structure; AGH034, AGH035, AGH036, and AGH037, situated within terraced structures. Several funerary units were identified across multiple stratigraphic levels, indicating repeated use and complex depositional histories. The necropolis is currently under excavation by the joint Egyptian-Italian Mission at West Aswan (EIMAWA), which has revealed heterogeneous preservation conditions within the tombs, ranging from highly commingled and fully skeletonized human remains to exceptionally well-preserved mummified individuals with intact wrappings, thus requiring the application of specific conservation and analytical protocols. The minimum number of individuals (MNI) varies substantially between tombs, ranging from approximately 10 to over 50 individuals, further emphasizing the diversity of funerary practices and population composition within the necropolis. Preliminary results show the presence of high percentages of non-adult individuals of different age groups, along with a predominance of female individuals. Various conditions were also identified, including degenerative joint diseases, as well as lesions consistent with infectious diseases, and traumatic injuries. The combined analysis of these data, together with the archaeological context, will enable a holistic investigation of the population buried in the Aswan necropolis.

2136. Worked to the Bone: An Investigation into Labour Division in a Transylvanian, Hungarian-Szekler Community (AD 1050-1800)

Authors: Carlos Da Silva Carvalho (The Ohio State University) – Jo Buckberry (University of Bradford) – Katie Zejdlik (The Ohio State University) – Jonathan Bethard (University of South Florida) – Zsolt Nyárádi (Haáz Rezső Museum)
Format: Oral

Activity-related skeletal change (ARSC) refers to changes in bone morphology due to mechanical stress. Certain increased activity markers, such as developmental defects (os acromiale, unfused acromion), robusticity (bone thickness relative to size), and entheseal change (location on bone where muscle attaches) have been noted on modern overarm throwing athletes and medieval archers. Further studies have demonstrated the effectiveness of ARSC in understanding historic division of labour, specialised activity and

changes in industry. The following presentation aims to produce the first insight into activities undertaken by medieval Szekler communities. Therefore, a sample from the Papdomb site (1050-1800AD) in Văleni (HU: Patakfalva), modern-day Romania was used (n = 178). To understand sex-based division of labour and time-based changes in activity, developmental defects, robusticity and entheseal changes were analysed. Statistical comparisons were made between males and females, in addition to pre and post 16th century groups. The results presented no significant difference in robusticity and entheseal changes (except M. pectoralis major) between males and females, suggesting both groups participated in equally mechanically strenuous activities. Also, no differences were observed between time periods, indicating a continuation in equally strenuous activities. Difference in the robusticity of the distal humerus between sexes in the post 16th century sample suggests a change in sex-based division of labour. Papdomb males presented high prevalence of os acromiale (right 14.29%, Left 11.11%) in line with what has been previously observed in archery-associated groups (9.2-12.5%). The Results were in line with what is expected from an agricultural society.

777. Temporal dynamics of cremation practices in Roman-period southwestern Slovakia: A bioarchaeological and chemometric approach

Authors: Kateřina Bučková (Department of AnDepartment of Anthropology, University of West Bohemia in Pilsen) – Anna Pankowská – Adriana Machová (Department of Anthropology, University of West Bohemia in Pilsen) – Katarína Hladíková (Slovak National Museum-Archaeological Museum) – Marek Hladík (Institute of Archaeology of the Academy of Sciences of the Czech Republic, Brno) – Pavla Kučerová (Department of Analytical Chemistry, Palacký University Olomouc)
Format: Poster

Cremation was the dominant funerary rite in southwestern Slovakia during the Roman Period (1st–4th centuries AD), yet the technological and ritual variability of this practice remains poorly understood. This study investigates how cremation practices were shaped by chronological developments and local social dynamics by comparing two Germanic burial sites with distinct temporal frameworks: Kostolná pri Dunaji (ca. 1st–2nd century AD) and Gbely–Kojatín (ca. 2nd–3rd/4th century AD). We link excavation documentation and curated museum collections with an integrated analytical workflow combining osteological and bioarchaeological assessment of cremated human remains, including anatomical representation, degree of fragmentation, and age-at-death estimation, with chemometric assessment of burning intensity using FTIR-ATR spectroscopy. This interdisciplinary approach enables evaluation of both inter-site contrasts and intra-site variability in cremation technology. Our results reveal striking differences between the two sites. At Kostolná pri Dunaji, cremation intensity varies considerably and shows a clear chronological pattern: earlier graves display lower burning intensity than later ones. This variation correlates with burial chronology, bone fragmentation, tissue type (compact versus spongy bone), and age at death. In contrast, cremated remains from Gbely–Kojatín exhibit consistently high burning intensity and greater technological standardisation. Overall, cremation at Kostolná pri Dunaji was less intense and more heterogeneous compared to Gbely–Kojatín. These findings highlight significant temporal changes and site-specific patterns in cremation practices within a relatively narrow geographic area. They suggest that variability in Roman-period funerary customs was shaped primarily by evolving social structures and the presence of internally differentiated groups, including individuals buried with weaponry. The study was supported by a grant SGS 2025 006 and by Slovak Research and Development Agency No. APVV-23-0299 and by the Strategy AV21 research programme “The Power of Objects: Materiality between Past and Future”.

2244. Traces of Fire in the Early Iron Age inhumation necropolis of Carlota (Beja, Lower Alentejo, Portugal)

Authors: Linda Melo (CIAS- University of Coimbra | Uniarq - University of Lisbon) – Rui Monge Soares (Uniarq - University of Lisbon) – Carlos Ferreira (Independent Researcher) – Rosa Mateos – José António Pereira (Novarqueologia)
Format: Poster

The Carlota archaeological site was identified during Cultural Heritage Impact Mitigation works conducted within the framework of the Alqueva Global Irrigation System and Multipurpose Development, specifically along the Pisão–Beja connection. The necropolis is located in the union of the parishes of Trigaches and São Brissos, in the municipality and district of Beja, southern Portugal. It lies within the Alentejo peneplain, a region characterized by predominantly flat topography. The site was excavated by a team from the company Novarqueologia Ltd. The archaeological site consists of a series of rectangular enclosures defined by ditches, attributed to the Early Iron Age. Three inhumation graves were identified, containing human osteological remains in a poor state of preservation. In addition, Grave 14 yielded a cremation deposit, comprising a ceramic vessel interpreted as a funerary urn, associated ceramic fragments, and two intentionally bent spearheads. The present work aims to present the results of the archaeological and anthropological study of this site including the excavation and the subsequent analysis of the human osteological remains recovered from the interior of the ceramic cremation vessel.

2618. Differential diagnosis of a calcified nodule recovered with a 16th century Szekler female in Transylvania

Authors: Jonathan Bethard (University of South Florida) – Lauren Reinman (University of South Florida) – Elizabeth Bews (University of Montana) – Katie Zejdlik (The Ohio State University) – Zsolt Nyárádi (Haáz Rezső Museum) – Carolina Mcennan (University of South Florida Morsani College of Medicine)
Format: Poster

Bioarchaeologists utilize numerous lines of evidence to reconstruct how people experienced and were affected by a variety of pathological conditions in the past. Additionally, bioarchaeologists leverage numerous methodological tools (e.g., digital radiography, microCT, histology) and engage in collaboration with clinicians to improve generating differential diagnoses from skeletal and dental tissues. In the case study presented here, we describe a calcified nodule recovered from the cervical vertebral region of 16th century young adult female (G482) from a Szekler village context in Transylvania. Though relatively common in modern clinical contexts, examples of soft tissue calcification in the cervical region are relatively rare in the bioarchaeological record. Numerous modalities were utilized to generate possible differential diagnoses of the calcified nodule. This case study provides a framework for how bioarchaeologists might best collaborate with clinicians in the investigation of calcified nodules recovered from bioarchaeological contexts. Additionally, this case study demonstrates the benefits of detailed documentation during both the excavation and laboratory phases of salvage archaeology.

250 GAME CHANGER. NARRATIVES OF BELONGING AND MOBILITY IN TERMS OF NEW METHODS AND TECHNOLOGIES

Theme: 7. Interaction, connectivity and mobility
Organisers: Martina Seifert (University of Hamburg) – Ewdoksia Papuci-Wladyka (Polish Centre of Mediterranean Archaeology in the University of Warsaw) – Nikola Babucic – Thorben Frieling (University of Hamburg) – Lukasz Miszk (Jagiellonian University in Krakow)
Keywords: narratives, theoretical conceptuaization, mobility, belonging, materiality, new technologies
Format: Regular session

SESSION ABSTRACT

The last few decades have shown how new technologies and methods are rapidly changing working methods in archaeology. Through the systematic development of analog and digital data, significantly larger amounts of information can be processed, visualized, and interpreted. There is no doubt, that this is transforming and creating entire research fields, e.g. in archaeometry, geophysics, or image sciences. However, to what extent do these technologies affect theoretical approaches and our perspectives on long-standing narratives? The emphasis of the session is on theoretical conceptualization. In light of the background outlined above, the session will address the question of how new methods and technologies produce, maintain and change established narratives of belonging and mobility in archaeology. We are looking for contributions that deal with the significance of materiality regarding transportable topographies, shared technological knowledge or image transfer in the aforementioned contexts and the diverse overlaps of socio-spatial practice and meaning. Interdisciplinary contributions from all disciplines of ancient studies discussing different geographical areas and architectures or objects from different periods are most welcome.

CONTRIBUTION ABSTRACTS

1382. Changing Methodologies and Theoretical Frameworks Prompting New Research Questions and Interpretations at the Sanctuary of Hera, Perachora

Authors: Susan Lupack (Macquarie University) – Barbora Weissova (Charles University) – Matthew Skuse (British School at Athens) – Sarah James (University of Colorado, Boulder) – Panagiota Kasimi (Ephoreia of the Antiquities of the Corinthia)
Format: Oral

The Perachora Peninsula Archaeological Project is working with the legacy data of two archaeologists whose views of the habitation site associated with the 8th–2nd century Sanctuary of Hera, Perachora, are diametrically opposed. The extent to which a researcher’s views – their theoretical framework – affects the interpretation of a past society is striking. Available methodologies also affect the type of data researchers collect, modifying the types of questions they even think to ask. Theoretical approaches and methodologies have always been intricately intertwined in the creation of archaeological knowledge; Perachora provides an exemplary case study. In the 1930s, the Heraion’s initial excavator, Payne, concluded that the habitation site was a substantial, fortified town, but used only the architectural remains to substantiate his evaluation, with the ceramics being characterised (by Dunbabin) with the statement: ‘Individual finds, as might be expected, were unimportant’. In contrast, Tomlinson, excavating in the 1960s, interpreted the site as a usually ‘quiet and deserted’ . . . ‘sporadic scatter of structures’. Tomlinson’s view has had lasting effects on the modern world’s narrative of the site, making it something of an archaeological backwater for decades. Significant changes to both theoretical frameworks and methodologies have increased our capacity for asking fresh research questions. Our project is investigating the intersection of the economic, political, and religious landscapes surrounding the sanctuary and, thereby, illuminating not only the identities of the people who lived within the town, but also those who travelled to worship at the sanctuary, traded with the townspeople, and traversed its lands on military expeditions. Our surface survey is providing context for the architectural remains which gave rise to prior archaeologists’ interpretations, while photogrammetry and Lidar are very literally broadening our view of the landscape’s use, prompting challenges to long-held interpretations of the sanctuary, its town, and its surrounding region.

2180. Does the game change the player or does player change the game? New technologies and old

narratives in Paphian archaeology

Authors: Lukasz Miszk (Jagiellonian University in Krakow)
Format: Oral

The technological revolution we are witnessing is profoundly changing what archaeology is today. This change in Cypriot archaeology is taking place within the context of the island history, from L. Palma di Cesnola's "work" to that of great Cypriot archaeologists V. Karageorghis, K. Nicolaou, S. Hadjisavvas and modern, international teams of archaeologists working today in Cypriot institutions and international expeditions. Cypriot archaeology is experiencing what archaeology around the world is going through. It is experiencing a phenomenon of a rapid technological change that is supposed to have a positive impact on the development of archaeology as a science. The Nea Paphos archaeological site is a perfect example of a witness where we can observe the change that has taken place in archaeology and the impact of this change on our ability to construct narratives about the past. This will be the starting point for a discussion about the idea of the session: whether it is the players who have changed the rules of the game or the game that has changed the players? In other words, based on past and present research conducted in Paphos, so changed by the rapid technology development, I would like to ask whether we are still able to construct narratives based on contemporary scientific findings, in the style of Karageorghis's "eternal Paphos", or perhaps the game has changed so much that we can talk, for example, about the very detailed issues i.e. archaeometry research on archaeological artefacts. And if the latter is true, can we provide the story in a way that is interesting enough to be socially acceptable? The key question, then, is how the change in the rules of the game affects our ability to describe, in a socially acceptable way, what mobility or belongings meant in ancient times.

1935. A Landscape in Flux: The Archaeology of Movement and Change at Helenopolis

Authors: Isil Akalan Gunduz (Hamburg University) – Serkan Gunduz (Bursa Uludag University)
Format: Oral

The Hersek Delta excavations, encompassing both terrestrial and submerged sites, are situated along the Sea of Marmara in modern-day Türkiye. The project is located at the narrowest section of the Kocaeli Gulf (the ancient Gulf of Nicomedia), which was once home to the prominent metropolis of Nicomedia. Strategically positioned on the primary Anatolian land route leading to Constantinople, the delta served as a vital maritime hub. Historically, the delta is the site of the ancient city of Helenopolis. Named after Empress Helena, mother of Constantine the Great, it is traditionally regarded as her birthplace. Systematic archaeological underwater research in this region commenced in 2017. Following the identification of extensive coastal and submerged cultural heritage, the initial survey transitioned into a comprehensive excavation program including both land and underwater excavations. Despite the historical fame of Helenopolis, reconstructing its urban layout has proven challenging due to a lack of surface remains. Furthermore, the region's history of seismic activity, tsunamis, and flooding has complicated the interpretation of geophysical data. This presentation examines how the technologies and methodologies employed in this research provide insight into centuries of mobility and movement within this volatile landscape, specifically examining its strategic role as a hub connecting Constantinople to the Anatolian interior through integrated maritime and terrestrial networks. Moreover, it explores how this strategic site served as a deliberate act of placemaking by the Byzantine Empire and the Crusaders, and how it transformed into different forms through repeated cycles of seismic destruction and systemic reconstruction.

264. Geophysical Maps in Circulation: Transportable Topographies across Teams, Platforms, and Heritage Contexts

Authors: Nikola Babucic (University of Hamburg)
Format: Oral

Geophysical prospection has become an established component of archaeological research, generating extensive datasets and high-resolution spatial visualizations. Beyond their methodological function, geophysical maps increasingly operate as autonomous archaeological objects that structure interpretation, comparison, and narrative formation. This paper conceptualizes geophysical maps as transportable topographies: materially and digitally mediated representations that detach archaeological space from its local context and render it mobile across different analytical, institutional, and discursive levels. Based on geophysical investigations in ancient urban landscapes as well as in rural settlement contexts of Roman border regions, the paper demonstrates how such maps reconfigure concepts of spatial belonging and connectivity. In urban contexts, large-scale ground-penetrating radar surveys and extensive magnetic mapping enable the reconstruction of infrastructural continuities and functional zoning beyond the limits of excavated areas, producing coherent urban narratives grounded in subsurface evidence. More generally, geophysical mapping reveals spatial, infrastructural, and functional relationships that remain invisible in excavation-based or find-poor contexts, thereby qualifying interpretations that primarily frame peripheral settlement areas as isolated or marginal. The paper argues that the mobility of geophysical maps—between research teams, digital research environments, and heritage management contexts—produces new forms of archaeological belonging. By establishing shared visual languages and comparable spatial units, these maps significantly influence how archaeological spaces are integrated into broader historical and regional narratives. Mobility, in this sense, refers not only to movements in the past but also to the circulation of spatial knowledge and interpretive frameworks in the present.

1284. Reading Old Maps with New Eyes: A Computer Vision Workflow for Extracting Burial Mounds

from Archival Topography

Authors: Angel Grigorov – Nadezhda Kecheva – Ivo Cholakov (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Julia Tzvetkova (Sofia University "St. Kliment Ohridski") – Kalin Dimitrov (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Lyubomir Angelov (Burgas Free University) – Veronika Gencheva – Ivet Kirilova (National Archaeological Institute with Museum, Bulgarian Academy of Sciences) – Lyubomir Nedyalkov (Freelancer) – Adela Sobotkova (Aarhus University)
Format: Oral

While mounds are primarily recognized as funerary sites, some of them likely held complex semantic meanings for ancient communities, serving as boundary markers of liminal zones and indicators of ancient movement practices along routes. Mid-20th-century topographic maps contain vital information about these features, yet they are often missing from modern digital registers. As intensive agriculture continues to erase these landscapes, archival documents frequently remain the only record of lost heritage. However, the manual digitization of thousands of map sheets is resource-intensive and often unfeasible. This presentation outlines the methodological framework of "AI ArchaeoTopia: Archaeology of Topographic Maps Using Artificial Intelligence", a newly launched research project financed by the Bulgarian National Science Fund (Contract КП-06-Н100/5, 10.12.2025). We propose a scalable workflow combining traditional cartographic processing with computer vision techniques. The workflow initiates with automated georeferencing and spatial validation, followed by the isolation of 'regions of interest' to build training datasets for two tasks: object detection for standardized symbols and semantic segmentation for topographic signatures. By converting AI-extracted symbols into standardized vector layers, the project aims to transform static cartographic features into a "transportable" and interoperable dataset. This enables new landscape-level analyses of mobility corridors, territorial organization, and long-term land use. Simultaneously, we address the technical challenges of legacy data (inconsistent print quality, overlapping layers) through a rigorous validation protocol using GNSS positioning and RTK-equipped UAVs. This validation is crucial not only for technical accuracy but for the historical narrative: by eliminating false positives, we actively shape which features remain in the "story" for reconstructing the past, ultimately integrating verified data into the GIS Archaeological Information System "Archaeological Map of Bulgaria".

36. Beyond Agriculture: Deconstructing Medieval Colonisation Narratives through GIS Analysis

Authors: Kamila Hanáková (Institute of Archaeology and Museology, Faculty of Arts Masaryk University)
Format: Oral

This paper utilizes GIS, LiDAR, and digital geological and topographic mapping to deconstruct established narratives of medieval colonisation. It argues that the settlement of previously uninhabited areas was not a spontaneous or purely agrarian process, but a systematic socio-spatial practice driven by the strategic exploitation of mineral resources. These digital approaches make it possible to identify a direct correlation between settlement patterns and lithological boundaries or dislocation zones—areas where geological disturbances facilitated the formation and accessibility of mineral deposits. This relationship is explored through a case study of the deserted medieval village of Mstěnice (Vysočina Region, Czechia). The results demonstrate that the development of settlement phases closely followed a lithological boundary associated with iron ore deposits. Within this framework, colonisation elites operated as strategic "investors", possessing the know-how for efficient resource exploitation, managing population mobility, and systematically planning the use of physical resources. A striking example of this geological strategy is the placement of the manorial estate directly above a pyrope garnet deposit, illustrating a rational choice that prioritised status and economic gain from mining over agricultural suitability (serpentinite bedrock). This settlement logic is not limited to Mstěnice but can be traced across the Czech lands (e.g. across the Czech-Moravian Highlands), with implications of international relevance. By combining spatial data with historical sources, this study provides a missing piece in understanding the logic of medieval colonisation. GIS-, LiDAR-, and digital topography-based analyses thus move beyond the reconstruction of settlement layouts, fundamentally reshaping our understanding of mobility, materiality, and socio-spatial practices, and offering a richer, multi-layered interpretation of medieval settlement narratives.

530. Heavy Metal Curses. Magical Lead Artifacts between Natural Science and Image Studies

Authors: Thorben Frieling (University of Hamburg)
Format: Oral

Scientific interest in magic and especially necromancy as the oracle of the dead in ancient Greece is based on more than a few decades of research, ideas and heated discussions. Focal points of interest were usually the architectural layout of sanctuaries, cult practices, and rituals. Some of these acts are archaeologically well documented and fall under the category of harmful curses or warding off curses. The backgrounds and roots behind these religious and eschatological believes can be – at least to an extend – answered mostly by consulting ancient literary sources describing acts of magic or necromancy, and the written artifacts themselves, first and foremost curse tablets and magical papyri. Iconographical and iconological examinations can attest for gaps that can't be explored by epigraphy alone. One medium that treads among both fields of epigraphy and image studies is a group of mostly leaden figurines in sepulchral contexts, buried either with the intend of harm or protection. These kolossoi function similarly to African and Caribbean voodoo dolls. Lead isotope analyses show that at least in Attica most of the lead used for these figures and curse tablets stems from Laurion and indicates that 1. lead was quite a cheap material and 2. its usage in magical and necromantic rituals became

the standard from around 400 BC. With cursing being very popular in 4th century Athens it begs the question if there were professional magic workshops or if the curse artifacts were homemade products.

2332. "Pocket Alexandria" - iconography on the MNP A79 (National Museum in Poznań) oil lamp through the lens of provenance studies

Authors: Marceli Dzięcielski (Adam Mickiewicz University)
Format: Oral

Oil lamps as archaeological sources have often been left "aside", especially when compared to other ceramic-made items, on which countless articles and books have been written. They are, however, just as capable of playing the role of medium when it comes to transferring information, worldviews, stories. MNP A79 is a particular example of this kind of item, when it comes to late Hellenistic–Early Roman periods. While lamps of the period often feature mythological figures or gladiators, this artifact's central disc represents a port. This picture has in the past been interpreted as Alexandria, including the artist's vision of the Eastern Port and the tomb of Alexander the Great. But what should the archaeologist see when looking at the lamp? Is the image an "accurate" representation of Alexandria and would knowing the story of the artifact answer this question? Through the example of this lamo, the study aims to give insight into how modern technology can offer new ways in which we can interpret artifacts. The paper utilises archival studies and XRF clay analysis (comparison with other clay objects) to present the item's biography. Knowing the lamp's "past", interpretations of the image on the disc will be put forward, using multiple methods of interpretation of art (e.g. semiotics of Peirce, post-colonial approach) to show how ancient viewers from different backgrounds and locations could have seen the representation. The study shows, that meaning of iconography on artifacts, even as "insignificant" as oil lamps, changes depending on the people who saw it. Provenance studies, including XRF, can help us trace where the item was made – but who saw it and how is a matter of narrative, which the scholar creates. New technologies add onto the possibilities in which we can interpret items, but cannot change the necessary humanistic approach of the scholar.

2206. Pottery and archaeometry: a breakthrough in the narrative about Paphos pottery

Authors: Ewdoksia Papuci-Wladyka (University of Warsaw)
Format: Oral

This paper aims to demonstrate how archaeometric research, which has developed significantly in recent years, has changed the narrative regarding pottery discovered in Cyprus. The key turning point is R. Jones's 1986 work, "Greek and Cypriot Pottery: a review of scientific studies." Since then, various research programs involving archaeometric analyses have developed. The approach to ceramic research is shifting from a traditional focus on typology and chronology to a multifaceted approach, with a primary focus on distinguishing local production from imported production, both from other areas of the island and beyond, as well as on reconstructing technological changes and chaînes opératoires. A specific "case study" will be pottery discovered during 60-year-old Polish excavations in the ancient city of Nea Paphos conducted in the area known as Maloutena where inter alia the Villa of Theseus and the House of Aion have been uncovered, and the Agora. The city, designated a UNESCO World Heritage Site, was the capital of Hellenistic and Roman Cyprus for several centuries. The study of pottery discovered in Paphos has undergone a major change in recent years thanks to the implementation of archaeometric techniques on a larger scale, which will be shown in this presentation.

2671. Technological study of Iron Age pottery from the Mpa'a site (Djohong, Adamawa-Cameroon): Macroscopic, microscopic and infrared spectroscopy analyses

Authors: Zoila Epossi (University of Yaounde1)
Format: Oral

The Mpa'a site is situated around 4.2 km from Djohong in the Adamawa Region of Cameroon. The site is an underground one characterised by the heterogeneity of artefacts on the surface from LSA, Neolithic, Iron Age and sub actual period [1]. This research is the first pilot study using an archaeometry approach to understand pottery production in Mpa'a and to contribute to the knowledge about the settlement of the people in the border of Adamawa region, a savannah area. The samples studied belong to the Iron Age period 2640 +/- 40 BP attested by the Radiocarbon dating. Using a combination of macroscopic, microscopic and infrared spectroscopy analyses, 21 ceramic fragments were studied, to reconstruct various steps of the chaîne opératoire, including paste recipes and firing parameters. The petrographic analysis confirms the presence of one main group among the samples analysed, indicating that they were made with the same raw materials and paste recipe. All samples contain coarse quartz and feldspar, with numerous opaque inclusions and small-sized quartz and mica in the clayey matrix. Most samples display a homogeneous reddish colour, indicating firing in a well-controlled oxidising atmosphere. Eight samples show a "sandwich structure", suggesting that the firing process did not last long enough to allow equal redox conditions, while one sample was grey, following from firing in a reducing atmosphere. The presence of phyllosilicate bands in the infrared spectroscopy spectra indicated that the sherds were fired below750°C [2]. This low firing temperature might be taken to suggest that firing was carried out in an open structure. These archaeometry results are consistent with the technology of ceramic in the forest area from the center of Cameroon and Congo according to the literature [3,4], indicating a shared pottery technology between the forest and savannah people during Iron Age period in Central Africa.

251 FROM CRADLES TO GRAVES: THE ARCHAEOLOGY AND ANTHROPOLOGY OF CHILDHOOD IN THE POST-MEDIEVAL PERIOD

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Csilla Líbor (Hungarian National Museum) – Maciej Gembicki (Adam Mickiewicz University in Poznan) – Hubert Lepionka (Podlaskie Museum in Białystok | Adam Mickiewicz University in Poznan) – Olga Dec (Adam Mickiewicz University in Poznan)
Keywords: children, postmedieval, bioarchaeology, modern age, paleopathology, childhood
Format: Regular session

SESSION ABSTRACT

Our session aims to highlight two crucial themes: the significance of children and the importance of archaeology over the past 500 years. Studying children offers a valuable opportunity to gain a broader understanding of past societies. The post-medieval period, in particular, is a relatively underexplored era within archaeological research, despite the wealth of observations from this time that can be utilized to illuminate our distant past. Information related to children is unquestionably a key component of this understanding. Examining non-adult burials and related archaeological evidence can significantly contribute to our insights into mourning practices and societal structures during this era, especially when multiple sources of data are available to inform our research. Burial sites from this period are especially important for researching diseases and health conditions, and we also wish to emphasize the interpretation of double or multiple burials. However, our session is not limited to the bioarchaeological analysis of burials; we also welcome presentations on archaeological artifacts and symbolic objects associated with children. Analyzing juvenile burials and related archaeological evidence can significantly contribute to our insights into mourning practices and societal structures during this era, particularly when multiple sources of data are available to inform our research. Topics: - Bioarchaeology - Paleopathology - Cemetery analysis - Archaeological sites and artifacts - Ethical questions.

CONTRIBUTION ABSTRACTS

1168. The Archaeology of Grief: Investigating Post-medieval Nonadult Burials in Hungary

Authors: Csilla Líbor (Hungarian National Museum)
Format: Oral

In Hungarian archaeology, a legislative boundary traditionally defines the year 1711 as the temporal limit of protection. Consequently, funerary heritage from the last three centuries—lacking formal legal status—is being lost at an alarming rate. This paper highlights the scientific importance of the Post-medieval period through the analysis of a unique nonadult burial assemblage excavated in Szécsény. The research focuses on the manifestation of grief and the social perception of childhood through the lens of funerary practices. While osteological remains provide direct biological data, the burial context—specifically the grave goods and the spatial arrangement of the deceased—reflects the emotional and social responses of the grieving community. A key element of this study is the analysis of nonadult's graves, where the presence of specific attire, such as delicate jewellery and traditional headdresses (párta), serves as a poignant indicator of the care, status, and identity afforded to deceased children. Furthermore, the presentation examines diverse modes of interment, including multiple burials and the symbolic co-placement of children and adults. By analyzing these spatial relationships and the material culture of the grave, the study aims to reconstruct how parental and communal grief were ritualized. Despite the high mortality rates of the era, these patterns suggest that the loss of a child was a profound trauma, processed through elaborate ritual expressions. This research contributes to the expanding European discourse on the archaeology of childhood and the emotional history of the Post-medieval period.

1011. Children from the Winthir Collection – A new documented skeletal assemblage of non-adults from post-medieval Central Europe

Authors: Janette Lee – Albert Zink – Michaela Harbeck (SNSB - State Collection for Anthropology Munich)
Format: Oral

Understanding childhood in the post-medieval period relies not only on archaeological burial evidence but also on documented skeletal collections that provide individual biological and contextual information. Such assemblages offer rare opportunities to investigate growth, health, disease, and social inequality among non-adult individuals within well-defined historical populations. This contribution introduces the newly established Winthir Collection, a documented skeletal assemblage from Munich-Neuhausen (Germany), recovered during rescue excavations of an abandoned cemetery extension and dating primarily to the late nineteenth century. The collection comprises 90 non-adult individuals with associated biological documentation, including 72 individuals (80%) younger than 12 years. As one of the first Central European documented skeletal collections of the post-medieval period containing a substantial number of well-preserved non-adult remains, the Winthir Collection represents an exceptional resource for the archaeology and anthropology of childhood. We highlight the collection's potential to advance bioarchaeological research on growth, health, and disease in childhood, as well as social differentiation within an urban nineteenth-century population. In addition, the documented nature of the assemblage enables population-specific calibration and evaluation of osteological methods

applied to non-adults. Recent work assessing sex estimation approaches in non-adult remains from the Winthir Collection will be presented, underscoring the importance of documented post-medieval reference samples for improving methodological reliability and deepening our understanding of children's lives and deaths in the recent past.

1366. An overview of early modern period child burials in Žumberak (Croatia) from the archaeological and anthropological perspectives

Authors: Sebastijan Stingl (Institute of Archaeology, Zagreb)
Format: Oral

In Žumberak, a small settlement in the Žumberak Mountains, there is a Roman Catholic parish Church of St Nicholas the Bishop, which was, according to historical sources, used by both Roman Catholics and Greek Catholics during the 17th century. The Eastern rite Catholics, refugees from the territories under Ottoman control, were settled in the Žumberak Mountains in the first half of the 16th century. Archaeological excavations were conducted at the site of St Nicolas the Bishop Church for several years, and so far, 333 graves have been explored, out of which 322 can be dated to the early modern period, predominantly to the 17th and 18th centuries. Two of them were discovered in the crypt, the only archaeologically excavated part of the interior, one outside of the cemetery wall, while the rest of them were in the churchyard. Out of those 322, 78 were child burials. This paper analyses the burial practices of these burials, and deals with their differences in comparison to the burials of adults, but also aims to differentiate the burials of children from Roman Catholic families and those belonging to the Greek Catholics. Additionally, through the analyses of the anthropological data, the aim is to reconstruct their short lives, primarily the way they were treated, with a focus on everyday labour, food distribution, and its quality.

1842. Traces of Status in Post-Medieval Children's Burials from the Church Crypts in Byszewo

Authors: Mikolaj Dobek (Nicolaus Copernicus University in Toruń)
Format: Oral

Church crypts are commonly associated with burial places of local elites, noble families who patronized the church, and members of the clergy. Research conducted over the past decade by Nicolaus Copernicus University in Toruń has demonstrated that the underground spaces of the church in Byszewo represent a unique site. Archival sources indicate that among more than one hundred individuals uncovered, representatives of the local peasantry were also buried there. This issue inspired the doctoral dissertation project "Intrapopulation social stratification and its manifestations in the light of archaeological and bioarchaeological research of the population buried in the Church of the Holy Trinity in Byszewo". The aim of the project is to determine whether analyses of human remains combined with the study of material culture can reveal indicators of affiliation with social groups of higher or lower social and economic status. An important stage of this research is the examination of numerous children's burials discovered in the Byszewo crypt. The presentation will outline the course of analyses conducted on a series of children's burials. The physical condition of the deceased children will be discussed based on bioarchaeological analysis, including, but not limited to, paleopathological and osteometric assessments. The accompanying grave goods (such as clothing, devotional items, and plant remains) will also be presented. On this basis, a preliminary interpretation of the results will be proposed, along with directions for further, more detailed micro-analyses. The initial results of the study of children's burials from Byszewo will demonstrate to what extent it is possible to identify indicators of social status during life in post-medieval archaeological material.

1883. Children at the Convent: an unusual "funerary space" identified at the 16th century former Convent of Graça, Lisbon (Portugal)

Authors: Linda Melo (CIAS- University of Coimbra | Uniarq - University of Lisbon) – Sandra Assis (CRIA- NOVA University of Lisbon | Egas Moniz School of Health & Science) – Carlos Ferreira (Independent Researcher)
Format: Oral

The analysis of burials context associated with convents and monasteries offers important insights into the health status, disease patterns, and lifestyles of enclosed male and female religious communities. In some cases, it also provides perspectives on socially privileged groups, sometimes interred in private chapels. The identification of burials of immature individuals is comparatively less frequent. This study presents and discusses the case of an undocumented, crypt-like funerary space, containing the remains of 27 immature individuals. The funerary context was identified in 2017, as part of the rehabilitation works carried out in the cloister area of the former Convent of Graça in Lisbon, built in the 16th century and with successive reconstruction works overtime. Archaeological excavation revealed evidence of three distinct phases of funerary occupation. The earliest phase is represented by primary inhumations of adults in coffins, suggesting a formally organised burial context. This was followed by an intermediate phase consisting of a funerary level containing the remains immature individuals, indicating a possible change in burial practices or the specific use of the space for juvenile interments. The latest phase is characterised by a large secondary deposit of approximately 500 disarticulated human bones, reflecting extensive post-depositional disturbance or deliberate reorganisation of human remains. This study focuses on the preliminary archaeological and anthropological results of the investigation, including stratigraphy, burial practices, bone preservation and biological profile of the individuals recovered, with particular emphasis on the immature sample, and its role for understanding mortality, funerary behaviour, and the use and reuse of space in the post-medieval period. These initial results contribute to a broader discussion of funerary variability within conventual contexts in Lisbon and highlight the research potential of this newly identified burial assemblage.

573. Untimely Deaths in the City. Child Burials in Early Modern Bucharest

Authors: Raluca-Iuliana Motei – Dan Pîrvulescu (Bucharest Municipality Museum)
Format: Oral

During the medieval and early modern periods in Wallachia, burial practices were regulated by the Orthodox Church, with interments permitted only inside churches or in their surrounding churchyards. In accordance with Christian norms, the deceased were buried in a shroud or coffin, laid supine with the head oriented to the east. This system remained in place until the mid-nineteenth century, when burial reforms required the relocation of cemeteries beyond the urban area. As a result, churchyard cemeteries were used continuously over several centuries, reflected by a high density of burials, superimposed graves, and frequent reinterments. Urban archaeological research in Bucharest, including excavations linked to infrastructure rehabilitation and the consolidation of religious edifices, has identified several cemeteries dating from the seventeenth to the mid-nineteenth century. Within these assemblages, children represent a substantial proportion of the buried population, making juvenile burials a key source for exploring childhood and vulnerability in a pre-modern urban context. The presence and distribution of non-adult burials provide insights into social responses to early death, mourning practices, and family structures. In several instances, double or multiple burials, including adult–child associations, may reflect close familial relationships or shared funerary treatment during periods of heightened mortality. Alongside these collective contexts, some individual child burials display care in the selection of coffins and funerary accessories, including jewellery, which may indicate the symbolic importance of children within their families. The frequent occurrence of infant and juvenile burials is consistent with the high mortality rates characteristic of medieval and early modern societies. Although indicators such as childhood malnutrition and anaemia point to difficult living conditions, the archaeological visibility of children in these cemeteries extends beyond biological evidence, offering insight into social practices and attitudes surrounding childhood and death in early modern Bucharest.

2549. Strangers in a strange land – investigating the health of 18th century immigrant children from Tartu, Estonia

Authors: Linda Vilumets (University of Tartu | Tallinn University)
Format: Oral

The beginning of the 18th century proved to be one of the most devastating periods in the history of Tartu (South Estonia). The town was destroyed during the Great Northern War (1700–1721) and forced to capitulate in the favour of the Russian Empire. As the slow recovery process began, many immigrants of Russian orthodox background also found home among the ruins. Historical data points to poor living conditions of this new population, which undoubtedly had the biggest effect on the well-being of the children. Lillemäe cemetery at the suburbs of Tartu was one of the burial places established and used throughout the 18th century. Archaeological excavations in 1987, 1991 and in 2025 have revealed over 650 burials, containing the remains of at least 180 non-adults. The latter offer a unique opportunity to investigate the health of children who spent their short lives in a strange and war-torn place. Preliminary results suggest that the newcomers did not adapt well to their surrounding environment and many children suffered from malnutrition. Compromised health was further illustrated by the presence of various forms of dental enamel hypoplasia, dental diseases and other miscellaneous conditions that also shed light on the childrearing practices. These results will be compared against data gathered from other previously analysed contemporary children, to interpret any differences in morbidity and mortality.

1787. Children from Dąbrówki in Podlasie, Poland – a preliminary analysis of child burials from an early modern cemetery

Authors: Joanna Wawrzeniuk (Institute of Archeology, Cardinal Stefan Wyszyński University, Warsaw)
Format: Oral

In the medieval period, a child was initially treated as a "small adult," while in later centuries it was perceived on the one hand as a sinful being and on the other as fragile, transient, and particularly marked by death. For this reason, the period of birth and early childhood was associated with numerous protective practices of a religious and magical nature. Baptism was of key importance and was often administered as soon as possible after birth, due to fears that a child might die without the sacrament. A serious problem was the burial of the deceased without baptism, often in fields or even beneath houses. Despite the still unsatisfactory state of research on late medieval and early modern cemeteries in the Polish lands, a high mortality rate among infants and young children is evident. It is estimated that nearly 50% of children did not survive to the age of five, with a significant proportion dying within the first year after birth. The causes were varied and included disease, the lack of effective medical care, malnutrition, and difficult sanitary conditions. Archaeological research conducted between 2019 and 2024 at a randomly discovered cemetery dating to the 16th–17th centuries in Dąbrówki, a locality situated on the borderland between the territories of the Crown of the Kingdom of Poland and Lithuania, revealed a specific character of funerary practices, in which nearly half of all recorded graves were burials of infants and children. Such a high proportion indicates significant mortality among the youngest members of early modern communities. Anthropological and spatial analysis of this category of burials, as well as the forms of funerary rituals, allows for a partial reconstruction of the demographic structure, living conditions, and funerary practices of the local community in the early modern period.

2109. Children and community: selected biological and cultural aspects of child burials in the Polish–Lithuanian Commonwealth (16th-18th century)

Authors: Hubert Lepionka (Faculty of Archaeology, Adam Mickiewcz University in Poznań | Podlaskie Museum in Bialystok) – Olga Dec (Faculty of Archaeology, Adam Mickiewcz University in Poznań) – Angelika Słodka (Independent Researcher)
Format: Oral

Child burials constitute one of the most challenging yet informative categories of funerary evidence in early modern archaeology and bioarchaeology. This paper examines the biological and cultural dimensions of child burials from the borderland of the Polish Crown and the Grand Duchy of Lithuania, based on anthropological and archaeological materials from the town of Tykocin, the small town of Nowy Dwór, and the rural communities of Knyszewicze, Harkawicze, Załuki, and Pieńki. Drawing on osteological analysis and burial context, the presentation discusses age-at-death structure, biological characteristics of the juvenile population, and variability in funerary treatment in relation to adult burial practices. Particular attention is paid to issues of funeral rites and deathways of child burials by comparing urban, small-town, and rural contexts. Lecture highlights the role of local traditions and borderland dynamics in shaping attitudes toward child death and burial. The study demonstrates that child burials offer crucial insights into social organisation, religious practice, and community boundaries in the early modern Polish–Lithuanian borderland.

2239. Skeletal Evidence of Early Life Stress in Children and Adolescents from Gać, Poland (17-18th c.)

Authors: Meghan Langlois (McMaster University) – Paige Lynch (University of North Texas) – Joanna Wysocka (Polish Academy of Sciences) – Erin Riley (University of Cambridge) – Maciej Gembicki (Adam Mickiewicz University) – Grace Holmes (University of Manitoba) – Marcin Krzepkowski (Regional Museum in Wągrowiec)
Format: Oral

Childhood health provides important insight into the lifeways and well-being of the community. This research provides an overview of mortality and health evidenced through macroscopic assessment of pathological lesions in the skeletal remains of children and adolescents (<18 years) from the early modern site of Gać, Poland (17-18th c.). The village of Gać dates to the 14th century, but radiocarbon dates reveal primary use of the cemetery in the 17-18th centuries. Archival evidence suggests the site was likely a Protestant burial ground, established separate from the Catholic cemetery, populated in part by migrants from Brandenburg and Pomerania. Individuals below 18 years of age (n=121) at time-of-death make up 53.5% of the demographic profile of the cemetery, indicating high childhood mortality. There is a high crude prevalence of non-specific stress lesions, including cribra orbitalia (25.3%), subperiosteal new bone formation (27.8%), and linear enamel hypoplasia (29.1%). The high prevalence of scurvy (7.5%) and caries (30.2%) provide additional evidence for nutritional stress. There are few fractures amongst children indicating activity, however, evidence of spinal joint disease was identified beginning in the early adolescent age category (10-14 years). Crude prevalence of joint disease is 21.4% among early adolescents and 25% in middle adolescents (15-17 years). The results of this analysis provide evidence that young people experienced significant physiological stress during early life. Greater Poland experienced a series of conflicts, famine, and disease epidemics in the early modern period, which likely resulted in the high prevalence of pathological lesions and mortality in younger individuals. Additionally, the presence of spinal joint disease in early adolescence indicates individuals likely participated in labour beginning at a young age. This research provides insight into rural, Protestant village life in early modern Poland, a currently understudied area of research.

2387. Child Mortuary Practices in the Early Modern Cemetery at Drawsko

Authors: Maciej Gembicki (Faculty of Archaeology, Adam Mickiewicz University)
Format: Oral

This paper examines the treatment of children in an early modern post-epidemic cemetery in Drawsko, Poland, excavated between 2008 and 2019 by the Slavia Foundation. The cemetery functioned for nearly 250 years as an auxiliary burial ground during periods of increased mortality, particularly in the 17th and 18th centuries. The analyzed assemblage comprises 556 skeletal burials. Subadults constitute a substantial proportion of the burial population, accounting for 42.5% of all interments, reflecting the severe demographic impact of epidemic disease on children. The cemetery is also characterized by a high frequency of apotropaic (anti-vampiric) practices, recorded in 21.76% of all graves. However, children are disproportionately underrepresented among such burials: only approximately 30% of apotropaic graves belong to subadult individuals. This pattern indicates that children, despite their numerical prominence in the cemetery, were less frequently perceived as a post-mortem threat requiring preventive intervention. While not excluded from apotropaic treatment, subadults were subject to these practices less often than adults, suggesting age-dependent interpretations of danger, agency, and liminality in death. These findings challenge simplified distinctions between "typical" and "atypical" burials and demonstrate that epidemic-related mortuary responses were selectively applied. The Drawsko cemetery provides important insight into how early modern rural communities conceptualized childhood, vulnerability, and the perceived power of the dead during periods of recurring epidemic crisis.

1946. Too Young to Die: Bioarchaeological Perspectives on Non-Adult Stress and Mortality in Post-Medieval Stenjevec (Zagreb)

Authors: Željka Bedic (Institute for Anthropological Research) – Maja Bunčić (Archaeological Museum in Zagreb)
Format: Oral

The skeletal remains from the Stenjevec cemetery in western Zagreb, spanning from the early Middle Ages to the 18th century, offer a unique opportunity for a diachronic analysis of childhood health in a transforming rural landscape. Non-adults represent approximately 26% of the total sample (N=160), providing a robust dataset for investigating shifts in mortality and morbidity over time. The primary focus of this study is the post-medieval population, whose health is reconstructed through the analysis of subadult stress indicators, metabolic diseases, and dental health. By examining markers such as linear enamel hypoplasia, cribra orbitalia and subperiosteal new bone formation, we track the physiological challenges faced by these children in comparison to earlier medieval phases of the cemetery. Special attention is paid to multiple burials containing women and children, exploring the biological and social implications of these shared graves. These contexts allow for a deeper investigation into maternal-infant health links and the environmental stressors that shaped the journey from cradle to grave in this historical community on the outskirts of Zagreb.

357. Flickers of life: Children of the Early Modern cemetery of the Dominican monastery in Bol, Croatia

Authors: Zrinka Premuzic (Faculty of Humanities and Social Sciences, University of Zagreb) – Mario Novak (Institute for Anthropological Research, Zagreb | Faculty of Humanities, University of Primorska, Koper) – Mario Caric (Institute for Anthropological Research, Zagreb) – Josip Burmaz – Dinko Tresić Pavičić (Kaducej Ltd., Split)
Format: Poster

The Early Modern cemetery located at the Dominican monastery and Church of Our Lady of Mercy in Bol, Croatia served the local community for a period of 355 years, from 1475 to 1830. Archaeological excavation in 2024 discovered 120 well-preserved graves, most of them single inhumations. The results of anthropological analysis of the skeletal material revealed that subadults represent 72,2% of the sample, a share unexpectedly high even for an archaeological population. Moreover, juveniles younger than 5 account for 84,6% of the subadult sample, indicating peak mortality for this age group. Paleopathological analysis showed pathological changes in only 5 individuals; this suggests mortality driven by either acute, rapidly progressing diseases or conditions that spare the skeletal elements. Preliminary stable isotopes analysis showed high nitrogen levels, indicating breastfeeding practices or prolonged episodes of physiological stress caused by malnutrition, infection or disease. Analysis of archaeological context (such as burial location, body position) showed that there was no difference in burial treatment between juvenile and adult individuals. This carries an implication of the social status: all children, even the youngest, were recognized as members of the community and granted some form of burial ritual. By combining anthropological and archaeological data, this analysis provided an insight into fragile lives of this community's most vulnerable members with a focus on health status as well as mortuary practices.

1132. (Un)Lived Lives: Bioarchaeology of Childhood, Death and Loss in a Cemetery from Rural Modern-Age Southern Romania

Authors: Franceska Ştirbu ("Vasile Pârvan" Institute of Archaeology) – Patricia Ebrașu (University of Bucharest) – Gabriel Vasile ("Vasile Pârvan" Institute of Archaeology) – Raluca Kogălniceanu (1 Decembrie 1918 University of Alba Iulia)
Format: Poster

The study draws on recent archaeological research conducted at "St. Nicholas Church", Iepurești site, situated in a rural area of southern Muntenia (= Greater Wallachia, Giurgiu County), a region that remains underrepresented in studies of post-medieval funerary practices. The site provides a valuable base for examining health, pathology, funerary behaviour, and social identity within a rural community of the Kingdom of Romania during the reign of Carol I, in the late 19th and early 20th centuries. The large number of subadults discovered during the excavation allows for the bioanthropological analysis of the demographic structure of the community, childhood mortality patterns, and growth and developmental stress. On the other side, from an archaeological point of view, patterns such as cemetery organization, grave typology, and variability in burial treatment, including the presence and composition of grave goods, may reflect forms of social differentiation as well as culturally adaptive responses to periods of social and economic change. Additionally, the investigation of osteopathological indicators, with particular attention to infectious, degenerative, and metabolic conditions, was essential in providing insight into living conditions and nutritional stress during the childhood years. Thus, by combining the two, the study offers valuable insight into modern-age rural life, the emotional dimensions of loss and the community's expressions of grief surrounding subadult burials, while emphasizing the importance of interdisciplinary perspectives in the reconstruction of complex historical and anthropological contexts. Lastly, other than reconstruction of past contexts, the study also concerns the present-day people of the Iepurești locality by contributing to the recovery and preservation of local heritage, as well as by fostering a deeper awareness of the cultural practices and identities that continue to shape this society today.

1482. Children of the Outskirts: A Bioanthropological Study of Non-Adult Individuals from the Ras Region (13th–18th Century)

Authors: Dragana Vulovic (Institute of Archaeology, Belgrade) – Vladan Vidosavljević (Ras Museum, Novi Pazar) – Uglješa

Vojvodić (Institute of Archaeology, Belgrade)
Format: Poster

In both modern and ancient populations, children represent the most vulnerable members of the community. Consequently, child mortality is regarded as the most sensitive indicator of population health and represents a key component in bioarchaeological interpretations of past societies. Due to rapid growth, their developmental processes can easily be disturbed. Environmental and socio-cultural risks, such as contaminated water, poor sanitation, indoor air pollution, inadequate food hygiene, etc., have always endangered children's health. In this regard, non-adult individuals play a crucial role in the reconstruction of the health status and living conditions of the ancient population, with special attention placed on neonatal mortality and mortality among children under five years of age. They are susceptible to various metabolic stresses caused by factors such as infectious diseases, inadequate nutrition, and parasitic infections that may leave a permanent record on bones and teeth. This presentation reports the results of a bioanthropological analysis of non-adult skeletal remains from the medieval necropolis of Dublje iznad Kuće (Novi Pazar, Serbia). Archaeological research indicates that the necropolis was used continuously from the 13th to the 18th century, spanning the medieval period and the era of Ottoman rule. The site served the population of a nearby rural settlement, which, although its exact location remains unconfirmed, was undoubtedly situated in the immediate vicinity of the episcopal Church of the Holy Apostles Peter and Paul in Ras, as well as the administrative center—the unfortified central square of Ras/Novi Pazar. Accordingly, the examination of skeletal remains of individuals up to the age of 17 (classified here as "non-adults") provides significant insight into the sustainability and resilience of the rural population living near these central hubs during the turbulent historical events in the Ras district.

1847. The Children of the Elisabethian Cemetery: An Interdisciplinary Study of Subadult Burials at Vienna's First Women's Hospital

Authors: Hannah Grabmayer (University of Vienna | Novetus GmbH) – Felix Kaufmann (Stadtarchiv Graz) – Eva Riedlsperger (University of Vienna) – Britta Van Tiel – Pontus Skoglund (The Francis Crick Institute) – Michaela Binder (Novetus GmbH)
Format: Poster

In 2018/19 archaeological excavations uncovered the cemetery of the first Viennese women's hospital of the Elisabethians, built in 1715 and used until 1784. The excavations revealed the well preserved, articulated skeletons of 355 individuals, who, according to historical records, were largely part of Vienna's lower social class. Around six percent (n=20) of the individuals were subadults under the age of 18. This study investigates why children were buried in the cemetery of a hospital that neither maintained a maternity ward nor explicitly admitted pediatric patients, and examines the illnesses from which they suffered. Archival sources including death and patient records are combined with bioarchaeological and biomolecular analyses, to explore the institutional and social mechanisms that led to the burial of children at this site and to reconstruct their pathological conditions. The children had an average age at death of 12 years, ranging from four to 17. DNA analysis of six individuals identified all as biologically female, indicating that the Elisabethian hospital not only distinguished between male and female adults, but did so for children as well. Historical sources show that some, despite their young age, were already working as maids and were admitted through networks of noble patronage, either by their employers or on recommendation. At the time of admission, most of the children were seriously ill. Cases of congenital syphilis, tuberculosis, and possible chronic mercury exposure were among the conditions observed. This study aims to contribute to a better understanding of childhood, illness, and social welfare in post-medieval Vienna period and to show how the integration of bioarchaeological and biomolecular data as well as archival sources can shed light on the lived experiences of girls who are otherwise rarely visible in historical sources.

1913. Adorned for Eternity: Child Burial Crowns in the Post-Medieval northwestern Croatia

Authors: Maja Bunčić (Archaeological Museum in Zagreb)
Format: Poster

This poster aims to present findings from a rescue excavation conducted at the parish church of Stenjevec in Zagreb, a site spanning the early medieval to the post-medieval period. Among the 171 burials recovered, two non-adult individuals (aged 6–7 and 11.5–12.5 years) were identified with significant remains of complex head attire in varying states of preservation. The presence of copper staining, bronze wire fragments, and beads on the crania provides tangible material evidence of the "dead-bridal" costume within a local rural context. Dated to the mid-17th century, these finds contribute to the growing corpus of child-specific mortuary rites documented across post-medieval Croatia and Central Europe. By analyzing these burial "crowns" or "wreaths," we explore how post-medieval societies navigated high childhood mortality through the construction of "idealized" identities. These adornments represent more than simple decoration; they signify the symbolic transformation of a lost life into an eternal, spiritual celebration, reflecting deep-seated beliefs regarding innocence and the afterlife.

252 CONNECTIONS BETWEEN THE CARPATHIAN–NORTHERN BALKAN REGION AND THE AEGEAN DURING THE BRONZE AGE IN LIGHT OF RECENT ARCHAEOLOGICAL DATA

Theme: 7. Interaction, connectivity and mobility
Organisers: Csaba Bodnár (Eötvös Loránd University) – Eszter Fejér (Institute of Archaeological Sciences, Eötvös Loránd University) – Filip Franković (Institute for Pre- and Protohistory, Heidelberg University) – Piotr Zeman (Institute of Archaeology and Ethnology of the Polish Academy of Sciences)
Keywords: Bronze Age, Aegean, Carpathian Basin, northern Balkans, mobility, interaction
Format: Regular session

SESSION ABSTRACT

Archaeological evidence for connectivity between societies in the Aegean and those in the northern Balkans and the Carpathian Basin during the Bronze Age has long attracted scholarly interest. Similarities in material culture suggesting interactions between these regions – though varying in intensity over time – have been recognized since the mid-20th century, and interpreted in diverse ways within different theoretical frameworks. The impact of Aegean contacts has often been viewed as a key factor in shaping the economic and social structures of Bronze Age Southeastern Europe; conversely, in certain periods, the role of northern elements has also been emphasized in the formation of Aegean societies. The aim of this session is to reconsider the current state of knowledge about these interconnections, drawing on recent advances in archaeological and scientific research in the Aegean on the one hand, and in the Carpathian Basin and the northern Balkans on the other. We invite papers that examine – whether through top-down narratives or from the bottom-up perpectives of local communites – the nature of contacts between the Aegean and the Carpathian–northern Balkan region, spanning from the Early to the Late Bronze Age, including the types and scales of interactions, their agents, mechanisms, geographical and material expressions. Contributions presenting new evidence for the movement of people, objects (finished products or raw materials), technologies, social practices (rituals, funerary behaviours, foodways, social institutions, etc.) and cosmological concepts from south to north or vice versa are all welcome. We especially encourage papers that address how encounters with 'foreign' southern/northern influences were received and appropriated within local social and cultural contexts, as well as research into the role played by intermediary communities in these transmission networks.

CONTRIBUTION ABSTRACTS

2762. Keynote: The Balkans in the Bronze Age: connected or disconnected?

Authors: Anthony Harding (University of Exeter)
Format: Oral

This session gives an unparalleled opportunity to discuss how connected the different parts of the Balkan peninsula were in the Bronze Age, and the contributors all address this rather critical question from a number of standpoints. Historically, the view has been that the advanced societies of the Aegean were on an altogether different cultural level from those further north. Recent discoveries have shown, however, that a much more nuanced interpretation is in order. Some writers (though not those contributing to this session) still favour a World Systems approach, which to my mind offers little agency to those in the "periphery". The progress of research, including palaeogenetics, remote sensing, and other technologies, means that in many areas we now have a much fuller understanding of local or regional groups in their own context. Studies of individual artefact types still have a role to play, however, though they must always be considered within the wider picture of their cultural background. Amber, for instance, which is the subject of at least two contributions, is now much better studied than it was when I undertook my PhD work. In this paper I shall review some of this recent work, comparing it with traditional narratives of the Balkan Bronze Age, with a particular focus on the changing evidence for long-distance connections throughout the peninsula.

2495. Early Bronze Age networks between the Carpathian Basin and the Aegean

Authors: Vajk Szeverenyi (University of Miskolc)
Format: Oral

Interregional interaction between the Carpathian Basin and the Balkans during the Early Bronze Age (3rd millennium BC) has been the subject of study for a long time. Nevertheless, new results can be expected through the application of new theoretical approaches that highlight new aspects of this interaction and provide new insights into social and cultural change. In this paper a series of objects and archaeological phenomena will be highlighted that provide evidence for various types of connections between the Carpathian Basin, Southeast Europe and the Eastern Mediterranean. This evidence will be analysed to demonstrate how new forms of material culture of ultimately foreign origin are adopted and reinterpreted according to local cultural logics. The paper will investigate how these cultural sets are recontextualized and used to create, maintain and reproduce new types of identities, social roles and personhood. These cultural changes seem to have been of utmost importance with regard to the later development of the Bronze Age in East Central Europe.

1662. Birds flying high... The Balkanic roots of the bird representations of the Bronze Age Carpathian Basin

Authors: Janos Dani (University of Szeged | Déri Museum)
Format: Oral

The Bronze Age in the Carpathian Basin is known to be rich in bird representations. The prevalence of various types of bird representations (rattles, askoi, bird-shaped vessels, bird depictions) in the Middle and Late Bronze Age clearly testifies to the existence of specific religious beliefs/practices. Two recently discovered, uniquely decorated askoi (Debrecen-Szepesi-telek and Orosháza-Gyopáros) allow us to date the similar, extremely rich Vučedol-decorated specimens to the so-called "Transitional period" (between the late Copper Age and the early Bronze Age), to approximately 2900-2600 calBC. But where do these stylized bird depictions originate, how did they find their way into the Carpathian Basin, and what connections do they have with the Balkans? What purpose did the earliest bird representations, the bird-shaped askoi serve? Is it possible to determine the exact species of these birds? What religious concepts and practices are associated with the Bronze Age bird representations? These questions (among others) are addressed in this research related to two recently discovered finds in eastern Hungary.

1219. Trading cosmological symbols? Bronze Age cosmological depictions and the southern relations

Authors: Emilia Pasztor (Türr István Museum)
Format: Oral

Several types of abstract signs are portrayed as sun symbols on the most diverse artistic works of the European Bronze Age. The finds in the Carpathian Basin are also abundant in these. There are also some, but hardly any, pictorial, storytelling images, and most of these seem to be cosmological in nature. These are considered the result of southern contacts. Symbols can make a belief system visible, and these visual symbols are communicated through the medium of iconography. Such symbols (as icons and emblems) could be exchanged between different cultures, travelling along international routes of communication that were used by traders. As the icons of a specific region, these religious beliefs were literally "exported." After a brief introduction on visual cosmological symbols, the presentation will investigate whether celestial/cosmological signs conveyed any meaning or information beyond simple similarity, and whether this can be revealed with the help of archaeology. Can it be established that some characteristic symbols really migrated from south to north, or perhaps in the opposite direction, or is it impossible to grasp a "birthplace" for them, because they owe their existence to general human cognitive processes? Did the Carpathian Basin serve only as an intermediary region, or did the people living here incorporate this information into their own communal culture, and their use became more than a simple decorative motif?

1167. From Hand to Hand: Bronze Age Two-Handled Cups between Anatolia, the Aegean, and the Carpathian Basin

Authors: Filip Frankovic (Heidelberg University) – Peter Pavúk (Charles University in Prague)
Format: Oral

In the second half of the third millennium BCE, various forms of two-handled cups began to appear in the ceramic assemblages of diverse communities across a wide area, extending from West Anatolia and the Aegean in the south to the southern part of the Carpathian Basin in the north. By the second millennium BCE, two-handled cups had become one of the most recognisable ceramic forms in Southeast Europe. Consequently, they have played a central role in the construction of local typo-chronological frameworks and in interpretative narratives concerning connections between the northern and southern parts of the region. Questions surrounding their appearance, development, and eventual disappearance are therefore closely tied to broader debates on social, cultural, and political change in Southeast Europe from the late third to the end of the second millennium BCE. Despite their significance, attempts to synthesise evidence across Southeast Europe remain limited. This lack of comprehensive research is particularly striking in the case of the Aegean and Anatolia—regions frequently regarded as the point of origin of the phenomenon. As a result, four interrelated research problems remain insufficiently explored: (1) terminological inconsistencies; (2) local typo-chronological developments and interregional synchronisms; (3) the origins of the phenomenon; and (4) regional variation in use and the socio-cultural meanings attributed to two-handled cups. This paper addresses typo-chronological developments, interregional synchronisms, and possible origins of the two-handled cup phenomenon. Rather than providing an exhaustive synthesis, it aims to (1) identify broad patterns in the distribution of specific two-handled cup types between the Danube and the Aegean; (2) examine correlations that may point to causal relationships; and (3) outline directions for future research.

2633. The Maros Group and Aegean Connectivity: Local Communities in Bronze Age Networks

Authors: Orsolya Gyurka (Móra Ferenc Museum | Babeș-Bolyai University, Cluj-Napoca)
Format: Oral

Archaeological research has long highlighted the importance of interregional connectivity between the Aegean, the northern Balkans and the Carpathian Basin during the Bronze Age, emphasizing the circulation of materials, technologies and social ideas across these regions. The Maros Group, an Early and Middle Bronze Age cultural complex situated in south-eastern Hungary, western Romania and northern Serbia, occupied a strategically significant position within these interaction networks, particularly along the Maros (Mureș/Moriš) and Tisza (Tisa) river corridors. This paper explores the role of Maros Group communities within broader Aegean–Carpathian networks from a bottom-up perspective, focusing on how external influences were received, negotiated, and embedded in local social and cultural contexts. Archaeological evidence indicates sustained long-distance connectivity. Amber finds attest to participation in continent-spanning exchange systems, while Columbella shells in settlements and cemeteries provide direct evidence for contacts reaching the Mediterranean. At the level of social display, similarities in bone and gold decorative motifs from elite burials suggest that Maros communities adopted status symbols reflecting patterns observed in contemporary Aegean material culture. Newly uncovered material further refines our understanding of these connections. A recently discovered stone artefact, resembling a double axe from a Middle Bronze Age inhumation grave in the Szeged–Szőreg-C cemetery (Hungary), provides a compelling example of an Aegean symbolic form that was appropriated and reinterpreted within a local funerary and social context. By integrating established datasets with new finds, this contribution complements our understanding of the nature, mechanisms, and social meanings of interactions between the Aegean and south-eastern Hungary.

2023. Local, regional, long-distance? Trade networks in the Tumulus period through raw material analyses from Maklár (NE Hungary)

Authors: Ákos Mengyán (University of Miskolc | Hungarian National Museum Public Collection Centre) – Zita Hrabák (University of Szeged | Hungarian National Museum Public Collection Centre) – Bernadett Bajnóczi (HUN-REN Research Centre for Astronomy and Earth Sciences) – Veronika Szilágyi – Zsolt Kasztovszky (Budapest Neutron Centre, HUN-REN Centre for Energy Research) – Ferenc Kristály (University of Miskolc)
Format: Oral

In Northeastern Hungary, two partly excavated cemeteries are known on the northern Great Hungarian Plain in the municipality of Maklár, both dated to the Tumulus period, between 1600/1500 and 1300/1200 cal BC. The sites are Maklár-Koszpérium (121 burials) and Maklár-Nagyrét II (210 graves). Solely cremation burials were identified in the cemeteries, including both urn graves and scattered cremation graves. Most burials contained multiple vessels, creating diverse sets of ceramics. Furthermore, thirty-four blue glass beads in the Nagyrét II, and two stone axes were found, one from each cemetery. This research focuses on the composition and provenance of ceramics, glass beads and stone axes, in order to shed light on trade networks and traditions of the Maklár communities. The raw material procurement and tempering practices of the ceramic assemblages were studied by thin-section petrography. The main aim was to define the technological traits of pottery production and to identify similarities and differences in the production process. The stone axes with shaft-hole were investigated by non-destructive prompt gamma activation analysis (PGAA) and X-ray diffraction (XRD) analysis. Stone axes are rare in burial context, and their composition indicate regional and imported raw material use. In addition, the blue glass beads were analysed by SEM-EDS and LA-ICP-MS. Blue glass beads appeared in larger quantity around 1500 BC in Central Europe, including the Carpathian Basin. The trace element composition of the Central European blue glass beads suggests Mesopotamian and Egyptian origin. The provenance of the Maklár glass support this theory and suggest complex long-distance trade networks between Central Europe and the Eastern Mediterranean, in which the Aegean societies could have played an important role.

1891. Burial Rite between the Central Balkan and North Aegean World during Early and Middle Bronze Age

Authors: Aleksandar Kapuran (Principal research fellow)
Format: Oral

During the 3rd and first half of the 2nd Millennium BC, it is possible to notice certain parallels in burial rites between the communities that settled the northern parts of the Aegean and the Central Balkan territory. During the 3rd millennium BC, these parallels were first manifested among the prominent representatives of the communities, while in later periods, especially during the first half of the 2nd millennium BC, we believe that a certain equality in the funeral ritual appeared. Since a few Early Bronze Age graves have been found on the territory of the Central Balkans, an incomparable number of necropolises and solitary burials have been discovered during the Middle Bronze Age, so that it is now possible to establish a clearer insight into the burial practices of populations buried in large necropolises, especially in the moutanious regions of the Iron Gates Hinterland, and also in the plains in the south of the Carpathian Basin. Due to the fact that a certain number of necropolises in Serbia and Greece have not been published in an adequate volume to date, we believe that the time has come to look at certain aspects of burials and the influences they were subject to from a new perspective.

1142. Funerary kits, high-res c14 and a late Middle Bronze Age Danubian epidemic, as contextual data for southeast European contacts

Authors: Tibor Daróczi (Institutul de Arheologie "Vasile Pârvan" al Academiei Române | Facultatea de Istorie, Universitatea din București)
Format: Oral

This presentation explores the archaeologically visible contact between Middle Bronze Age communities on the Danube and the emerging Mycenaean world during the late Middle Helladic period. To understand this connectivity, we argue for a strong, causal correlation between three key elements: a disruptive wave of disease, high-precision radiocarbon chronologies, and the comparative

analysis of funerary kits. First, we propose that a scientifically under-discussed epidemic on the Danube served as the primary engine driving major social, demographic, and cultural changes on the threshold of the Late Bronze Age. While published multi-proxy evidence for this epidemic is currently limited, modeling it provides a clear catalyst for the sudden movement of populations and ideas. Second, by synchronising new high-precision radiocarbon chronologies, we can map the direct consequences of this disruption. This synchronisation reveals the specific directionality of exchanges in goods, people, and concepts between the Danube and the Aegean. Finally, the presentation will argue that these demographical and chronological shifts are materialised in the archaeological record through dozens of similar funerary kits found in both regions, dating to the first half of the second millennium BCE. A comparative analysis of these kits indicates converging burial customs and a shared projected self-image. Consequently, these funerary kits highlight the circulation of similar beliefs—and likely people—acting as the medium through which shifting populations negotiated their identities after being set into motion by the initial wave of disease.

963. The Middle Bronze Age site of Slivnitsa, Bulgaria: at the crossroads of Northern and Southern Balkans

Authors: Denitsa Ilieva (Sofia university St. Kliment Ohridski) – Yana Mutafchieva (National Archaeological Institute with Museum Bulgarian Academy of Sciences) – Veselina Dimitrova (Independent researcher)
Format: Oral

Over the past decade, our understanding of Bronze Age development in Central Western Bulgaria has expanded significantly, largely due to the increasing number of rescue archaeological investigations conducted in connection with major infrastructure projects across the region. Yet, the Middle Bronze Age remains comparatively understudied, with limited systematic research and few long-term, comprehensive excavations. In this context, the recently investigated site of Slivnitsa, still largely unfamiliar to the scholarly community, provides a rare and valuable case study, offering new insights into a poorly documented phase of regional prehistory. Situated at a strategically significant location in the central Balkans, the site provides a crucial perspective for reassessing broader settlement patterns, transformations in material culture, and the nature of cross-regional interactions during this period. Of particular importance are the data on pottery production, which reveal the diverse cooking practices of the site's inhabitants. While the ceramic assemblage displays a distinct local character, it simultaneously bears clear traces of cultural influence from both the northern and southern Balkans, positioning Slivnitsa at a dynamic crossroads of overlapping traditions and practices.

1032. The amber road: The earliest evidences of amber in context of territory of present-day Bulgaria

Authors: Petar Minkov (National Institute of Archaeology-Bulgarian Academy of Sciences)
Format: Oral

This study focuses on presenting the preliminary results of a salvage archaeological excavations in the area of the city of Ruse, located in northeastern Bulgaria on the shore of Danube river. The present presentation subject are the amber beads found in Late Bronze Age necropolis, which has been partially excavated so far. The structure of the graves consists of shallow simple pits, the burial rite is inhumation, and the position of the buried is hocker, with the head to the east. The most significant discovery in the necropolis is undoubtedly a necklace consisting of nine amber beads, which have already been restored. They were found on the chest of the individual. The significance of this discovery is that amber has been found for the first time in an archaeological context from the Late Bronze Age in modern-day Bulgaria. Until now, the only known example of amber from Bulgarian lands was on the cross-shaped bronze base from one of the gold lids in the world-famous Vulchitrun gold treasure, which was found in an unknown archaeological context. The proximity of the necropolis to the Danube River raises a number of questions about the origin and route by which the amber came to be found in modern Bulgarian territory. The cultural determination of the necropolis is associated with the Noua-Coslogeni-Sabatinovka complex. This allows us to make an initial assumption that this discovery can be linked to the bearers of this cultural network. Preliminary analysis of the amber indicates that its potential raw material origin can be localized in the Baltic Sea area, where the highest concentration of natural amber deposits in Europe are located.

2330. The End of the Bronze Age. The Case of Plovdiv, Bulgaria

Authors: Elena Bozhinova (Plovdiv Regional Archaeological Museum)
Format: Oral

The modern city of Plovdiv has inherited its role as an administrative and economic center from earlier historical periods. Although there were intervals during which the site was abandoned, the final phase of the Late Bronze Age and the transition to the Early Iron Age appear to have been a time of prosperity. Recent excavations have revealed well-stratified features that make it possible to distinguish separate chronological phases within the final stage of the Late Bronze Age and the beginning of the Early Iron Age. One phase, characterized by specific pottery forms and simple decoration consisting of shallow incised lines, has been identified and dated to the late 13th and early 12th centuries BC. This phase precedes or partially overlaps with the fluted ware horizon that characterizes the transitional period in Thrace. At the same time, a cremation burial from the village of Manole provides clear evidence for the presence of foreigners, as it contained pottery atypical of the Thracian Plain but characteristic of the Incrusted Pottery culture of the far northwest. This migration should be synchronized with the arrival of newcomers from Thrace in Troy VIIb. A subsequent chronological phase is marked by the first appearance of stamped decoration, dated to the 12th century BC. Some pottery vessels are exceptionally elaborate and attest to the importation of at least new ideas, the origin of which remains to be established. The innovations in pottery decoration at the Plovdiv settlement outline directions of contact and influence. Situated

in the heart of Thrace, at the crossroads connecting north and south as well as west and east, the developments in Plovdiv reflect broader processes across Thrace and, together with evidence for migration, reveal a dynamic situation in the final phase of the Bronze Age and the transition to the Iron Age.

1767. Mycenae and the Carpathians. Similarities in social valorization of architecture

Authors: Liviu Marta (County Museum Satu Mare)
Format: Oral

New research on fortifications and bronze hoards in the Carpathian Basin strengthens the picture of similarities with Mediterranean civilizations, once again reopening the question of the region's links with Mycenaean civilization. These links are evident in the case of the monumental building currently under investigation at Sântana. They become more elusive, however, if we try to compare the way the Sântana building was used and the settlement's layout (planimetry) in shaping social relations. Such an assessment is complemented by the archaeological data provided by recent research at the settlement of Căuaş. The agglomeration of approx. 1300-1400 buildings did not allow the provision of agricultural resources within some households with included lots. This situation denotes an overcoming of the sense of immediate subsistence, characteristic of the independent family spirit.The architectural message shows that the direction of movement in the settlement takes place between the access points and an area free of construction, an area that the route of communication paths highlights as a central space of social life. The large number of amulets and ritually destroyed objects discovered in the fortified settlements at Căuaş and Sântana provides evidence regarding the use of routes within these settlements. The use of bronze objects as symbols has been highlighted by studies over the last three decades on the role of such objects in hoards from the Carpathian Basin. The symbolic value of the objects from the fortified settlements at Căuaş and Sântana reveals the meaning of movement from the entrance gates to the inner enclosures. The symbolism of the amulets—linked to the rituals and processions in which they were used—together with the architecture, points to profound similarities between Mycenaean civilization and the civilization between the Tisza and the Apuseni Mountains. To what extent can their use in constructing comparable social mechanisms be assessed?

2170. Old stories from the local view of the southern Carpathian Basin: new finds and contexts

Authors: Daria Ložnjak Dizdar (Institute of Archaeology, Zagreb)
Format: Oral

The southern Carpathian Basin played a role in narratives related to the events of 1200 BC. In most cases, this role was interpreted from an Aegean perspective or a broader Central European perspective. The regional perspective was unanimously presented through a culture-historical approach in the second half of the 20th century, wherein changes in material culture were interpreted as a consequence of migrations. Recent reviews have addressed these questions by combining both perspectives, thereby adding a new dimension to the interpretation of contacts between the Carpathian Basin and the Balkans with the Aegean. Newer works have presented topics concerning settlements, weapons, and metallurgical analyses with an emphasis on local and regional development. This paper will examine the state of research through the distribution of specific objects – fibulae, swords, and defensive equipment – that were used as material evidence of connections between the Carpathian Basin and the Aegean. Newly researched contexts (graves and hoards) as well as absolute dates will be presented as a contribution to the understanding of the 13th and 12th centuries BC in the southern Carpathian Basin.

2190. The "cutting-edge" perspective – utilitarian implements and transregional interactions between the Aegean and the Carpathian Basin

Authors: Eszter Fejer (Eötvös Loránd University)
Format: Oral

This paper addresses the question of long-distance relations between the Aegean and the Carpathian Basin as reflected by some utilitarian implements, and examines the significance of both the presence and the absence of such connections. The primary materials considered for this study are everyday cutting implements: metal sickles and knives. The study investigates the distribution of various types, the movement of individual objects and techniques from the perspective of the Carpathian Basin throughout the Middle and Late Bronze Age (ca. 16th–8th centuries BC), encompassing developments from the earliest bronze to the earliest iron variants. Sickles constitutes one of the most common categories of bronze artefacts in the Carpathian region. Particularly during the formative stage of their development, they share numerous formal and functional traits with knives. While the majority of bronze types point to strong connections with the western regions of Central Europe, a limited number of finds indicate southern interactions as well. This paper will evaluate these latter objects within their chronological and cultural contexts, aiming to outline differences in the communication networks involved, and in the value and function attributed to these artefacts. By the end of the Bronze Age, the earliest iron artefacts appear in the Carpathian Basin, with iron knives occupying a significant position. The emergence of iron technology in this region has long been the subject of scholarly debate, and several authors have emphasized the role of Aegean workshops in this process. Through a critical reassessment of the Late Bronze Age iron assemblage, this paper examines whether the evidence provided by these knives lends support to such hypotheses.

2578. Bronze socketed axes from Corinth? – Balkan–Aegean interactions in the post-palatial and Early

Iron Age: evidence from metal objects

Authors: Csaba Bodnár (Eötvös Loránd University, Budapest) – András Márton (Chercheur associé, CRBC, Brest)
Format: Oral

This paper focuses on three bronze socketed axes that entered the collection of the Museum of Fine Arts, Budapest, as part of the former collection of Béla Gerster (1850–1923), chief engineer of the Corinth Canal. According to the records of the Hungarian collector, they originate from the Corinthian Isthmus. The provenance information provided by Gerster appears reliable, and it is reasonable to assume that, similarly to the other items in his collection, these bronze objects were also acquired in Greece. The particular significance of the three axes lies in the fact that, to our knowledge, no comparable specimens have thus far been recovered from the Aegean region. Their closest parallels are attested in the northern Balkans and the Carpathian Basin and are dated to the Late Bronze Age of those regions (12th–9th centuries BCE). In this paper, we examine the morphological and technological characteristics of the objects, including traces indicative of use and possible secondary manipulation. We also review the spatial distribution of their analogies and their archaeological contexts. The appearance of northern, non-Mediterranean type metal objects in mainland Greece during the late and post-Mycenaean period is a documented, although relatively rare phenomenon, often interpreted by previous research within broader historical narratives. In the second part of the presentation, we briefly survey the material culture evidence for long-distance Balkan-Aegean interactions during this period. Focusing primarily on metal finds, we examine the nature of these contacts and address how these 'foreign' northern objects were received and integrated within the local contexts of post-palatial Bronze Age and Early Iron Age Greek communities.

1317. Keynote: Endnote to the session

Authors: Joseph Maran (Heidelberg University)
Format: Oral

Until recently, there has been a strong tendency in scholarship to attribute social and economic changes in the Bronze Age of the northern Balkans and the Carpathian Basin to external influences. In this context, the Aegean has repeatedly played a central role, as it was often argued that second millennium BCE Aegean palatial societies exerted a direct influence on historical developments in Eastern Central and Southeastern Europe. In recent decades, however, alternatives to this "Aegeo-centric" approach have become increasingly evident. In particular, the diffusionist-evolutionist standpoint—that cultural innovations must always have originated in strongly hierarchically structured, bureaucratic societies and then spread unilinearly from there into so-called "peripheries"—has proven untenable. On closer inspection, it becomes clear that the spread of innovations is better understood in terms of a "dialogical principle" and the co-production of knowledge. This is based on the fact that innovations across the entire region between the Carpathian Basin and the Aegean neither spread unilinearly nor did they remain unchanged in the course of their transfer. Instead, they were subject to processes of "translation", in which, by adapting them to local contexts, new forms of material culture and knowledge were created, which in turn could become the subject of exchange relationships. This process of merging the "global" with the "local" has been called "glocalization". During the Bronze Age certain periods of intensified interaction stand out in the zone between the northern Balkans and the Aegean. One of these is the Cetina phenomenon at the very beginning of the Bronze Age, a second one the time of the Shaft Grave period in southern Greece, and a third during the time of the Urnfield period in the 13th and 12th centuries BCE.

253 "IMAGING THE IMAGINABLE": VIRTUAL AND INTERDISCIPLINARY APPROACHES TO RECONSTRUCTING PHYSICAL ACTIVITY IN THE PAST

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Fotios Alexandros Karakostis (University of Tübingen | Senckenberg Research Institute | University of Basel) – Chrysa Tsimopoulou (Democritus University of Thrace) – Pablo González Fernández (University of Granada) – Laura Watson (Senckenberg Research Institute and Natural History Museum) – Pia Lorenz (Universität zu Köln)
Keywords: 3D imaging, Virtual Anthropology, Physical Activity, Behavioral Evolution, Biomechanics, Bone functional adaptation
Format: Regular session

SESSION ABSTRACT

Reconstructing habitual behavior in the past is a central objective of archaeological sciences. In recent decades, the accelerating wave of technological innovation has transformed the tools available to archaeologists, opening new avenues for studying the human past from perspectives that were previously inaccessible. Relying on high-resolution 3D imaging techniques, novel virtual morphometric methods have been developed to reconstruct habitual physical activity based on the morphological study of bone. These approaches have provided a valuable new foundation for exploring critical aspects of past life, such as patterns of labor division and socioeconomic differentiation, without being limited by material access or the constraints of traditional anthropological methods. In this session, we aim to establish a dialogue on virtual approaches used to reconstruct physical behavior from skeletal morphology, spanning prehistoric to historical contexts. We welcome general, case-specific, and methodological contributions, with particular encouragement for cross-disciplinary approaches that integrate diverse types of archaeological evidence, such as biomechanical modeling, 3D functional morphology, isotopic analyses, and histological techniques, among others. By highlighting innovative methodologies, this session seeks to assess the future directions of interdisciplinary research on activity reconstruction and its contribution to understanding past human behavior and biocultural evolution.

CONTRIBUTION ABSTRACTS

1551. Reconstructing past physical behaviour with computational anatomy and virtual anthropology

Authors: Antonio Profico (Department of Biology - University of Pisa)
Format: Oral

Bone is a dynamic tissue that records mechanical and environmental signals throughout life. In archaeological contexts, the analysis of postcranial skeletal elements provides a valuable opportunity to reconstruct past loading history and patterns of activity. Traditionally, biological anthropologists extract single cross-sections from long bones, most commonly at the midshaft, to calculate shape descriptors and biomechanical parameters. Over the last decades, these approaches have increasingly benefited from the application of digital and computational methods. Within the framework of virtual anthropology, skeletal remains are studied through high-resolution 3D models, while computational workflows allow the reproducible extraction of quantitative variables from long bones. In this context, morphomap is an R package specifically developed for the analysis of long bone morphology. Digital models of long bones are analysed by extracting equiangular semilandmarks on multiple cross-sections along the entire diaphysis, which can be used for geometric morphometric analyses, the reconstruction of biomechanical parameters, and the generation of cortical thickness maps. In this communication, I present recent updates to morphomap that extend its analytical capabilities. These include support for the analysis of solid 3D models, the comprehensive investigation of skeletal asymmetry through the comparison of antimeric bones, and the joint analysis of multiple bones belonging to the same individuals. Together, these developments enhance the potential of morphomap for integrative and reproducible studies of long bone structure in archaeological and anthropological research.

1316. Virtual Approaches to Developmental Integration and Biomechanical Adaptation of the Wrist–Metacarpal Complex

Authors: Azahara Salazar Fernández – Rebeca García González (Laboratory of Human Evolution. University of Burgos) – José Miguel Carretero Díaz (Laboratory of Human Evolution. University of Burgos | UCM-ISCIII Center for Research on Human Evolution and Behavior) – Laura Rodríguez (Laboratory of Human Evolution. University of Burgos | Department of Biodiversity and Environmental Management, University of León)
Format: Oral

The bones of the wrist and metacarpal complex constitute a key anatomical region due to their complex developmental patterns and their fundamental role in load transmission and biomechanical adaptation of the hand. Despite their functional importance, most studies of hand development rely on radiographic data, whereas information derived from dry bone material remains scarce. This limitation restricts the integration of ontogenetic and biomechanical effects in skeletal identification within both clinical and archaeological contexts. This study examines shape changes in the wrist–metacarpal complex in non-adult individuals by analyzing spatial relationships among its components using virtual approaches. The main objective is to assess how individual bones develop in relation to the complex as a whole. Carpal bones contribute to wrist mobility, force absorption, and stability, while metacarpals connect the wrist to the phalanges, shape the palm, and enable grasping and manipulation. Together, these elements form an integrated functional unit critical to hand function. Three-dimensional geometric morphometrics was applied to a sample of 3D-scanned skeletal elements, including 80 metacarpals and 222 carpal bones from the Dental Age Collection of San Pablo, housed at the Human Evolution Laboratory (Burgos, Spain). All metacarpals and carpal bones are homogeneously represented, except for the pisiform. Results show that coordinated changes in the articular surfaces of the carpal bones produce clear age-related shape variation, associated with the progressive reduction of growth cartilage. In contrast, developmental changes in the metacarpals are primarily expressed through modifications in diaphyseal curvature and metaphyseal morphology. This study provides the first three-dimensional analysis of dry bone material from the wrist–metacarpal complex in non-adult individuals. The findings offer new insights into skeletal maturity assessment and functional anatomy, with potential applications in clinical research, physical anthropology, and as a comparative framework for paleoanthropological and primate studies.

489. An Indicator of Activity or Inactivity? Exploring the Etiology of Osteoarthritis in Archaeology

Authors: Elizabeth Nist (Harvard University) – Fotios Alexandros Karakostis (University of Tuebingen | Senckenberg Research Institute | University of Basel)
Format: Oral

Osteoarthritis (OA) is one of the most observed skeletal pathologies in the archaeological record. In bioarchaeology, increased incidence and severity of OA are often interpreted as indicators of strenuous lifestyles, based on the assumption that OA is a degenerative disorder associated with habitual physical activity. However, this simplistic 'wear and tear' model is inconsistent with current

medical understanding of OA, and recent experimental research suggests that inactivity may also contribute to OA pathogenesis. Additionally, archaeological studies often downplay the role of systemic factors known to influence OA, such as age, sex, and body mass. In this study, we used an integrative approach combining the Validated Entheses-based Reconstruction of Activity (VERA) 2.0 method with archaeologically visible skeletal traits to examine relationships among activity, systemic factors, and OA, and to evaluate the validity of using OA as a tool for activity reconstruction. We analyzed skeletons from a rural 13th–15th century population from Grevenmacher, Luxembourg. We examined five joint surfaces across the skeleton using principal component analyses to explore the relationship between OA traits (eburnation, osteophytes, lipping, and porosity) and systemic factors (age, sex, and body mass). In a subsample of distal first metacarpals and distal first metatarsals, we then analyzed virtual 3D entheseal surface areas of opponens pollicis and tibialis anterior in relation to OA traits and systemic factors to investigate the association between OA and activity. Overall, our results reject a straightforward association between OA and activity and do not fully support either the 'wear and tear' or 'inactivity' hypotheses. We therefore caution against using OA for activity reconstruction until its relationship with activity can be further understood.

1030. An integrative multi-proxy approach to settlement type and status in Roman northern Greece: mandibular function, stable isotopes, and mortuary context

Authors: Chrysa Tsimopoulou – Elissavet Ganiatsou – Asterios Aidonis (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace) – Eleni Kalliga (Laboratory of Biological Anthropology, Democritus University of Thrace) – Tania Protopsalti (Ephorate of Antiquities of city of Thessaloniki, Ministry of Culture Greece) – Christina Ziota (Ephorate of Antiquities of Florina, Ministry of Culture Greece) – Vasileios Nannis (Laboratory of Biological Anthropology, Democritus University of Thrace) – Fotios Karakostis (Paleoanthropology, University of Tübingen | Senckenberg Research Institute Tübingen | Integrative Prehistory and Archaeological Science, University of Basel) – Christina Papageorgopoulou (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace)
Format: Oral

Roman-period connectivity networks ("Roman globalization") reshaped local economies and food systems, but their effects were not always even across settlement types and social strata. In this context, urban and rural communities, and individuals of different status within them, may have experienced distinct dietary regimes and food-processing practices, with following consequences for masticatory loading and mandibular functional adaptation. Using an integrative framework that combines mandibular functional adaptations, stable isotopes, and mortuary evidence, we evaluate how diet, urbanization, and status intersect at two Roman-period sites in northern Greece (1st–4th century AD). Our sample includes a total of 118 individuals coming from urban Thessaloniki (n=65, 30 females/ 35 males), capital of Provincia Macedonia, and rural Mavropigi (n=63, 32 females/ 31 males) in Eordaea region of western Macedonia, Greece. Mandibular functional signals are assessed through three complementary proxies: 3D mandibular shape, cross-sectional geometric properties at the M1–M2 junction, and quantification of masticatory entheseal expression. Adult diet is reconstructed using carbon ($\delta^{13}C$), nitrogen ($\delta^{15}N$) and sulphur ($\delta34S$) stable isotope values from femoral bone collagen, while mortuary practices are used as archaeological indicators of social differentiation. Preliminary results indicate larger and more robust mandibular morphology in Thessaloniki, consistent with higher masticatory demands, whereas Mavropigi displays lower robusticity, suggesting reduced mechanical loading. By integrating isotopic and mortuary data, we evaluate whether these differences reflect settlement-dependent food systems, status-related access to softer or more intensively processed foods, or a combination of both, offering a more refined alternative to a simple urban-rural dichotomy.

2500. Virtual reconstruction of Australopithecus afarensis hand digits

Authors: Miguel López Cano (National Museum of Natural Sciences of Madrid | Universidad Complutense of Madrid) – Markus Bastir (National Museum of Natural Sciences of Madrid) – John Rowan (University of Cambridge) – Christopher Campisano (Arizona State University) – Ignacio Lazagabaster (Centro Nacional de Investigación sobre Evolución Humana CENIEH | University of Liverpool)
Format: Oral

The human lineage is characterized by a major transition in hand use, from a primarily locomotor role to increasingly dexterous manipulation, closely associated with the emergence of habitual bipedalism. It is widely accepted that all Plio-Pleistocene hominin species engaged in tool-related behaviours to some extent. However, hand remains with secure taxonomic attribution are rare in the hominin fossil record, limiting our understanding of the evolution of manual functional capabilities. The hominin hand assemblage from Hadar, attributed to Australopithecus afarensis, represents the most complete collection of Plio-Pleistocene hand bones recovered to date from a single east African site (Bush et al. 1982), yet it still lacks a comprehensive, up-to-date revision. The hand morphology of A. afarensis is critical for understanding subsequent evolutionary developments in hominin manual function, both because of its antiquity, close in time to the earliest known stone tools (Lomekwian), and because A. afarensis remains one of the most likely stocks from which the genus Homo arised. Moreover, Hadar provides one of the best-sampled hominin assemblages, making A. afarensis among the species for which paleobiological and paleoecological context is best understood (Kimbel and Delezene, 2009). In this study, we serially reconstruct and analyse all available proximal and intermediate phalanges from Hadar using 3D geometric morphometrics (3DGM), with particular attention to grip capabilities and its functional implications. These specimens are compared with phalanges from other African Plio-Pleistocene hominins, including KNM-ER 101000 (Paranthropus

boisei; Mongle et al. 2025), KNM-WT 15000 (Homo erectus; Walker and Leakey 1993), MH 2 (Australopithecus sediba; Kivell et al. 2018), UW 101 (Homo naledi, Kivell et al. 2011; 2015), in order to better understand the evolution of manual functional anatomy, considering taxonomic and temporal variation among African Plio-Pleistocene hominins.

654. "Taphonomic or not?" Evaluation of the use of taphonomically altered entheses in attempts to reconstruct physical activity in past populations

Authors: Manolis Papadakis (University of Tübingen) – Jane Buikstra (School of Human Evolution and Social Change, Arizona State University | American School of Classical Studies at Athens) – Fotios Alexandros Karakostis (University of Tübingen | Senckenberg Research Institute | University of Basel)
Format: Oral

Reconstructing physical activity from skeletal remains in ancient populations has been an important objective of bioarchaeological research. One of the methods used is the examination of modifications to the muscle attachment areas, commonly known as entheses. For evaluating such changes, both visual scoring methods lacking experimental validation and experimentally validated virtual 3D anthropological approaches have been used. The former approach commonly disregards taphonomically altered entheses as "non-informative", thereby reducing sample sizes and affecting the study's reliability. By contrast, virtual approaches, such as the Validated Entheses-based Reconstruction of Activity (VERA), enable the selection of precise areas of interest, where the investigators can decide whether or not they would include the remaining portion of the enthesis. Consequently, the damage should be recorded in the dataset, and the effect of taphonomic damage on the results can be assessed. This paper proposes a methodological protocol applied to poorly preserved skeletal remains from the Phaleron burial ground, dated to the Greek Archaic Period, including groups of normative and non-normative burials. Two datasets were generated: one included the poorly preserved entheses, and the other excluded only those preserved at <50%. Differences between the two datasets were evaluated, together with the effect of the interaction between preservation and burial group on the measured entheseal changes. No major differences between the datasets' results were observed, and the interaction between preservation and burial group was non-significant. This research serves as a promising pilot study for applying this statistical protocol to similarly fragmented entheses in future research, proposing the inclusion, rather than the exclusion of fragmented entheses in activity reconstruction studies.

470. Lower limb activity reconstruction of the Bronze Age human remains from Cape Trafalgar (Spain) using the VERA method and CSG

Authors: Pablo González Fernández (University of Granada) – Fotios Alexandros Karakostis (University of Tübingen | Senckenberg Research Institute | University of Basel) – Marta Díaz Zorita-Bonilla (University of Granada | University of Tübingen)
Format: Oral

In this paper, we present the bioarchaeological results from Bronze Age human skeletal remains excavated at Cape Trafalgar (Cádiz, Spain). These remains offer an opportunity to gain better insight into the physical activities of Bronze Age communities from southern Iberia. Based on archaeological literature and the assumption of a farming lifestyle, this analysis challenges previous assumptions. Our initial hypothesis was that the population buried at Cape Trafalgar had a diet based on agricultural products (crops and livestock) and exhibited low levels of long-distance mobility and walking activity, consistent with a sedentary agricultural lifestyle. To address this hypothesis, we applied the Validated Entheses-based Reconstruction of Activity method (VERA 1.0) and Cross-Sectional Geometry (CSG) analyses to foot bones (proximal hallux phalanges) from the Bronze Age Cape Trafalgar necropolis. These data were compared with an extensive sample of sedentary individuals and habitual walkers to assess walking intensity. This study represents the first application of the VERA method to the lower limbs. Our main findings indicate that these individuals likely experienced high levels of lower limb activity, as evidenced by relatively larger extensor entheseal sizes when compared with the sample of habitual walkers. Secondary findings suggest that footwear does not appear to play a significant role in bone morphology changes associated with lower limb physical activity. The significance of this study lies in both the new information it provides and the introduction of a novel application of the VERA 1.0 method for investigating lower limb physical activity in Prehistoric populations.

605. Functional Biomapping — Decoding Past Physiological Behaviour and Adaptation in Early Bronze Age Individuals from Drasenhofen, Lower Austria

Authors: Sofie-Kristin Schendzielorz – Katharina Rebay-Salisbury (Austrian Archaeological Institute, Austrian Academy of Sciences | University of Vienna) – Fotios Alexandros Karakostis (University of Tübingen | Senckenberg Research Institute) – Fabian Kanz (Department of Forensic Medicine, Medical University Vienna)
Format: Oral

Biomechanical strains induced by daily activity have been shown to manifest individually due to the skeleton's adaptation capabilities and anatomical functionality. This pilot study investigates the external and internal 3D morphology of muscle attachment (entheseal) sites, aiming to reconstruct habitual activities based on selected entheses of the upper limb region, in 18 individuals from the Early Bronze Age cemetery site of Drasenhofen, Lower Austria (2000–1650 BC). This project will rely on 3D semi-automated analyses involving the Validated Entheses-based Reconstruction of Activity 2.0 (VERA 2.0) and 3D solid cross-sectional

bone analysis (morphomap). This approach will focus on assessing both habitual muscle loading and associated biomechanical strength. By performing statistical analyses on the external topography of selected entheseal sites, along with shape data captured as semi-landmarks across multiple sections, cortical thickness maps, and calculated biomechanical parameters, a comprehensive picture of activity marker distribution and bilateral observations can be generated. Based on this preliminary analysis, a catalogue of change-related entheseal patterns will be developed, providing a foundational overview of the range and expression of entheseal changes observed within the sample. The multidimensional approach of visually biomapping these entheseal changes can help to understand the relation between external and internal adaptation processes in the entheseal sites and facilitate future comparisons with other bioarchaeological materials. Exploring the single entheses as integral components within the body's larger movement apparatus will enhance further research into the connection between muscle synergies and tools and provide a substantial contribution to the field of reconstructing habitual physical activity in the past. Current limitations arising from the lack of demographic information and comparative data will be addressed through further methodological testing and a comparative validation study using modern human remains with well-documented occupancy histories.

1870. "Skeletons of Society": A Multivariate Assessment of Differences in Labour Intensity across Socio-Economic Status in Medieval Grevenmacher, Luxembourg

Authors: Pia Lorenz (University of Cologne) – Fotios Karakostis (University of Tübingen | Senckenberg Research Institute | University of Basel)
Format: Oral

Throughout medieval Europe, the spatial relationship of an individual's burial spot to the respective graveyard's church building is commonly regarded as indicative of social standing, thus presenting an excellent proxy for investigations of biological factors by socio-economic status (SES). In this study, we investigate the potential correlations between habitual movement and SES in a well-preserved population from the Catholic graveyard of Grevenmacher, Luxembourg (14th-15th century) using a multivariate approach, namely the Validated Entheses-based Reconstruction of Activity method (VERA 1.0). While previous studies presented results consistent with correlations between bone morphology, diet, and SES through visual scoring and isotopic analyses, there was no unambiguous evidence for a connection between labour intensity and status. We tackle this gap in research by attempting to reconstruct physical activity patterns based on entheseal surface measurements taken digitally from selected muscle attachment sites of the upper limb. Once we establish such entheseal patterns, we integrate the distance to the church (DTC) variable and eventually the stable isotope values (δ15N) related to diet into the analysis, i.e., principal component analysis (PCA). Merging these various lines of evidence in one PCA is an innovative way to gain insight into SES in bioarchaeological contexts and can be easily combined with other methods. Our findings corroborate historical sources regarding differences in labour between higher- and lower-SES individuals. Lower-SES individuals exhibit patterns related to high-intensity activities, whereas higher-SES individuals engaged in less strenuous physical labour. Our results also support the previous isotope study, which linked a protein-rich diet, represented by a higher δ15N concentration, to decreased distance from the church using discrete categories. Conversely, with increased DTC and lower protein values, the entheses display a gradual upward shift in musculoskeletal stress.

1612. The impact of biological factors and mandibular form on masticatory muscle attachment morphology

Authors: Chrysa Tsimopoulou – Christina Papageorgopoulou (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace) – Fotios Karakostis (Paleoanthropology, University of Tübingen | Senckenberg Research Institute, Tübingen | Integrative Prehistory and Archaeological Science, University of Basel)
Format: Poster

Mandibular shape is often used to infer behavior and diet, yet the muscle attachment (entheseal) sites, the only direct osteological correlates of soft tissue, remain underexplored. As entheses can remodel throughout an individual's lifetime, they can register habitual masticatory loading, whereas general mandibular shape largely reflects broader intergenerational adaptations. This study explores mandibular entheseal expression in relation to biological, morphological, and functional factors to assess how variation reflects biomechanical adaptation and its potential as an indicator of diet and mastication intensity in past populations. We analyzed 82 3D mandibles from an open clinical dataset (39 females, 43 males; 17.7–65.5 years old) from the materials presented in Chalazoniti et al. (2024). A multi-proxy framework combined geometric morphometrics, cross-sectional geometry at M1–M2, and high-resolution 3D quantification of the medial gonial angle using the "Validated Entheses-based Reconstruction of Activity 2.0" (VERA2.0) method, alongside 3D surface topography metrics via the molaR R package. Results show no association of entheseal elevation with biological age, side, or missing teeth. Entheseal variation, as a response variable in multiple regression analyses, was mostly explained by variation in mandibular shape (PC3 - changes in ramus/posterior body), with a consistent biological sex effect (higher in males). Size and cross-sectional area were high in bivariate tests but insignificant once sex and shape were modeled (adj. $R^2 = 0.55$). Two-block Partial Least Squares, focusing on gonial angle geometry, confirmed robust shape-enthesis covariation ($r = 0.67$), with similar within-sex magnitudes. These findings indicate that mandibular entheses capture habitual loading primarily via functional shape covariation, not size alone (the primary sexual dimorphic trait). Our findings suggest that extending VERA 2.0 to the mandibular muscle attachments and integrating it with 3D morphometrics and cross-sectional indices provides a reproducible and biologically interpretable framework for inferring habitual mastication and associated dietary trends in past populations.

2334. Labor and Life: Applying the VERA 2.0 method on the Deltoid Tuberosity of the Phaleron Cemetery

Skeletal Individuals

Authors: Morgan Bendzinski – Bethany Turner-Livermore (Georgia State University) – Susan Kirkpatrick-Smith (Kennesaw State University) – Louis Ruprecht (Georgia State University)
Format: Poster

For decades, bioarchaeologists have inferred activity patterns in past populations through the study of entheseal changes. This paper reports on entheseal changes of skeletal individuals from the Phaleron Bioarcheological Project. This cemetery is located in Athens, approximately 4 km southeast of the Acropolis and was in use from 700 through 480 BCE. It primarily contained individuals of lower socioeconomic status affected by structural violence, and some individuals associated with performed violence labeled as the delta group. This study aims to investigate patterns in entheseal changes to deepen our knowledge of labor and social conditions during a politically reformative period of Archaic Athens. Specifically, this study employs the Vera 2.0 method on noninvasive scans of the deltoid tuberosity of the humeri combined with statistical analysis and theoretical frameworks. These analyses aim to evaluate patterns in activity related entheseal changes between age groups as well as between the delta group and non-delta group.

254 ARCHAEOLOGICAL OBJECTS IN MOTION: UN/BELONGING, RE/INTEGRATION, DIS/PLACEMENT

Theme: 7. Interaction, connectivity and mobility
Organisers: Leticia Rodriguez (University of Houston) – Camille Acosta (University of California, Irvine) – Anna Vangelatou (University of Cambridge)
Keywords: object studies, migration, integration, transcultural, circulation, multi-temporal
Format: Regular session

SESSION ABSTRACT

Recent work on the archaeology of migration has fruitfully adopted interdisciplinary and contemporary methodological approaches to the study of human movement in the ancient world. This session seeks to complement this often data-driven research by exploring object-centered transculturalisms and biographies of ancient material culture in motion: i.e., un/belongings, re/integrations, and dis/placements deeply entangled with and/or reflective of various 'migratory' processes, as understood through objects, practices and human agents of circulations past, present, and future. How are such movements visually commemorated, or materially documented (and re-documented) in and across the ancient world? In what ways do 'immigrant' objects resignify, reinforce, alter, and interact with established cultural and religious landscapes, in ancient and modern contexts alike? With regard to the afterlives of ancient objects in later periods, the historical canon in material culture studies has focused heavily on early modern artisanal production, reproduction and newfound global circulations, while 19th-century histories of commerce and materiality in relation to antiquity remain relatively understudied. Therefore, we invite papers that address these questions (and more) in regions spanning the ancient Mediterranean world, broadly defined; proposals might include the examination of ancient objects created by or for migrant communities, objects that have themselves become émigrés through networks of movement, or case studies on the integration, incorporation and/or reevaluation of (previously) 'foreign' artefacts in academic and museological discourses. These examples are only meant to be suggestive, however, and papers on related questions of material culture in motion are also most welcome.

CONTRIBUTION ABSTRACTS

888. A war trophy for sale: "Law Code of Hammurabi, King of Babylon" on the move

Authors: Zeynep Akture (Izmir Institute of Technology)
Format: Oral

The collection of artefact replicas at the UN headquarters in NYC include a "Law Code of Hammurabi, King of Babylon" cast that is presented as "the oldest written legal codes". This proposal traces the reference object's three lifecycles to highlight usefulness of object biographies for grasping conjectural change in cultural history. The first lifecycle corresponds to the initial stele's production by regulating preexisting practices and texts, and its archaeologically documented reproductions now exhibited in some European museums. The object (now in the Louvre) was unearthed in 1901-2 in the Elamite capital Susa in Iran whereto it was brought as a war trophy in response to Hammurabi's sack of Susa, and fragmented during Susa's later destruction by Ashurbanipal to avenge sufferings of the Mesopotamian peoples at the hands of the Elamites, marking the end of the cycle. The second lifecycle started with this French rediscovery and continued with casts in slightly different sizes and materials gifted to museums in Europe and USA with diverse narratives of display. Some of these casts were on long-terms loans in or acquired by other institutions, repaired or served as the originals for other casts. During its third lifecycle, this international significance shifted to the national, exemplified by Iraq's gifting the UN cast, also produced by the Louvre workshops, immediately before the war between the object's countries of origin and discovery, during the vice-presidency of Saddam Hussein who later included the stele among his propaganda material. This cycle overlaps with the object's becoming a museum giftshop and internet sale item, in life-sized and smaller physical

and recent digital copies. The concluding discussion highlights the need for different theoretical frameworks and methodologies to scrutinize these three lifecycles, in demonstration of the value object biographies have for academic studies of changing power structures and relations through material culture.

177. The Sargon Stele at Kition: Imperial Materiality, Mobility, and Recontextualization

Authors: Yu Song (New York University)
Format: Oral

The so-called Sargon Stele from Kition (modern Larnaca, Cyprus) offers a compelling case study for examining ancient objects in motion and their shifting regimes of belonging. Erected under the Assyrian king Sargon II (721–705 BCE), the basalt stele, which bears royal imagery and inscription, was installed far beyond Assyria's territorial core, in a maritime settlement shaped by long-distance exchange and cultural plurality. This paper approaches the stele through an object-biographical framework, tracing its displacement, emplacement, and re-integration across ancient and modern contexts. Rather than reading the monument solely as a static marker of imperial domination, I argue that its presence at Kition reflects a dynamic process of transcultural negotiation. Situated in a port environment embedded in Phoenician and Cypriot networks, the stele functioned as a mobile expression of imperial authority that required translation into local visual, political, and ritual landscapes. As such, it exemplifies how "immigrant" objects could simultaneously assert foreign power and acquire new meanings within host communities. The paper further considers the stele's modern afterlife, its excavation, scholarly debates over attribution and function, and museum display, as a second phase of displacement that reshaped its interpretive framing. By foregrounding the Sargon Stele as a materially and conceptually mobile object, this study contributes to broader discussions on un/belonging, re/integration, and dis/placement in ancient imperial systems and their modern archaeological narratives.

627. A Sardian "Ritual Dinner" in the Black Sea? Un/Belonging, Re/Integration, and the Construction of Identity in Late Archaic Olbia Pontica

Authors: Kari Fossum (Bryn Mawr College)
Format: Oral

Recent archaeological work in Olbia Pontica has included the excavation of a late Archaic building complex in the city's so-called southwestern "suburb," identified by its excavators as a sanctuary. Among the finds from this complex is an assemblage comprising a fragmentary grey-glazed oinochoe, an iron knife blade, a small bronze dolphin, and the skeleton of a puppy. Left unremarked upon in the preliminary publication is the existence of an important body of comparanda: the "ritual dinner" sets from (Lydian) Sardis which characteristically include oinochoai, iron knives, and puppy skeletons and have suggested to some scholars adherence to Carian customs. The presence of an assemblage evincing both Lydian and Carian connections yet including a new element, the bronze dolphin, takes on special significance in Olbia, a "colony" traditionally associated with the Ionian city of Miletos and sharing the same patron deity and symbol, Apollo Delphinios and the dolphin, in light of the literary and archaeological evidence indicating the fundamental entanglement of these notionally discrete cultural groups (Lydians, Carians, and Ionians). In my paper, I approach this assemblage as a manifestation of the displacement of these entanglements from central- and southwestern Anatolia to the Black Sea. By first considering the origins and meanings of its constituent objects, then the significance of its extramural deposition, and finally contextualizing the practices which it signifies within the broader Olbian cultural and religious ecosystem, I demonstrate what this assemblage may contribute to our understanding of the enactment of un/belonging, re/integration, and the construction of new individual and community identities in a diverse immigrant community.

2713. Achaemenids in the Air: The Case of a (non) Circulating Incense Burner in the Menil Collection

Authors: Leticia Rodriguez (University of Houston)
Format: Oral

An Achaemenid Persian incense burner in the Menil Collection (Houston, Texas), is one of numerous ancient objects acquired by John and Dominique de Menil between the 1960s and 1970s. The object (dated 550-331 BCE), at home in the Achaemenid Persian court, is of the kind of elite paraphernalia that would have been gifted to Persian imperial officials or brought by them to the satrapies, and also replicated in local workshops. This paper considers the potential circulation of this object within its ancient context, and subsequent entanglements with local Anatolian visualities and cultural practices; who would have had the perceptual software to decode the object's social function as understood through its form, materiality and iconographic elements, and how were these qualities translated in visually dynamic Anatolian communities? In its modern context, the paper examines how such a work, which was once associated with the ruling elite and whose circulation had the potential power to resignify or alter 'established' forms of expression, now exists in stasis, its networks of movement frozen, and proposes a museological reevaluation of the object that reintegrates it into its archaeological and art historical context.

1358. Untangling migration and material culture: the case of immigrant burials in Classical Athens

Authors: Camille Acosta (University of California, Irvine)
Format: Oral

Although migration has been a constant throughout human history, the relationship between migrants and their material culture is not always straightforward, posing an interpretive challenge to archaeologists. Objects—and their associated typologies—are studied and categorized using labels that imply a direct connection between material culture and ethnic identity. Funerary archaeology, in particular, often interprets graves along these lines: the presence of seemingly "foreign" grave goods and practices are generally taken as evidence that the deceased is a migrant. In the case of Classical Athens (5th-4th century BCE), several gravestones name the deceased as an immigrant, yet none of the burials they marked contain objects from the place of origin listed on the inscription. Rather than simply taking these graves as evidence that immigrants were "assimilated" into Athenian society, they will be used as an opportunity to unpack the interpretive assumptions that underlie the archaeology of migration and to move towards an approach that considers intersectional aspects of identity beyond ethnicity, such as gender, age, and status along with the specific historical circumstances of the migration event.

2627. Displacement of Roman Glassware and Its Reintegration in Chinese Elite Tombs

Authors: Junjie Zhou (Shanghai International Studies University)
Format: Oral

Glass artifacts had a long history in the Mediterranean as luxuries until the mid-first century BCE when artisans in Roman Syria invented the technique of glassblowing. This invention enabled the mass production of glassware and therefore made it accessible to the common people. Meanwhile, maritime trade routes connecting the Mediterranean and the Indian Subcontinent facilitated the migration of Roman glassware as far as coastal China. This paper will present two case studies of Roman glassware displaced in Chinese elite tombs and reintegrated as prestige burial goods. The Shuangshan Tomb of a member of the Chinese imperial family included a Roman mosaic ribbed bowl alongside jade objects. Such mosaic glass imitated the material properties of luxury murrhine and functioned as an emulation of prestige goods in the Roman context, while in the Chinese context, it was received as a prestige good in its own right. In addition, the inclusion of a Roman blown cup in the Laohudun Tomb alongside a genuine jade disc illustrates its displacement from utilitarian origins and reintegration in a transcultural funerary context. Ignorant of their original cultural context in the Mediterranean, Chinese elites in the first two centuries CE endowed new meaning to the imported Roman glassware and adapted it to the repertoire of prestige burial goods.

658. Antiquities in Motion: Charles Newton, Market Clusters, and Steam Transit from the Aegean to the British Museum, 1861-1885

Authors: Anna Vangelatou (University of Cambridge | The British Museum)
Format: Oral

This paper explores the spatial, cultural, and socio-economic conditions of artefact mobility in the nineteenth-century Eastern Mediterranean. Centred on the 1870s, it extends the session's temporal scope into the nineteenth century to examine the circulation of archaeological objects within the expanding European art market. How did antiquities surfacing in the trade find their way into the British Museum at a moment of heightened infrastructural, diplomatic, and financial integration? The analysis centres on the curatorial activities of Charles Newton, Keeper of Greek and Roman Antiquities at the British Museum (1861–85). His reports and correspondence with suppliers illuminate the complex procedures by which artefacts were discovered, commercialised, transported, and absorbed into institutional and private collections. The analysis follows the archaeological pursuits of a group of dealers and associates in Rhodes. In the Aegean maritime, Greek-Ottoman borderland, artefact mobility was steered by steam navigation, notably the Messageries Maritimes line, which connected ports such as Rhodes to Alexandria, Smyrna, Constantinople, Piraeus, and Marseille. These routes operated in tandem with postal services carrying parcels, letters, contracts, and invoices. Itineraries compressed distance and bolstered connectivity but also exposed antiquities to customs and storage scrutiny. Consulates, credit and telegraphic networks facilitated transactions, yet local legislation, export restrictions, and mounting challenges to extraterritorial arrangements restrained movement. Thus, far from a coherent supply chain, the recycling of tangible heritage in the region was negotiated through a dialectic of technological breakthroughs and disruption. Methodologically, the paper combines archival and object-centred research in the Department of Greece and Rome at the British Museum with press coverage, diplomatic records, and cartographic material from the British Library and the Greek Parliament and Foreign Ministry Archives. In doing so, it places administrative files in dialogue with physical and 'archived' objects and historical maps.

255 THE RESONANCE OF VIKING AGE CONNECTIVITY BETWEEN NORTHERN EUROPE AND NORTH AMERICA INTO THE EARLY MODERN PERIOD

Theme: 7. Interaction, connectivity and mobility
Organisers: Paul Ledger – Véronique Forbes – Bryn Tapper (Memorial University of Newfoundland and Labrador) – Linus Girdland-Flink (University of Aberdeen)
Keywords: Viking Age, Connectivity, Indigenous, Canada, Northern Europe, Basque
Format: Regular session

SESSION ABSTRACT

Newfoundland and the Atlantic provinces of Canada bordering the Gulf of St Lawrence were the theatre of the earliest European explorations of North America. From the 11th century, these lands and the networks of Northern Europe were connected through Norse settlements stretching across the North Atlantic, from the northern British Isles in the east to L'Anse aux Meadows in the Strait of Belle Isle in the west. The duration of this engagement, and degree of integration into the trading and exchange networks of diverse Indigenous Arctic and ancestral First Nations around the Gulf of St Lawrence is debated. Even more contentious is the possibility that medieval-era networks between northern Europe and northeastern North America never entirely ceased. Iceland's rich documentary tradition, which first recorded these potential interactions, hints at sustained linkages into the 14th century (e.g. reference to a sailing from Markland in AD 1347). Archaeological evidence, comprising North American wood in fourteenth century contexts, at the Norse cathedral in Greenland's Eastern Settlement, together with indications that Norse knowledge of North America circulated in Mediterranean Europe (e.g. Cronica Universalis) until at least the time of the Black Death, support this idea. History is silent until the late 15th to early 16th century and the voyages of agents (e.g. Cabot, Corte-Real, Cartier) of the monarchs of western Europe. Yet, early cartography of Newfoundland and Labrador suggests an enduring transatlantic engagement led in the first instance by the Basques, best documented at Red Bay from AD 1530, a site located 63 km northwest of 11th century Norse settlement. In this session, we seek to explore the idea of a persistent North Atlantic connectivity linking North America and northern Europe from the late Viking Age until the early-modern period. We invite papers discussing any aspect of archaeology that contributes to this theme.

CONTRIBUTION ABSTRACTS

2780. Vegetation history over the last millennium in the North Atlantic (Iceland, Greenland, Canada): respective impacts of humans' settlements, fires, wildlife

Authors: Emilie Gauthier (Université Marie et Louis Pasteur, Chrono-environnement | Institut Universitaire de France - IUF) – Elia Roulé (Université Marie et Louis Pasteur, Chrono-environnement) – Natasha Roy (Geotop, Université du Québec à Montréal) – Mathilde Ducloiset (Université Marie et Louis Pasteur, Chrono-environnement)
Format: Oral

At the beginning of the 9th century, the Norse took advantage of their seafaring abilities and favorable climatic conditions to settle the islands of the North Atlantic, reaching Canada in the 11th century. Norse farmers brought agropastoralism to Iceland and Greenland and established long-distance trade with Scandinavia. However, their ventures were not entirely successful, as they ultimately failed in Greenland and Canada. Nevertheless, there is little evidence to suggest that they completely ceased visiting these remote areas. In this presentation, we provide an overview of the history of vegetation in Iceland, Greenland, and the east coast of Canada to define the types of environments in which the Norse settled and the impact these settlements had over the last millennium. While Iceland was uninhabited at the time of colonisation, this was not the case in Greenland and Canada. It is therefore interesting to compare the respective impacts of the European and Thule/Inuit populations in Greenland and Newfoundland, extending the study area to the Labrador Coast and the Saint-Pierre et Miquelon archipelago. The sedimentary sequences collected and analysed come from lakes and peat deposits, and the results show that human impact is not always easy to demonstrate and that some changes could also be linked, to fire events and the presence of wild herbivores.

2159. Towards a New Chronology of Norse Greenland

Authors: Fanny Sikström – Margot Kuitems – Sean Desjardins – John Du Plessis – Benjamin Allport – Michael Dee (University of Groningen)
Format: Oral

By the end of the first millennium, Norse expansion had reached its greatest extent, approaching the edge of their known world. As part of this expansion, Norse settlers established settlements in Greenland. Greenland offered not only uninhabited land but also valuable commodities for the European market, ensuring strong connections could be maintained with Northern Europe. The Norse occupation of Greenland has been the subject of extensive dating efforts by various researchers over the years. Consequently, an enormous number of relevant radiocarbon dates are now available. However, these data have yet to provide definitive answers to the question of whether the years recorded in historical documents correspond to the actual timing of events. This leaves lingering doubts about the precise chronology of key developments, such as the Norse settlement and eventual abandonment of Greenland. Specifically, the arrival of the Norse in Greenland is still commonly regarded as having occurred at the times described in the sagas. Although no direct evidence yet contradicts these accounts, the broad and imprecise radiocarbon dates that have previously been acquired complicate efforts to validate or refute the saga-based chronology. Thus, in order to refine this framework, we have obtained radiocarbon samples from a range of specifically targeted locations. These include the earliest contexts at the earliest sites, such as Ø29a, recognised as the location of Brattahlid, where Erik the Red founded his farmstead during the first phase of settlement. Taking these new results together with legacy datasets, and combining them in Bayesian models, it should be possible to delineate the chronology of Norse activity in Greenland with generation-scale precision.

2656. 'Images of contact': Indigenous petroglyphs and early European encounters on the Maritime Peninsula

Authors: Bryn Tapper (Memorial University of Newfoundland and Labrador)
Format: Oral

Interpretations of petroglyphs depicting European sailing vessels found at rock art sites in southwestern Nova Scotia and coastal Maine suggest early contact between Indigenous peoples and Europeans, from at least the early 17th century, and possibly earlier. Though few in number, these images provide valuable evidence of cross-cultural encounters and offer insights into Indigenous responses to European exploration and trade. The idea of a pre-Columbian Norse presence in North America has captured public imagination since the late 19th century, and has, on occasion, prompted speculative interpretations of Indigenous rock art. Some have suggested that certain petroglyphs found on the Maritime Peninsula reflect Norse contact, influence, or even authorship; ideas that have endured in some circles of popular discourse but which often detract from the significance of Indigenous cultural practices and achievements. This paper critically examines the petroglyphs within their broader archaeological contexts, situating them within the material culture and lifeways of Algonquian-speaking peoples, such as the Mi'kmaq, from the Late Woodland period onward and across the boundary of European Contact.

799. America in Milan: The 'Cronica Universalis' by Galvaneus de la Flamma and Marckalada

Authors: Federica Favero (Università degli Studi di Bergamo)
Format: Oral

The Milanese Dominican friar Galvaneus de la Flamma (1283 - 1344?), in the third book of his 'Cronica universalis', in a long geographical digression mentions a land further west than Greenland which he calls 'Marckalada' (or 'Marchalanda'). This land is nothing other than Markland which appears in Vínland sagas (such as, for example, the Eiríks saga and the Grœnlendinga saga), a location on the north-eastern coast of America. Galvaneus was not familiar with those sagas or Northern European Latin sources that mentioned Markland (for example, the 'Gesta Hammaburgensis ecclesiae pontificum' by Adam of Bremen) and – as far as we know – he never travelled outside Northern Italy. We must therefore assume that he learned about Marckalada in Genoa, city he frequented first for study reasons and then, perhaps, for issues related to the Dominican order. Sailors and merchants of Genoa, in fact, had contact with Northern Europe, place of origin of such information.

2194. Palaeoenvironments, human impact and a long Viking Age at L'Anse aux Meadows

Authors: Paul Ledger – Véronique Forbes (Memorial University of Newfoundland and Labrador)
Format: Oral

In so far as is known, the Viking Age reached it western geographic frontier at L'Anse aux Meadows (LAM) in northern Newfoundland. In the 1960s, the discovery of the collapsed, and heavily eroded, remains of eight Icelandic turf structures at LAM illustrated to the world that the Medieval Icelandic stories of Norse voyages beyond Greenland in the eleventh century were records of real events. In 1978, UNESCO accordingly listed LAM as representing "…a significant achievement in the history of human migration and discovery … [and] the earliest evidence of Europeans in North America". An integral part of the extensive archaeological excavations at this iconic site were a series of studies of the palaeoenvironmental context of human occupation. In all cases these studies concluded that there was no evidence of environmental change coincident with Norse landnám (settlement). These findings are in stark contrast to those from extensive palaeoecological work elsewhere in the North Atlantic islands where Norse landnám resulted in a repeated suite of environmental changes. The reported absence of environmental impact at LAM has, to some extent, engendered and supported a narrative of Norse activity in Newfoundland as being short-lived. Here we examine these ideas in light of a review of legacy data and renewed archaeological and palaeoenvironmental research conducted at LAM over the past eight years.

2369. Evaluating the potential for biomolecular archaeology at L'Anse aux Meadows

Authors: Linus Girdland Flink (University of Aberdeen) – Véronique Forbes (Memorial University of Newfoundland and Labrador) – Anders Götherström (Department of Archaeology and Classical Studies, Stockholm University | Centre for Palaeogenetics, Stockholm University) – Emrah Kırdök (Department of Biotechnology, Mersin University) – Paul Ledger (Memorial University of Newfoundland and Labrador) – Anna Linderholm (Centre for Palaeogenetics, Stockholm University | Department of Geological Sciences, Stockholm University)
Format: Oral

L'Anse aux Meadows (LAM), the only confirmed Norse site in North America, is situated within a heterogeneous sedimentary sequence that includes peat, cultural deposits, glacial deposits, and organically enriched anthropogenic horizons, reflecting varying degrees of human activity and natural accumulation. Here, we present the initial results of comprehensive shotgun DNA metagenomic screening of ~15 sediment samples from a peat sequence intimately associated with the Norse archaeological remains, providing a first insight into biomolecular preservation at the site. Our results indicate that endogenous DNA signals persist within multiple stratigraphic horizons, suggesting that favourable preservation conditions may extend across both peat-dominated and more mineral-rich contexts elsewhere at the site. Building on these results we identify how future biomolecular analyses at LAM can be

extended and optimised by explicitly considering variability in molecular taphonomy across sediment types. We also consider how broader biomolecular analysis, including proteins and lipids, may enhance our understanding of lifeways and the wider connectivity of the Norse inhabiting the site.

1546. Peatland excavations at L'Anse aux Meadows (Newfoundland, Canada) reveal there's more to its Viking Age story than meets the eye

Authors: Véronique Forbes – Paul Ledger (Memorial University of Newfoundland and Labrador)
Format: Oral

L'Anse aux Meadows (LAM), in northern Newfoundland, remains to this day the only site with indubitable physical proof of a Norse presence west of Greenland, nearly five centuries before Columbus. Over the course of fieldwork directed by Norwegian archaeologist Anne Stine Ingstad from 1961 to 1967, eight 'Icelandic-style' turf structures, a bronze ringed cloak pin, a spindle whorl, the fragment of a bone needle and evidence of iron working were recovered at LAM. In the 1970s, extensive excavations commissioned by Parks Canada revisited the same turf structures and opened up large areas, including in the wetland just to the west of the Norse ruins. This led to the recovery of a glass bead, numerous wooden objects of uncertain function, as well as two nuts and a fragment of wood from the butternut tree (Juglans cinerea), a species exotic to Newfoundland. The combined results of excavations undertaken in the 1960s and 1970s have since been interpreted as evidence that the Norse occupied the site for a brief period from c. A.D. 1000 and used it as a basecamp for exploration and boat repair. Half a century later, fieldwork targeting the peat bog east of the Norse ruins has led to a series of unexpected findings that suggest there is much yet to be uncovered about this unique UNESCO World Heritage Site. This paper presents the story of the 'Biocultural and Archaeological Legacies at L'Anse aux Meadows' project and the largest, most detailed (and surprising) archaeological datasets obtained from LAM since the 1970s.

256 COLLAPSE, MOBILITY, AND RENEWAL: RETHINKING THE CHALCOLITHIC–BRONZE AGE TRANSITION IN SOUTHEASTERN EUROPE AND THE BLACK SEA REGION

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Ana García-Vázquez (ArchaeoScience Platform. Research Institute of the University of Bucharest) – Robert Hofmann (Institute of Prehistoric and Protohistoric Archaeology, University of Kiel) – Liudmyla Shatilo (Institute of Archaeology of the National Academy of Science of Ukraine)
Keywords: Chalcolithic–Bronze Age transition, Southeastern Europe, bioarchaeology, interdisciplinary archaeology, population dynamics
Format: Regular session

SESSION ABSTRACT

From the end of the 5th millennium BC through the 4th millennium BC, the transition from the Late Neolithic and Chalcolithic to the Early Bronze Age in Southeastern Europe and around the Black Sea marks one of the most dynamic and debated periods in Eurasian prehistory. Across this geographical area, a dramatic decline in the density of archaeological evidence occurred: long-lived settlements were abandoned, new types of material culture appeared, and population movements—both local and long-distance—reshaped social and economic networks. This session aims to explore what triggered these transformations and how they unfolded in different regions. We invite contributions employing a wide range of analytical, contextual, and interpretative approaches to investigate this crucial turning point: refined chronologies through radiocarbon dating; bioarchaeological, isotopic, and ancient DNA data to trace population mobility, diet, and provenance; studies of ceramic residues and environmental proxies (pollen, sediments, fauna) to reconstruct subsistence strategies and landscape change; as well as archaeological, zooarchaeological, and anthropological perspectives addressing material culture, settlement patterns, and social organisation. By integrating these diverse datasets, the session seeks to address fundamental questions: Was there a demographic replacement, or rather an adaptation of existing groups to new cultural paradigms and economic lifeways? What role did climate fluctuations play in settlement reorganisation and mobility? And how can interdisciplinary research help to build a more nuanced picture of this transformative era? The Romanian contribution to this session was supported by a grant from the Romanian Ministry of Education and Research, CNCS-UEFISCDI, project number PN-IV-P1-PCE-2023-1899 (BioArhSteppe).

CONTRIBUTION ABSTRACTS

2675. Outline of the Late Neolithic–Chalcolithic transition chronology in the southwestern outskirts of the Carpathian Basin

Authors: Katarina Botić (Institute of Archaeology, Zagreb)
Format: Oral

The geographic region between the Danube River in the east and the Alps in the west was marked by significant changes at the end of the 5th millennium cal BC: the abandonment of most Late Neolithic tells, the formation of settlements in new areas, the reorganization of settlement structures, a significant change and diversification of material culture remains, etc. However, in some micro-areas, the Late Neolithic tradition persisted simultaneously with the emerging Chalcolithic traditions that gradually substituted previous ones, or at least that is what can be concluded based on the available radiocarbon dates from previously published works. After re-evaluating published radiocarbon evidence and previously formally modeled chronologies, these data are used as an outline for a regional formally modeled chronology, supplemented by data on individual contexts and settlement structures. The result is a more robust chronology that is comparable to chronologies in geographically close areas and that more closely defines this specific transitional period. This work is supported by the project "Transformation of Identities in the Past" (TIPS), funded by the European Union – NextGenerationEU.

2156. South-Eastern and Eastern Europe on the threshold to the 4th millennium BCE: The end of an era or regional changes?

Authors: Robert Hofmann (Kiel University) – Liudmyla Shatilo (Institute of Archaeology of the National Academy of Science of Ukraine)
Format: Oral

The period between about 4200 and 3900 BCE is perceived in Southeast and Eastern European archaeology as one of the dramatic turning points and "one of the most fascinating and still unsolved problems of Balkan prehistory". During this period, Tell settlements were abandoned in the eastern Balkans, and a dramatic decline in archaeological evidence (e.g., settlements, graves, metal) was recorded across large parts of Southeast Europe, interpreted as indicators of collapse, population decline, or increased mobility. On the other hand, synchronous with the "collapse" in the Balkans, we see the beginning of a boom in highly populated Trypillia megasites in the region northwest of the Black Sea, and we see similarly dramatic changes at much earlier dates in the western Balkans and the Pannonian Plain, for example (e.g. 5500, 4500 BCE). Based on an analysis of settlement patterns, population trends, graves, and material culture, we therefore intend to address the question of the qualitative and quantitative extent to which the aforementioned transformations at the dawn of the 4th millennium BC can be distinguished from earlier phases of transformation, and to identify what we can and cannot yet say about this period of European prehistory.

1101. First encounters: the early 4th millennium site of Orlovets in Central North Bulgaria

Authors: Nadezhda Todorova (Sofia University St. Kliment Ohridski) – Vanya Petrova (National Institute of Archaeology with Museum)
Format: Oral

Intensive rescue excavations carried out recently in northern Bulgaria have brought to light a number of previously unknown sites bearing evidence of occupation from the first half of the 4th millennium BC. Alongside the increased opportunities for more precise radiocarbon dating and interdisciplinary analyses, the newly accumulated data enable a more comprehensive and refined approach to studying the complex phenomena that followed the collapse of Late Chalcolithic societies and the abandonment of tell settlements across the Eastern Balkans at the end of the 5th millennium BC. This contribution presents the main results from one of these newly excavated sites: Orlovets-Papaz Cheshma, which is located in the central part of the Lower Danube plain. The fourth millennium occupation of the site has been radiocarbon dated to c. 3970–3800 cal BC. Field research has yielded indications of more or less permanent occupation, as evidenced by pit dwellings equipped with fire installations and multiple reconstructions. Analysis of plant macroremains and fauna highlights subsistence strategies and economic activities related to farming and hunting and gathering. Of major relevance to the session's topic is the analysis of pottery. A small but significant proportion of the assemblage consists of shell-tempered ware featuring 'wickelschnur' and combed decoration, as well as organic-tempered ware. The technology and stylistic-morphological features of these wares differ significantly from the local Chalcolithic tradition, bearing a strong resemblance to the so-called Type C pottery of the Cucuteni B1-2 complexes, which is often attributed to contacts with pastoral communities from the North Pontic steppe zone. Though isolated 'steppe' elements occur at other sites as well, Orlovets represents the most substantial and so far, unparalleled account of the penetration of this foreign pottery style south of the Danube, thus raising the question of the nature, timing, and impact of these contacts.

2043. Last Man Standing? Biomolecular Evidence from Grave M1/1962 at the Gumelnița Site

Authors: Ana García-Vázquez (ArchaeoScience Platform. Research Institute of the University of Bucharest) – Alexandra-Gabriela Gheorghe (The Genomics Research and Development Institute | Faculty of Biology, University of Bucharest) – Mihaela Culea ("Francisc J. Rainer" Institute of Anthropology, Romanian Academy) – Mircea Iliescu (The Genomics Research and Development Institute | Research Institute of the University of Bucharest) – Valentin Radu (National Museum of Romanian History | ArchaeoScience Platform. Research Institute of the University of Bucharest) – Cătălin Lazăr (ArchaeoScience Platform. Research Institute of the University of Bucharest)
Format: Oral

Grave M1 was one of three burials excavated in 1962 at the Gumelnița site and attributed to the Kodjadermen–Gumelnița–Karanovo VI (KGK VI) horizon. It shows no atypical funerary treatment: the individual was buried in a left-crouched position, but no grave

goods were present. Anthropological analysis identified M1 as an adult male (30–35 years), with mild degenerative changes (osteophytes on two thoracic vertebral bodies and the distal epiphysis of the left fibula) and no evidence of developmental stress. Ancient DNA confirms male sex and indicates clustering with other KGK VI individuals. Mobility proxies (87Sr/86Sr and δ18O) indicate a local origin and limited movement during life. The most revealing results concern diet and chronology. Rib collagen δ13C and δ15N values (reflecting late-life diet) place M1/1962 within the female isotopic range (the only male in that group). At this site, women show mean δ15N values c. 1.5‰ lower than men, with statistically distinct means. This pattern appears more consistent with higher average male protein intake than with culturally driven dietary separation between sexes. Bayesian dietary modelling indicates a plant-forward diet (domestic plants 48 ± 26%), reduced terrestrial animal input (24 ± 21%), and a substantial freshwater component (molluscs 19 ± 15%; fish 9 ± 11%). Radiocarbon dating places M1/1962 at the end of KGK VI and provides the youngest date at the site. Calibration yields 3974 ± 51 cal BC, whereas correction for the freshwater reservoir effect shifts the estimate to 3799 ± 117 cal BC, overlapping c. 3900 cal BC (5.9 ka; Bond Event 4). M1/1962 may therefore represent either one of the last KGK VI individuals, potentially affected by climate-related pressure on crops and livestock, as reflected in his lower δ15N values, or an early member of the still-cryptic Cernavodă I population.

279. Animal management in the Lower Danube during the Late Chalcolithic: case study of the Săveni site, Romania (4th millennium BC)

Authors: Valentin Radu (University of Bucharest, ICUB, Bucharest | National History Museum of Romania, Bucharest) – Adrian Bălășescu ("Vasile Pârvan" Institute of Archaeology, Romanian Academy) – Alexander Wilkinson (Leiden University Faculty of Archaeology – World Archaeology) – Florin Vlad (Ialomita County Museum)
Format: Oral

The Cernavodă was considered the first cultural manifestation of the North Pontic steppe populations that arrived in the Balkans. It evolved in three phases throughout the 4th millennium BC. Its first phase covered an area across the Prut-Dniester interfluve, regions both sides of the Danube, Muntenia, and Dobrogea. The archaeological site at Săveni, located in the lower area of one of the Danube's tributaries (Ialomița), is the only Cernavodă I site currently being researched, which allowed a pertinent analysis of their animal management. To investigate animal husbandry strategies, archaeozoological analysis, and stable isotopes (δ13C, δ15N) were conducted. The prevalence of domestic fauna, cattle, sheep, and goats is observed, which attested that the dominant activity was animal husbandry. Cattle were exploited in a mixed way, both for milk and meat production. Sheep and goats were mainly milk suppliers and had secondary uses for meat or possibly wool. Pigs are rare, which would support a greater mobility of the Cernavodă I, because of the manoeuvrability needed to feed abundant amounts of horned mammals on good pastures. Hunting, of large (red deer and horse), and very large game (auroch), supplemented diet. Compared to the other Cernavodă I settlements in southeastern Romania, Săveni is characterized by the high frequency of large horned mammals in the animal paleoeconomy. At the beginning of the 4th millennium BC, after climatic cooling at the end of the Eneolithic, we observe regionally more diverse herding strategies for cattle, sheep, and goats compared to the previous Gumelnița culture from stable isotopes. This work was supported by a grant of the Romanian Ministry of Education and Research, CNCS - UEFISCDI, project number PN-IV-P1-PCE-2023-1899. Stable isotope analysis was funded and conducted at the University of York – BioArCh.

1625. Steppe inspirations in the Balkan mortuary practices IV-III millennia BC

Authors: Piotr Wlodarczak (Institute of Archaeology and Ethnology Polish Academy of Sciences) – Stefan Alexandrov (National Archaeological Institute with Museum, Bulgarian Academy of Sciences)
Format: Oral

In the second half of the 4th millennium BC, the barrow burial rite appeared in various regions of Bulgaria. It manifested in different forms in NW Bulgaria, NE Bulgaria, and Upper Thrace. Throughout, it was characterised by the incorporation of steppe elements and features associated with local communities of the Early Bronze Age. A distinct steppe influence predates the burial horizon of the Early Yamna stage. New fieldwork, isotope analyses, and ancient DNA studies enable a better understanding of this development. On one hand, they reveal a long-term migration trend of steppe groups; on the other, a notable contribution of local populations to the formation of Early Bronze Age societies in the northern Balkan zone. Similar processes are observed in the settlement areas of the Cernavodă, Coțofeni, and Ezero cultures. Both barrows and flat cemeteries are present, and both sites feature comparable burials with similar grave goods. The migration of the Early Yamna community at the turn of the 4th and 3rd millennia BC is not a major breakthrough but a continuation of previously started trends.

1602. The Early Bronze Age children's graves in burial mounds in the Upper Thracian Plain, Bulgaria

Authors: Todor Valchev (Regional historical museum - Yambol)
Format: Oral

The end of the 4th and the first half of the 3rd millennium BC is one of the most dynamic and interesting periods in Balkan prehistory. It is a time of migration, transfer of technological know-how and cultural influences. During this period, the migrating communities of the Yamnaya culture came to the territory of today's Bulgaria. The newcomers crossed the Stara Planina Mountain and reached the valleys of the Tundzha River and the Sazliyka River. With them appeared new ways of representing the prestige in prehistoric society. Some of them are the burial mounds and the spiral hair rings made of silver. The archaeological excavations show that during the Bronze Age there was a hierarchical society including at least two social groups – free men and women and "elite" – chiefs, priests, and warlords. During this period, personal skills were very important and supported the accumulation of authority and prestige, but this is also the time when the first "genealogies" began to appear and a high social status "by birth" was established. The last is represented by the primary graves of children with silver hair-rings in the burial mounds, which are also the aim of the present report.

308. From Cucuteni-Trypillia to something else: a premise of the beginning of the Early Bronze Age, marked by socio-cultural transformations

Authors: Ghenadie Sîrbu (Institute of Cultural Heritage, Chisinau)
Format: Oral

The transition from the Chalcolithic/Eneolithic to the Bronze Age in Southeastern Europe and the Black Sea region represents not a uniform progression but a complex mosaic of collapse, marked by demographic decline, settlement abandonment, and cultural discontinuity. Recent archaeological, paleoenvironmental, and bioarcheological evidence, however, invites a more nuanced interpretation. Moving beyond traditional culture-historical frameworks that emphasize abrupt discontinuities and invasion hypotheses, this paper propose to re-examines this pivotal period through an integrated lens of collapse, mobility, resilience, and social reorganization. Drawing on settlement patterns, material culture transformations, subsistence strategies, and emerging data on human mobility, the study argues that population movements and adaptive responses played a central role in reshaping regional societies. The paper proposes that transition was characterized by the dissolution of old hierarchies and the emergence of new, resilient forms of connectivity and identity. Key processes include the diffusion and hybridization of knowledge (notably, tin-bronze metallurgy), increased pastoral mobility, and the formation of new interaction zones that bridged the steppe, the fertile plains, and the Aegean. Ultimately, this study reframes the Chalcolithic/Eneolithic – Bronze Age transition not as a simple "dark age" but as a dynamic period of creative destruction, in which new forms of social complexity, exchange networks, and technological innovation emerged. By situating Southeastern Europe and the Black Sea region within broader Eurasian dynamics, this reassessment highlights the transition as a formative process that laid the foundations for Early Bronze Age.

1681. Population mobility in the North Pontic steppe in 4300-3300 BCE

Authors: Alexey Nikitin (Grand Valley State University)
Format: Oral

This paper examines population mobility in the North Pontic steppe during a millennium of profound transformation that preceded the emergence of Early Bronze Age steppe societies. Integrating archaeological evidence with recent paleogenetic, radiocarbon, and stable isotope data, the paper explores how mobility, interaction, and demographic restructuring shaped the Eneolithic–Bronze Age transition in the region from which the "steppezation" of Old Europe was launched. Genome-wide data from the North Pontic region reveal increasing population heterogeneity, reflecting sustained gene flow from the Caucasus–Lower Volga zone and integration with farming communities of Trypillia and coastal Balkans, as well as with hunter-forager groups of the Dnipro Valley. The emerging pattern suggests that mobility was not a singular migratory episode but a long-term structural feature of regional lifeways. Rather than large-scale population replacement, the evidence points to repeated cycles of movement, integration, and social reorganization. By incorporating genetic and isotope data into a broader archaeological framework, this paper argues that increased connectivity resulting from technological advancements accompanied by ideological shifts and coupled with demographic fragmentation and differentiation at the end of the Atlantic Climatic Optimum (ca. 3600 BCE) created the conditions from which the Yamna phenomenon emerged as a consolidating force.

1896. Closing a tell before "collapse": Stratigraphy, Bayesian ^{14}C modelling, and the 5.9 ka BP event at Chiselet tell site (Romania)

Authors: Catalin Alexandru Lazar (University of Bucharest) – Johannes Müller (Kiel University) – Stefan Dreibrodt (Landesamt für Denkmalpflege Baden-Württemberg Bestätigte) – Theodor Ignat (Bucharest Municipality Museum | University of Bucharest) – Robert Hofmann (Kiel University)
Format: Poster

Accounts of the end of Neolithic/Chalcolithic tell settlements are still too often reduced to "abandonment" or "destruction", with little attention to what people did in the terminal sequences and how those actions relate to climate variability, mobility, and the emergence of post-tell lifeways. This contribution reframes the end of the tell life-cycle as an observable, diachronic set of practices that we treat analytically as a closure (closer) horizon rather than as an undifferentiated "collapse". Our case study is the Chiselet tell in the Lower Danube plain (Romania), a key KGK VI settlement with a long occupational sequence. We hypothesize that the closure horizon(s) reflect structured behaviours—cleaning, levelling, selective deposition, and building abandonment—whose tempo and meaning are not evident from architecture or typology alone. To investigate this, we integrate: 1. High-resolution stratigraphic correlation distinguishing (i) closure deposits from final Gumelnița occupation (A2-B1 phases), (ii) an overlying burnt dwelling, and (iii) later intrusive features like a Cernavodă I burial; 2. A targeted AMS ^{14}C program on short-lived samples, modelled in a Bayesian framework to test anteriority, contemporaneity, or succession between final house use, closure formation, and Cernavodă burial; 3. Ceramic attribution under taphonomic control, comparing closure-phase ceramics with diagnostic A2/B1 material, and assessing

whether Cernavodă-like traits reflect mixing, curated deposits, or real overlap. We then place the resulting site-level model against regional signals: (i) the 5.9 ka impact, and (ii) the radiocarbon-inferred contraction of KGK VI settlement density after ~4350 calBC peak. Importantly, a nearby floodplain record documents a temporary episode of local land abandonment around same time and a subsequent low-intensity land-use phase associated archaeologically with Cernavodă groups.Treating "closure" as a measurable depositional regime with testable timing aims to distinguish abrupt collapse from phased reorganisation, and to identify whether mobility and "renewal" begin before, during, or after tell abandonment.

2575. A Preliminary Archaeogenomic Investigation of High-Resolution genomic data from the Late Neolithic and Early Bronze Age in Romania

Authors: Britta Van Tiel – Eirini Skourtanioti – Christopher Barrington – Jessie Jay – Monica Kelly – Pontus Skoglund (The Francis Crick Institute) – Anca Popescu – Gabriel Vasile – Adina Boroneant (Vasile Pârvan Institute of Archaeology)
Format: Poster

The dynamic transformations during the Late Neolithic to Early Bronze Age transition in Romania and more broadly Southeastern Europe have long been the source of scholarly interest. Specifically, questions surrounding demographic replacements or adaption of existing populations to new lifeways has been a source of lively discourse. In this ever-evolving discussion, the introduction of ancient DNA has been one source of biomolecular data supplementing interpretations of the material culture and providing an additional perspective in the demographic replacement versus local adaptation debate. As one of the broader goals of the Ancient European Genomes project, a new research initiative from the Skoglund Ancient Genomics Laboratory, we are aiming to provide new genetic insights into ancient individuals and communities in Romania and more broadly Southeastern Europe. While the dataset is still being developed to be able to undertake these analyses at a broader scale we have been undertaking preliminary analyses on newly sequenced genetic data from the late Neolithic through to Early Bronze Age individuals across Romania. This has entailed exploring patterns of genetic relatedness between individuals within sites and examining their genetic affinities with published contemporaneous data. These results presented in this poster provide new insights into the connections between these individuals from sites across Romania, as well as within the broader context of Southeastern Europe.

258 PROFESSIONAL ARCHAEOLOGY, ETHICS AND SOCIETY: EVOLVING PERSPECTIVES

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Alessandro Garrisi (Associazione Nazionale Archeologi) – Athina Chroni (Hellenic Ministry of Education, Religious Affairs and Sports)
Keywords: Profession, Ethic, Society, AI, Community
Format: Regular session

SESSION ABSTRACT

The practice of professional archaeology has developed along distinct paths in different European countries, but all face similar challenges in preserving cultural heritage and the conditions of those who work in the field. Ethics plays a critical role in ensuring high-quality archaeological work. However, when economic pressures compromise the quality of work, cultural heritage and the community to which that heritage belongs pay the price. Archaeological work encompasses much more than simply collecting data: archaeologists interpret the past for contemporary audiences, shape cultural policies, and help communities engage with their heritage. However, the field now faces the dual challenge of developing new ways to communicate the value of archaeology to stakeholders while establishing clear ethical guidelines for professional practice. This session, continuing reflections begun at Belgrade 2025, explores the ethical challenges in contemporary European professional archaeology, examining in particular: - The impact of economic pressures on the quality of archaeological work and professional standards; - Ethical considerations in relationships between archaeologists, developers, authorities, and local communities; - Professional responsibilities in public engagement and cultural heritage management; - Ethical implications of integrating artificial intelligence into archaeological work; - Implementation and compliance with ethical codes in archaeological practice. By comparing practices across Europe, this session aims to define the core principles of professional archaeology and establish guidelines for maintaining ethical standards while ensuring sustainable professional practice. In many countries there is a real conflict between urban and infrastructure development from one part and archaeological research from the other part. This happens daily almost everywhere in Europe. Only through highly specific work, varying from country to country due to differing regulations, can we plan to approach the coming years with the prospect of strengthening our ability to defend cultural heritage and hand it down intact and usable for future generations.

CONTRIBUTION ABSTRACTS

640. Ethics under Pressure: Gendered Precarity, Harassment, and Professional Standards in Spanish Archaeology

Authors: Giulia Uccheddu (Instituto de Productos Naturales y Agrobiología IPNA-CSIC | Universidad de La Laguna)
Format: Oral

Despite formal commitments to equality, professional archaeology in Spain continues to reproduce gendered hierarchies in job security, leadership, fieldwork authority, and professional recognition. Situated within European heritage-management settings increasingly shaped by development-led and project-based archaeology, gender inequality is framed here as a core ethical and professional challenge affecting safeguarding, standards of practice, and the sustainability of archaeological careers. Mixed-methods evidence is presented on how archaeologists perceive and experience inequality across key employment sectors (universities, the CSIC—Consejo Superior de Investigaciones Científicas—and other research bodies, commercial archaeology, museums, and public administration). The dataset combines an online survey conducted between March and April 2024 (n = 408) with 27 semi-structured interviews carried out in 2024, integrating descriptive statistics, gender-disaggregated comparisons, and thematic analysis. Survey responses converge on a shared diagnosis of persistent inequality in working conditions and career progression, including the limited representation of women in leadership roles and widely reported experiences and observations of gender discrimination. Harassment—sexual, psychological, and verbal—emerges as a recurrent feature of professional life, with fieldwork frequently described as a high-risk setting due to proximity, isolation, blurred boundaries, and hierarchical dependency. Work–life balance is identified as the most severe structural barrier, underscoring how care responsibilities and "ideal worker" expectations (continuous availability, mobility, uninterrupted productivity) shape career trajectories and exits from the profession. Interview accounts clarify key mechanisms: precarious employment increases the perceived costs of reporting harm, intensifies reputational vulnerability, and normalizes sexist workplace repertoires that undermine credibility and authority.

1505. Professional Archaeology Across Borders: Internationalization, Standards and Ethical Challenges

Authors: Marcella Giorgio (Associazione Nazionale Archeologi)
Format: Oral

In an increasingly globalized economic and professional context, archaeology is also undergoing processes of internationalization. If, in economic terms, internationalization refers to the adaptation of an activity or service for use beyond its original market or regulatory environment, in archaeology this can be understood as the growing tendency of professionals and companies to operate across national borders as part of ordinary professional practice. Such transnational practice requires not only technical competence, but also a deep knowledge of different legal frameworks, professional standards, and ethical responsibilities, in order to ensure the quality of archaeological work and the protection of cultural heritage. What ethical challenges emerge when archaeology becomes fully professionalized and increasingly mobile across national boundaries? In the European context, where formal borders are limited and professional mobility is encouraged, archaeologists and archaeological companies are not always adequately prepared to build sustainable and ethically sound transnational professional networks. Several factors play a key role in shaping effective and responsible professional mobility in archaeology, including university and post-university training, national legislations, working methodologies, documentation standards, and ethical frameworks. This contribution aims to identify both the critical issues and the potential opportunities inherent in the internationalization of archaeology, highlighting its ethical implications for professional practice, heritage protection, and the relationship between archaeology and society in contemporary Europe.

1748. Between Legislation and Ethical Codes: A Comparative Experience Among Italy, France, and Greece

Authors: Aglaia Margani (Associazione nazionale Archeologi)
Format: Oral

In our last meeting, we conducted an overview of professional ethics in Europe, touching upon various significant topics such as: the duty of ensuring clear and transparent communication of excavation data; the dissemination of good working practices within safe and non-discriminatory work environments; the spread of a fair culture of compensation appropriate to one's work duty; The vital role of well-structured professional associations and codes of conduct in protecting archaeologists within every sovereign state. This time, we will examine in detail the main characteristics of current legislation in Italy, France, and Greece regarding the protection of archaeological heritage, and how these states have organized themselves to also protect the archaeological profession. Alongside the activities of regulatory bodies, the work of legally recognized professional associations (or similar) is essential, acting as de facto safeguards for each state. These insights will be useful for outlining guidelines to be adopted in Europe, while also providing examples of best practices in the sector—such as public and participatory archaeology projects. Through the correct application of preventive archaeology, these projects successfully involve citizens, returning to them a protected and accessible archaeological heritage that would otherwise remain unknown (focusing on the application of regulations, fair professional compensation, and the quality of the professionals involved). It is fundamental to safeguard archaeological professionals in order to protect our archaeological heritage and return it to the community in the most appropriate and effective manner.

952. Navigating challenges in stakeholder relationships: Lessons learned from Nationally Significant

Infrastructure Projects (NSIPs)

Authors: Calliope Owens (Arcadis)
Format: Oral

As cultural heritage consultants within a multi-disciplinary business, we regularly navigate complex stakeholder relationships through the variety of projects in which we work. This paper presents a case study of our involvement in a recent Nationally Significant Infrastructure Project (NSIP) and explores the ethical and societal dimensions of managing relationships between consultants and land agents, landowners, tenants, businesses, opposition groups, and the wider public. A central part of this discussion is the prevalence of local opposition to governmental-backed change, that can clash with broader societal progress and sustainability goals to meet Net Zero pledges. The paper investigates how fears and resistance to development that are rooted in concerns over disruption, cultural heritage loss, and perceived threat to local identity, were managed through transparent communication, ethical decision-making, and inclusive public engagement strategies. The paper also examines the 'lessons learned' from both explicit (e.g. direct negotiations, written agreements) and implicit (e.g. Health and Safety Plans, Stop Work Authorities) approaches, and how these helped build trust, resilience, confidence, and a positive reputational outcome between parties. By reflecting on these experiences, the paper offers recommendations for strengthening ethical standards and community engagement in professional archaeology, ensuring that stakeholder engagement not only supports project delivery, but also upholds the values of cultural heritage stewardship and social value. These insights hope to contribute to the ongoing conversation about ethics, society, and sustainable progress in archaeology alongside climate-focused NSIPs.

24. Collaborative and Community-Engaged Archaeology: A View from the United States

Authors: Charles Bello (Independent researcher)
Format: Oral

Collaborative and Community-Engaged Archaeology (or any of the new terms that come into play on a regular basis) continues to be an important and relevant topic in our profession, involving an ever increasing (and often innovative) range of activities. This paper addresses the commitment of conducting research and historic preservation in effective partnership with multiple stakeholders as a matter of fairness, ethics, and as a way to create robust and useful final products. Archaeological endeavors affect Indigenous peoples, local residents, and descendant communities in many ways. It is clear that successful projects establish broad-scale community rapport—caring, listening, and being honest—effectively building trust and relationships. Obviously, it is critical to understand and to acknowledge ideological differences between archaeologists and the wider community, especially concerning potential intersections of the material & spiritual worlds. There are many archaeologists/heritage preservations groups working across the world who are committed to conducting research (and other types of historic preservation projects) with a unique spectrum of stakeholders. It is also evident that we all share a common awareness of the usefulness of community involvement and are achieving productive results and are taking the time to record our work.

1399. The Bronze Age Eastern Mediterranean cultural network: GIS for theory and practice crossroads, public engagement and cultural heritage management reconciliation

Authors: Athina Chroni – Vassilia Karathanassi (National Technical University of Athens)
Format: Oral

Cultural heritage plays a crucial role in the strategic and effective management of the urban as well as of the natural environment, serving as a key catalyst for sustainable socio-economic and cultural development. Standards and principles are now laid out in the New Urban Agenda-the UN Habitat III 2016, recognizing the impact of archaeological and architectural heritage on sustainable urban development, as well as on the social well-being of different groups of people. The Mediterranean constitutes a maritime area of intensive navigation throughout time, favoring the movement of goods, also peoples' contacts, finally, accelerating cultural exchanges. In this context the western coastline of Messenia Prefecture, southwest Greece, integrated in the broader east Mediterranean trade routes network of antiquity, nowadays a highly fragile ecosystem, also one of the most attractive landscapes worldwide, thus facing rapid tourism challenges, ending up in increased disaster risks, both for the cultural as well as for the environmental assets, constitutes the related case-study in the perspective of a holistic cultural heritage management. Accordingly, an interdisciplinary methodology within the scientific field of digital humanities has been applied for digitizing archaeological sites and revealing the related cultural networks, as well as cultural buffer zones, finally highlighting the relevant ancient trade routes, whether sea or land routes. In this framework, geoinformatics proved to be the most effective methodology in the perspective of an effective strategic planning on the part of the State apparatus, whether for private or public works, taking also into consideration charters, European directives and good practices, already applied worldwide, thus fulfilling the notion of applied archaeology. Final milestone, involving the civil community, under the perspective of public archaeology and supporting mild tourism practices.

1417. Applied archaeology: geoinformatics for a holistic documentation of the Mycenaean cemetery at Kambi, Zakynthos island, Greece

Authors: Athina Chroni (National Technical University of Athens) – Christina Merkouri (Ephor-Ephorate of Antiquities of West Attika- Hellenic Ministry of Culture)
Format: Poster

The deployment and application of digital technologies in the field of cultural heritage, i.e., the scientific field of digital humanities, renders possible nowadays the holistic management of archaeological sites and finds for developing and enriching databases, definitely taking into consideration the related legislative framework, as well as charters, European directives and good practices already applied worldwide. Relevant case study the Mycenaean cemetery at Kambi, Zakynthos island, Greece, the southernmost island of the Ionian Sea, integrated in a significant prehistoric sea route, connecting the East with the West, specifically a sea route of communication and transfer of ideas and goods, thus connecting the south and east of the Helladic area with the west, precisely lower Italy and Sicily. The cemetery, located on the island hitherto, consists of 15 slab pit graves carved in the natural limestone rock, dating back to the late Mycenaean period (1400-1190 BC), thus rendering a provincial character to the site, as this type of graves appear, in the main Mycenaean centers, during the early Mycenaean period (1600-1500 BC). Applying geoinformatics for the holistic documentation of the burial site contributed effectively in integrating the site in the wider trade routes network of east Mediterranean Sea, highlighting also regional cultural sub-networks. Furthermore, in visualizing the field and laboratory work results, potentially opening up to the local community, in the context of an inclusive cultural heritage management, that is, towards a public archaeology proposal.

259 POTTERY AND MEDITERRANEAN CONNECTIVITY - PRODUCTION, TRADE, USE, AND CULTURAL AGENCY OF CERAMICS AROUND THE MEDITERRANEAN IN CLASSICAL ANTIQUITY

Theme: 1. Widening perspectives in material culture studies
Organisers: Daniel Andrade (NOVA University of Lisbon) – Paula Plaza Conesa – Raquel Guimarães (University of Barcelona)
Keywords: Ancient pottery, Cultural exchange, Material Agency, Ancient Trade and Economy, Classical Archaeology, Roman, Hellenistic and Punic Pottery
Format: Regular session

SESSION ABSTRACT

Pottery was one of the most pervasive and dynamic materials in Classical Antiquity, connecting people, places, and practices across the Mediterranean. Far from static artefacts, ceramic vessels were embedded in complex networks of production, circulation, and use that both reflected and actively shaped the social and cultural worlds of antiquity. This session invites contributions that explore pottery as an active medium of cultural expression and interaction, a material through which communities negotiated identities, exchanged ideas, and shared imaginaries across the Roman, Punic, and Hellenistic worlds. We welcome papers addressing any stage in the social biography of ceramics: from production and trade to primary and secondary uses, iconography, and the role of material agency in shaping human behaviour and cultural meaning. Particular consideration will be given to research that integrates aspects such as ceramic quantification, archaeometric approaches, and typological precision. We ask, in particular, how technological choices, stylistic traditions, and modes of consumption influence and respond to the shared cultural matrix of the ancient Mediterranean world? In what ways did ceramics mediate between local practices and broader, interconnected cultural frameworks? By bringing together theoretical and contextual perspectives, this session aims to foster a dialogue on pottery as both a product and a producer of Classical culture, a material agent in the creation of Mediterranean connectivity, memory, and identity.

CONTRIBUTION ABSTRACTS

82. When More Is Not Just More: Expanding Ceramic Corpora and the Reassessment of Attic Pottery Consumption in Populonia

Authors: Martino Maioli (Independent researcher)
Format: Oral

Over the last fifty years, the study of Attic pottery has increasingly relied on quantitative approaches to refine chronological, typological, and historical interpretations. Yet the relationship between the size of ceramic corpora and the stability of interpretive models remains only partially explored. This paper addresses a central methodological question: to what extent does the growth of a ceramic dataset actually transform our understanding of ancient consumption patterns? The contribution is based on the case study of Attic figured pottery from Populonia (northern Etruria), originally published as a doctoral corpus in 2021. Subsequent research conducted in museum storerooms and archival collections has led to the identification of over one hundred additional Attic vessels and fragments. This has substantially expanded the dataset within a short time span. Rather than presenting these materials descriptively, the paper uses the enlarged corpus as a heuristic tool to reassess the interpretive framework previously proposed. The analysis focuses on a limited number of key indicators—dominant vessel forms, chronological distribution, and the relative balance between black-figure and red-figure pottery. This allows a direct comparison between earlier and updated datasets. The results show that while certain trends are reinforced by the increased quantity of material, others prove to be more unstable

than initially assumed. The paper argues that expanding ceramic corpora should not be understood as a linear progression toward greater interpretive certainty. Instead, quantitative growth exposes the provisional nature of ceramic "editions" and encourages a more reflexive and dynamic approach to the analysis of Attic pottery consumption in the ancient Greek world.

550. Adoption and Reinterpretation of Attic Pottery in Iberian Societies. A Reflection on a Case of Cultural Appropriation and Transformation

Authors: Jorge Hernández Egea (University of Granada)
Format: Oral

This study addresses the significance and role of Greek pottery in the processes and strategies of cultural exchange and influence among the various Mediterranean societies. This study investigates the utilitarian, economic, identity-related, cultural and symbolic significance that Attic pottery acquired outside its original context of production, as well as the responses it generated and its consequences in the various communities of the east and south of the Iberian Peninsula in the 5th-4th centuries BC. In this context, pottery acts as a mediator and carrier of cultural patterns and systems, which is reflected in local production through the adoption and selection of certain elements and characteristics. Underlying this process is an intentional decision to distance oneself from the original model and to differentiate oneself, without renouncing the dynamics of integration and connectivity that insert Iberian communities into a shared Mediterranean identity. Similarly, the importance of the contemporary Mediterranean historical context of the chronological period covered by the study is highlighted, as well as commercial dynamics, as an interpretative framework for understanding the processes described.

302. Local Black-Gloss Productions and New Institutional Economics: Combining Archaeometric and New Institutional Economic Approaches

Authors: Giancarlo Martini (Durham University)
Format: Oral

While the employment of archaeometric studies to investigate the economy of fine-wares in antiquity has increased drastically, a coherent approach to understanding the diachronic changes in the fine-ware economy is still lacking. New Institutional Economics (NIE) provides a flexible and realistic perspective for understanding choices made by economic actors with bounded rationality in the fine-ware economy. NIE holds that there are costs associated with using the market mechanism for trade; these transaction costs are determined by formal and informal institutions in a society. The value of a NIE approach for studying fine wares can be illustrated well by local/regional black gloss (BG) productions in Italy during the Republican period . A geochemical study of BG samples from stratified contexts suggests the number of producers supplying a local market with BG wares at a given time. It also shows the diachronic change in number of producers. Because the communities of Italy were incorporated into the Roman state at different times and with varying legal statuses, there were different transaction costs associated with using the market mechanism in each community. The transaction cost associated with the exchange of BG wares varied on the basis of institutional constraint on economic behavior in each community. The change in number of BG producers supplying a market reflects decision making on the part of economic actors in the face of changes in transaction cost. This combined archaeometric-NIE approach has not been applied to the production history of BG ceramics, though it has been posited as an explanation for the shift from BG to terra sigillata production in Italy in the first century BC (Hawkins, 2012). Application of this approach to local BG production histories will highlight the interplay between economic development and political integration during the Roman expansion in Italy.

942. Taming „Hyperborea" through wine. Connectivity, imitation and acculturation, from Eastern Mediterranean to the Lower Danube

Authors: Dragos Mandescu (National Museum of Transilvanian History / Arges County Museum)
Format: Oral

Throughout the Late Iron Age, the Eastern Mediterranean wine was one of the most desired and appreciated in the Getic tribes of the Lower Danube. The peak was reached by the wine of Rhodes, which in the 2nd century BC imposed itself on the local market as the absolute leader in competition with the other centers. Fragments of Rhodian transport amphorae (less often even whole vessels) are not absent from almost every settlement in the Getic land crossed by the Danube (southeastern Romania and northeastern Bulgaria). The great river also represented the main axis of transport and penetration of wine, from the direction of the Black Sea. Together with wine, the consumption model after the Hellenistic Mediterranean one took root in the local society, new social customs were adopted and new ceramic categories and pottery sets intended for the commensal consumption of wine appeared and proliferated. With a great capacity for imitating and adapting in its own style the foreign prestige forms, the Getic culture adopted not only the late Hellenistic ceramics intended for wine consumption, but also Rhodian-style amphorae, imitating even the process of stamping the handles of these amphorae. Judging by the evidence that is increasingly multiplying in some important Getic centers (Popești, Cetățeni, Gorna Orjahovica), one can even speak of a local wine production and distribution, an industry that emerged and developed very likely by professionals (winemakers and potters) familiar with the Greek environment. The paper aggregates the evidence regarding Aegean wine as a civilizing agency of Getic society, with an emphasis on locally produced amphorae after the Rhodian pattern and on their imitation stamps. This work was supported by a grant of the Romania Ministry of Research, Innovation and Digitization, CNCS-UEFISCDI, project number PN-IV-P1-PCE-2023-0153, within PNCDI IV.

2242. Food Consumption in an Insular Context. Amphora Evidence from Roman Pollentia (Balearic Islands)

Authors: Raquel Guimarães (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona | Centro de Humanidades CHAM) – Paula Plaza Conesa (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona) – Patrizia Siclari (Independent Archaeologist) – Miguel Ángel Cau Ontiveros (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona | Institució Catalana de Recerca i Estudis Avançats | Chercheur associé, Aix-Marseille Univ, CNRS, CCJ) – Esther Chávez-Álvarez (Universidad de La Laguna | Grupo de Investigación Arqueología, Historia y Patrimonio) – Catalina Mas Florit (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona)
Format: Oral

Research on imperial foodways has often focused on large-scale dynamics and long-distance connections, prioritising major production areas and redistribution centres. While this approach has, no doubt, been essential for understanding the functioning of ancient economies, it tends to leave less room for smaller communities and for how they engaged with supply systems on a more local scale. This paper proposes to address this issue through the case study of Pollentia (Alcudia, Mallorca) using amphora assemblages from Early Imperial contexts to explore patterns of food consumption within an insular context. The analysis is based on a range of urban and port contexts and focuses on the circulation of wine, fish-based products and olive oil as a way of exploring broader patterns of supply and consumption over time. Rather than treating Pollentia as an isolated case, the paper examines how these assemblages can be used to discuss different scales of connectivity within an insular setting, and to reflect on the relationship between local practices and wider exchange networks. By looking at amphorae from the point of view of consumption rather than production, this paper uses foodways as a way of thinking about how imperial connectivity played out at a local scale. In Pollentia, integration into imperial networks did not necessarily result in uniform or standardised patterns of consumption. Imported goods were taken up in ways that reflect insularity, local resources and practical choices, rather than any straightforward adoption of wider Mediterranean models. Rather than drawing firm conclusions, this paper aims to use the case of Pollentia to reflect on how amphora assemblages can be used to approach questions of local consumption and connectivity in insular contexts.

1845. From clay selection to painted surfaces: Iberian ceramic production at Fontscaldes (Valls, Catalonia)

Authors: Judith Peix Visiedo – Joan Canela Gràcia (Institut Català d'Arqueologia Clàssica) – Maria Carme Belarte (Institució Catalana de Recerca i Estudis Avançats | Institut Català d'Arqueologia Clàssica) – Anna Tsoupra – José Mirão (HERCULES Laboratory-University of Évora | In2Past-University of Évora) – Jaume Buxeda I Garrigós (Universitat de Barcelona | GRACPE)
Format: Oral

This study presents the first comprehensive technological analysis of the Iberian ceramic workshop of Fontscaldes (Valls, Catalonia), dated to the first half of the 2nd century BC and considered one of the most important production centres in the north-eastern Iberian Peninsula. The research combines the archaeometric characterisation of raw materials, ceramic pastes and painted decorations. Local clay sources were analysed by X-ray diffraction (XRD) and thermogravimetric analysis (TGA) to assess their mineralogical composition, thermal behaviour and phase transformations during firing. A total of 40 ceramic individuals, including amphorae and red-painted fine wares such as plates and kalathoi, were chemically characterised by X-ray fluorescence (XRF) and mineralogically by X-ray diffraction (XRD), allowing the definition of compositional reference groups and the reconstruction of firing conditions. The results indicate that both amphorae and fine wares were produced using the same paste base, pointing to a shared technological tradition and the absence of functional differentiation in raw material selection and paste preparation. In contrast, the painted decorations exhibit greater technical variability. Decorative motifs were investigated by scanning electron microscopy (SEM) and micro-XRD, revealing different application techniques while consistently identifying iron-based pigments systematically associated with manganese. Overall, this integrated approach provides new insights into the organisation of ceramic production at Fontscaldes, linking raw material procurement, paste preparation and decorative practices within a single workshop. The results contribute to a better understanding of Iberian ceramic production systems and offer a reference framework for future archaeometric studies of fine wares and their circulation.

1084. Persistence and Choice: Roman Painted Pottery of Indigenous Tradition in a High Imperial Rural Settlement in Central Hispania

Authors: Lidia Vargas (Universidad Autónoma de Madrid)
Format: Oral

This contribution aims to analyze the ceramic assemblage from the rural Roman site of Camino de Baracalde, located in the center of Hispania, and occupied between the late 1st century AD and the mid-3rd century AD. The identification of a residential structure associated with several pits and two large refuse deposits containing abundant pottery provides a suitable context for examining patterns of tableware consumption and supply in a rural High Imperial setting. The ceramic evidence reveals the coexistence of

imported fine wares —commonly interpreted as indicators of standardization and integration within imperial distribution networks— alongside Roman painted pottery of indigenous tradition, linked to long-term local practices, within the same assemblage. This association raises a key interpretative question concerning the selective maintenance of local ceramic traditions within rural contexts fully embedded in Roman economic and cultural systems. By focusing on this ceramic assemblage, the proposal offers reflections on processes of adaptation, selection and cultural resistance in rural consumption practices. It proposes a non-linear interpretation of ceramic change, beyond models that explain change only through the replacement of local pottery by imported wares. In this way, it contributes to current debates on regional production and pottery circulation in Roman rural contexts of Hispania.

935. Advances in the study of roman coarse wares from the Sisapo mining district: an archaeometric approach

Authors: Maria Rosa Pina Buron – Mar Zarzalejos Prieto (Universidad Nacional de Educacion a Distancia)
Format: Oral

The territory of the ancient town of Sisapo (La Bienvenida, Ciudad Real, Spain), located on the northern slope of the Sierra Morena, included one of the most renowned mining districts in Hispania, a major supplier of cinnabar ore, silver, and lead to the Roman Empire, as reported by Strabo and Pliny the Elder. The large-scale exploitation of the Sisapo mines, which began in the mid-2nd century BCE, led to dense occupation of the territory and an influx of people and goods that accelerated the process of Romanization in this region of the Iberian Peninsula. The study of pottery assemblages from both residential and productive contexts constitutes one of the main goals of our research project on the production and circulation of goods in this territory during the Roman period (ProCir PID2023-146940OBI00, Ministry of Science, Government of Spain). In this presentation, we will discuss the results of a comparative archaeometric analysis of coarse wares—cooking, transport and storage vessels—from selected contexts dating from the 2nd century BCE to the 2nd century CE, in which locally produced items of indigenous tradition, Italic imports, and regional imitations of the latter can be distinguished. The characterization of the pottery helps shed light on the logistics of these settlements.

1632. Decorated Italic Terra Sigillata from the Roman City of Pollentia (Mallorca, Balearic Islands)

Authors: Paula Plaza Conesa – Catalina Mas Florit (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona) – Miguel Ángel Cau Ontiveros (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona | Institució Catalana de Recerca i Estudis Avançats | Chercheur associé, Aix-Marseille Univ, CNRS, CCJ) – Esther Chávez-Álvarez (Grupo de Investigación Arqueología, Historia y Patrimonio | Universidad de La Laguna) – Raquel GuimarãEs GuimarãEs (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona | Universitat de Barcelona | Centro de Humanidades CHAM)
Format: Oral

This paper examines an assemblage of decorated Italic terra sigillata recovered from the Roman city of Pollentia, founded following the Balearic campaign of Q. Caecilius Metellus in 123 BC and strategically located between the bays of Pollença and Alcúdia. This location facilitated its integration into western Mediterranean trade networks, making its Late Republican and Early Imperial ceramic record a particularly suitable context for investigating the circulation of Italic wares in a provincial setting. Italic terra sigillata has a long-standing scholarly tradition within classical ceramology, primarily focused on typological approaches; however, the systematic and comparative analysis of relief-decorated wares remains a relatively underdeveloped line of research. Drawing on the Pollentia assemblage, this study adopts a dual analytical framework. On the one hand, patterns of workshop affiliation and commercial distribution are examined through the identification of the decorative punzoni used on individual vessels, understood as a methodological procedure of regular application, albeit one that must be employed with greater caution than stamped signatures. This line of analysis allows for the attribution of fragments to specific workshops and, in certain cases, provides insight into the activity of individual officinatores. On the other hand, the paper addresses the study of figurative repertoires from an iconographic and intermedial perspective, considering the compositional complexity of vessels whose imagery is constructed through motifs shared with other visual media of the classical world. Two case studies are presented to illustrate this second approach: a cup decorated with an erotic scene, whose interpretation is refined in light of iconographic parallels, and a singular vessel characterised by a previously undocumented combination of decorative punzoni, as well as by the presence of a possibly altered nominal stamp, attributable to the final phase of the workshop of Perennius.

949. Between Tradition and Transformation: Pottery Production after the Roman Conquest in Northwestern Hispania

Authors: Alicia Hernández-Tórtoles (Spanish National Research Council - CSIC | National University of Distance Education - UNED)
Format: Oral

This paper studies regional dimensions of pottery production in the northwestern Iberian Peninsula, starting with the outcomes of the previous research in contexts from the Late Iron Age through the Early Roman period (1st-2nd centuries AD). During the Late Iron Age, pottery production operated through local/regional networks linking artisans and communities, embedded within

agrarian economies and small-scale settlement systems. It facilitated the circulation of goods, technical knowledge, and stylistic traditions, resulting in objectscapes shaped by environmental constraints and the idiosyncrasies of the communities. The Roman conquest broke the social structures by introducing new economic and political conditions, led by a strategic control of the territory and the impact of gold-mining exploitation. Therefore, this work focuses on three aspects. First, the different economic scales of pottery production and patterns of consumption: handmade self-sufficient productions, regional manufactures (trends toward standardization, widespread use of the potter's wheel, specialized workshops, and more Roman-style forms), Hispanic-Roman wares, and the imperial trade networks. Second, we address the persistence of technical and aesthetic features rooted in pre-Roman indigenous traditions, traced through Roman, Late Antique periods and even in modern traditional pottery. Three key elements are highlighted: black vessels, burnished surfaces and burnished-lattice decoration. Finally, we explore the relationships between ceramic groups through their spatial distribution, evaluating how these patterns relate to the emergence of new social demands in rural communities and the gradual formation of a small local elite. Archaeological evidence shows communities that had different responses, from resistance and submission to adaptation and imitation. Local potters responded to those incomes while maintaining aspects of their inherited savoir-faire, producing ceramics that mediated between regional traditions and imperial demands. Situating these assemblages within a wider context contributes to broader debates on economic organisation, and the inequal negotiation of cultural identities within the local communities and the Roman world.

522. Romula – a Roman ceramic centre in the Lower Danube region

Authors: Mircea Negru (University of Bucharest | Spiru Haret University Bucharest)
Format: Oral

Romula was the only city in the Roman province of Dacia Inferior (Malvensis), being also the residence of the governor of this province north of the Lower Danube. At the same time, the city was the main economic, commercial and cultural centre of this province. The main branch of the economy of the Roman city was the production of ceramics, from construction materials (bricks and tegulae) and ceramic vessels, to coroplastic objects and lamps, which places it among the most relevant in the Lower Danube region. So far, a total of eight ceramic production workshops have been investigated here, with 27 kilns. Of these, five were for the production of construction materials, and the others for the production of ceramic vessels, coroplast objects and lamps. The ceramic vessels belong to both tableware and kitchenware. Terra sigillata type vessels were produced in this site; in other cases, they were imitated. Recent investigations also indicate the production of Kapitan II type amphorae, which are very numerous in the discoveries. In this ceramic center, a series of types of Roman lamps were imitated, but it was also the place where Firmalampen with the ARMENIVS stamp that circulated in the Lower Danube region were produced. The coroplastic objects include a variety of manifestations, from ceramic statuettes of divinities (especially Venus) to anthropomorphic vessels and from children's toys to medallions. In recent years, there have been some archaeometry investigations on Roman bricks, amphorae, and kaolin vessels, which revealed the pattern of local production fabrics made at Romula. Due to the scale and diversity of the products, the ceramic centre from Romula is among the most relevant of those researched so far in the Roman Danubian province.

84. From idea to tangible: the potential interpretation levels of Sarmatian painted pottery in relation to its Roman influences

Authors: Tamás Szebenyi (Department of Archaeology, University of Szeged)
Format: Oral

The so-called 'red-painted pottery' represents an understudied but methodologically promising group among the find material of the Late Roman Period Sarmatian Barbaricum in the Carpathian Basin. This ceramic type was formed in response to the mid-3rd-century AD decline in the import of Western terra sigillata products. While Barbarian potters were unable to reproduce the Roman 'slip' (Glanztonüberzug), they achieved a comparable visual effect by polishing a simpler red engobe coating. In terms of morphology, Sarmatian workshops sought to pass on the traditions of the 2nd–3rd-century Rheinzabern, Westerndorf and Pfaffenhofen workshops into the 4th–5th centuries AD, primarily through the imitation of forms Dragendorff 33, 37 and 54. Recent publications from the foreground of Aquincum (Pannonia Inferior) indicate that, the form selection of this pottery type followed a more complex pattern than previously assumed. Mechanical imitations of terra sigillata vessels (impact level 1) appears to be rare instances (see the case of stamp-ornamented bowls). However, the technical constraints of Barbarian pottery production occasionally necessitated simplifications (e.g. the application of foot-discs instead of foot-rings). More frequently, their morphology were modified to varying degrees to meet the local demands (impact level 2). These modifications range from minor 'barbarising' features (e.g. grooves below the rim) to the hybridisation of multiple Roman and Barbarian vessel types. For instance, pronounced articulation on Dragendorff 33 imitations may derive from the adaptation of the Dragendorff 30 form. In several cases, the symbolism of 'red painting' appears to have been abstracted, transferring the elevated status once associated with terra sigillata to painted vessels imitating glassware. On the other hand, red painting could lose its original semantic values and is applied to independently developed Sarmatian froms (impact level 3). At this stage, the phenomenon is better explained through workshop-level production traditions than through broader cognitive processes (e.g. glocalisation, hybridisation).

2318. Imitation and Innovation: Knowledge Transfer in Ceramic Production at Late Republican - Early Imperial Salacia Imperatoria (Alcácer do Sal, Portugal)

Authors: Daniel Andrade (CHAM – Centro de Humanidades. NOVA/FCSH - NOVA University of Lisbon) – Raquel

Guimarães (Equip de Recerca Arqueològica i Arqueomètrica de la Universitat de Barcelona | Institut d'Arqueologia Universitat di Barcelona - University of Barcelona | CHAM – Centro de Humanidades. NOVA/FCSH - NOVA University of Lisbon) – Camila Lacueva – Tiago Nunes – Paula Pereira (ERA Arqueologia, SA)
Format: Oral

The Roman city of Salacia Imperatoria (modern Alcácer do Sal, Portugal) was a key urban center in the lower Sado basin and along the western Atlantic façade of the Iberian Peninsula during the late Republican and early Imperial periods. Strongly influenced by Mediterranean commercial and cultural traditions, Salacia developed into a significant center for amphora production, supporting the distribution of fish products from nearby processing sites, particularly at Tróia. Excavations by ERA Arqueologia revealed a substantial waste deposit associated with local pottery production, containing both imported wares and locally produced imitations of exogenous imperial products, including terra sigillata, Roman lamps, and Campanian black-gloss ware. While these imitations often lack the refined surface treatments of their models, their morphological fidelity and sporadic experimental coatings indicate active engagement with unfamiliar techniques and ongoing technical learning. This paper examines the technological and morphological characteristics of these imitative wares, situating them within broader processes of craft knowledge transfer and adaptation. By comparing local products with their imported counterparts, the study explores how Salacian potters negotiated the introduction of imperial forms, integrated them into local production systems, and responded to changing economic and urban contexts. Through this lens, Salacia emerges as a site where practical skill, experimentation, and cultural interaction intersected, illuminating the dynamics of craft knowledge transmission and technological adaptation in the Ancient Mediterranean.

260 MODELS AND WORKSHOP PRACTICES IN THE PRODUCTION OF DECORATION ON CINERARY URNS AND SARCOPHAGI

Theme: 1. Widening perspectives in material culture studies
Organisers: Samuele Cambianica (Universität Zürich, Institut für Archäologie) – Anna Anguissola (Università di Pisa, Dipartimento di Civiltà e Forme del Sapere)
Keywords: Workshop models, Cinerary urns, Sarcophagi, Motif repetition, Workshop practices, Transmission of iconographies
Format: Regular session

SESSION ABSTRACT

The recurrence of iconographic schemes, figure types, and decorative patterns on cinerary urns and sarcophagi across the ancient Mediterranean raises fundamental questions about how workshops produced the decoration on these artefacts. A central issue concerns the mechanisms of replication of decorative motifs and what models and intermediate mediums could actually have been: concrete templates used within the workshops, or rather mental, internalised schemata to which artisans referred? Reconstructing these production means is fundamental for investigating their practices of use and meaning in production processes. The identification of shared workshop models underlying multiple artefacts also contributes to hypotheses regarding common artisanal origins and the transmission of iconographies. In both plastic decoration and polychrome painting on cinerary urns and sarcophagi, formal motifs are repeated even across different materials, despite the distinct technical requirements each material imposes. Phenomena such as "contamination" of iconographies and duplication of figure types within single compositions highlight questions about how models were employed, adapted, and combined. Motif repetition within the contexts of placement of cinerary urns and sarcophagi provides insights into how client expectations and commissioning practices shaped common figurative repertoires responsive to specific requirements. The session aims to provide insights into workshop practices involved in motif repetition on cinerary urns and sarcophagi, and to discuss methodologies and approaches to the study of models in ancient image production. We invite contributions, particularly from early career researchers, on topics that may include: - Case studies in which workshop models and their modes of use can be reconstructed - Transfer of motifs between production groups, for example between sarcophagi and cinerary urns or across materials within the same artefact class - Contextual considerations regarding motif repetition and the placement and display of cinerary urns and sarcophagi - Adaptation of models to local requirements, variations, changes in content, and attribute combinations.

CONTRIBUTION ABSTRACTS

1679. From Workshops to Canvas: Mapping Iconographic Patterns in Clazomenian Sarcophagi

Authors: Juan Navarro (The University of Edinburgh)
Format: Oral

Is the iconography of the paintings on the so-called Clinomania sarcophagi (c. 625–450 BCE) truly standardised, as is sometimes suggested? Do each workshop, in addition to exhibiting stylistic patterns, also possess a distinctive iconography? Or, conversely, does the object itself determine the images, so that, regardless of its place of manufacture, as a funerary monument, it imposes its pictorial scheme? This paper focuses on the figurative paintings of the Clinomania sarcophagi, specifically providing a mapping of the distribution of motifs and scenes across a diverse range of sites. The material extends beyond Ionia, encompassing northern (Acanthus, Abdera) and southern Aegean sites (Rhodes), revealing geographically patterned concentrations of decoration. It

also traces how certain figure types, their combinations, and the layout of decorative panels recur across the corpus. In this paper, iconography is not used as a method for identifying workshops; rather, it is treated as an object of analysis. The evidence suggests that the most striking feature of the corpus is its considerable variation. While organisational schemes remain largely consistent, the depicted subjects display significant diversity, which may reflect a negotiation between clientele preferences, social status, aspects of identity, and a drive for creativity and originality. Consequently, it is possible to propose that the medium does not necessarily dictate funerary iconography (unlike in other monuments, such as grave stelai or pinakes, where the format more strongly shapes subject matter), but rather functions as a "blank canvas" for making a statement of social status, which becomes visible in the ways originality is expressed. By providing an integrated overview of the corpus, the study lays the groundwork for further research on regional workshops, stylistic groups, and early Mediterranean funerary decoration.

1751. Scaling the Model: The Amazonomachy with Vanth from Sarcophagi to Cinerary Urns

Authors: Valeria Riedemann (University of Washington)
Format: Oral

This paper examines the role of models and workshop transmission in the production of decorated Etruscan sarcophagi and cinerary urns, focusing on the Amazonomachy with the female death demon Vanth as a case study. While the Amazonomachy derives from Greek mythological imagery, its appearance in fourth-century BC Etruscan funerary contexts reveals a sustained process of adaptation shaped by local workshop practices, materials, and patronage. The first phase under consideration concerns the dialogue between painted and carved sarcophagi in southern Etruria, particularly at Tarquinia, Tuscania, and Vulci. Stylistic correspondences suggest the circulation of shared compositional models across media, with workshops adapting figural schemes to different artistic techniques. Locally produced stone sarcophagi display flexible narratives and iconographic arrangements, indicating that models were not mechanically reproduced but actively reworked. The second phase traces the transmission (or 'revival') of the motif on later cinerary urns, largely produced in northern Etruria. Here, earlier large-scale sarcophagus compositions are condensed to fit smaller, standardised urn formats. This process required selective compositional reduction and figure rebalancing, revealing workshop strategies of scaling and adaptation rather than simple copying of traditional models. The persistence of key iconographic elements, especially the inclusion of the winged demon Vanth, suggests the existence of workshop templates that were repeatedly reinterpreted. By analysing shifts in material, composition, and scale, this paper contends that the Amazonomachy with Vanth functioned as a mobile and adaptable visual model within Etruscan funerary production. Its transformation across media shows that workshops did not merely replicate inherited schemes but reshaped the iconographic tradition to suit new formats and funerary contexts.

2639. Case Studies of Model Use in the Image Production on Hellenistic Etruscan Urns

Authors: Samuele Cambianica (University of Zurich)
Format: Oral

Etruscan urns decorated in relief are characterised by two phenomena: the use of motifs from the Hellenistic formal repertoire, and the repetition of schemes depicting both the same and different iconographic subjects. This class of finds therefore constitutes an exceptional corpus for the study of models used in the production of images in processes of pattern transfer and replication. The purpose of this paper is to present case studies that facilitate discussion of these issues and provide insight into the specific artisanal practices employed in the production of these cinerary urns. To discuss the nature of the models - whether concrete or conceptual, two-dimensional or three-dimensional - and the modi in which artisans employed them, it is essential to identify artefacts with repeated motifs that share a common artisanal origin. This permits specific considerations regarding a particular series of cinerary urns and their decorations. A further aim of this paper is therefore to offer some methodological reflections on the identification of a "common artisanal origin" of sculptural works. The proposed approach considers style as one of the final stages in the production of decorated artefacts - subordinate to questions of material and design - and proposes an integrated method that encompasses multiple aspects of the entire production process, as well as the combination of various investigative methods. Morphological (formal and typological) and design considerations are, furthermore, intimately connected to the question of the models underlying the production of images on sculptural works.

2743. Regional Models and Local Traditions: Garland Sarcophagi from Hierapolis of Phrygia

Authors: Anna Anguissola (University of Pisa) – Daniele Renna (University of Pisa)
Format: Oral

Hierapolis of Phrygia (Turkey) preserves the largest known concentration of travertine and marble sarcophagi in the Roman world, produced mainly between the 2nd and 3rd centuries CE. The fact that these monuments are very often preserved in situ, associated with their original funerary buildings, as well as with a rich epigraphic record, allows for precise reconstructions not only of production processes but also of the function and social significance of these objects. Within this vast corpus, a particularly widespread production stands out: finished and semi-finished garland sarcophagi are the predominant type among marble chests. Once thought to be imports from nearby Aphrodisias, these are now recognized as local products created by workshops firmly rooted in a regional tradition and well versed in both travertine and marble sculpture. Based on a catalogue of over 1,000 pieces, the paper examines this material by highlighting the distinctive features of the sculptors of Hierapolis, through comparison with other types

of sarcophagi and, above all, with architectural sculpture and the productions of neighboring centers. In particular, the paper discusses how the garland motif is adapted and modified through the inclusion of mythological figures that have few parallels elsewhere, as well as portraits. What emerges is the vitality and innovative capacity of local workshops, which translated a complex visual language across different material supports within a funerary landscape densely packed with buildings and marked by intense competition for visibility and space.

1015. Making and Meaning from Miniature to Monumental: Tracing Cross-Scale Models in the Sarcophagi of Roman Phoenicia

Authors: Nicholas Aherne (University of Groningen)
Format: Oral

The floruit of sarcophagi across the Roman Empire leaves no doubt that the success of Graeco-Roman art depended upon repetition. The recurring stock motifs enveloping sarcophagi may appear prosaic, but the perennial penchant of their designers to adopt and innovatively adapt schemes from an orchestrated repertoire, sometimes punctuating them with localised or personalised idiosyncrasies, present exceptional cases to approach art and making. In contemporary rhetorical practice we can identify model-based learning and visual memory techniques which sarcophagus makers presumably relied upon. Like rhetoric, we witness art employ formulaic expression, standardisation, and codification, consolidating socio-cultural connotations and reflecting broader conditions or experiences of Roman thought. This paper undertakes a conceptual and methodological investigation of such notions through the lens of predominantly ornamental but also figural motifs decorating sarcophagi of Roman Phoenicia, the topic of my ongoing PhD. Having shifted away from the direct-prototype paradigms central to early scholarship, this interdisciplinary study formally analyses sarcophagi of stone, lead, terracotta, and wood. It identified models from the miniature to monumental: coins, magical amulets, pottery, altars, temples, and baths across the Empire which I propose help us to reconstruct the entangled network of models and inspirations that sarcophagus workshops drew upon. Whilst replicative ornamentation would have resonated indelibly with diverse audiences, I deliberate whether esoteric nuances were only fully appreciated by makers, and the degree to which meaning was assimilated with motifs. This paper also situates the sarcophagi within their material-visual-spatial landscape and considers lived experiences of makers and viewers. By analysing replicative ornament across media and scales, this paper demonstrates how sarcophagus production depended not on linear prototype transmissions, but on a malleable repertoire of shared visual models activated through workshop practice, copybooks, material properties, and embodied memory. These findings contribute new perspectives on workshop organisation, cognitive dimensions of making, and Graeco-Roman imagery.

263 BETWEEN LIFE AND DEATH: FUNERARY PRACTICES OF WESTERN ASIA IN THE 7TH–6TH MILLENNIA BCE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Anna Bach Gomez (Universitat Autònoma de Barcelona) – Eva Fernandez Dominguez (Durham University) – Miquel Molist Montaña (Universitat Autònoma de Barcelona)
Keywords: Neolithic, Funerary practices, Multi-proxy analysis
Format: Discussion session

SESSION ABSTRACT

Funerary practices during the 7th and 6th millennia BC in the Near East reveal a complex net of social, symbolic, and ritual behaviors associated with the treatment of the dead. Since the pottery appearance, this period, marked by profound transformations in settlement patterns, technology and community organization, also witnessed the emergence of diverse ways of conceptualizing death and the afterlife. Through a comparative analysis of burial contexts from key Neolithic sites across Upper Mesopotamia, this study explores how mortuary variability reflects shifting notions of identity, memory, and ancestry but also mobility of goods and people. The integration of bioarchaeological evidence, tanatoarchaeology, spatial distribution, and material culture allows for a nuanced understanding of the interplay between the living and the dead within early agricultural societies. Ultimately, the study highlights how funerary practices served as a medium for negotiating social cohesion, territoriality, and cosmological beliefs during the consolidation stages of Neolithic communities.

CONTRIBUTION ABSTRACTS

1991. Populations and Burial Practices at The End of the Pre-Pottery Neolithic Period in Southern Levant (7100-6300 Cal BC)

Authors: Marie Anton – Hila May (Faculty of Medecine, Tel Aviv University | The Dan David Center for Human Evolution and Biohistory Research | The Shmunis Family Anthropoly Institute) – Hamudi Khalaily – Jacob Vardi (Israel Antiquities Authority IAA) – Fanny Bocquentin (CNRS UMR 8068 Technologie et Ethnologie des Mondes PrehistoriqueS)
Format: Oral

The first half of the 7th millennium BC, also known as the Pre-Pottery Neolithic C (PPNC), was a chaotic period. The settlements flourishing during the end of the 8th millennium were abandoned during the first half of the 7th millennium, hence the term "Palestinian Hiatus" proposed by J. Perrot. While the occupation of sites in the northern Levant continued and ceramics gradually emerged, a real cultural break was described for the southern Levant. Indeed, the main sites were almost abandoned, and smaller settlements appeared, which suggests that communities were highly mobile. In this context, ceramics in the southern Levant appeared 500 to 700 years later than in the northern Levant on a massive scale (Early Pottery Neolithic: 6300-5900 Cal BC). The numerous burials recently uncovered have allowed us to tackle the early 7th millennium question. Analyzing funerary archaeology and biological anthropology through those burials enabled us to observe the funerary treatments and certain social practices of populations that were completely unknown and yet the main protagonists of the last stage of the Neolithic process in the Levant. The results suggest a continuity between the PPNC and the rest of the Pre-Pottery Neolithic periods: individuals are buried in the habitat, in a wide variety of positions and orientations. However, new funerary practices, as the earliest evidence of cremation, emerged during the PPNC. Several of these traditions were observed during the subsequent period, the Early Pottery Neolithic, when the deceased were not allowed in the inhabited area.

2602. Reading Ancestry in Teeth: Dental Topography as a Proxy for Population History in Neolithic Funerary Assemblages

Authors: Albert Epitíe Dyowe Roig (Universitat de Barcelona) – Ferran Estebaranz-Sánchez (Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona) – Eva Fernández-Domínguez (Department of Archaeology, Durham University) – Alejandro Pérez-Pérez (Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona) – Bérénice Chamel (Institut Français du Proche-Orient MEAE/CNRS) – Ali Metin Büyükkarakaya (Human Behavioral Ecology and Archaeometry Laboratory IDEA Lab | Hacettepe University) – Rima Khawam (Directorate-General for Antiquities and Museums DGAM) – Miquel Molist Montaña (Universitat Autònoma de Barcelona) – Arkadiusz Sołtysiak (University of Warsaw) – Laura M Martínez Martínez (Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona)
Format: Oral

Funerary contexts of the 7th–6th millennia BCE in Western Asia provide key insights into how early Neolithic communities conceptualised identity, ancestry, and belonging. While mortuary practices are commonly explored through spatial organisation, ritual treatment, and material culture, bioarchaeological proxies offer a complementary perspective for assessing population continuity and mobility. Although part of the dataset predates the 7th millennium BCE, these earlier populations represent the demographic and biological foundations upon which later Neolithic funerary traditions and notions of ancestry were constructed. This study examines diachronic and regional variation in lower molar morphology among Natufian, Pre-Pottery Neolithic B, and Pottery Neolithic individuals from Southwest Asia. A total of 93 unworn first and second lower molars recovered from funerary contexts across Levant, Upper Mesopotamia, Zagros, and Central Anatolia were analysed using high-resolution 3D dental topography. Four complementary metrics (RFI, DNE, OPCR, and PCV) were employed to capture variation reflecting both functional adaptation and inherited morphology. Results reveal substantial morphological continuity between Natufian and PPNB groups, alongside marked intra-group variability during the PPNB, consistent with genomic evidence for fine-scale population structure and individual mobility. Genomic and morphological continuity across the Epipalaeolithic–Neolithic transition allows earlier populations to be directly integrated into discussions of ancestry, memory, and funerary practices during the 7th–6th millennia BCE. In contrast, Pottery Neolithic individuals (particularly from Central Anatolia) exhibit a distinct topographic signal characterised by increased crown relief and reduced occlusal exposure, suggesting both dietary change and population differentiation during the consolidation of Neolithic lifeways. By integrating dental topography with archaeological and genetic frameworks, this study highlights the value of bioarchaeological evidence derived from funerary assemblages for reconstructing population histories. Dental morphology emerges as a robust complementary proxy in contexts where ancient DNA preservation is limited, enriching interpretations of Neolithic mortuary variability and the relationship between the living and the dead.

2766. Neonatal Mortuary Practices in the Middle Euphrates: Current Evidence and Methodological Challenges

Authors: Olivia Orri – Miquel Molist (Autonomous University of Barcelona, Research group SAPPO-GRAMPO)
Format: Oral

Neonatal burials constitute a particularly relevant field of analysis for the study of liminal conceptions between life and death within pottery Neolithic communities of the Near East. In the Middle Euphrates valley, especially during the Halaf cultural horizon (c. 6200—5300 cal BC), the archaeological evidence currently available for perinatal and neonatal individuals remain relatively limited, dispersed and unevenly documented. This contribution presents a state of the question on neonatal burials documented in the Middle Euphrates and its main areas of influence, based on a critical review of the archaeological and bioarchaeological literature from sites in northern Mesopotamia and the middle river basin. The analysis focuses on the characterisation of funerary contexts attributed to neonates, including primary inhumations in pits or shafts, burials within ceramic containers, cremations and collective contexts, as well as their spatial relationship with domestic and communal areas. In addition, this paper reviews the principal analytical variables commonly employed in the study of these burials—such as intra- or extramural location, body position and orientation, the presence or absence of grave goods, and the typology of associated material culture—while placing particular

emphasis on the methodological limitations arising from the differential preservation of neonatal skeletal remains, excavation biases and the limited application of systematic bioanthropological analyses.

2767. Intramural Burials and the "Domestication" of the Dead: Memory, Ancestors and Architecture in the 7th–6th Millennium Near East

Authors: Anna Bach Gomez – Miquel Molist (Autonomous University of Barcelona, Research group SAPPO-GRAMPO)
Format: Oral

Intramural burial practices—interments located within domestic spaces such as beneath floors, inside rooms or in courtyards—represent one of the most distinctive mortuary phenomena of the Near East during the 7th–6th millennium cal BC. Despite their wide distribution across the Late PPNB, the Pottery Neolithic and the Early Halaf horizon, the social meaning of these practices remains difficult to assess. Were intramural burials primarily embedded in processes of ancestor-making, whereby the dead became active social agents in the reproduction of household memory and identity? Did they function instead as strategies of territorial control, legitimising claims over space, property and lineage through the physical anchoring of bodies within the built environment? Or should they be interpreted more pragmatically, as practical solutions for corpse management within sedentary communities? Beyond formal inhumations, many sites also document human remains in secondary contexts—disarticulated bones, selected skeletal elements, or partial bodies—redeposited within floor make-up layers, wall foundations, or architectural fills. These practices raise further interpretative challenges: should such remains be understood as part of funerary behaviour and domestic commemoration, as "closing deposits" linked to architectural renewal, or as the outcome of taphonomic disturbance and the reworking of earlier burial spaces? This paper addresses these tensions by critically reviewing the archaeological signatures most used to differentiate "ritual" from "functional" intramural mortuary practices. Attention is paid to the relationship between architectural renovation, floor sequences and the reopening or transformation of burial contexts. The discussion highlights the analytical potential of fine stratigraphic recording, micro-contextual approaches, and the distinction between articulated primary inhumations and secondary redepositions. By reassessing intramural mortuary variability across regions and cultural horizons, this contribution aims to refine interpretative models and evaluate the extent to which domestic mortuary practices can be meaningfully compared through time and space in the Neolithic Near East.

264 HOW CAN ARCHAEOLOGY SKILL GAPS BE ADDRESSED? EXPLORING ISSUES AND SOLUTIONS FOR THE DEVELOPMENT OF TECHNICAL SKILLS

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Cara Jones (Chartered Institute for Archaeologists) – Pirjo Hamari (Museovirasto - Finnish Heritage Agency)
Speakers: Angela Pencheva (Balkan Heritage Foundation)
Keywords: Skills, Skill Gaps, Training, Future Skills
Format: Round table
Affiliation: Chartered Institute for Archaeologists (CIfA), Community on Teaching and Training of Archaeologists - CTTA

SESSION ABSTRACT

The mechanisms to identify and record skill gaps in archaeology is increasingly being applied by organisations to their workplaces, specialisms, and individual projects. They can be identified through skill audits or anecdotal evidence and then reported through Labour Market Intelligence processes or data gathering associated with strategic skills initiatives. Ultimately skill gaps are recognised as a 'risk' to our ability to carry out the very process of archaeology. Previous responses have included 'fixed-term' (supported by fixed-funding) training programmes or in-house training, but this solution is often dependent on available resource, capacity and the accessibility of the training initiative. It is rare that these solutions are sustainable or systematic. Therefore, is there a need to redesign how we develop our archaeologists of the now and of the future by rethinking how we respond to skill gaps? Should we as a profession be looking towards more formalised ways of meeting our skill needs? Should we look at developing vocational qualifications or micro-credentials specifically designed for archaeologists? Organised by members of the EAA Community for teaching and training of archaeologists, this discussion session seeks to • Explore how skills gaps are identified and addressed • Discuss if the utilisation of micro-credentials or vocational qualifications support archaeologists to rapidly respond to new areas of practice (such as Artificial Intelligence or Climate Change) • Identify examples or case studies of the sustainable and systematic responses to skill gaps While this roundtable will prioritise space for discussion, we welcome short presentations from external contributors.

266 ARCHAEOLOGY OF DELTA- ACROSS CULTURAL TRADITION

Theme: 7. Interaction, connectivity and mobility
Organisers: Durga Basu (University of Calcutta) – Sergiu Musteaţă (History and Geography Faculty, Ion Creanga State University)
Keywords: Archaeology, coastal region, settlement, cross-cultural tradition, connectivity
Format: Discussion session

SESSION ABSTRACT

Delta regions across the world represent dynamic zones shaped by environmental change, dense human occupation, and long-standing cultural interactions. Their fertile landscapes, shifting waterways, and strategic locations have fostered distinctive settlement patterns, subsistence systems, and networks of exchange. This session examines the archaeology of deltaic environments across countries to understand how communities adapted to and transformed these complex landscapes. To sharpen the analytical focus, the session invites contributions addressing questions such as: • How have environmental dynamics and geomorphological changes influenced settlement patterns in delta regions? • What types of material culture illuminate intercultural connections, trade, or shared technological traditions in these landscapes? • In what ways did subsistence strategies evolve in response to deltaic ecological opportunities and constraints? • How do archaeological datasets from different deltas compare, and what broader patterns of connectivity or divergence emerge? Case studies, comparative analyses, and interdisciplinary approaches—including geoarchaeology and environmental archaeology—are especially welcome. The session aims to develop a clearer, more integrated picture of deltas as key spaces of interaction, connectivity, and cultural tradition.

CONTRIBUTION ABSTRACTS

1389. Archaeology of Delta- Across Cultural Tradition, focusing on the Gangetic Delta of India

Authors: Sayamtara Mitra (Burdwan University)
Format: Oral

The Gangetic delta, largely corresponding to present-day West Bengal, constitutes one of the most significant archaeological landscapes of eastern India. Formed by the Ganga–Bhagirathi–Hooghly river system, this deltaic region has experienced continuous geomorphological transformation, profoundly influencing human settlement and cultural development. Archaeological sites such as Chandraketugarh, Harinarayanpur, Deulpota, Mangalkot, Bharatpur, and Tamluk (ancient Tamralipta) provide crucial evidence for understanding the dynamics of settlement, subsistence, and connectivity within a coastal delta environment. Analysis of settlement patterns indicates a preference for elevated landforms and palaeochannel zones, reflecting adaptive responses to flooding, sedimentation, and river migration. Material culture assemblages recovered from these sites—including Northern Black Polished Ware, rouletted ware, terracotta figurines, beads, seals, and numismatic evidence—demonstrate both regional cultural continuity and sustained cross-cultural interaction. The discovery of Roman coins and imported ceramic forms, particularly at Tamralipta, underscores the delta's participation in long-distance riverine and maritime trade networks linking the Gangetic hinterland with the Bay of Bengal and the wider Indian Ocean world. Subsistence strategies combined wet-rice cultivation, fishing, shell exploitation, and craft production, indicating ecological flexibility and economic integration. The archaeological record of the Gangetic delta thus highlights its role as an active centre of settlement continuity, cultural interaction, and connectivity within the broader framework of delta archaeology.

2506. The Port Cities of Krishna Godavari Delta- An Archaeological Search

Authors: Durga Basu (University of Calcutta | Society For Heritage, Archaeology & Management)
Format: Oral

The Krishna–Godavari Delta, located along the eastern coast of India bordering the Bay of Bengal, is an extensive and fertile alluvial region traditionally referred to as the "rice bowl of India." Geologically, the delta is characterized by a complex system of river channels and deltaic formations. Owing to these natural advantages, several port cities emerged within the deltaic landscape of present-day Andhra Pradesh. These ports played a significant role in ancient maritime activities. Archaeological excavations and exploratory surveys along the coastal belt have revealed substantial evidence for the existence of numerous port towns dating to the Early Historic period. Situated in the central sector of India's eastern seaboard, Andhra Pradesh possesses a long-standing maritime tradition facilitated by its navigable rivers and favorable landing points, which supported long-distance oceanic trade across different historical phases. From the Early Historic period onward, traders established both major and minor maritime ports, contributing to the region's economic expansion. Epigraphic records referring to pre-Sātavāhana rulers and various corporate and mercantile organizations further attest to the intensification of economic and trade activities. The present study examines the archaeological context and significance of port cities in the Krishna–Godavari Delta region.

2795. Danube Delta and its Outstanding Universal Value

Authors: Sergiu Musteata („Ion Creanga" Pedagogical State University of Chişinău)
Format: Oral

This paper examines the Danube Delta as a long-term contact zone where environmental dynamics, mobility, and cultural interaction have shaped human occupation across multiple historical periods. Situated at the interface between the lower Danube, the

Black Sea, and the Eurasian steppe, the Delta has historically functioned as a corridor of communication and exchange linking diverse cultural traditions. Archaeological evidence from the region illustrates how communities adapted to a constantly shifting deltaic landscape while maintaining networks of interaction that connected riverine, maritime, and steppe environments. Within the thematic framework Archaeology of Deltas – Across Cultural Traditions, the Danube Delta offers a particularly relevant case study of how dynamic wetland environments generate both cultural diversity and shared strategies of adaptation. Changes in waterways, sedimentation processes, and ecological conditions influenced settlement distribution, subsistence practices, and mobility patterns, shaping long-term cultural landscapes that reflect continuous negotiation between human communities and fragile environments. The presentation places particular emphasis on the concept of Outstanding Universal Value (OUV) and its implications for interpreting and managing the Danube Delta within UNESCO heritage frameworks. Although the site is internationally recognised for its exceptional natural significance, its archaeological record and long-term cultural history remain underrepresented in heritage narratives. By foregrounding the Delta's role as a socio-ecological landscape shaped by interactions across cultural traditions, the paper argues for a more integrated approach that bridges natural and cultural heritage perspectives. Through this comparative analysis, the presentation contributes to broader discussions on cultural landscapes, sustainability, and heritage governance in dynamic environments. It highlights the potential of archaeological research to inform more holistic management strategies and strengthen recognition of deltas as complex heritage systems in which natural processes and cultural histories are deeply intertwined.

2195. Rivers in Motion: Geo-archaeology and Changing Settlement Networks in the Ganga–Brahmaputra Delta of Bengal

Authors: Arabinda Singha Roy (Maulana Abul Kalam Azad University of Technology, West Bengal)
Format: Oral

Deltaic Bengal represents one of the most dynamic human–environment systems in South Asia, where shifting river channels, sedimentation, flooding, and coastline changes have continually reshaped patterns of habitation and mobility. This paper examines how geomorphological processes in the Ganga–Brahmaputra Delta influenced settlement location, economic strategies, and regional connectivity from early historic to medieval times. Drawing on palaeo-channel mapping, sediment studies, satellite imagery, and archaeological site distribution, the study reconstructs former river courses and floodplain zones that structured human occupation. It explores how communities selected elevated levees and inter-fluvial tracts for habitation, adapted agricultural practices to seasonal inundation, and exploited waterways as transport corridors linking inland Bengal with coastal and overseas networks. The paper further argues that environmental instability was not merely a constraint but also a catalyst for cultural interaction. Migrating rivers redirected trade routes, encouraged the rise of new centres, and contributed to the abandonment or burial of others. By comparing Bengal's deltaic record with other global deltas, the study highlights broader patterns of resilience, mobility, and technological response in wetland environments. Through a geo-archaeological lens, the paper positions Bengal's riverine landscape as an active historical agent—one that continuously mediated connectivity, cultural transmission, and long-term settlement planning in eastern India.

2185. Port Cities of Ancient Bengal: Connectivity and Cultural Exchange at Tamralipta and Chandraketugarh

Authors: Debsmita Bonu (University of Calcutta | Heritage Academy High School)
Format: Oral

Ancient Bengal occupied a strategic position between the Bay of Bengal and the riverine highways of eastern India, fostering long-distance exchange networks that connected South Asia with Southeast Asia and the Indian Ocean world. This paper investigates the role of deltaic port-settlements—especially Tamralipta and Chandraketugarh—as nodal points of trade, mobility, and cultural interaction. Combining archaeological evidence such as coins, terracotta plaques, ceramics, beads, and architectural remains with geo-archaeological data on palaeo-estuaries, river migration, and siltation patterns, the study reconstructs the environmental settings that sustained these centres. It examines how tidal channels, distributaries, and sheltered anchorage zones enabled maritime activity, while also assessing how geomorphic change contributed to harbour relocation and eventual decline. The paper situates these Bengal ports within wider trans-regional networks involving Roman, Southeast Asian, and inland Gangetic contacts, arguing that delta landscapes functioned as powerful mediators of intercultural exchange rather than passive backdrops. By foregrounding the interaction between river dynamics and material culture, the study offers a comparative framework for understanding how coastal–deltaic systems across the world generated distinctive urban forms, commercial infrastructures, and hybrid cultural traditions.

268 DECODING THE WETLANDS: NEW METHODS AND MULTIDISCIPLINARY APPROACHES TO WATERLOGGED ARCHAEOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Patricia Vandorpe (IPNA, Universität Basel) – Alexandra Schmidt (Environmental Genomics, Department of Biology, University of Constance) – Cristiano Nicosia (Dipartimento di Geoscienze, Università di Padova) – Ana Smuk (Groningen Institute of Archaeology, Faculty of Arts, University of Groningen)
Keywords: Wetland archaeology, Bioarchaeology, sedaDNA, Methodological innovation
Format: Discussion session

SESSION ABSTRACT

Waterlogged archaeological sites contain unique, detailed data about human activities, the environment and the economy in the past. Their organically rich sediments offer a valuable opportunity to reconstruct the interactions between humans and the environment and thus answer key questions about mobility, subsistence models, use of resources etc. Bioarchaeological methods including archaeobotany, zooarchaeology, palynology and geoarchaeology have a long tradition of being used to study these wetland environments. In this session we would like to explore how combining traditional bioarchaeological methods with emerging sedaDNA techniques (or more general with studies of ancient DNA) can transform our perception of wetland settlements and their surrounding landscapes. The focus of this session is on methodological innovation and the integration of diverse datasets, including archaeobotanical, zooarchaeological, palynological, isotopic, sedimentological and genetic data. Within this interdisciplinary framework, the aim is to evaluate the strengths and limitations of each line of evidence, as well as the associated interpretative challenges. We invite contributions that present methodological advances, interdisciplinary applications, and critical reflections on data integration in the investigation of waterlogged archaeological sites. We also welcome contributions on coherent strategies for integrating complex datasets, as well as on establishing common standards for future research in wetland archaeology.

CONTRIBUTION ABSTRACTS

634. A Story in Multiple Acts: Taking a Multi-Proxy, More-Than-Human Approach to Scotland's Peatland Heritage

Authors: Isobel Harvey (University of Glasgow)
Format: Oral

This paper will present on ongoing doctoral research into the cultural and natural heritage of Scotland's peatlands. The blanket bogs of the Scottish uplands represent a unique resource for examining human-environmental relationships that often lie upslope of the agricultural zone. By going beyond the head-dyke, and using a three part methodology that considers the various attitudes, activities and impacts humans have had in these wetlands, this study hopes to tell a more holistic narrative of people-peatland relationships through time. This paper will examine the initial insights from two field sites where different environmental proxies were used to establish local palaeoecological sequences of the peatlands. The use of coleoptera for an isolated corrie on the slopes of Ben Lawers in the Central Highlands will be compared with the use of pollen for the site of Canna in the Small Isles. This paper will also draw upon more-than-human discourse and Assemblage Theory to situate these ecological proxies within a wider narrative that weaves together people, places, plants and animals. Through this discussion, this paper will demonstrate the importance of these wetlands to a vast array of actors both in the past and the current anthropogenic climate and biodiversity crises.

2044. Methods and Preliminary Results of Archaeozoological and Isotope Analysis from Neolithic Pile-Dwelling Sites at Lake Zug and Lake Zürich (Switzerland)

Authors: Kirsten Scheinberger – Sabine Deschler-Erb – Marguerita Schäfer – Simone Häberle – Renate Ebersbach (IPNA, Universität Basel) – Rouven Turck (Universität Zürich)
Format: Oral

The multidisciplinary project "Deciphering Lakesite Settlements" (funded by the Swiss National Science Foundation, German Research Foundation and Austrian Science Fund) contains various approaches of established bioarchaeology like the study of plant macroremains, palynology and morphological archaeozoology as well as stable isotope analysis and innovative sedimentary ancient DNA (sedaDNA). This interdisciplinary approach not only allows comprehensive research of the late neolithic (Horgen) Lakesite settlement (around 3000 BC) Immensee Dorfplatz at Lake Zug in central Switzerland, but aims to investigate the possibilities and limitations of the individual and combined disciplines. The results of new data from Immensee Dorfplatz will be compared to other Horgen settlements at Lake Zug and the well-studied site Zürich Opèra at Lake Zürich (3176-3160 BC). To achieve this, the project involves experts from four Universities (Basel, CH, Zürich, CH, Konstanz, D Innsbruck, A) as well as the Center for Underwater-/Dendroarchaeology of Zürich, CH. A main aim of this interdisciplinary project is to show the economic concepts of the sites and to establish whether the lakeshore communities were sedentary or highly mobile. The combined archaeozoological and stable isotope analyses are a key part to finding answers to this question and will benefit from constant exchange with the other disciplines to add to the wider picture. The presentation shows the comprehensive strategies and methods of those two disciplines on the faunal remains from the site Immensee Dorfplatz. Furthermore, it addresses the preliminary results that hint to a special role of this settlement which shows in an exceptionally high percentage of game as well as the first data from Immensee Dorfplatz received from sampling teeth from domestic animals.

2175. Human-environment interactions in Neolithic pile-dwelling sites at lakes Zug and Zürich (Switzerland) in light of archaeobotany and sedimentary ancient DNA

Authors: Juliette Elie (IPNA, Universität Basel) – Alexandra Schmidt (Universität Konstanz) – Patricia Vandorpe – Bigna Steiner – Cécile Bettschart (IPNA, Universität Basel) – Laura Epp (Universität Konstanz) – Niels Bleicher (Unterwasserarchäologie und Dendroarchäologie Stadt Zürich) – Örni Akeret (IPNA, Universität Basel)
Format: Oral

The lakeshore settlements of the Alpine foreland are renowned for the exceptional preservation of organic remains, including seeds, fruits, and other botanical macroremains, in waterlogged environments. These conditions provide rare and detailed insights into plant economy, daily life, and landscape management of past human populations. While the potential of these sediments as genetic archives is increasingly recognized, it remains largely underexploited. Ancient DNA from archaeological layers provides a direct window into the human-environment interface of prehistoric life. Within a Weave project, we applied a multidisciplinary approach at two pile-dwelling sites on Lake Zug and Lake Zürich (Switzerland), both dated to the Late Neolithic period. We conducted systematic sampling across different organic layers and combined archaeobotanical analysis with sedimentary ancient DNA (sedaDNA), including multi-marker metabarcoding of eukaryotes in general, plants and selected vertebrate groups. We compared terrestrial and aquatic DNA signals with macroremain assemblages from different archaeological layers within the settlements. This integrated strategy will allow us to assess the respective strengths, weaknesses, and blind spots of both methods, refine the interpretation of (bio)archaeological datasets, and develop standardized protocols for the investigation of waterlogged lakeshore sites.

2238. Pollen and NPPs from Near-Site Sediment Records at the Neolithic Pile-Dwelling Site of Immensee-Dorfplatz (Switzerland)

Authors: Marie-Claire Ries (University of Innsbruck, Department for Archaeology | University of Innsbruck Department of Botany) – Peter Trebsche (University of Innsbruck, Department for Archaeologies) – Laurent Marquer (University of Innsbruck Department of Botany) – Niels Bleicher (Underwaterarchaeology/Dendrolab of City of Zurich)
Format: Oral

Waterlogged lakeshore settlements in peri-Alpine waterscapes provide exceptionally rich archives of past human–environment interactions, yet linking micro-contextual on-site activities with broader landscape-scale processes remains challenging. This study addresses this issue using new high-resolution palaeoenvironmental data from a near-site sediment core recovered adjacent to the Neolithic pile-dwelling settlement of Immensee-Dorfplatz (Lake Zug, Switzerland). This study is part of the interdisciplinary project Deciphering Lakeside Settlements (DeciLak). Vegetation, land-use, and aquatic ecosystem changes during the late 4th and early 3rd millennium BC are reconstructed using pollen and NPP analyses. Regional and extra-local vegetation contemporaneous with settlement occupation are assessed from the near-site lake sediment, whereas local vegetation and site-specific human activities are reconstructed from on-site palynological records. Pollen data assess woodland openness and anthropogenic disturbance, coprophilous fungal spores indicate grazing pressure, and aquatic NPPs together with microcharcoal serve as proxies for trophic shifts and fire activity. The first results of this project aim at showing how comparing proxies—from settlement interiors to the surrounding vegetation mosaic—help to understand the links between on-site activities and a larger landscape. This approach forms the basis for future integrative analyses combining palaeoenvironmental data with archaeobotanical, zooarchaeological, isotopic, and emerging ancient environmental DNA evidence.

2293. New Insights from the Alpe-Adria Lakes: Absolute Dating and Interdisciplinary Research at the Prehistoric Pile-Dwelling Site Kapuzinerinsel (Lake Wörthersee, Austria)

Authors: Marie-Claire Ries (University of Innsbruck, Department for Archaeologies)
Format: Poster

Southern Austria's lakescapes offer significant potential for studying early settlement development and long-term human–environment interactions. The Klagenfurt Basin in Carinthia comprises numerous lakes and wetlands of high archaeological relevance; however, key periods such as the emergence of sedentary lifeways and early metallurgy at the onset of the Copper Age remain poorly understood in this region. Recent underwater archaeological investigations led to the discovery of a previously unknown, multiphase insular pile-dwelling site at Kapuzinerinsel in Lake Wörthersee. Dense pile fields and well-preserved waterlogged remains dating to the 4th millennium BC were documented, including material associated with the Kanzianiberg–Lasinja complex and communities producing furrowed-incised pottery. Systematic excavations in 2024 recorded and sampled more than 100 wooden piles and associated stratigraphic features. These remains provide the basis for high-resolution dendrochronological and radiocarbon dating, alongside detailed material culture analyses that refine site phasing and settlement organisation. Ongoing interdisciplinary research integrates palaeoenvironmental and biomolecular approaches, including ancient DNA from plant remains, to reconstruct subsistence strategies and local environmental conditions. At the same time, alarming levels of erosion underscore the vulnerability of this site. Investigations at Kapuzinerinsel fill a major chronological gap and anchor an eastern Alpine site more firmly in the European pile-dwelling research network.

270 TRACKING STONES, TRACING STORIES: PROVENANCE, SUPPLY CHAINS AND DAILY LIFE IN ANCIENT QUARRIES

Theme: 1. Widening perspectives in material culture studies
Organisers: Caterina Previato – Simone Dilaria (University of Padua) – Anna Gutiérrez Garcia-Moreno (Institut Català d'Arqueologia Clàssica) – Daniel Diffendale (Scuola Normale Superiore di Pisa)
Keywords: Stone quarries, Stone provenance, Stone supply chains, Stoneworkers, Daily life
Format: Session with keynote presentation

SESSION ABSTRACT

One of the most recognizable materials in the archaeological record is stone. From well-established studies of lithic resources catchment in prehistoric times to the use of the finest marbles in antiquity and beyond, stone has long caught the attention of scholars. In recent years, our knowledge of the first phases of stone supply in ancient societies has grown extensively. This session focuses on two aspects of these early stages in the supply chain, first, identifying the place of origin of stone by means of geoarchaeological provenance analyses, and second, the experience of those who worked in quarries, not just during the extraction of stone but in all aspects of their daily life. The first sub-session focuses on the provenance of stone materials, whether used for construction or artefacts, by presenting case studies, methodological challenges, and analytical approaches applied to the identification of lithic sources in archaeology. Contributions addressing these topics are welcome, ranging from site-specific case studies to methodological and analytical advancements. The second sub-session hosts contributions aimed at reconstructing the inner organization of and life in ancient stone quarries based on data deriving mainly from archaeological excavation and ethnographic parallels. The focus is on shelters, infrastructure, worship sites and other material evidence (ceramics, tools, epigraphy, ecofacts, etc.) related to the daily life of stoneworkers in quarries. Contributions that meaningfully incorporate both of these approaches are also welcome.

CONTRIBUTION ABSTRACTS

2761. Keynote: Can We Identify Marble Provenance Without Ancient Quarries? Methodological Limits and Analytical Possibilities

Authors: Vasiliki Anevlavi (National Hellenic Research Foundation, Greece | Austrian Archaeological Institute, Austrian Academy of Sciences)
Format: Oral

Provenance studies of ancient stone have traditionally relied on the identification and sampling of archaeologically attested quarries. Yet in many cases such quarries remain unknown. In prehistoric contexts, organised extraction sites are rarely preserved or recognisable, while in later periods, including the Roman era, despite the extensive use of marble, the precise sources often remain uncertain or speculative. Moreover, modern exploitation has frequently destroyed or obscured ancient quarry landscapes. How, then, can we meaningfully identify the origin of raw materials when the quarry itself is archaeologically invisible? This keynote proposes a reverse methodological approach to stone provenance. Rather than beginning with known quarries and matching artefacts to them, the analysis starts from the artefacts and expands outward to the geological landscape. Systematic investigation of regional marble formations and sampling of modern extraction fronts within broader lithological provinces allow the construction of comparative reference datasets independent of securely identified ancient quarry sites. Multi-proxy archaeometric analysis, combining petrography, stable carbon and oxygen isotope ratios, and trace element geochemistry, enables the definition of geological signatures at the level of formations or micro-regions. Statistical clustering and comparative modelling permit the assignment of artefacts not necessarily to a single quarry, but to a specific geological zone. When artefacts are securely dated, provenance attribution acquires a chronological dimension: materials assigned to previously undocumented geological areas may indicate phases of exploitation that are not archaeologically visible in the landscape/region. In this way, dated objects become chronological anchors for reconstructing extraction histories. The absence of visible quarries should therefore be understood not as a limitation, but as an opportunity to rethink provenance methodology. The case study of Roman inland Thrace (present-day Bulgaria) demonstrates the potential of this approach for reconstructing lost extraction landscapes and refining our understanding of stone supply systems from prehistory to antiquity.

2747. Polished stone implements from the Baradla Cave, Hungary

Authors: Erika Kereskényi (National Institute of Archaeology, Hungarian National Museum) – Béla Fehér (Department of Mineralogy, Herman Ottó Museum) – Ferenc Kristály (Institute of Exploration Geosciences, Miskolc University) – Veronika Szilágyi – Zsolt Kasztovszky (Budapest Neutron Centre, HUN-REN Centre for Energy Research) – György Szakmány (Department of Petrology and Geochemistry, Eötvös Loránd University)
Format: Oral

The Baradla Cave, located in northern Hungary, has been settled since prehistoric times and was repeatedly used by human communities as a temporary dwelling, refuge, and possibly as a place for ritual activities. Archaeometric investigations at the cave have revealed 20 polished stone tools made from various raw materials. Most of the polished implements are flat chisels therefore we presume that they belong to the Bükk culture, Middle Neolithic period. Regarding the sandstone curved hoe, the limestone handstone and basalt polished stone tools, their shape do not fit exclusively to the Neolithic era, they might also date from the Late Bronze period of time. The analysed artefacts are inventoried in three institutional collections: the Herman Ottó Museum (Miskolc), the Institute of Archaeological Sciences of Eötvös Loránd University, and the Hungarian National Museum (Budapest). All mineralogical and geochemical analyses were carried out using non-destructive methods. Mineral-chemical investigations were performed by electron microprobe analysis on the original surfaces of the tools. Most specimens were analysed by X-ray diffraction, while

bulk rock chemistry was determined using Prompt Gamma Activation Analysis. Eight lithological types were identified. The most frequent raw material is blueschist, represented by eight stone adzes. Four tools were classified as contact metabasite, four as greenschist–amphibolite, while serpentinite, sandstone, limestone, and volcanic rock occur as single ones. The blueschist tools contain glaucophane-bearing assemblages and record polyphase metamorphism. The most possible provenance is the nearby Bórka Unit in Slovakia. Contact metabasites represent long-distance raw materials derived from the Bohemian Massif, reflecting wide-ranging exchange networks within the Carpathian Basin and beyond. The mineral assemblages, textural features, and metamorphic characteristics of the greenschist–amphibolite tools point to the Western Carpathians as the most likely source area. Provenance determination of serpentinite, basalt, sandstone and limestone adzes remains uncertain due to limited diagnostic features.

726. Building stones of the Archaic sanctuary on Despotiko Island (Greece): geoarchaeological insights into expedient exploitation of variable local rock resources

Authors: Erich Draganits (University of Vienna)
Format: Oral

The islands in the Aegean Sea are stony, and rocks are easily accessible in many areas. Although there are many studies about properties and provenance of (white) marble from a few large quarry areas, other rock types and less important quarry locations are understudied. In this geoarchaeological research, we investigate building stones of the Archaic sanctuary on the island of Despotiko (central Cyclades), combined with a survey of quarries on the island and surrounding islands. Eleven different rock types have been recorded in the main building of the archaic sanctuary: white mylonitic gneiss, medium-grained white calcitic marble, coarse-grained white calcitic marble, grey orthogneiss and calcrete are common lithologies, while Pleistocene eolianite, pegmatitic gneiss, grey banded calcitic marble, dolomitic marble, rhyolite and mica schist are rare. With exception of the coarse-grained white calcitic marble, all rock types can be found on the island. Despite the small size of Despotiko and Tsimitiri, 17 quarries/rock extractions have been documented in 7 different areas on both islands. Excluding three small eolianite quarries in southern Despotiko, as well as the 4 small white mylonitic gneiss quarries southeast of Panagia chapel, all other quarries are situated within 420 to 880 m distance from the sanctuary. Unambiguous quarrying traces are very rare, because in most cases rocks most likely have been loosened along tectonic fractures and foliation, without leaving clear traces. This study shows that in the main building of the archaic sanctuary most building stones probably originate from small-scale quarrying of local sources. The only exception are the largest building stones (e.g. thresholds, columns, architraves, friezes and geisa), which are made from coarse-grained white calcitic marble, which does not occur on Despotiko. The existence of this high number of small quarries is interpreted that expedient use of nearby sources dominated the rock extraction during several periods.

1822. Quarrying and stone procurement at Rudiae (Lecce, Italy): evidence from the Messapian city walls and the Roman amphitheatre

Authors: Nicoletta Di Benedetto – Giuseppe Scardozzi (CNR-ISPC, Lecce) – Emma Cantisani (CNR-ISPC, Firenze)
Format: Oral

This contribution investigates quarrying and stone procurement at Rudiae (Lecce, Italy) through two major monuments from different periods: the Messapian city walls (4th century BCE) and the Roman amphitheatre (1st–2nd century CE). These large-scale building projects had a major impact on the exploitation of local natural resources. The Messapian fortifications were built predominantly with large blocks of local calcarenite attributable to the Calcareniti del Salento Formation, a lithotype available in the immediate vicinity of the city. Quarry areas around Rudiae–exploited from antiquity into modern times–provided an accessible supply that strongly conditioned construction choices, reflecting a procurement logic primarily driven by proximity, efficiency, and structural requirements. The amphitheatre, by contrast, reveals a more articulated selection of materials. While calcarenite was employed for several structural components, other elements–especially decorative features and high-status architectural details–were executed in pietra leccese, a more valued calcarenite historically preferred for prestigious architectural elements and sculpture. The nearest sources of pietra leccese lie approximately 1.5 km north-west of the site, implying a deliberate procurement choice that goes beyond purely functional and logistical considerations. Overall, the evidence points to a shift from predominantly local, convenience-based supply for the Messapian defences to a Roman-period strategy that integrates aesthetic aims with construction needs, offering new insights into changing supply chains and building practices at Rudiae.

1325. Marble in Roman epigraphy at the centre of the Mediterranean: data from Sicily

Authors: Alessia Coccato (University of Oxford) – Germana Barone – Paolo Mazzoleni (University of Catania) – Jonathan Prag (University of Oxford) – Devi Taelman (Vrije Universiteit Brussel)
Format: Oral

Despite stone being one of the most widely used epigraphic supports – or at least the one that survives most frequently – the material properties and geological provenance of inscribed monuments have rarely been integrated into epigraphic interpretation. This paper addresses this gap by examining the use of marble in Roman inscriptions from Sicily as part of a wider Mediterranean production and exchange network. The study forms part of the Crossreads project (ERC, H2020, GA No. 885040), which combines epigraphic studies with data from different disciplines, including petrography. Within Crossreads, the precise identification of rocks and therefore of their provenance becomes part of an interdisciplinary discussion investigating on the one hand the exploitation

of Sicilian rocks through time and on the other the long-distance trade routes involving Sicily in antiquity. A corpus of inscribed marbles from archaeological contexts across Sicily has been analysed systematically using a non-destructive protocol (pXRF and digital microscopy), complemented by targeted micro-destructive laboratory techniques (XRD, thin-section petrography, isotopic analysis, etc.) to assess their probable quarry sources. The results allow the identification of multiple marble varieties, revealing patterns in the selection of imported marble across different periods and epigraphic contexts. By situating these findings within recent quantitative and diachronic studies on Roman marble trade, the paper explores the interpretive potential and methodological challenges of systematic geology-derived analytical methods in epigraphy. By integrating material provenance into epigraphic analysis, Crossreads offers new insights into economic, cultural, and social history of Sicily and the Mediterranean in Roman times.

22. Living, working, and praying in newly discovered or re-discovered rock-cut sites of Messinia in the Peloponnese, Southern Greece

Authors: Sophia Germanidou (Hellenic Ministry of Cutlure)
Format: Oral

Rock-cut sites in the Peloponnese, southern Greece, are limited in number and have not been thoroughly investigated, or are still undiscovered. In this paper, I will share preliminary survey results from four such sites in the Messinia province: Drosopigi near Mila (central region), Agios Onoufrios in Methoni (in the SW), and Pyrgos and Kampinari (in the district of the Outer Mani peninsula). The sites are particularly distinct because, additionally, they served combined agro-pastoral, religious, and residential purposes. In this paper, I will talk about several issues on these archaeological sites, including: a) the environmental setting, particularly their direct connection to quarries and their access to water—whether natural or artificial, b) their hewn micro-structural features, such as multiple niches, mangers, and presses, c) evidence of their religious use, whether pagan or Christian, d) their topography, which may involve positioning that remains "hidden" yet effectively oversees settlements, passages and harbors. A further aim of this research is to explore the experiences of the people who worked, lived, and expressed their faith in these multi-functional yet marginal "hubs," thereby addressing issues related to the session's second sub-topic: tool marks in the rock-cut sites and the adjacent quarries; stone remains of micro-industrial operation; evidence of cult or funerary practices such as Byzantine paintings, crosses, tombs.

1811. Mount Altesina: Quarrying Practices and the Construction of a Ritual Landscape

Authors: Giuseppe Labisi – Anna Caiozzo (University of Orléans) – Simona Raneri (University of Florence) – Vito Trecarichi (Independent)
Format: Oral

This paper presents the results of the most recent archaeological investigations conducted at Mount Altesina, where ongoing excavations are directed by G. Labisi. The November 2025 campaign focused on the summit area of the mountain, characterised by a cave and a rock-cut architectural complex dated to the Classical period (6th–1st century BCE), interpreted as a place of worship connected with the cult of water and subsequently reused during the early Middle Ages. The structures rest directly on bedrock that was deliberately shaped and the mountain itself served as the quarry for their construction. The contribution examines the quarrying practices employed at Mount Altesina and their role in transforming the natural rocky outcrop into a cultic landscape. Particular attention is paid to the technical relationship between extraction marks, architectural features, and the geomorphology of the summit area, highlighting how quarrying was not merely functional but integral to the creation and long-term reuse of the site. The paper also considers the geological and geomorphological characteristics of the mountain which conditioned both the extraction strategies and the spatial organisation of the sanctuary. The contribution aligns with the session's focus on provenance, quarry organisation, and lived experience in extraction contexts, offering a site-based case study that combines material sourcing, cult practice, and diachronic reuse.

2130. Quarries, Coastlines, and Sea Routes: Stone Extraction and Maritime Supply Networks on the Karaburun Peninsula (Albania)

Authors: Krist Anastasi (Laboratory HiSoMA, University Lumière Lyon 2) – Adrian Anastasi (National Institute of Archaeology - Academy of Sciences of Albania)
Format: Oral

This contribution presents the results of three years of archaeological and geoarchaeological research focused on stone extraction and supply networks on the Karaburun Peninsula (southern Albania), an area characterized by the presence of major ancient quarries and strategic maritime routes. The study concentrates on three quarry areas: two large extraction zones in the area locally known as Mermeri and a third quarry located on the outer western side of the peninsula, within the Bay of Grama. All three sites preserve extensive evidence of extraction activities, including quarry faces, tool marks, and block detachment surfaces. It is hypothesized that their exploitation began in the early fourth century BC. The methodological approach is based on petrographic analyses carried out on stone samples collected from quarry blocks, from three altars dating to the Classical period, and from architectural structures and fortifications of major ancient coastal centers of the Hellenistic period, including Dyrrachium, Apollonia, Treporti, and Oricum. Comparative petrographic results demonstrate clear material correspondences, providing strong evidence for organized maritime transport of stone from Karaburun to these urban centres. In addition to extraction evidence, the quarry landscapes reveal features related to logistics and daily activity, such as loading areas adapted to local and prevailing wind conditions. The Bay

of Grama represents a particularly complex context, functioning not only as a quarry and anchorage point but also as a significant ancient sanctuary, as indicated by its numerous inscriptions. By integrating provenance studies with archaeological evidence from quarry landscapes, this contribution reconstructs stone supply chains and highlights the multi-functional character of quarry sites within ancient coastal and maritime systems.

1843. Worship in the quarry: evidence from Hierapolis in Phrygia (Turkey)

Authors: Francesca Di Palma – Giuseppe Scardozzi (National Research Council of Italy - Institute of Heritage Science CNR ISPC)
Format: Oral

In the Yokuşyol district of Pamukkale (Denizli, Turkey), near the ancient city of Hierapolis in Phrygia, a quarry face exploited for calcite alabaster extraction has been documented. The trench measures 32.5 m in length, 5 m in depth, and up to 2 m in width, oriented along a north-west/south-east axis. On its eastern side, a substantial outcrop of polychromatic breccia is visible, which was also partially quarried in antiquity. This context lies within the territory of Hierapolis, where extractive activities are associated with high-quality lithic materials. The contribution focuses on a relief carved into the eastern wall of the quarry, near its north-western entrance, extant until 2005 and subsequently removed by unknown parties. The relief, roughly rectangular (65 × 90 cm) and set within a shallow recess of about 5 cm, can be broadly dated to the Roman Imperial period. Despite partial erosion, three deities are identifiable: at the centre, Apollo Citharoedus, clad in a long chiton; to his right, Artemis Ephesia; and to his left, Heracles, depicted performing the gesture of dexíosis with Apollo. The iconography aligns closely with the local pantheon, as documented in monumental reliefs and coinage of Hierapolis from the 1st to the 3rd centuries AD. The presence of the relief within an extractive context allows reflection on the role of quarries as sites of cultic activity. Comparisons with ritual practice in Roman quarries suggest that the Yokuşyol quarry face may have combined productive and religious functions. The depiction of Heracles may be associated with the cult of Hercules Saxanus, attested in extractive contexts in Italy, the Western provinces, and the Aegean, while evidence from Asia Minor is comparatively limited. The Yokuşyol relief represents a rare example of the sacralisation of a quarry space in Roman Asia Minor, indicating interplay between economic activity and ritual expression.

797. Late Antique and Early Medieval stonemason workshops and quarries in Northern Dalmatia – new data from Galovac

Authors: Ana Maričić (University of Zagreb Faculty of Mining, Geology and Petroleum Engineering) – Mirja Jarak (University of Zagreb Faculty of Humanities and Social Sciences) – Ante Uglešić – Tomislav Fabijanić (University of Zadar, Department of archaeology) – Ivo Ćevid (University of Zagreb Faculty of Humanities and Social Sciences)
Format: Oral

The paper presents results of the petrographic analyses of stone monuments in the frame of the Croatian Science Foundation project „ The 8th and 9th century workshop production and imports at the territory of Northern Dalmatia“. The project includes research into church furniture and architectonic sculpture from the locality Galovac in the Zadar hinterland. The stone monuments from Galovac belong to three different phases: the 1st is from the Late Antiquity (6th century), the 2nd from the 8th and the 3rd from the middle of the 9th century. The paper includes the results of examination of the stone monuments from the first two phases (Late Antiquity and the 8th century), while the research into monuments from the 9th century has been planned in 2027. The goal of the project research is a better knowledge of the origin of limestone used for the sculptural monuments of the church building in Galovac. With regard to different styles of stone monuments, a recognition of quarries from which stone material originates could throw some light on stonemason workshops during Late Antiquity and the Early Middle Ages in Zadar and surroundings. A closer determination of stone material could suggest some differences in supply policy of the Zadar workshops during the periods under study. Petrographic analyses have included samples taken from stone sculpture of different phases and from quarries, especially from the quarries on the Zadar islands.

274 HERITAGE CROSSROADS: THE ETHICS AND POLITICS OF RESONANT PASTS

Theme: 3. Museums and cultural heritage in the era of ‘permacrisis’
Organisers: Andreas Pantazatos (University of Cambridge) – Helaine Silverman (University of Illinois Urbana-Champaign)
Keywords: ethics, politics, dissonance, heritage, legacy, museums
Format: Session with keynote presentation

SESSION ABSTRACT

A definitive feature of heritage institutions, broadly construed, in times of the so-called permacrisis is the demand for rapid responses to future conditions of perpetuating uncertainty. From the protection of heritage in violent conflict zones to the role of heritage institutions in identity building, post-colonial discourse and epistemic justice, these responses shape our relationship with the past and affect our lives. Hence, heritage is inextricably related to ethics and politics. Two realms that concern the impact of our actions

onto significant others and decision making that help us living together. The aim of this session is to initiate a dialogue between heritage, ethics and politics focusing on the consultative role of ethics and politics beyond dilemmas and hard cases. The proposed dialogue becomes viable if we allow space for the fluid nature of heritage in our ethical reflections and our political deliberations as we engage with the different stages of the heritage-making process. The session addresses, but it is not limited to, the following questions: • How do our conceptual tools in ethics and/or politics engage with heritage management in the permacrisis era? • How do we understand the role of ethics and/or politics in heritage institutions that need to respond to the demands of decolonisation? • What are the ethical and political demands of identity building for heritage institutions such as museums in times of political polarisation in Europe and beyond? • How do we engage with the ethical and political pressures of the legacy of cultural and environmental heritage disasters (such as violent conflict and natural disasters)? • How could heritage practitioners respond to the ethical needs and political demands of communities who live with difficult pasts?

CONTRIBUTION ABSTRACTS

2801. Keynote: Caring encounters: Understanding, care, and the heritage of the Leros Psychiatric Hospital

Authors: Andreas Pantazatos (University of Cambridge)
Format: Oral

Scholars recognise and advocate a relationship between heritage and ethics, but what is the heritage-making process, and how do the relationships work? I address this problem in three ways. First, I draw upon the oral history project I have conducted on the island of Leros in Greece, focusing on the heritage of the psychiatric hospital there in terms of the architectural, emotional, and social traces that have been left on Leros residents. Leros’ hospital has a multi-layered heritage whose ethical conundra have arisen through the heritage-making process. Second, theoretically, the dramatic case of Leros invites us to distinguish between interpretation and understanding. I argue that the latter is a prerequisite of the former. I highlight that lack of sufficient understanding leads to misapprehension of what is selected for interpretation, and this therefore undermines the significance of what is transmitted, as heritage, to the future. If heritage interpretation is about revealing relationships with the past, then lack of sufficient understanding can conceal who the significant other(s) are who might be harmed or benefitted during the heritage-making process. Third, I propose adoption of an informed ethics of care, which will provide the needed framework for helping us to navigate the ethical considerations that arise in heritage making overall. The ethics of care is rooted in the human capacity to form relationships with others and with the environment.

2802. Keynote: Anticipating loss, again: Exploring the ethical implications of the dialectical relationship between heritage and risk perception

Authors: Dacia Viejo Rose (University of Cambridge)
Format: Oral

Central to the idea of heritage is the need for it to be protected, which suggests the question: What does it need to be protected from? How we answer this is critical to informing safeguarding strategies for heritage and ethical considerations. The relationship between heritage and perceived risk has a dense history. It is also a productive dialectic through which our understanding of heritage and the challenges we face as societies mutually inform and shape one another. Since sociologist Ulrich Beck theorised about ‘the risk society’, we have seen a growing crescendo in crisis reporting. Has the perception of an ever-larger number of risks spurred a growth in the number of heritages we feel need to be protected? Has it changed our appreciation of what counts as heritage? This chapter addresses these questions by exploring the social aspects of risk as they relate to heritage. To do so, it brings in research on risk from various disciplines to focus on notions of fragility, transmission and the implications for heritage ethics, including the consequences of ingrained ways of responding to perceived risks, often in scenarios marked by a sense of emergency and urgency. To conclude, this contribution will propose an alternative approach to making ethical decisions about heritage in relation to risk.

2690. Heritage in/of/and Exception: Disaster, Risk and the Normalization of Crisis in the Aftermath of the 2023 Turkish Syrian Earthquakes

Authors: Ladin Akcacioglu (University of Cambridge)
Format: Oral

In the aftermath of the 2023 Turkish-Syrian earthquakes, this presentation explores the political dynamics of heritage management in the historic city of Antakya in southernmost Turkey and asks: what does it mean to “safeguard” heritage when its governance renders crisis a permanent and persistent condition of everyday life? In providing a historically grounded analysis of the recent earthquakes, the presentation aims to situate the 2023 earthquakes within the broader legacies of authoritarian emergency rule in contemporary Turkey. As an authoritarian mode of governance, ruling through exception can help to maintain control, assert authority, and, at times, legitimize state violence. Central to the argument is the awareness that whether some interventions appear to be political or politically neutral depends on epistemic positionality. When disaster risk is calculated solely on the basis of the destructive impact of physical hazards, risk-reduction strategies appear to be politically neutral, scientifically necessary interventions. There are two interconnected logics of exceptionality at play in such circumstances: the exceptionality of heritage value, in which heritage protection is framed as a moral responsibility. Here, the assumed neutrality and vulnerability of heritage simultaneously

help to conceal how heritage can be weaponized as a resource of political power. Finally, the exceptional nature of disasters, which obscures how post-disaster heritage governance reinforces the systemic vulnerabilities that transformed natural hazards into disasters in the first place.

236. State-driven Restitutions: Their Ethics and Politics, through Case Studies from the Spanish Civil War

Authors: Maria Ruigomez Eraso (University of Cambridge)
Format: Oral

Heritage restitution has become one of the most visible ethical museological responses to institutions' legacies of extraction. In this context, they are often framed as mechanisms of repair, or reconciliation, and even as a tool for decolonisation. What is often highlighted in these debates is the importance of restitution for transitional justice, the potential of an act of return for healing, and the need for reparations. However, research has focused less on the reasons why states decide to restitute proactively. This paper will draw on ongoing PhD research to examine restitution as a performative practice through which states actively reconstruct their relationship to resonant pasts. I will focus on how, in Spain, restitution acts of objects displaced during the Spanish Civil War are mobilised to produce specific narratives on the past. The paper asks: what values are prioritised in these restitution processes, who is authorised to speak for the past, and how does it shape collective memory in the present?

966. The Affective Aesthetics of Greek Marble: from Archaeopolitics to Artistic Cognition and Craftivism

Authors: Isavella Voulgareli (University of Cambridge)
Format: Oral

In recent decades, heritage scholarship has approached politics through questions of (mis)recognition and contestation over value. However, such work tends to highlight moments of formal decision making. What remains underexplored is ethical–political praxis at the mundane level. Drawing on the case of marble craftsmanship on the Cycladic Island of Tinos in Greece, I aim to investigate how ethics and politics are (re)enacted through micro-relations in heritage practice. Tinian marble craftsmanship (from 1662-1664 CE onward) has been mobilised to link ancient Greece (until 146 BCE) and the modern Greek state (est. 1832 CE). After the end of Ottoman rule, marble craftsmen from Tinos were brought in to rebuild the new capital (Athens) at the moment of national constitution. This act embedded invalid claims of uninterrupted transmission between past and present into the neoclassical architectural fabric of the state. Such ideological positions have since been reactivated at turbulent times (under authoritarian regimes, in subsequent folklorist revivals, and within resurgent far-right discourses), demonstrating how the craft operates as an archaeopolitical mechanism. Hence, it is in negotiation with these established tendencies that modern practice unfolds. I divide the paper into two sections. First, I examine how local practitioners introduce experimental methods that unsettle material assumptions in marble work. While this reorientation opens up alternative possibilities for the craft as an artistic medium, it also produces distinct forms of dissonance. Uneven distributions of power persist, with particular aesthetics of craft considered superior. Second, I address craftivism on the island in relation to the artistic shift of the practice. In this context, craftivism reworks relations of care between humans and non-human tools, technologies and environments. I emphasise that such small-scale activities enable material-affective attachments that stretch traditional perceptions of resistance and therefore transform ethical and political coalitions in heritage practice.

2705. Heritage-Making and Imaginary Governance: The Case of China's National Archaeological Site Parks

Authors: Junting Lyu (University of Cambridge)
Format: Oral

In the face of the permacrisis, how heritage institutions respond to ongoing challenges and increasing instability has become a critical issue. This paper draws on social imaginaries-the background frameworks through which communities make sense of their social existence-as a theoretical lens for examining heritage-making. It proposes rethinking heritage-making as a form of imaginary governance, through which collective ideals, future visions, and social expectations are organised and mediated. This study examines the consultative role of ethics and politics in heritage practices by focusing on how heritage institutions mediate social expectations amid processes of identity formation and ongoing social transformation. It argues that heritage institutions operate as expectation-mediating mechanisms across everyday, institutional, and national scales, embedding and enacting ethical and political positions within heritage landscapes. Empirically, the paper draws on China's National Archaeological Site Parks (NASP) project as a case to demonstrate how imaginary governance operates through institutional forms and unfolds in everyday settings. By examining both the policy framework and heritage practices of selected NASP sites, the paper shows how particular ways of perceiving the past and understanding contemporary identities are institutionally configured and embedded in everyday landscapes through heritage-making processes, thereby shaping how collective futures are imagined.

1746. Copyright as Heritage-Making: Ethical Responsibility in the Digital Museum

Authors: Porin Šćukanec Rezniček – Matko Gospodnetić (Archaeological Museum in Zagreb)
Format: Poster

Museums increasingly operate at the sensitive intersection of cultural heritage preservation, digital accessibility, and ethical stewardship. In the context of the ongoing permacrisis – marked by accelerated digitalisation, institutional precarity, and competing demands for openness – the dissemination of collections through online platforms has transformed the protection of authors' rights from a purely administrative task into a significant ethical and political responsibility. This poster explores the challenges of copyright management in museums, focusing on the balance between public access and the rights of creators within the framework of Heritage Crossroads. It examines key risk areas intensified by the digital turn, including the digitisation of legacy archives, open-access policies, and the ethical use of documentation. Through selected case studies, the contribution highlights how proactive rights management – via transparent licensing practices and internal ethical guidelines – functions as a form of institutional decision-making within the heritage-making process. Ultimately, the poster argues that navigating copyright is not merely a legal requirement but a fundamental ethical and political obligation. In the context of resonant pasts, copyright management shapes how heritage is made visible, interpreted, and shared, and is therefore essential for maintaining trust between cultural institutions, creators, and the public. Responsible approaches to copyright ensure that the transformation of legacy data into digital heritage experiences remains both ethically grounded and socially accountable.

275 ARCHAEOBOTANY MEETS HISTORICAL ARCHAEOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Daniel Fuks (Ben-Gurion University of the Negev) – João Tereso (University of Porto) – Ali Caimi (University College London)
Keywords: historical archaeology, archaeobotany, history, agriculture, crops, food
Format: Regular session
Affiliation: Crop History Community

SESSION ABSTRACT

Historical archaeology offers the prospect of comparing historical and archaeological records, exploring the instances and reasons for their mutual reinforcement or disagreement, and thus attaining more detailed, nuanced understandings of the past. Such prospects are high in the study of agricultural history, as exemplified by numerous historical archaeological studies of agricultural installations, landscapes and plant remains, alongside textual and iconographic evidence. However, with the development of archaeobotany, and its increasing application to historical (as opposed to prehistoric) periods, integration of these sources has not kept pace. For example, the original studies of transformations like the Columbian Exchange, the Islamic Green Revolution, and Roman Agricultural Diffusion were conducted by historians before archaeobotanical evidence was widely available for these periods. Today, many archaeobotanical studies abound but relatively few historians work on textual evidence for the agricultural crops and practices that form the basis of these phenomena. This session aims to encourage multidisciplinary integration by inviting proposals that combine any or all the following types of sources: archaeobotany, historical-archaeological studies, textual and iconographic evidence. Papers may focus on a particular crop plant, a series of crops, agricultural practices, or a combination thereof. Both specific case studies and broader syntheses are welcome.

CONTRIBUTION ABSTRACTS

438. Moving plants in the 1st millennium CE Mediterranean and Middle East

Authors: Daniel Fuks (Ben-Gurion University of the Negev)
Format: Oral

One of the more interesting and debated topics in agricultural history is the Islamic Green Revolution thesis (IGR), discussed by scholars for decades. The counterpoint to the IGR is Roman Agricultural Diffusion (RAD), long appreciated by Greco-Roman historians and more recently by archaeobotanists. Most recently, a recent special issue of Vegetation History and Archaeobotany sheds light on these phenomena through several regional archaeobotanical and historical syntheses covering much of the Mediterranean, Middle East and beyond. Collectively, this body of work demonstrates that the first millennium CE was totally unprecedented in the long-term history of agriculture in terms of the number of new crop introductions. Although some new introductions had major impacts in some regions, most did not replace familiar staple crops, supporting a gradualist model of crop diffusion. Methodologically, the richness of the textual record and its relationship to the archaeobotanical record indicates high potential for synergies between these key sources on ancient plants.

179. Identify Chinese bottle gourd and its useful relatives through phytolith analysis

Authors: Yong Ge (Institute of Vertebrate Paleontology and Paleoanthropology)
Format: Oral

Chinese bottle gourd is one of the most useful Cucurbitaceae plants in the world, especially in China, as it is both useful as a container, and also has blessing meanings. However, such plant remains are uncommon in archaeological contexts, similar to other famous plants: common in historical textile records but rarely seen. So we are seeking a new way to evidence their presence: to use phytolith

analysis. Phytoliths are more likely to be preserved than soft plant tissues in archaeological contexts due to their inorganic nature, and we have found that Chinese bottle gourd and its useful relatives all produce diagnostic morphotypes in the rind, which can be distinctly discriminated from phytoliths produced in leaves and veins. The spheroidal scalloped phytoliths are the main type of the rind, while acute, polygonal, tracheid phytoliths are the main types of the leaves and veins. The spheroidal scalloped phytoliths showed size variance in different plants, which could further help in a more precise identification. Our study showed the potential of phytolith analysis in understanding the history of formerly uncommon plants in archaeobotanical studies.

1624. Plants, Texts, and Practice in Al-Andalus: Integrating Archaeobotanical, Legal and Agronomic Sources

Authors: Leonor Peña-Chocarro – Josep Suñé-Arce (Instituto de Historia, CSIC) – Antonio Peralta-Gómez (Instituto de Historia, CSIC | University of Granada)
Format: Oral

This paper explores the integration of archaeobotanical data with legal and agronomic historical sources to deepen our understanding of plant use in Al-Andalus (the Muslim-ruled territory of the Iberian Peninsula). While historians have traditionally focused on textual records and archaeologists have often overlooked archaeobotanical evidence, combining these approaches allows for a more nuanced reconstruction of past practices. Drawing on novel plant remains recovered through the MEDAPP project and a carefully selected corpus of legal and agronomic texts, we examine which species were cultivated, consumed, and valued in medieval Iberian societies. By systematically comparing material and textual evidence, we can identify both correspondences and discrepancies, revealing patterns of cultivation, dietary practices, and economic and social significance that neither source alone could fully illuminate. This interdisciplinary methodology demonstrates the complementarity of archaeobotany and historical written sources, offering fresh insights into everyday life, agricultural management, and plant-related practices in Al-Andalus, and highlighting the broader potential of combining plant remains and textual sources in archaeological research.

2079. Texts and archaeobotany: the case of fruit trees in early medieval North-West Iberia (10th-11th centuries)

Authors: María Valero-Rodríguez (Instituto de Historia, CSIC | Universidad Autónoma de Madrid) – Antonio Peralta-Gómez (Instituto de Historia, CSIC | Universidad de Granada) – Julio Escalona – Leonor Peña-Chocarro (Instituto de Historia, CSIC)
Format: Oral

This paper examines the presence, management and use of fruit trees in North-West Iberia during the Early Middle Ages (10th-11th centuries), through an interdisciplinary approach that combines the information derived from archaeobotany with that of Latin texts. On the one hand, the study primarily focuses on notarial records of property transfers -such as donations, sales, and exchanges-, in which fruit trees are cited as a common feature of the agricultural landscape. These texts make it possible to identify the main species, and to envisage how they were integrated in the landscape -their distribution, economic value, etc. They are, though, not free from biases derived from the very nature of those legal records. On the other hand, archaeobotanical data provide an alternative view of fruit-tree cultivation. By comparing these two data sets an integrated, more complex view emerges that boosts our understanding of agricultural practice and social dynamics associated in early medieval North-West Iberia.

1846. Reassessing Medieval Crop History through Archaeobotany and Documentary Sources: rural communities and nobilty in Central Portugal

Authors: Catarina Magalhães (CITCEM, Center for Transdisciplinary Research Culture, Space & Memory, U. Porto) – Luís Seabra (ISEM, Université de Montpellier, CNRS, IRD, Montpellier | CIBIO, Centro de Investigação em Biodiversidade e Recursos Genéticos | BIOPOLIS Program in Genomics, Biodiversity and Land Planning) – João Tereso – Catarina Tente (NOVA University of Lisbon, Institute for Medieval Studies) – João Lobão – Maria Ferreira (Município de Trancoso)
Format: Oral

Research on medieval Portugal has long been shaped by a pronounced seigneurial bias, owing to the predominance of elite-produced written sources such as foral charters and other contractual documents. As a result, lordly centres are far better documented than rural communities, which have only recently become a significant focus of archaeological research. In the inland region of central Portugal, however, a growing number of rural sites dated between the ninth and twelfth centuries are now known, several of which have undergone archaeobotanical analysis. In 2021-22, storage deposits were excavated in the castle of Trancoso, a comital centre occupied during the same period. The archaeobotanical study focused on two sequential fire-related destruction layers, with radiocarbon dates spanning the tenth and twelfth centuries. Systematic sediment sampling produced well-preserved assemblages dominated by a diverse range of cereals and pulses, with notable differences between the two phases. This study integrates unpublished archaeobotanical data from the castle storage contexts and regional contemporaneous rural settlements, together with archaeological and documentary sources, to investigate production and consumption dynamics within the medieval agrarian system. By contextualising the results within broader settlement histories and regional frameworks, it seeks to reconstruct patterns of crop use, management, and distribution across space and time. The approach contributes to the history of crop cultivation by

moving beyond a narrow focus on staple cereals to encompass a wider spectrum of cultivated plants, including pulses and other under-represented taxa. It also considers how historiographical and archaeological biases have shaped which crops become visible in prevailing narratives of medieval agriculture. Through this interdisciplinary perspective, the study demonstrates the potential of combining material and textual evidence to refine our understanding of agricultural practices and the diverse plant economies that sustained medieval societies.

439. Can interdisciplinary crop history research promote present-day agricultural biodiversity?

Authors: Daniel Fuks (Ben-Gurion University of the Negev)
Format: Poster

Biodiversity loss is a global challenge, directly associated with agricultural expansion of a small number of commodity crops. A recent review by the Crop History Consortium (CHC) indicated that selective biases in modern agriculture may replicate themselves in certain fields of archaeology-based crop history research. After exploring this evidence, the present paper will draw on local case studies to ask whether the direction of influence can go the other way. That is, can research on ancient agriculture contribute to present-day biodiversity conservation efforts and agricultural sustainability? Indeed, history, archaeology and related disciplines are uniquely poised to offer a deep historical perspective on how some crops became marginalized while others colonized the globe, and to examine the chronological depth of local growing conditions, agricultural traditions and sustainability. Such data on ancient crops, their past geographic distributions, domestication status, local significance and infraspecies diversity could be of great value for designing policies to expand and promote agricultural biodiversity.

276 PLAYING THE PAST: INTERDISCIPLINARY PERSPECTIVES ON ANCIENT BOARD GAMES, SOCIETY, AND LEARNING

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Barbara Care (University of Lausanne) – Theodora (Dorina) Moullou (Hellenic Open University | Ministry of Culture)
Keywords: Board games, Archaeoludology, Cultural transmission, Digital heritage, Museum education
Format: Regular session

SESSION ABSTRACT

In recent years, the archaeology of board games has evolved into a dynamic and truly interdisciplinary field, drawing together archaeology, classics, anthropology, computer science, and museum studies. Once regarded as a marginal or antiquarian pursuit, the study of ancient play now offers a productive framework for investigating human behaviour, communication, and cultural transmission. Games were deeply integrated into the social and intellectual fabric of ancient societies. They mirrored hierarchies, expressed values, and mediated identities; at the same time, they fostered skills such as strategic reasoning, numeracy, and literacy. The material traces of play — boards carved in stone, portable sets, dice, and tokens — reveal how games travelled across regions, adapted to local traditions, and acquired new symbolic meanings. Far from being mere pastimes, they often intersected with politics, religion, and education, reflecting broader notions of order, fate, and competition. This session invites contributions adopting interdisciplinary approaches to board games and gaming artefacts across cultures and periods, from prehistory to late antiquity. We particularly welcome papers combining archaeological, historical, and digital perspectives, including AI-assisted simulations, 3D documentation, as well as studies addressing the manufacturing, use, and social functions of games. A further focus of the session concerns the potential of ancient games in museum and heritage education. Increasingly, reconstructed games are being integrated into exhibition design and public programmes, fostering inclusive and hands-on engagement with the past. By examining games as both material and intellectual artefacts, the session aims to bridge research, digital experimentation, and educational practice — showing how the study and recreation of ancient play can connect academic inquiry, cultural heritage, and public learning in innovative ways.

CONTRIBUTION ABSTRACTS

270. To play or not to play: Possible board game accessories from the Bronze Age in northern Hungary

Authors: Szilvia Guba (Hungarian National Museum - Castle Museum Szécsény) – Nicklas Larsson (Hungarian National Museum - National Archaeological Institute)
Format: Oral

The number of Bronze Age artefacts from the Carpathian Basin that can be associated with gaming accessory, particularly board games, is relatively limited. The identification of certain clay objects of uncertain function as potential game boards has been proposed, suggesting that they may represent variants of the so-called senet and mehen games. However, their identification and classification in this context remain highly challenging. The recognition of board game pieces is even more difficult than that of game boards, as they are typically smaller objects. Among these, many may have been used in an ad hoc manner, with neither their

raw material nor their method of manufacture explicitly indicating their function as gaming accessories. In many cases, they could be made from materials found in nature such as pebbles, crops, seeds and fruits, or even fragments of dried manure. A substantial assemblage comprising over 700 ceramic and stone discs, along with polished sheep or goat bones (astragalus and metacarpus), was excavated in 2022 at a single Bronze Age site in northern Hungary. These objects have been recovered from both funerary and settlement contexts. The circular, flat, unperforated discs with polished edges, which vary in size and colour may be identified as board game pieces. These possible tokens were produced secondarily from the side walls of broken ceramic vessels, or sandstone. Additionally, polished artefacts crafted from the astragalus or other foot bones (such as the phalanx and metacarpus) of various small ruminants have been documented, with several examples featuring deliberate notches. This paper provides a concise overview of the site, the typology of the artefacts, their technological characteristics, and a possible interpretation of their role in board games.

1096. Weiqi and Senet: Identity Politics and Religious Morality Behind Race and Territorial Competition

Authors: Zhangheng You (School of history and culture heritage Xiamen University)
Format: Oral

Games functioned not only as material expressions of intellectual thought, but also as extensions of ideas about life and death, moral values, and social hierarchy. Focusing on Weiqi (Go) in early medieval China, this paper examines the game's ethical and philosophical connotations, its symbolic role among the aristocratic elites of the Northern and Southern Dynasties (4th–6th centuries CE), and the relationship between systems of game ranking and broader structures of social classification. Archaeological finds of board games from elite tombs of this period, together with textual accounts of 棋品("ranks of Go skill"), provide a material and documentary basis for exploring how Weiqi became embedded in aristocratic culture. During the Northern and Southern Dynasties, the Nine-Rank System (九品官人法) institutionalised social stratification by grading individuals according to pedigree and moral reputation, reinforcing the distinction between elite and common. Within this context, Weiqi emerged as a refined aristocratic practice, and the ranking of Go skill gradually shifted from a purely technical evaluation to a symbolic marker of social prestige: higher chess ranks increasingly signified higher social identity. Some rulers of non-aristocratic origin even cultivated Weiqi as a means of attracting elite support and integrating into aristocratic networks. The game also served as a medium for the performance of character and composure, exemplified by narratives such as Xie An's calm continuation of a Go match following the victory at the Battle of the Fei River. A comparative perspective is introduced through the ancient Egyptian board game Senet, closely associated with funerary ideology and afterlife judgment in the Book of the Dead. Contrasting Senet as a race game with Weiqi as a territorial strategy game highlights how different forms of play carried distinct moral and symbolic meanings. The paper concludes with reflections on incorporating gaming experiences into museum exhibition practice.

1778. Pieces of gaming equipment in funerary contexts in Roman Pannonia

Authors: Linda Dobosi (HUN-REN - ELTE Research Group for Interdisciplinary Archaeology | ELTE Eotvos Lorand University)
Format: Oral

Pieces of Roman gaming equipment are found in various contexts: most often during settlement excavations, in graves or sometimes as ritual offerings. This study discusses the gaming paraphernalia deposited as grave goods in Roman Pannonia along with their possible symbolic meanings and their role in communicating a deceased person's identity. Pieces of gaming equipment turn up regularly in burials all over Roman Pannonia. Mostly known from inhumation burials of the 4th century AD, they are occasionally observed in earlier cemeteries as well, in both civilian and military contexts. An overview of the published material reveals that gaming paraphernalia in graves are largely limited to just a few dice or counters in a burial and are usually present in only one or two burials within a necropolis. Complete gaming sets are extremely rare in Pannonia, the sole evidence so far being a set for ludus duodecim scriptorum in Scarbantia (Sopron, Hungary). Pieces of gaming equipment tend to be placed in the richest burials in cemeteries, in adult male burials more often than in female or child burials. As observed in earlier studies, it seems to be a cross-cultural phenomenon that playing board games served as a symbol of elite identity. Placing pieces of gaming equipment in a grave underlined the high status of the deceased and might also have been indicators of their intelligence, leadership qualities or strategical skills.

1394. Did Roman legionaries and the Germanic elite play ludus latrunculorum on the borders of the province of Pannonia?

Authors: Branislav Kovár (Institute of Archaeology, Slovak Academy of Sciences) – Summer Courts (Department of Archaeology, University of Reading) – Tim Penn (Department of Classics, University of Reading)
Format: Oral

Interaction between the Roman army and Germanic tribes did not take place only on the battlefield. Exchange between Romans and Germanic tribes also took place through other forms of cultural interactions, including boardgames. There were several Roman military camps on the border of the province of Pannonia (today Slovakia). Contacts between the Germans and the Romans also took place through strongholds and trading posts. Evidence of boardgames has been found at several sites of this type in Slovakia. In addition to individual gameboards, archaeologists have also discovered sets of tokens, which were often found in the graves of Germanic elites. Both the Germanic and Roman peoples played games using similar equipment, and dice and counters are likely to have been produced within the Empire, then exported. Along the limes, inside the Roman Empire, Ludus Latrunculi, a strategy

boardgame played on a grid-shaped board without dice, was particularly popular, but the presence of dice suggests people also played other games. The presence of similar counters and dice in the Barbaricum, outside of Roman territory, suggests participation in a similar tradition – it is possible, though not certain, that people beyond the empire's borders played a similar game. The only board from Slovakia outside of Roman territory, at Poprad, is a grid, but it may have been too big to play Latrunculi. The Slovakian data fills a gap in the published record and situates this material within the published record from Britain in the west to Egypt in the east. Our presentation will not only focus on archaeology, but in the second part of the talk, we will also focus on presenting the issue to the general public through organizing various workshops. Playing Ludus Latrunculi is more than suitable for introducing the life of the Romans and Germans to a wider audience.

1615. Games and Cultural Connectivity in Kyivan Rus': Archaeological and Textual Insights

Authors: Natalia Khamaiko (Institute of Archaeology of the National Academy of Sciences of Ukraine)
Format: Oral

Board games in Kyivan Rus' (10th–13th centuries) provide evidence for cultural connectivity, social hierarchy, and intellectual practices in medieval Eastern Europe. Archaeological finds together with written and epic sources reveal networks linking Rus' with Scandinavia, Byzantium, and other regions, demonstrating the movement not only of objects but also of ideas, skills, and social models. Board games were not characteristic of Slavic material culture prior to the arrival of the Rus' and their Scandinavian connections. While children's and physical games are universal, board games typically emerge in socially stratified societies. In Kyivan Rus', their appearance coincides with the consolidation of elites and new forms of social distinction. Gaming sets made of stone, glass, precious materials, and walrus ivory signalled high-status ownership. Written sources associate these games with princes and warriors and describe exceptionally high stakes, highlighting their prestige and social significance. Finds from the emporium of Shestovytsia and from urban Kyiv indicate that board games were primarily embedded in elite and urban environments rather than rural life. The shift from hnefatafl in the 10th century to the spread of chess in the 12th century reflects changing cultural orientations and intellectual fashions. At the same time, the persistence of hnefatafl in Scandinavian-associated contexts in Kyiv Podil serves as a marker of continued long-distance contacts and international exchange networks. Board games thus acted as instruments of elite identity, strategic learning, and cross-cultural interaction. They formed part of the social language through which status, affiliation, and cultural knowledge were expressed and negotiated in medieval Rus'.

1258. Nothing but Time: Anthropological Notions of Play and Gaming at Archaeological Sites of Confinement

Authors: Alexander Anthony (Syracuse University)
Format: Oral

Play and gaming are an essential part of what it means to be human. Far from being merely a trivial past-time, games create material places that become nodes of meaningful social interaction, a structured environment in which to alleviate interpersonal tensions, and an opportunity to demonstrate skill and mastery of indeterminacy in a bounded setting reinforcing and potentially restructuring social hierarchies. Additionally, games often manifest materially - the traces of which abound in the archaeological record and offer insight not only into the nature of being human, but to the interaction between humans and non-living agents, as can be seen with rain on a football pitch, or an errant strike of a pool cue due to an uneven billiards table. Further, when skilled players are well matched, play has the potential to alter our fundamental experience of time itself for participants and observers alike. This presentation draws from discoveries of gameboards made by the Central Mediterranean Penal Heritage Project (CMPHP) during analysis of a 3D capture of the Prigione del Castello at the medieval city of Noto Antica, Sicily, modern ethnographic observations, and other archaeological recoveries at sites of confinement. The goal is not to answer whether people in confinement play, instead it is to explore how modern anthropological notions of play and gaming can be applied to the now abundant archaeological evidence to better understand the lived experience of confinement in the past and present.

196. LUDITECH: Integrating Tactile Sensing and Computational Modelling in the Archaeology of Ancient Board Games

Authors: Barbara Care (University of Lausanne) – Dorina Moullou (Hellenic Open University | Greek Ministry of Culture and Sports)
Format: Oral

The LUDITECH (LUDIc + TECHnology) project, recently funded by the Swiss National Science Foundation (SNSF) under the Spark scheme, introduces a new methodological framework within the emerging field of digital archaeoludology. The project aims to reconstruct the material and experiential dimensions of ancient board games by combining tactile sensing technology, computational modelling, and traditional archaeological analysis, Previous research has relied primarily on textual references, iconography, ethnographic analogy, or on computational simulations of rules. These approaches, while informative, offer limited insight into the physical traces of use preserved on the artefacts themselves. LUDITECH employs high-resolution tactile sensors capable of detecting sub-micron wear, scratches, and residues, thereby generating a new category of empirical data that documents the interaction between players and boards. The study follows three interrelated research axes: 1. Validation of rule hypotheses by comparing simulated wear "heatmaps" with observed micro-traces; 2. Functional assessment, distinguishing objects used for play from those serving

ritual or decorative purposes; 3. Manufacturing analysis, identifying tool marks and craftsmanship to infer production methods and skill levels. Through the integration of tactile data and computational experimentation, the project reorients the study of ancient games from rule reconstruction toward questions of materiality, performance, and cultural context. Beyond ancient board games, the same methodology offers significant potential for investigating other categories of artefacts, such as inscribed or worn surfaces, and for developing interactive museum applications that connect the public with the sensory dimensions of the past.

98. Playing for the Afterlife: Senet as a Tool for Public Engagement with Ancient Egypt

Authors: Porin Šćukanec Rezniček (Archaeological Museum in Zagreb)
Format: Oral

The ancient Egyptian board game Senet occupied a unique position at the intersection of play, religion, and social practice. Archaeologically attested from the earliest periods in Ancient Egypt onward and richly represented in both material culture and iconography, Senet developed from a leisure activity into a game imbued with cosmological and eschatological meaning. Its boards, pieces, and textual associations reflect broader Egyptian concepts of order, fate, and the journey to the afterlife. This presentation explores Senet not only as an object of archaeological and historical inquiry, but also as an effective medium for public engagement and museum education. Drawing on a series of workshops and public presentations held at the Archaeological Museum in Zagreb, at the science-fiction and fantasy convention Sferakon, and in various educational and informal cultural settings, the contribution examines how reconstructed gameplay can make Ancient Egypt more approachable to diverse audiences. Through hands-on interaction, participants encounter abstract concepts—such as Maʿat, chance, divine intervention, and social hierarchy—through embodied experience. i.e. playing the game, rather than purely textual or ex cathedra explanations. By contextualising Senet within its archaeological, religious, and cultural frameworks while simultaneously reactivating it as a playable game, these activities demonstrate the potential of ancient board games to bridge scholarly research and public learning. The presentation argues that Senet functions as both a material artefact and an intellectual interface, capable of fostering curiosity, dialogue, and critical engagement with the ancient past. In line with current interdisciplinary approaches to the archaeology of play, this case study highlights how ancient games can serve as powerful tools for inclusive, experiential heritage interpretation and museum practice.

309. "Games and Toys in Ancient Times" - an Interdisciplinary Program for Kids and Students. Theory, and Methods (NAIM-BAS)

Authors: Kaloyan Pramatarov (National Archaeological Institute with Museum)
Format: Oral

"Games and Toys in Ancient Times" is one of the successful programs for working with preschoolers and primary school students. Applied by the museum pedagogues at the Archaeological Museum – Sofia, it combines three modules: 1. a short movie with explanation of what Archaeology is, what the essence of the archaeological profession is, what the museum is, and why all these artifacts are displayed to the attention of the broad public; 2. Specialized lectures and concomitant discussions dedicated to the games and toys in prehistoric Europe, ancient India, Egypt, Thrace, Greece, Rome, and Medieval Bulgaria; 3. Interactions with replicas of ancient toys and practicing various ancient games (rotta, draughts, alquerque, mancala, etc.). The present report describes the theoretical bases of these pedagogical technologies for game interactions. It lists and explains the methods used by museum specialists, emphasizing a personality-based approach, the social aspects of the educational process, and interactivity with archaeological materials, artifact replicas, and restored ancient board games and toys.

388. Ancient Board Games and Museum Engagement

Authors: Ema Kosnica (Archaeological Museum in Zagreb)
Format: Oral

Ancient board games offer a fascinating glimpse into everyday life in the past. They were not only a form of entertainment, but also a way for people to spend time together, learn, and communicate. Because of this, they are especially well suited for presentation in museums. This paper looks at how knowledge about ancient games, gained through archaeology, can be brought closer to today's visitors through playing, reconstructing old games, and creating new ones inspired by the past, using examples from the Archaeological Museum in Zagreb. Drawing on archaeologically attested games such as senet, mill, and tris, the museum has developed a public programme that integrates reconstructed ancient games into exhibition-related events and educational activities. Within the programme Evenings of (Ancient) Board Games (Večer (drevnih) društvenih igara), visitors actively engage with games connected to archaeological collections, learning about their material evidence, rules, and social contexts through hands-on experience rather than passive observation. A central focus of the paper is the development of the Archaeological Museum in Zagreb's first original board game inspired by ancient Egypt. Designed on the basis of archaeological and historical research, the game functions simultaneously as an educational tool, a museum programme activity, and a commercially available museum souvenir. Its dual role highlights the potential of board games as intellectual artefacts that mediate between research, public learning, and sustainable museum practice. By examining reconstructed and newly designed games as interpretative media, this paper argues that ancient board games offer a powerful framework for connecting archaeological research, museum education, and contemporary audiences, while fostering inclusive, participatory, and reflective engagement with the past.

1263. Loaded Luck: A Mercury-Loaded Gaming Dice and Inclusive Heritage at Roman Mageroy

Authors: Valentina Limina (UCLouvain | Arc-Hab) – Sylvie Collignon – Anémone Peteers (Arc-Hab) – Thomas Daniaux (University of Reading) – Jean-François Baltus (Parc naturel Haute-Sûre Forêt d'Anlier)
Format: Poster

The Roman villa of Mageroy (Habay, Belgium) has been investigated through archaeological excavations conducted since 1984 by the non-profit organisation Arc-Hab. Occupied from the second half of the 1st century to the end of the 4th century AD, the site comprises an extensive agricultural courtyard (3 hectares), enclosed by a perimeter wall and flanked by several ancillary buildings. The complex also includes a masonry-lined basin approximately 65 m in length, constructed in the valley bottom, while the residential sector is characterised by a private courtyard to the north. A remarkable gaming artefact - an ivory dice - was recovered from a 3rd-century deposit located between the residential courtyard and the basin. Accidentally fractured during excavation, the object revealed the presence of minute droplets of mercury. Measuring only 9 mm per side and dated to the 3rd century AD, this dice constitutes the only known Roman example of a mercury-loaded gaming dice. It provides rare and direct material evidence of cheating practices associated with dice games, which were both widespread and socially ambivalent in Roman society. As such, the artefact offers valuable insights into the social dynamics of play, chance, and risk in the ancient world. Beyond its archaeological importance, the Mageroy mercury dice now serves as key reference point for interdisciplinary heritage interpretation and learning. The site is currently part of the LEADER project "Patrimoine en-jeux: Exploring Heritage through Play and Inclusion", which brings together multiple regional partners and seeks to approach heritage through gaming and inclusive practices. Within this framework, the die has inspired the development of an inclusive role-playing game that combines archaeological evidence, historical interpretation, and participatory learning. This initiative aims to integrate ancient gaming practices into educational and public outreach programmes, fostering new forms of engagement and reaching more diverse audiences through play-based heritage mediation.

2614. Ancient Board Games of the Northern Black Sea in Museum and Educational Practice

Authors: Mariia Lobanova (Odesa Archaeological Museum of the National Academy of Sciences of Ukraine)
Format: Poster

At the beginning of the full-scale invasion, the Odesa Archaeological Museum of the National Academy of Sciences of Ukraine was closed to visitors, its exhibition dismantled, and public activities suspended. This led to a reconsideration of the museum's role as an educational and public engagement space. Within the framework of the grant programme "Heritage. Space for Work," the exhibition about "Zmiinyi Island: The Island Protected by the Gods" was opened, dedicated to the archaeological heritage of Zmiinyi Island - the site of the ancient Temple of Achilles and archaeological research conducted since the 1840s. A series of educational events was held, including the interactive programme 'Replay Achilles. An Evening of Ancient Board Games.' Student interns from Odesa National University helped prepare the event. Limited funding required the use of simple game replicas, and the game rules were adapted for a museum audience. The event concept was based on finds from the Island - especially glass gaming pieces from the 1st–2nd centuries CE - and on materials from other Northern Black Sea sites (Olbia, Tyras, Nikonion). This emphasized the local context for how board games spread in the ancient world. The event featured an introductory lecture and practical gameplay using reconstructed sets. The programme, conducted at multiple venues including the Odesa Archaeological Museum, schools, orphanages, and festivals, effectively engaged diverse audiences, merging academic insight with hands-on experience to deepen understanding of southern Ukrainian archaeology. Active student involvement linked education with practical cultural heritage work. Reconstructing ancient board games proved a successful way to foster archaeological knowledge in museums, educational institutions, and outreach settings.

277 THE FLUVIAL ANTHROPOSPHERE: PAST INTERVENTIONS, LEGACY IMPACTS, LESSONS LEARNED

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Laszlo Ferenczi (Charles University, Prague) – Rowin Van Lanen (The Cultural Heritage Agency of the Netherlands) – Martina Bergamo (Ca' Foscari University of Venice) – Jacopo Paiano (University of Trento)
Keywords: fluvial/coastal archaeology, landscape archaeology, geoarchaeology, wetlands, climate change, adaptation
Format: Regular session
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

River basins are in focus of climate adaptation strategies [1]. Current and future adaptation and restoration plans depend much on informed decisions based on substantial knowledge about historical conditions [2]. Wetlands preserve valuable environmental archaeological information; however, they are the most vulnerable parts of riverine/coastal landscapes significantly affected by climate change [3]. In addition to the integration of different hydrogeomorphological approaches—paleohydrography, paleohydrology, paleohydraulics—holistic, multidisciplinary studies are necessary to analyze complex paleoenvironmental dynamics and

linkages between climate, river environments, and societies [4]. To contribute to this goal, this session invites papers that address the issues of environmental challenges, forcing mechanisms, exposures, hazards, disasters, crises, long-term environmental impacts of past interventions, in connection with problems of socio-economic vulnerabilities, coping mechanisms, responses, adaptation, risk mitigation, resilience at the various stages of the Holocene timeline of human influence, i.e. domestication, agriculture and irrigation, hydraulic engineering, intensification of technological impact [5],[6]. In line with past EAA sessions on the 'Fluvial Anthroposphere', we are primarily looking for landscape archaeological and environmental archaeological contributions working on the basis of different types of evidence and analytical methods. In view of the holistic approach, however, papers which comply with other themes of the conference (material cultural aspects, agency, connectivity, modelling and computational methods, etc.) are also welcome, in case they specifically focus on fluvial/coastal environs. In addition to the agenda of previous years' sessions, contributions on the meta-analysis of sedimentary archives—assessing baseline biophysical conditions and contrasting different deviations in riverine/coastal contexts [7],[4]—as well as on segmenting, contrasting, comparing fluvial and coastal areas as lived spaces, based on criteria of choice, are particularly welcome. References: [1] https://doi.org/10.1111/j.1475-4959.2006.00221_5.x [2] https://doi.org/10.1186/s12302-021-00561-4 [3] https://doi.org/10.15184/aqy.2022.112 [4] https://doi.org/10.1016/j.quaint.2009.03.009 [5] https://doi.org/10.3390/quat1030021 [6] https://doi.org/10.1007/978-3-031-11181-5 [7] https://doi.org/10.1890/1540-9295-12.8.427

CONTRIBUTION ABSTRACTS

1833. Safe and Sound: Stability and Adaptation in Riverine Landscapes. Comparative Case Studies from Northern Italy

Authors: Jacopo Paiano (University of Trento) – Martina Bergamo – Diego Calaon (Ca' Foscari University of Venice)
Format: Oral

Extreme climatic events, the increasing variability of hydrological regimes, and the resulting reduction in the habitability of fluvial landscapes are currently exerting a significant impact on settlement patterns in Italy. In recent years, risk perception related to rivers has grown steadily, largely because of climate instability and the increasing frequency and intensity of torrential processes. While these dynamics are often perceived as a specifically modern concern, archaeological and historical evidence demonstrates that large-scale flood events also occurred frequently in antiquity, affecting areas that remain densely urbanized today. This contribution explores a selection of case studies from northern Italy, with the aim of assessing long-term strategies of human adaptation to riverine environments characterized by differing degrees of hydrological instability. Particular attention is paid to contrasting contexts: on the one hand, highly dynamic fluvial systems prone to rapid changes and catastrophic flooding; on the other, relatively stable environments associated with spring-fed rivers, whose constant discharge and limited tendency toward levee failure created more predictable conditions for settlement. Well-documented examples of both ancient and recent flood events are drawn from several areas of northern Italian regions, highlighting the recurrent challenges posed by fluvial dynamics and the diverse responses adopted over time. In contrast, the case of the Sile River and the other spring ones (Veneto region) is presented as a positive model of long-term coexistence between human communities and a stable fluvial system. Here, a well-developed yet non-invasive settlement network emerged, apparently shaped by an enduring - if not always explicit - awareness of environmental constraints and by a generally moderate and sustainable exploitation of riverine resources.

1851. Fluent places: water networks, settlement dynamics and spatial organisation in the western High Adriatic (Late Roman - Early Middle Ages)

Authors: Martina Bergamo (Ca' Foscari University of Venice) – Jacopo Paiano (University of Trento) – Diego Calaon (Ca' Foscari University of Venice)
Format: Oral

Riverine systems and lagoonal areas played a crucial role in shaping settlement patterns in the western High Adriatic during the Late Roman and the Early Middle Ages, a period of profound socio-environmental reorganisation. In this transitional context, water networks served as both environmental frameworks and essential infrastructure, shaping mobility, connectivity, and access to resources within a dense and evolving hydrographic landscape. Fluvial and lagoonal routes significantly influenced settlement dynamics, contributing to the reorganisation of existing sites and the development of new early medieval centres. Waterways also structured the landscape at an intra-site scale, where the arrangement of built spaces, open areas, and activity zones reveals a close link with riverine and lagoonal routes. Particular attention is given to interfaces between settlements and waterways, such as landing sites and waterfront areas, which appear to have played an important role in daily practices and economic activities. Studying these spaces over the long term provides insights into adaptive responses to hydrological variations and changing conditions. This paper explores the relationship between settlement systems and water networks through a multi-scalar approach that combines a sub-regional perspective with selected intra-site case studies. By integrating landscape-scale analysis with detailed spatial observations, the study aims to investigate how places were articulated in relation to the flow and variability of riverine and lagoonal routes over time. Through this approach, it is possible to trace strategies of adaptation and response to environmental instability, hydrological stress and change, and climate-related adverse events as embedded in spatial organisation.

2564. How does archaeology inform current decision making in relation to climate change mitigation in the the Great Hungarian Plain?

Authors: Laszlo Ferenczi (Charles University, Prague)
Format: Oral

The Great Hungarian Plain (Pannonian Basin) experienced dramatic hydrological transformations in the 19th century through regulation works that reshaped drainage, flooding regimes, and water balance. These hydrological modifications, implemented in tandem with a shift toward intensified agricultural exploitation, redefined land-use systems and landscape resilience for generations. This presentation introduces the potential relevance and limitations of integrating archaeological investigations—encompassing archaeological topographical surveys, surface surveys, and geoarchaeological studies—into contemporary land-management strategies aimed at mitigating climate-driven pressures on crop production. We argue that archaeological topography and geoarchaeology can illuminate long-term land–water–soil interactions, revealing historical hydraulic infrastructures, floodplain dynamics, sedimentation patterns, and agrarian practices that historically sustained productivity under variable climate conditions. Such insights offer a dual benefit: (1) identifying historically robust configurations of field layouts, water-control features (e.g. the so-called 'fok'-system), and crop associations that could inspire resilient, low-input strategies in the present climate regime, and (2) providing a critical baseline to distinguish climate-driven signals from legacy anthropogenic alterations in soil and hydrology. The methodological core combines field surveys, landscape archaeology, sedimentary proxy analyses (grain size, organic matter, mineralogy), GIS-based reconstructions, and historical cartography, enabling diachronic assessments of land-use transitions and hydrological performance. However, a central caveat governs the applicability of past practices: contemporary environmental conditions—temperature regimes, precipitation patterns, soil moisture dynamics, and extreme events—diverge markedly from those of the past. We thus propose a nuanced framework that (a) identifies historical practices for ecological and hydrological compatibility with present conditions, (b) adapts them through climate-informed design (e.g., reconfigured drainage, buffer zones, and soil-water management), and (c) couples archaeological insights with modern agronomy to foreground sustainability over nostalgic imitation. The talk highlights policy-relevant pathways for climate-smart agriculture that draw from deep-time landscape knowledge while acknowledging current environmental limits.

2551. Tracing the environmental impact of settlement activity and industrial exploitation in the area of the Mures River

Authors: Gergely Szenthe (Hungarian National Museum Budapest) – Levente Daczó (Romanian Academy, Institute of Archaeology and History of Art of Cluj-Napoca) – Alpár Dobos (National Museum of Transylvanian History, Cluj-Napoca) – Erwin Gáll (The Romanian Academy of Sciences, Institute of Archaeology "Vasile Pârvan") – Zsófia Rácz (Eötvös Loránd University, Institute of Archaeology) – Calin Cosma (Romanian Academy, Institute of Archaeology and History of Art of Cluj-Napoca) – Petr Libor (Masaryk University Department of Archaeology and Museology) – Lenka Lisa (ARUP) – László Ferenczy (Ustav pro archaeologii, Univerzita Karlova)
Format: Oral

The authors present preliminary results of archaeological topographical project focusing on the Transylvanian Basin, carried out in the framework of a project on early medieval networks, settlement, production and distribution systems (Project No. TKP2021-NKTA-24 financed by the Hungarian NRDI Office). During the Avar period (7th–8th century AD), the Avar type archaeological record was concentrated in the middle section of the catchment of the River Mureş (Transylvanian Basin, Romania), where important economic resources (salt deposits) may have been exploited. We investigate patterns of long-term settlement changes between the Roman (1th -2nd c. CE) and the Árpád period (11th–13th c. CE), and more specifically the settlement network of the Avars, studying environmental parameters. The fluvial environment seems to have determined human settlement in every historical period, and different patterns of settlement could be documented in the Mureş valley and in the valleys of its tributaries. The settlement pattern was influenced by local and supra-regional road systems, and, most probably also by the two salt deposits, situated to the south of the Mureş (in Ocna Mureş, and Ocnişoara). In addition to the extensive archaeological topographical surveys, we have been also conducting geophysical and geocemical surveys in 2025, focusing on a study site in Ocnisoara, the locality, where salt exploitation likely dates back to the medieval period or even earlier. The purpose of our investigation was to assess the character of subsurface archaeological features related to this activity, and study the chronology of dynamics of soil accumulation, which could be linked to land-use changes and surface erosion.

493. Medieval Gullies as Legacy Effects of Agrarian Land Use: A Landscape Archaeological Perspective from Central Europe

Authors: Lukáš Holata (Charles University)
Format: Oral

Extensive gully systems are among the most striking legacies of past human–environment interactions in fluvial landscapes, yet their relationship to historical land use remains insufficiently understood. This paper explores medieval gullies as long-term geomorphological consequences of agrarian practices in the Czech Republic, particularly in the hinterlands of deserted medieval villages. Using LiDAR data combined with systematic ground-truthing, we have documented large-scale relic field systems preserved under forest cover. Dense or exceptionally developed gully networks were detected in direct spatial association with former field parcels.

Gully formation does not simply correlate with slope steepness. The aim of this contribution is to reveal a broader set of interacting factors that contributed to the formation and development of gullies. At a macro-scale, GIS-based modelling is employed to assess topography, soil properties, and erosion susceptibility. At a micro-scale, detailed analyses of land-use organization and field-pattern morphology are applied to selected case studies, allowing closer examination of how medieval agricultural systems structured runoff pathways and sediment fluxes. By integrating landscape archaeology, environmental modelling, and historical land-use analysis, this contribution situates medieval gullies within the framework of the fluvial anthroposphere. It highlights gullies not merely as erosion features, but as durable archives of socio-environmental decision-making with relevance for understanding long-term human impacts on river basins and for informing present-day landscape management and climate adaptation strategies.

2174. Highland Transformation: Human Impact in the Bukov Brook Valley from the 11th to 17th centuries (Bohemian-Moravian Highlands, CZ)

Authors: Miroslav Dejmal (MUNI - Department of Archaeology and Museology) – Jan Petřík (MUNI - Department of Geological Sciences) – Libor Petr (MUNI - Department of Botany and Zoology) – Michal Vágner – Michaela Prišťáková (MUNI - Department of Archaeology and Museology) – Katarína Adameková (Institute of Archaeology of the Czech Academy of Sciences, Brno)
Format: Oral

The history of human activities in the Central European mid-mountains differs significantly from the intensively inhabited lowlands. The Bohemian-Moravian Highlands are believed to have been settled during the onset of metal mining in the 13th century AD. But our evidence from the floodplain deposits of Bukov Brook demonstrates sporadic human activity during the prehistoric era. Since the 10th-12th centuries, an agricultural landscape with mild deforestation is inferred from buried valley floodplain sediments, despite limited archaeological evidence of settlement. Significant geomorphological changes were observed in the 11th-13th centuries, with prospecting, mining activities, the construction of a pond, and intensive deforestation, alongside the presence of scarce cultivated grain. This dating contradicts the existing historical model, which assumes the colonization of this area at the end of the 12th century and especially in the 13th century. Analysis of pond sediments from the 13th to 16th centuries saw the end of mining, increased anthropogenic influence, and a deforested landscape supporting more agriculture, grain cultivation, and grazing. From the 16th century onwards, erosion from fine washouts from fields and pastures occurred, and the once-functional pond vanished. This can perhaps be connected with the Thirty Years' War, the economical decline of the whole area and perhaps the onset of the Little Ice Age. Excavations in the Bukovy Valley highlight the importance of researching smaller catchments in mid-mountain regions like the Bohemian-Moravian Highlands, allow to verify the existing historical-archaeological models and sets the stage for further exploration into the evolving dynamics of humanenvironment interactions across various historical periods.

1519. Changing patterns in the Vál Valley. Investigating settlement pattern dynamics from the Neolithic to the Middle Ages

Authors: Rebeka Gergácz (Hungarian National Museum | Eötvös Loránd University, Doctoral School of History)
Format: Oral

Riverbeds and valleys play a crucial role in human occupation, as they provide essential resources such as water and food, and also serve as channels for communication, travel, and trade. As a result, throughout various archaeological periods, many settlements have been established in close proximity to natural water sources. However, the choice of specific habitation sites near these water bodies often varies based on the needs of the settlements, environmental constraints, and prevailing climatic conditions. In this paper, I analyse the location of settlements and their changing patterns from the Neolithic to the Middle Ages in a 30 km segment of the Vál Valley, located in Northeast Transdanubia, Hungary. The Váli-stream flows in a northwest-southeast direction towards the most significant river of the Carpathian Basin, the Danube. This advantageous connection, along with the fertile soils of the valley, greatly enhances the availability of the microregion. This inquiry raises further questions like 1) which archaeological periods are likely to be represented in similar or identical locations, 2) how the settlement locations suggest historical waterlevels and access to water, and 3) how the varying detectability of the archaeological periods affects general insights. For the archaeological dataset, I utilise the findings from the systematic artefact collections conducted in the valley as part of the National Archaeological Topography Program and my PhD research. With over 20 km² already surveyed, these results offer valuable insights into the settlement patterns of the area through GIS analysis.

2203. Waterscapes in Sardinia (Italy): Investigations in the Mar'e Pontis Lagoon – Cabras

Authors: Maria Mureddu – Viviana Pinna – Giorgio Franco Murru (Fondazione Mont'e Prama) – Rita Auriemma (Università del Salento) – Filiberto Chiabrando (Politecnico di Torino) – Paolo Emanuele Orrù (Università degli Studi di Cagliari) – Emanuela Solinas (Independent Researcher) – Pier Giorgio Ignazio Spanu (Università degli Studi di Sassari) – Anthony Muroni (Fondazione Mont'e Prama)
Format: Oral

The Mont'e Prama Foundation manages the Archaeological and Natural Park of the Sinis Peninsula, in central-western Sardinia. One of the objectives of the Foundation is the realisation of research projects in the territory. The three-year project "Water Landscapes. Research in the Mar'e Pontis Lagoon", was born in this perspective and aims to reconstruct the transformations of the Cabras Lagoon

and the surrounding landscape, from the geomorphological aspects of its formation, to the interactions of human communities with it, from prehistory until contemporary times. The project is carried out in collaboration with the University of Sassari, the University of Salento, the University of Cagliari and the Polytechnic of Torino. It employs a multidisciplinary approach. Traditional land-based and underwater surveys are supplemented by paleoecological sampling and analysis, geophysical surveys, and instrumental underwater surveys. Aerial and topographic surveys are also conducted. The data obtained are fed into a Territorial Information System/GIS which also includes the existing literature, the survey cartography, and thematic visibility cartography. The lagoon, fed by two freshwater streams, flows in the Oristano Gulf via various natural and artificial channels, which conformation certainly changed through time. It is still today an important resource for fishing activities, and has attracted human occupation since Prehistory, as evidenced by Neolithic settlements identified along its shores. In various times it may also have served as a waterway, promoting contacts and commercial activities between different communities of the territory. On its southern shore, traditionally and perhaps significantly named Su Pottu (The Harbour) by locals, various hints suggest the presence of port activities during Late Roman and Medieval times. The multidisciplinary research in progress, allowing to reconstruct the evolution of the waterscape, points to a better understanding of the surrounding settlements and of the exploitation of the lagoon by human communities over time.

278 MODELLING SOCIO-ECOLOGICAL SYSTEMS AND HUMAN-ENVIRONMENT INTERACTIONS FROM INDIVIDUALS TO POPULATIONS

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Dries Daems (Vrije Universiteit Amsterdam) – Andreas Angourakis (Ruhr University Bochum)
Keywords: socio-ecological systems, human-environment interactions, computational modelling
Format: Regular session
Affiliation: Computational Modelling of Past Socio-ecological Systems - COMPS

SESSION ABSTRACT

Understanding the dynamics of human-environment interactions requires bridging scales from individual decision-making to population-level processes. Effective multiscalar research entails integrating diverse theoretical and computational approaches. This session brings together researchers exploring ancient societies, socio-ecological systems and human-environment interactions through a wide spectrum of methods, aiming to highlight how different frameworks can illuminate the complexity of past and present human behaviors within a socio-ecological context. Contributions are sought spanning a wide range of approaches, including ecological models such as optimal foraging theory, which provides insights into resource acquisition strategies under ecological constraints, and adaptive cycle models, which capture resilience and transformation in coupled human-natural systems. We also invite work employing computational modelling approaches such as agent-based modelling, enabling simulation of heterogeneous actors and emergent patterns, and network analysis, which reveals structural properties of social and ecological connectivity. By juxtaposing these approaches, the session seeks to foster dialogue on methodological complementarities, theoretical integration, and the challenges of scaling from micro-level interactions to macro-level outcomes. Beyond methodological innovation, this session emphasizes the relevance of modelling for archaeological interpretation, offering tools to reconstruct past socio-ecological dynamics and explore long-term trajectories of human adaptation.

CONTRIBUTION ABSTRACTS

1375. Modeling Socioecological Processes and Technological Innovation in the Archaeological Record

Authors: Letícia Correa (University of São Paulo) – Michael Barton (Arizona State University) – Astolfo Araujo – Camilo Neto (University of São Paulo)
Format: Oral

Innovation, the spread and adoption of new technology, is a process that can be affected by diverse social and ecological factors: culturally mediated willingness to accept new ideas, biases for social learning across cultural boundaries, opportunities for social interaction, demography, the effectiveness of a new technology to solve important problems in different social or environmental contexts to name a few. And of course, it is likely in many cases that innovation results from some combination of these and other factors. Hence, it is unsurprising that archaeologists have long debated whether variability in the remnants of past technologies that comprise the archaeological record serves as a proxy for cultural affiliation and norms, patterns of social interaction, or adaptation to environmental variation and change. To better explore the complex interactions of socioecological processes that encourage or inhibit technological innovation, we developed a simple modeling platform for agent based simulation. It allows a researcher to explore the consequences of these and other processes on technological innovation across varying temporal and spatial contexts. It also generates a digital 'archaeological record' to enable modeling results to be compared with empirical data. We use the Holocene record of forager sites from the State of São Paulo, Brazil as a test case for evaluating which interacting cultural, social, and ecological factors can produce results that most closely match the empirical archaeological record of this region.

2116. Modeling Late Holocene Expansions in Lowland Eastern South America: Simulation of Diffusion

Processes

Authors: Jonas Gregorio De Souza (Barcelona Supercomputing Center) – Luiz Silva De Lima (National Museum - Federal University of Rio de Janeiro) – Igor Pedroza (Fluminense Federal University)
Format: Oral

The late Holocene in lowland eastern South America was marked by major cultural expansions, often associated with the spread of agroforestry practices and, in some cases, with demic diffusion processes that contributed to the dispersal of the continent's most widespread language families. Despite these broad correlations, reconciling linguistic, archaeological, and chronological evidence remains a persistent challenge. In this paper, we address this issue through a comparative case study of two major familes in the South American lowlands: Tupi-Guarani and Jê. These traditions differ markedly in the timing and tempo of their expansions, as well as in their ecological contexts, with Tupi-Guarani populations primarily associated with rainforest environments, and Jê groups occupying savanna and grassland regions. Our objectives are twofold. First, we conduct a review of the available radiocarbon record for both traditions, proposing models for their initial settlement and regional expansion dynamics across different areas of eastern South America. Second, we simulate expansion processes at a finer spatial scale, comparing demic and cultural diffusion scenarios while incorporating paleoclimatic data. These simulations build upon and refine our previous modeling work, allowing us to explore how environmental constraints and different diffusion mechanisms may have shaped the observed archaeological and linguistic patterns.

2287. Understanding the Emergence and Stability of Cultural Groups by Modeling Cultural Transmission in Neolithic Europe (7000–3000 BP)

Authors: Simon Carrignon – Adrian Timpson – Mark Thomas – Stephen Shennan – Martin Hinsh (University College London)
Format: Oral

The persistence or non-persistence of human cultures through time and space raises multiple questions about how cultural groups form and disappear. How do coherent cultural entities emerge, why some disappear while others stay? The Neolithic in Europe is a great case study for exploring these phenomena. During this period, the arrival of new subsistence technologies was associated with the spread of new cultural groups, that cohabited, mixed and replaced pre-existing cultures. Here we use the Big Interdisciplinary Archaeological Database (BIAD) to analyse the spatial and temporal spread of major European cultures between 7000 BP and 3000 BP . We combine multiple methods to produce robust estimates of their geographical and temporal extent, leveraging the large dataset about on site geolocation, C14 samples and cultural material available in BIAD. To move beyond descriptive analysis, we develop an Agent Based Model (ABM) to test hypotheses about the formation and perpetuation of cultural groups and boundaries. The model focuses on two main factors that we hypothesise as having major impact on these groups formation: 1/ Isolation by distance: Cultural divergence resulting from geographic or natural barrier 2/ Homophily: The tendency for individuals to maintain interactions with culturally similar peers. The model combines complex network analysis with data-derived least-cost path and cultural transmission theory to explore the interactions between these processes. Using different inference methods such as Approximate Bayesian Computation, we fit the model to the estimated spatio-temporal pattern to identify under which combination of isolation by distance and homophily our model can best reproduce the archaeological observations. Our goal is to quantify the significance of these factors during the Neolithic and better understand the emergence of stable cultural groups in human societies at large.

2779. Household Demography model: An Agent-Based Framework for Exploring Population Dynamics in Past Socio-Ecological Systems

Authors: Andreas Angourakis (Ruhr-University Bochum | University of Cologne)
Format: Oral

This paper presents the Household Demography model, an agent-based simulation framework tailored for archaeologists seeking to explore the structure and transformation of past human populations. Moving beyond traditional demographic approaches, this model captures the complexity of ancient households and communities by simulating individual life events—such as birth, marriage, death, and the splitting of family groups—using probabilistic mechanisms and social rules grounded in archaeological and ethnographic evidence. Its implementation in NetLogo ensures accessibility and flexibility, making it suitable for both educational and research purposes within archaeology, especially when direct demographic data from the past is incomplete or fragmented. Key components include modular submodels for fertility, marriage, and mortality, with parameters informed by established demographic studies. The model's design enables archaeologists to adjust initial parameters—like household counts, age structures, and resource constraints—to reflect diverse cultural and environmental settings. Importantly, the model can simulate the impact of social practices and environmental pressures on household formation, population growth, and community sustainability, offering new avenues to test archaeological hypotheses about the resilience, decline, or transformation of past societies. A range of experiments demonstrates the model's usefulness for archaeological questions, from testing how changes in resource availability or social customs could influence population trajectories, to assessing the robustness of settlement systems under environmental stress. Results provide insights into the demographic mechanisms that may underlie observed archaeological patterns, helping to bridge the gap between material evidence and human behaviour. The discussion addresses the advantages and limitations of agent-based approaches

for archaeological demography, highlighting the potential for this model to enrich our understanding of household and population dynamics in ancient societies and to inspire further research at the intersection of archaeology, modelling, and social theory.

2141. Modelling socio-ecological systems through operational sequence networks and agent-based modelling in Iron Age to Hellenistic Anatolia

Authors: Dries Daems (Vrije Universiteit Amsterdam)
Format: Oral

Bridging multiple scales of analysis ranging from individuals to populations, constitutes one of the hardest challenges in studying multi-level socio-ecological systems. This paper seeks to critically evaluate two important frameworks shaping our understanding of past resource use and human-environment interactions: operational sequences and agent-based modelling. Operational sequence networks is a methodological framework that traces the sequence of technical processes involved in the production and use of material culture, from raw material acquisition to the final use and discarding of an object using network-based visualization and analysis. Agent-based modelling is a computational method used to simulate interactions between autonomous agents and their environment to assess the emergent effects of decision-making processes within the overall complex system. Both methodologies tend to operate at different scales. Yet, they are not mutually exclusive and significant potential is left untapped at their interface. By combining the micro-level, qualitative and macro-level, quantitative components of, respectively, operational sequences and agent-based modelling, I will present a robust approach that aims to provide a comprehensive understanding of resource exploitation and management strategies in past societies, and their long-term interactions with and impact on the environment. I will focus on case studies of craft production, community formation, and social complexity trajectories in Iron Age to Hellenistic Anatolia to further elucidate the theoretical and methodological integration of operational sequence networks and agent-based modelling.

964. Modelling settlement dynamics with targeted radiocarbon data: a Bayes-based case-study from Lochinver Quarry, North East Scotland (c. 2000 BC-100 AD)

Authors: Kevan Edinborough (Bournemouth University | Archaeological Research Services Ltd.) – Phillippa Hunter – Ana Rodrigues – Clive Waddington (Archaeological Research Services Ltd.)
Format: Poster

In recent years, large scale archaeological mitigation using strip, map and record methods have produced significant amounts of archaeological remains with associated radiocarbon data and additional targeted OSL dates. This allows us to better date sites constrained by well-informed archaeological features, many with stratigraphic relationships. In turn, high-quality data allows us to model broader settlement dynamics with far more confidence than previously possible. Here we present a case study with 108 targeted radiocarbon measurements spanning more several years of systematic excavations by Archaeological Research Services Ltd. from Tarmac's Lochinver Quarry near Elgin. This site has revealed a significant, multi-phase industrial settlement dating from the Bronze Age to the Roman Iron Age (c. 2000 BC – 100 AD). Key finds include cremation burials, a long sequence of roundhouses, rare iron-smelting furnaces, a souterrain and bronze cauldrons, suggesting a major craft centre in the later Iron Age to Roman Iron Age transition. Our radiocarbon results demonstrate how dynamic ancient settlement activity can be reconstructed using large-scale strip, map and record archaeological methods supported by a targeted and iterative programme of scientific dating. We argue that by using computational methods in this way we can significantly enhance outcomes for all stakeholders.

2169. Choosing the landscape: a GIS-based comparison of Late Bronze Age settlement patterns in Romanian Banat and Transylvania

Authors: Sofia Bertea (Babes-Bolyai University)
Format: Poster

The Late Bronze Age (c. 16th–11th centuries BC) in the Eastern Carpathian Basin is characterized by cultural diversity and intensified regional interaction, yet comparative spatial analyses of settlement patterns remain limited. This study presents a GIS-based comparison of Late Bronze Age settlement location strategies in two adjacent regions: Romanian Banat and Transylvania. By adopting a landscape-oriented approach, the paper aims to identify shared and regionally specific patterns of environmental selection and land-use behavior. The analysis is based on a georeferenced database of Late Bronze Age settlement sites compiled from published records, excavation data and field surveys. Spatial analyses were conducted using digital elevation models, hydrological networks and basic geomorphological units. Key variables include elevation, slope, distance to permanent water sources and settlement density. Comparative methods involve distribution mapping, kernel density estimation and statistical assessment of environmental parameters across the three regions. Preliminary results indicate a consistent preference for settlements located on slightly elevated terrains in close proximity to, but generally outside, major floodplains, suggesting a deliberate balance between access to fertile lowlands and avoidance of environmental risk. At the same time, notable regional differences are observed in settlement density and topographic positioning, reflecting local geomorphological constraints and potentially distinct socio-economic strategies. By emphasizing comparable spatial variables across neighboring regions, this study highlights both convergent and divergent landscape choices within the Late Bronze Age Carpathian Basin and demonstrates the value of GIS-based comparative approaches for understanding settlement organization at a supra-regional scale.

279 (RE-)PRESENTING ASIA IN EUROPEAN MUSEUMS: CURATING ACROSS COLONIAL LEGACIES, CONTEMPORARY PRESSURES AND INSTITUTIONAL PRAGMATICS

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Geonyoung Kim (University of Cambrige) – Willem Van Wijk (Leiden University)
Keywords: visual representation, heritage practice, museum practice, Asia, decolonisation
Format: Regular session
Affiliation: Early Career Archaeologists Community - ECA

SESSION ABSTRACT

The politics of displaying the Other in museums has been a sustained focus in anthropology, museum studies, and heritage studies, particularly related to the displaying of collections entangled with Europe's colonial history. Conventionally, these discussions centre around restitution, the right to represent, and on how exhibitions may reinforce colonial discourses. However, these conversations often overlook the specific challenges posed by material culture from diverse Asian contexts, particularly from regions more peripheral to Europe's colonial control. This gap limits the potential of treating Asia as a methodological concept with which to challenge Eurocentric heritage discourse. In recent decades, dedicated Asian galleries have been created in major European museums, often funded by Asian state agencies and private cooperatives. Additionally, blockbuster exhibitions, such as the V&A's "Hallyu! The Korean Wave" (2023) and the British Museum's China's Hidden Century (2023), have sparked intense public debate, reviving both familiar and newly articulated questions. This increased attention to the exhibition of Asian material and cultural practices creates a space in which emerging heritage practices can be discussed. This session invites papers that examine the opportunities and challenges that the exhibition of Asia in European museums brings to ongoing discussions of decolonising museum practices, with particular attention to material culture both within and beyond archaeological contexts. We seek contributions that address institutional pragmatics, curatorial strategy, and public perception. Themes may include, but are not limited to: • Visual representations of Asia's past and present in European displays • Institutional and practical challenges and opportunities emerge during curating Asia in European museums • Public perceptions of Asia galleries

CONTRIBUTION ABSTRACTS

2054. Heritage Beyond Borders: Inclusive Approaches to Heritage Governance and Equity – the Case of Korean Collections outside of Korea

Authors: Geonyoung Kim (University of Cambrige)
Format: Oral

This paper examines how the heritage production of Korean collections in UK museums contributes to heritage equity in the context of colonial acquisition. By evaluating collaborative practices between South Korean institutions and UK museums, the project aims to contribute to the discussions on decolonising museum practices and facilitating heritage equity and diversity. Using archival research, interviews and stakeholder analysis, the study assesses the roles of UK institutions and the South Korean government in shaping narratives on Korean heritage. It focuses on case studies from the British Museum, Victoria and Albert Museum, Fitzwilliam Museum and Ashmolean Museum, exploring decision-making structures and stakeholder dynamics in interpreting and exhibiting Korean collections. Specific attention is paid to analysing how both the South Korean government and institutional policies facilitated diversifying the stakeholders in interpreting Korean heritage outside Korea and promoted heritage equity in representing heritage interests related to the Korean collections held in institutions outside of South Korea. The findings suggest that heritage equity operates as a negotiated and evolving process, shaped by representational strategies, institutional practices, and the extent of Korean stakeholder involvement.

2668. On Decolonial Discomfort: Asymmetrical Heritagization and the Commemoration of Dutch Colonial Presence in Taiwan

Authors: Willem Van Wijk (Leiden University)
Format: Oral

This paper departs from ethnographic observations made during meetings around the commemoration of four hundred years since the Dutch colonization of Taiwan. These observations were made in part at discussions at the Taiwan Representative Office in The Hague and Dutch-themed exhibitions realised in Taipei and Tainan. In these encounters, I was confronted with the relative generosity with which Dutch colonial history in Taiwan is discussed and publicly heritagized, while efforts to commemorate this history appeared to be met with hesitation in the Netherlands. In Taiwan, the quadricentennial was actively taken up through multiple exhibitions and cultural platforms in 2024, supported by public funding and existing heritage and cultural infrastructures. These initiatives framed Dutch colonisation largely through narratives of encounter, exchange, and long-term connection. In the Netherlands, the same history resulted in a limited, paper-based museum presentation at the Rijksmuseum and a number of scattered events. Plans for a larger exhibition did not materialise, despite sustained interest among a significant group of artists,

researchers, and diplomatic actors. This paper suggests that such asymmetrical heritagization, expressed through differences in tone, scale, and institutional commitment, comes to matter in the commemoration of Asian–European colonial pasts. It explores whether this contrast can be understood in relation to the prominence of decolonial debates within European museum and heritage practice, without assuming that caution necessarily signals greater criticality, or that generosity implies a lack of reflexivity. Instead, it treats both positions as situated responses shaped by distinct historical, institutional, and political conditions.

1079. One collection, different representations: Stein Collection in India and the UK

Authors: Indu Prasad (Birkbeck, University of London)
Format: Oral

In the early decades of the 20th century the Hungarian-British archaeologist, Marc Aurel Stein, lead three archaeological expeditions (1900-01, 1906-08, 1913-16) from colonial India to what was then known as Chinese Turkestan, corresponding to the present-day Western Chinese provinces of Xinjiang and Gansu. Stein brought back more than 70,000 objects from these expeditions, which are today collectively known as the Stein Collection. The collection is today spread across multiple nations, most notably the UK and India. The objects from the collection have also formed the mainstay for exhibitions and material culture discourse related to Central Asia and the 'Silk Road' cultural networks, both in India and the UK in recent decades. This paper unpicks the representations of the Stein Collection that are on permanent display at the British Museum and the V&A in London, and the National Museum in New Delhi to juxtapose and illustrate the differing spaces of rhetorical landscapes the collection occupies in the post-colonial period. Further, it will extend the discussion to special exhibitions in both places over the last five years and the Stein Collection's representations in them. In doing so, the paper illustrates the complex and often conflicting ways in which material culture from a single colonial archaeological collection is employed in service of the larger geo-political and cultural narratives in museological practices in the two countries today.

2444. 'No Chinese Person Can Leave the British Museum Smiling'? Rethinking Emotional Engagement with Contested Legacies in Contemporary Museums

Authors: Qiwei Guo (University College London)
Format: Oral

In a context where social media have become key sites for the emotional negotiation and public contestation of heritage, the British Museum has attracted sustained attention from Chinese audiences. Discussions surrounding the display of Chinese artefacts in its galleries and exhibitions have circulated widely online, giving rise to popular slogans such as 'no Chinese person can leave the British Museum smiling' and short-form dramas like Escape from the British Museum. This paper examines how emotions shape Chinese audiences' interpretations of museum exhibitions, focusing on China's Hidden Century (2023), Silk Roads (2024–2025), and the British Museum's permanent China-related galleries. Drawing on in-depth interviews with a small number of Chinese participants, alongside observation of social media discussions, the study examines how affect participates in the interpretation of museum exhibitions. It combines critical discourse analysis and thematic analysis to explore how affect operates as an ambient condition shaping interpretive possibilities. The findings suggest that claims concerning the contested legacies of Chinese collections are often articulated in relation to state-influenced narratives of national humiliation. However, emotional engagements with collection histories do not necessarily translate into explicit nationalist demands or calls for restitution. Instead, such engagements frequently coexist with interpretive restraint and reflective distance, as audiences negotiate their positions between critique, identification, and self-awareness. By foregrounding the affective dimensions of audience interpretation, this paper reflects on how particular narrative configurations within contemporary museum frameworks carry specific affective affordances. It contributes to ongoing discussions about how museums are experienced, interpreted, and contested by transnational publics in digitally mediated environments.

2720. Chinese Painting, Taiwanese Perspectives: Canon and Display in Dutch Ethnographic Museums

Authors: Tzening Hong (Erasmus University Rotterdam)
Format: Oral

During visits to the Wereldmuseum in Leiden and Rotterdam, I encountered works by artists such as Qi Baishi, Xu Beihong, and Tai Jing-Nong within exhibitions introducing Chinese cultural production to European audiences. In Chinese and Taiwanese art historical education and museum exhibitions, these artists occupy a prominent place within the canon of modern painting and calligraphy. Encountering their work in Dutch ethnographic exhibition contexts therefore prompted reflection on how familiar figures from Chinese art history are framed within broader displays. In these exhibitions, objects are typically organised through regional and cultural classifications rather than through the art historical narratives that usually structure the study of painting and calligraphy. As a result, artists who occupy a central place in Chinese and are part of Taiwanese art historical traditions risk being presented primarily as examples of cultural categories rather than as individual contributors to the history of modern Chinese art. For visitors who recognise these artists from within these traditions, such encounters may also raise questions about national classification, particularly when artists whose work circulates between both Chinese and Taiwanese contexts are presented under the umbrella of "Chinese art" in European museum displays. Drawing on autoethnographic reflection from the perspective of a Taiwanese visitor trained in fine arts, this paper examines how encounters with familiar names from Chinese painting generate moments of recognition, uncertainty, and self evaluation. The paper argues that such encounters reveal how curatorial classification

and exhibition narratives shape the perceived significance of artworks. It further suggests that exhibitions presenting Chinese cultural production in European ethnographic museums may be interpreted differently by visitors whose cultural and educational backgrounds are closely connected to the works on display.

281 NETWORKS OF PRESTIGE? ELITE IDENTITIES IN MIRROR OF HIGH VALUE OBJECTS FROM AN ARCHAEOLOGICAL PERSPECTIVE

Theme: 7. Interaction, connectivity and mobility
Organisers: Šárka Krupicková (Czech Academy of Sciences, Institute of Archaeology, Brno) – Orsolya Heinrich Tamáska (Leibniz Institute for the History and Culture of Eastern Europe, GWZO)
Keywords: elites, supra-regional contacts, jewellery, dress accessories, high value metal objects
Format: Regular session

SESSION ABSTRACT

Jewellery, dress accessories, and other high value objects represent a key component of the self-identification and self-presentation of elites, who used them to construct their distinctive identities. These identities were regionally specific, yet simultaneously grounded in broader supra-regional cultural contacts and networks. Members of the elites were typically in close contact with counterparts from other regions—whether through long-distance trade or through direct and indirect social interactions, such as diplomatic exchanges accompanied by the presentation of prestigious gifts. Jewellery and other fine metalwork thus constitute essential archaeological evidence for studying supra-regional relations and provide valuable insights into the complex socio-economic structures of Europe's past. The nuanced interpretation of their chronological placement, spatial distribution, and functional context depends on analytical approaches, including detailed technological and production studies. Such analyses contribute to questions of provenance, technological character, and elite identity. This session welcomes contributions from all chronological periods that address the theme of supra-regional elite contacts through archaeological, material, or technological analyses of jewellery, dress accessories, and other high value objects, including ceremonial items and reliquaries. Theoretical or synthetic papers dealing with these issues are also highly encouraged.

CONTRIBUTION ABSTRACTS

1874. Connected Elites: Prestige Hoards and Long-Distance Exchange Networks in the Cucuteni-Trypillia Area

Authors: Senica Turcanu ("Moldova" National Museum Complex of Iasi)
Format: Oral

The paper analyses the hoards containing prestige objects from the Cucuteni-Trypillia cultural complex in Southeastern Europe (5th-4th millennia BC), focusing on supraregional networks and the identity of elites constructs. The inventories of prestige hoards varies from a few dozen to over 800 items. Their composition is extremely varied, including beads made from deer canines, copper, marble, and pottery; clothing accessories crafted from pharyngeal carp teeth and shells of Spondylus and Dentalium; copper bracelets (wire, bar or plate), diadems, pendants made of copper and gold, as well as weapons and axes made from stone and copper, interpreted as obvious markers of social status. The analysis of the provenance of raw materials and the typology of the pieces indicates that, although some of the objects could have been produced locally, the majority were acquired through long-distance exchanges. These exchanges reflect the existence of complex networks of interaction, which connected Cucuteni-Trypillia communities with distant regions of the Balkans and Central Europe. The analyzed hoards appear to represent accumulations built up over the course of several generations, suggesting not only the circulation of prestige objects, but also the symbolic transmission of status and elite identity. In this sense, jewelry, clothing accessories and weapons constitute essential archaeological evidence for understanding socio-economic relationships, mobility and supra-regional interconnection in Prehistoric Europe. Through an integrated approach to the archaeological context, raw materials, and certain functional characteristics of these objects, this contribution aims to highlight the role of Cucuteni-Trypillia prestige hoards as material expressions of elite networks and identities constructed through intercultural contact.

910. New Networks and Elites? Shifting representations of elite identities in an interconnected Tartessian First Iron Age (9th–6th centuries BCE)

Authors: Io Cruz Vera (Université Paris 1 Panthéon-Sorbonne | UMR 8215 Trajectoires | UMR 8546 AOrOc)
Format: Oral

From the conclusion of the second millennium BCE to the onset of the first millennium BCE, seafarers from the eastern Mediterranean, who were traditionally associated with the Phoenicians, established maritime connections with the western Mediterranean, particularly south-western Iberia. This protracted process of initial contacts gave rise to a number of phenomena from the latter quarter of the 9th century BCE onwards, including the establishment of new settlements partially settled by these Mediterranean seafarers,

and the mutation of the local archaeological culture. This evolution, discernible through the archaeological corpus, is particularly evident in the forms of representation by and for the social elites, which are the most visible aspect of this change in the local material culture. These elites adopted new ways of self-identification and representation, combining newly imported cultural markers with more traditional artefacts and techniques inherited from the Late Bronze Age. This marked a period of consolidation and diversification within this segment of Tartessian society. This is evidenced by the emergence of a more intricate social hierarchy, as demonstrated in the funerary registry, which unveils new levels of wealth among the upper social classes. The presence of imported objects and typologies, that appear to have been considered valuable, and even prestigious, by these populations, is often indicative of this wealth. The period is also characterised by pronounced disparities between the material culture of the elite, who adopted these newly imported, high-value objects, and that of the general population, which is often considered to be more traditional. The purpose of this communication is to enhance our comprehension of the manner in which Tartessian elites articulated their identity within the context of the consolidation of new trade networks and the facilitation of diplomatic exchanges, as well as the development of new forms of control and domination over the rest of society.

1856. The (in)visible elements of elite dress in the Early Iron Age of northern Croatia

Authors: Julia Fileš Kramberger – Hrvoje Potrebica (University of Zagreb)
Format: Oral

Monumental graves and their lavish inventories are a usual source for defining elite identities in particular communities. In Early Iron Age Europe these have traditionally been defined through surviving metal and pottery objects such as weapons, wagons, personal adornments, feasting sets, etc. At the same time, different elements of dress, jewelry and weapons were certainly key components in constructing and visually communicating various aspects of individual identity. In the Early Iron Age of northern Croatia prestigious objects such as local or imported bronze fibulae or pins, electrum beads as part of attire, whetstones with decorated bronze handles, as well as armaments such as traditional bronze and iron swords, or imported Greco-Illyrian or Corinthian helmets, represent key elements in the construction of local elite visual identities. They also reflect a complex network of inter-elite contacts through prestigious objects imported from the Balkans, the Mediterranean or Central Europe. Nevertheless, this evidence reveals only a partial image of elite visual identity as it does not include perishable materials that are rarely visible in the archaeological record, such as textiles, leather, and wood, which were undoubtedly an integral – if not essential – piece of the puzzle. This paper will show how elites from the periphery from the Hallstatt complex established and maintained their position as a major hub in network communications between elites from different cultural areas. It will also broaden the interpretative framework by stressing the importance of including these often "invisible" objects into the construction and reconstruction of the elite identity, since these elements may have played a crucial role in conveying regional or supra-regional messages.

2537. Jewellery as an element of self-presentation of the Sarmatian elites

Authors: Evgenia Velychko (National Museum of the History of Ukraine)
Format: Oral

A variety of jewellery is frequently found in the elite burials of the Sarmatians, nomads who lived in the steppes of the North Pontic region in Roman times. Among them are exquisite, technologically advanced jewellery that was made in the workshops of Egypt, Syria, or Italy. They clearly served as markers of high social status: the higher the presumed status of the burial, the more high-quality, non-local jewellery was buried in it. At the same time, products in the traditional Sarmatian turquoise-gold style, closely attuned to Central Asian visual culture and signalling Sarmatian aristocratic identity in its own right, continued to serve as markers of elite status and were often found together with imports. This unique mixture gave rise to the interesting phenomenon of Sarmatian elite burials, in which a single complex contained luxurious items of Mediterranean production, artefacts of Far Eastern origin, and crafts of local North Pontic workshops, clearly catering to barbarian tastes. This diversity mirrors the extensive social relations of Sarmatian elites, which had considerable influence on political and commercial activities in the North Pontic region and beyond.

390. The Supraregional Contacts of Roztoky Site (Czech Republic) in the 7th century AD

Authors: Nadezda Profantová (Institute of Archaeology of the CAS, Prague, v. v. i.)
Format: Oral

Roztoky near Prague is the largest settlement area in Central Europe for the Prague-type pottery Culture. The documents of supra-regional contacts are the most intensive with the South-East Regions (glass beads, bronze spiral necklace with pendants, silver fitting), quite intensive with the Western Europe (brass loop, iron strap-end, phalera, and inlay loop, antler comb case and decoration); the small lump of amber from the Baltic sea as a resource is also quite luxurious. The round bronze decoration is an unfinished local product, but we can find its inspiration in the East or South-East, probably in a milieu influenced by the Byzantine Empire. The small, round iron ´bowl´ is unique; its origin or inspiration is not known. Some of the antler-decorated finds - handles - are also local, and they show us a good level of local production. The local production of decorations is evidenced by the little pans with remains of non-ferrous metals and the find of a crucible with locally produced silver. Imports, artefacts influenced by supraregional contacts just like specialised production documents inform us that the local elite probably resided in Roztoky, even we did not find the residential building(s). I would not discount the possibility that the elite used a group of "common" houses.

601. A silver deposit in Smila (Ukraine,Cherkasy region): what tell us the objects about early medieval elites?

Authors: Viacheslav Baranov (Institute of archaeology of NAS of Ukraine) – Jens Schneeweiß (Leibniz Zentrum für Archäologie) – Orsolya Heinrich-Tamaska – Inga Utkina-Wöhrl (Leibniz Institute for the History and Culture of Eastern Europe) – Olga Manigda (Institute of archaeology of NAS of Ukraine)
Format: Oral

In 2008, near the town of Smila in the Cherkasy region of Ukraine, a treasure was discovered, which has since been transferred to the collection of the Medzhybizh State Historical and Cultural Reserve. The site is located on the road between the hillfort at Pastyrskyi (the most important central place of the region) and the crossing point to the left bank of the Dnieper. The treasure consists of nearly 200 silver items, was hidden in a pottery vessel, and belongs to the second group of so-called "Ant treasures", dating from the beginning to the first quarter of the 8th century. The collection includes several silver objects, like brooches, a necklace, bracelets, pendants with star-shaped rosettes and earrings with spherical pendants. With our team we are going to investigate these objects with different methods and we ask by whom and why those objects were hoarded. To this end, both the material and the manufacturing technique of all objects are being examined. We want to find answers regarding the origin of the silver used and the knowhow of the craftsmen, so that we can also discuss the social networks of the early medieval elites behind this composition. Chronologically and spatially we will discuss this deposit also in frame of the settlement structure of of the Pastyrskyi hillfort, which was destroyed at the same time, as the hoard was hidden.

977. Import, elite product, imitation? Searching for production mechanism and distribution of jewellery in early medieval Central Danube region

Authors: Šárka Krupicková (Czech Academy of Sciences, Institute of Archaeology, Brno) – Birgit Bühler (Vienna Institute for Archaeological Science, University of Vienna)
Format: Oral

One of the main identifiers of social stratification in all human communities is clothing, with metal clothing accessories and jewellery often being the only preserved elements of original attire, which are discovered in archaeological contexts. In the past, elite clothing accessories and jewellery made of precious metals using sophisticated jewellery techniques would be given as gifts among allies or vassals. The whole artefacts or rare components for their production (precious stones, pearls) could be the subject of long-distance trade. Erudite craftsmen who mastered specific demanding production techniques of hammering, chasing, filigree production, granulation or stone setting travelled between regions or were sent to serve in different territories. All the aforementioned forms of production and/or distribution are reflected in the form of artefacts that connect supra-regional fashion trends and specific technological processes used in their manufacturing. Exclusive fashion items could be also imitated for the purpose of spreading among the lower or local elites, but also for the purpose of distributing simplified variants among non-elite population strata. By comparing technological details, decorative motifs and also by comparison of the find context of jewellery and clothing items discovered during archaeological research in the Middle Danube region, we attempt to answer the question of which specific jewellery and clothing items could have travelled through Europe as imports, which artefacts reflected the local manufacturing process in elite workshops, and whether we also find imitations of elite products in the archaeological material.

1955. Mobile containers and the question of reliquaries from the 9th-century Moravia

Authors: Lumír Polácek – Šárka Krupičková (Czech Academy of Sciences, Institute of Archaeology, Brno) – Luděk Galuška – Lucie Valášková (Moravian Museum) – Michał Płygawko (Czech Academy of Sciences, Institute of Archaeology, Brno) – Michal Vopálenský (Czech Academy of Sciences, Institute of Theoretical and Applied Mechanics) – Martin Fořt (Czech Academy of Sciences, Institute of Archaeology, Brno)
Format: Oral

New analyses of a luxurious gold artefact with almandine from Mikulčice (Moravia, Czech Republic) – a probably valuable import – have opened the question of the functional interpretation of this exceptional archaeological find as a potential belt reliquary. This interpretation was based on the alleged finding of organic matter in the cavity between the two halves of the almandine cabochon. The presence of organic matter – perhaps blood-stained fabric – was detected during the opening of the artefact in the 1960s at the RGZM. Since then, the objects have been unofficially referred to as "the blood of Christ". A new comprehensive archaeometric investigation of the artifact has required, among other things, its re-opening. It has been found that the aforementioned cavity is empty, so the original interpretation loses its main argument for its validation. Therefore, we will focus more generally on artefacts that could have served as containers for preserving relics or other valuable substances. These will include both personal artefacts (amulets, capsules, captorges, reliquary crosses) and larger mobile containers that could have been part of the liturgical equipment of churches (reliquaries, pyxides). We will focus our attention on the area of Great Moravia and the surrounding regions in the 9th century. We will also examine the historical issue of the treatment of reliquiaries in the region under study in the given period. The reliquaries could have reached Moravia region probably through Christian missions coming here from the Frankish Empire, the Adriatic region or Byzantium, but also through gifts within the framework of supra-regional elite interactions. In any case, the question of the presence of reliquaries or similar containers in Great Moravia in the 9th century remains an important part of the cultural and ecclesiastical history of the early Middle Ages in East-Central Europe.

371. Luxury jewellery – exclusively for the highest elite? Social-culture topography of luxury jewellery in early medieval Bohemia

Authors: Katerina Tomková (Institute of Archaeology of the Czech Academy of Sciences, Prague)
Format: Oral

Luxury jewellery, the production of which is tied to more sophisticated production techniques and the use of gold and silver, is traditionally associated with elites and important early medieval centres. Mapping the penetration of this jewellery into other strata of early medieval society, as well as into peripheral areas of centres, duchies and empires, merits scholarly attention. The aim of the presentation is to describe various cases of these transfers using the example of Bohemia at the following levels: 1. finds of luxury jewellery from the burial ground in Lumbe Garden versus from the burial grounds of the satellite settlement in the surrounding area of Prague Castle; 2. luxury jewellery from the burial grounds of the inhabitants of hillforts and from rural burial grounds; 3. luxury jewellery on the periphery of the heart and eastern part of central Bohemia, including central Vltava region. The changes in the internal political and geopolitical situation in the 9th and 10th centuries will be taken into account, i.e. the transformation of Bohemia, governed by a larger number of princes in the 9th century, into the gradually centralised Duchy of the Přemyslids in the 10th century, as well as the rise and fall of the Great Moravian Empire.

1972. How was the production of Great Moravian luxury jewellery organized?

Authors: Šimon Ungerman (Czech Academy of Sciences, Institute of Archaeology, Brno)
Format: Oral

In recent years, there has been a revival of interest in luxury jewellery found in the territory of former Great Moravia (mainly present-day Moravia and southwestern Slovakia, 9th century), primarily in the technology of its production. The question of whether the production of this jewellery was somehow organized and whether it was redistributed is also starting to be discussed. In principle, three "ideal" models are conceivable. According to the first model, the main – or even the only – customer was the ruler, who operated jewellery workshops under his direction. He ordered the craftsmen how many and what kind of jewellery they were to produce. The ruler then distributed the jewellery to his allies and supporters. The second model assumes that each of the most important aristocratic families maintained its own workshop. The patron delivered the necessary amount of precious metal and provided instructions on how many pieces of jewellery should be made and how they should look. The primary reason for the workshop's existence was to satisfy the demand from women and girls from a given aristocratic family, but clients or allies of this family could also have access to the workshop. In other words, this model of jewelry production is decentralized and does not involve significant redistribution. The third model has a "commercial" character – it assumes that the workshops were independent and satisfied the demand of anyone who was rich enough to order the luxury jewellery. The question is whether, in addition to work on order, such workshops could also produce „to stock", i.e. without following instructions of a specific customer. In the paper, the three models are discussed in the context of the (very fragmentary) information we have about the work of jewelers in the Early Middle Ages in Western Europe, Byzantium, and the Near East.

1984. The social status of individuals buried in settlement graves furnished with precious-metal jewellery (Early Middle Ages, Central Europe)

Authors: Renáta Prichystalová (Masaryk University, Brno)
Format: Oral

During the Early Medieval period of the 9. and 10. centuries in Central Europe — specifically within the political sphere of influence of the so-called Great Moravia (present-day Czech Republic and Slovakia) — elite burials containing jewellery made of precious metals were usually found in the church cemeteries. These burial grounds were directly connected to the power and residential centres of Great Moravia, and the individuals buried there are traditionally considered to have been members of the upper classes. Similar graves also occur, albeit less frequently, in rural row cemeteries, where they are associated with local elites, whether clan-based or military. In settlement graves, however, jewellery made of precious metals is extremely rare, and such finds have not yet received systematic scholarly attention. Individuals buried in settlement burial grounds are generally considered to have belonged to the lower or middle social tiers of early medieval society. The presence of precious-metal jewellery in these graves challenges this conventional interpretation, raising the question of who these individuals actually were. This paper analyses these exceptional settlement burials and presents possible scenarios for interpreting their social status in early medieval Great Moravian society.

1474. Reflections of Wealth and Culture: Byzantine and Moravian jewellery in a 10th-century burial site in the Carpathian Basin

Authors: Dániel Giedl (Ferenczy Múzeumi Centrum, Department of Archaeology) – Péter Langó (Hungarian Academy of Sciences, Archaeological Institute, Faculty Member | Pázmány Péter Catholic University, Department of Archaeology, Faculty Member)
Format: Oral

A richly adorned female burial dating to the 10th century was unearthed during an excavation near Csévharaszt, Hungary, in autumn 2024. The grave contained the remains of a woman with an estimated age-at-death between 30 and 40 years. In addition to a variety of dress accessories, a range of jewellery items were uncovered in the grave, whose technological and typological characteristics suggest connections to both Byzantine and Moravian craftsmanship. A broader examination of these artefacts offers indirect insight into the diverse cultural connections of the former community. A particularly noteworthy discovery was a head ring of a rare type, composed of gilded silver plates. The distinctive technical features of the ring suggest that its design can be associated with Byzantine jewellery craftsmanship. However, only a few comparable examples, discussed in this study, are known from 9–11th-century East-Central European jewellery, reflecting the wearer's high social elite status. A gilded ornamental button, decorated with a floral pattern, was also found in the grave. The design of the ornamental button is indicative of the group of decorative buttons generally referred to as Great Moravian 'gombíky'. The Moravian decorative button discovered in the grave offers an opportunity to re-evaluate the potential nature of the relationship between the former Moravia and the Hungarians in the 10th century. In the presentation, an overview is provided of the distribution and chronology of Moravian decorative buttons discovered in the 9th–10th-century Hungarian environment. The valuable jewellery and clothing accessories found in the grave in Csévharaszt, which indicate the high social prestige of the wearer, provide an opportunity to understand the social network of the elite living in the region during that period.

319. Insignia of Noble Metals in Graves from the Roman Period in the Province of Thrace (1st – 3rd c.)

Authors: Kaloyan Pramatarov (National Archaeological Institute with Museum)
Format: Poster

After the establishment of Province of Thrace in AD 47/48 by emperor Claudius, in the burial mounds started the organization of representative funerals, reflecting common Graeco-Roman concepts about the Death, and the strive of the provincial elite to create an image for themselves as warriors, hunters, and participants in feasts by depositing category of specific objects, signs for economic prosperity, political power and social status: drinking ware and table ware, weaponry, jewelry, insigniae of gold and silver (wreaths, diadems, pectorals, appliques). The presence of the latter is related to the concept for the heroization of the deceased persons and finds parallel in other parts of the Roman Empire – Asia, Cyprus, Syria, Italy, Macedonia, characterized by an aristocratic ruling model and high economic potential. The present poster presents the possible interpretation of the discussed category of objects by representing the most valuable finds and situating them in the context of the Roman Empire.

1408. A gilded mask brooch from Tura, Hungary

Authors: Tibor Rácz (Ferenczy Museum Centre | Pázmány Péter Catholic University)
Format: Poster

Early medieval bow brooches were not merely functional dress fasteners but socially charged artefacts that conveyed status, wealth, and identity. Among them, anthropomorphic mask brooches represent a rare and highly debated variant whose interpretation has long been entangled with questions of ethnicity, particularly Slavic versus Germanic attribution. This poster presents a recently discovered gilded bronze mask brooch from Tura (Pest County, Hungary) and situates it within the wider archaeological and historiographical context of seventh-century Central and Eastern Europe. The brooch was recovered as a stray find during metal detector survey near an Avar-period cemetery and lacks a secure archaeological context. Its evaluation therefore relies on detailed morphological, stylistic, and technological analysis, combined with regional parallels and associated Avar-period material from the site. The artefact displays elaborate anthropomorphic and zoomorphic ornamentation, high-quality casting, and gilding, marking it as an exceptional prestige item. Rather than treating mask brooches as ethnic markers, recent scholarship interprets them as elements of an elite visual language transcending ethnic boundaries. The Tura brooch supports the view that such objects functioned as symbols of social distinction within interconnected elite networks operating across Byzantine, Germanic, and Avar cultural spheres.

1593. An Unwanted Decoration? When Fashion Becomes a Political Statement

Authors: Zbigniew Robak (Institute of Archaeology, Slovak Academy of Sciences | Department of Archaeology and Museology, Masaryk University)
Format: Poster

The poster addresses the problem of the surprisingly small number of brooch finds in the Great Moravian cultural milieu (from the late 8th to the early 10th century). This phenomenon is all the more intriguing given that in the neighbouring Carolingian cultural sphere brooches constituted a fundamental element of dress, fulfilling important practical, aesthetic and symbolic functions. The aim of the presentation is not so much a typological analysis of the few Great Moravian brooches as an attempt to reconstruct the ways in which they were perceived and the social meanings ascribed to them. The point of departure is the period around the turn of the 8th and 9th centuries, when the Middle Danube basin underwent profound social and cultural transformations: the collapse of the Avar Khaganate, the migration of people from Bavaria eastwards, the Christianisation of the Alpine and Danubian regions, and, as a result, the emergence of the first durable Slavic political organism – Great Moravia. These processes were reflected, among other things, in the appearance of female skeletal burials furnished with ornaments characteristic of Bavaria and Austria in the second half of the 8th century, including brooches, within burial grounds of an unequivocally Slavic character. This phenomenon

disappears with the common adoption of inhumation following the Christianisation of 831, despite the continued intensity of contacts with Bavarian and Frankish elites. The poster advances the hypothesis that brooches in the Great Moravian context may have been perceived as carriers of foreign, ethnically and politically charged symbolism, leading to their deliberate rejection. At the same time, the few burials containing brooches are examined as potential markers of a particular social status, origin, or cultural role of the individuals interred.

282 INTERDISCIPLINARY APPROACHES TO ARCHAEOLOGICAL METAL ANALYSIS

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Sebastian Wärmländer (Stockholm University | Cotsen Institute of Archaeology, UCLA) – Olga Zagorodnia (The British Museum: Department of Scientific Research) – Elisa Maria Grassi (The National Research Council: Institute of Cultural Heritage)
Keywords: Metal object, Metal analysis, Metal conservation, Archaeometallurgy, Interdisciplinary
Format: Regular session

SESSION ABSTRACT

Archaeometallurgy is a multidisciplinary field where researchers from different fields, and different traditions, come together to answer questions related to ancient metals and metalworking. Most research in this field is based on metallurgical analysis, but studies involving experimental archaeology or material provenancing are also common. In this session aims we welcome full-length papers that combine different aspects of metal analysis with other investigation strategies, such as typological analyses or historical studies, to clarify the cultural significance of metal artefacts. Other types of interdisciplinary work related to archaeometallurgy is also welcome, such as investigations of conservation methods for metal objects, analysis of non-metal tools used for metal artefact production, studies of use-wear or production marks created by metal objects (or found on them), et cetera. As the aim of the session is to provide instructive examples of interdisciplinary work that involves metal analysis combined with other research approaches, our session welcomes papers where the studied objects might come from any time period or geographic region. Furthermore, we especially encourage contributions from advanced students and young researchers.

CONTRIBUTION ABSTRACTS

2544. Resolving Copper Provenance in the Southern Levant through Osmium Isotope Analysis

Authors: Ivan Stepanov (Curt-Engelhorn-Zentrum Archäometrie, Mannheim) – Naama Yahalom-Mack (Hebrew University, Jerusalem) – Michael Brauns (Curt-Engelhorn-Zentrum Archäometrie, Mannheim)
Format: Oral

The limitations of lead (Pb) isotope analysis for distinguishing copper ore deposits of similar geological age and formation history are well recognized. In the Southern Levant, copper ores from the major ancient production centers of Timna and Faynan exhibit overlapping Pb isotopic signatures, complicating provenance studies. Both regions supplied copper to the Mediterranean trade network during the Late Bronze and Iron Ages. To address this long-standing challenge, we apply rhenium–osmium (Re–Os) isotope analysis as a complementary and more discriminating approach. Osmium is a highly siderophile element that preferentially concentrates in Fe/Mn oxide minerals and, consequently, in smelted metal products. The intentional use of Fe/Mn oxides as fluxes, as well as their accidental incorporation during copper ore smelting, was a defining feature of Bronze and Iron Age copper production in the Arabah. Because copper ores typically contain very low Os concentrations, the original osmium isotopic composition (187Os/188Os) of the ore was largely overprinted during smelting by the isotopic signature of associated Fe/Mn oxides. Copper produced at Faynan is characterized by radiogenic 187Os/188Os ratios (3.2–8.7) and elevated Os concentrations (200–2000 ppt), reflecting the osmium signature of Fe/Mn oxides associated with the local ores. In contrast, Timna copper exhibits lower Os isotope ratios (approximately 1.4–1.7), consistent with the less radiogenic osmium composition of regional hematite. Variability in Os isotopic compositions may also relate to repeated re-melting of copper, which promotes the removal of iron and/or osmium from the metal. These findings demonstrate the potential of osmium isotopes as a powerful tool for resolving copper provenance and reconstructing trade networks in the eastern Mediterranean during the Bronze and Iron Ages.

2567. The Crucibles from Groß-Rohrheim and their importance of early La Tène metalworking for the region of South Hesse, Germany

Authors: Anna-Lena Jerg (University of Tübingen) – Roland Schwab (Leibniz-Zentrum für Archäologie, Mainz)
Format: Oral

Archaeological excavations at Groß-Rohrheim revealed an unexpected Early La Tène metalworking complex. Several pits containing approximately 180 slags, 500 crucible fragments, and five almost entirely preserved crucibles, provide key evidence of early La Tène metalworking practices. The assemblage is of particular significance, as it represents not just the second largest complex, but

it originates from a region traditionally considered peripheral. Recent research suggests, however, that Groß-Rohrheim was characterised by a centralised settlement structure, within which metalworking activity may have played an important role. The area is also known for remarkable finds, including two gold-plated bronze rings with coral inlay and a golden disc, possibly components of drinking horns, typically associated with funerary contexts. In addition to the standardisation of the crucibles, which all belong to the same small and uniform type, a specialised and controlled use was suggested. This has led to speculation that the crucibles were used for melting precious metals. To test this hypothesis, all crucibles were systematically investigated using an interdisciplinary analytical programme combining metallurgical analyses with ceramic petrography. The combination of X-ray radiography, computer tomography and micro-X-Ray fluorescence analysis (μ-XRF) with ceramic petrography allowed the reconstruction of technological choices, production practices and distribution, including the analysis of raw material selection, clay preparation and temper composition. The results indicate a clay recipe with carefully selected and well-processed raw materials. The assemblage consists exclusively of single-walled crucibles of mostly consistent morphology and manufacturing traits and with only minimal adhering metal remains, which exclusively consist of thermally decomposed bronze. By integrating technological and archaeological perspectives, the results contribute to a reassessment of the role and significance of metalworking in the Early La Tène societies of South Hesse, while also addressing broader questions of craft organisation, regional settlement structure and underlying social structures.

322. Material Characterization and Manufacturing Processes of Elite Early Medieval Jewellery from Grave H53, Lumbe Garden Cemetery, Prague Castle

Authors: Estelle Ottenwelter (Czech Academy of Sciences, Institute of Archaeology, Prague | TRACES laboratory CNRS UMR5608, Toulouse) – Ludmila Barčáková (Czech Academy of Sciences, Institute of Archaeology, Prague)
Format: Oral

Among the findings at Lumbe's Garden Cemetery at Prague Castle - one of the most significant early medieval burial site in Bohemia (Czech republic) - grave 53 stands out for its exceptionally rich assemblage of elite 10th century jewellery. The grave goods include a metallic necklace with a silver zoomorphic amulet container, silver beads and a set of elaborately decorated globular earrings adorned with intricate granulation work. The fragmented condition of the jewels facilitated straightforward sampling and material characterization through metallographic examination and SEM/EDS analysis. X-ray radiography and SEM imaging of the surface of the golden globular earrings revealed mounting anomalies and surface defects which have shedded light on the manufacture of the earrings and material used. Additionally, creating replicas of the jewellery offered valuable insights into each stage of the manufacturing process. It also facilitated the assessment of craftsmanship skills, and allowed an estimation of time of manufacture for the whole set of jewellery emphasizing its uniqueness.

618. The Southern Roots of Northern Bronze: Multi-Proxy archaeometric investigation of Sögel-Wohlde swords and their European Origins?

Authors: Bart Cornelis (University of Tübingen) – Daniel Berger (Curt-Engelhorn-Zentrum Archäometrie gGmbH)
Format: Oral

Bronze metallurgy flourished in the Nordic Bronze Age during Period IB (1600–1500 BC), marking a transformative phase in metalworking. This breakthrough was driven by an unprecedented surge in metal supply and the emergence of sophisticated artifacts, particularly within "warrior assemblages." Among these, the Sögel-Wohlde metalwork stands out as a distinctive set of weaponry that gained pan-European significance. Swords of this type have been discovered across Northwest and Central Germany, southern Scandinavia, and the Low Countries, yet their sudden appearance is especially notable due to the absence of local precursors in these regions. Scholars have linked the Sögel-Wohlde swords to two major influences: the Hajdúsámson-Apa type metalwork from the Carpathian Basin and the swords of the Northern Alpine Tumulus Culture. The origins and development of these weapons, however, remain a subject of ongoing research. The project "Origin, Development, and Technology of the Sögel-Wohlde-Kreis" seeks to clarify these relationships by analyzing the chemical composition and lead isotope ratios of relevant swords, including tin and copper isotopic values of similar artifacts found throughout Northern and Central Europe. By employing multi-proxy data, the project aims to identify the ore sources supplying metal to each region and to uncover archaeometric similarities and connections between these artifacts. Preliminary results from chemical and lead isotopic analyses reveal that the Mitterberg mine, which had only recently become operational, was a major copper supplier for sword production across all regions. While Slovakian, British and southern Alpine copper was also used but to a lesser extent. The existence of extensive copper supply networks is evident, yet regional and typological variations suggest that ancient smiths either had limited access to certain copper sources or preferred distinct supplies for crafting their swords.

2384. Metallographic Insights into Early Viking Weapons from the Salme Ship Burials

Authors: Ragnar Saage (Aarhus University, Department of Geoscience)
Format: Oral

This paper presents the first results of the research project "Brothers in Arms: Provenancing Metal War Gear from the First Viking Raid to the East" (MetRa). In the 8th century AD, a battle took place near present-day Salme, on the Estonian island of Saaremaa in the Baltic Sea. The remains of one of the war parties were discovered in 2008 and 2010 in the form of two ship burials containing the remains of more than 40 male warriors. The ships were used as improvised burial structures for a mass grave and contained a

rich assemblage of grave goods, including weapons, gaming pieces, and personal items such as combs. Based on aDNA analysis, four of the warriors were identified as brothers. This exceptional find provides a unique opportunity to investigate the weaponry buried with members of the same family. The main objective of the project is to determine the provenance of the iron and copper alloys used in their weapons. As a first step in this provenance study, metallographic analyses of swords were being conducted. These analyses allow for the characterisation of the iron and steel used in their manufacture. In addition, the forging patterns of the bladed weapons were examined, as they offer valuable insights into production technologies and the deliberate choices made in combining iron and steel. This research is supported by an EC Horizon MSCA Postdoctoral Fellowship.

1795. From Ore to Slag: Interdisciplinary Perspectives on Iron Production in the Pisogne District

Authors: Elisa Grassi (National Research Council - Institute of Heritage Science)
Format: Oral

The iron mining and production district of Pisogne (Lombardy, northern Italy) provides an exceptional case study for investigating long-term technological change through an interdisciplinary archaeometallurgical approach. Documented from at least the 10th century to the mid-20th century, this landscape preserves extensive evidence of mining and ironworking activities. Within a broader project dedicated to heritage documentation and enhancement, archaeological survey, geoarchaeological analysis, and historical research were integrated to identify, map, and interpret more than 120 mining sites and approximately 30 iron-processing structures, including 15 roasting kilns. This paper focuses on the contribution of archaeometallurgical analyses within this research framework. Slags, roasted ores, and metallurgical residues collected during field survey were analysed using Scanning Electron Microscopy (SEM), X-ray Diffraction (XRD), and X-ray Fluorescence (XRF), in collaboration with industrial and research laboratories. When interpreted alongside spatial distribution, geological context, and archaeological data, these analyses enable a more nuanced reconstruction of local metallurgical practices. The slag assemblage reveals evidence for multiple production technologies, including direct smelting associated with medieval bloomery furnaces and materials linked to indirect smelting processes that became widespread in the later Middle Ages. In some instances, slag morphology and composition suggest pig-iron refining and possible steel production. Rather than representing discrete technological phases, the evidence points to gradual adaptation and technological continuity within a persistent metallurgical landscape. This study demonstrates the interpretive value of integrating laboratory analysis with landscape and historical approaches to understand innovation in long-term ironworking traditions.

2702. Challenges and case studies of Andean metalworking

Authors: Sebastian Wärmländer (Stockholm University | Cotsen Institute of Archaeology, UCLA)
Format: Oral

The history of South American metalworking still presents a number of unresolved questions, despite decades of archaeological and historical research. This is especially true for the Andean region, where in pre-Columbian times alloys of copper as well as precious metals were crafted into intricate objects of both decorative and utilitarian use. After European arrival, new methods were introduced and metal production became more industrial. Indigenous styles and techniques did not survive as independent traditions, but were modified and persisted to some extent in hybrid and Christianized expressions, such as in decorative objects crafted for churches. In this work, analytical metallographic techniques such as imaging and elemental compositional analysis with scanning electron microscopy (SEM), chemical characterization with X-ray diffraction (XRD) and infra-red (IR) spectroscopy, and optical microscopy analysis of polished and etched cross sections, are used to investigate different aspects of Andean metalworking in different case studies. By investigating both pre- and post-Columbian material, as well as studying both metal production/extraction and finished objects, we are able to illustrate the diversity of the outstanding research questions faced in South American archaeometallurgy.

2722. EDXRF Analysis of Silver Punch-Marked Coins from Bangladesh: Linking Composition to Typology and Trade in Ancient Bengal

Authors: Sabikun Naher (Jahangirnagar University, Savar, Dhaka, Bangladesh) – Mukant Bishwas – Md. Farhadur Rahman (Independent Researcher)
Format: Oral

Punch-marked coins represent the most ancient numismatic evidence in Bengal as well as in the Indian subcontinent. They are primarily made of silver or silver-based alloys, although a few examples made of copper and, rarely, gold have also been found in South Asia. The present study integrates Energy Dispersive X-Ray Fluorescence (EDXRF) analysis with numismatic studies and historical interpretation to examine thirteen silver punch-marked coins from Bangladesh, three from Mahasthan (Bogura), and ten from Naogaon; spanning Janapada (600–400 BCE) and Imperial (500–200 BCE) series. The analysis reveals a high silver content (90.47% to 95.51%) across all specimens, with trace elements such as copper, lead, gold, silicon, and iron indicating variations in metallurgical recipes. Notably, the Janapada series exhibited elevated levels of lead and gold (Pb up to 0.98%, Au up to 0.60%), suggesting the use of different ore sources or refining methods compared to the relatively uniform composition of the Imperial coins. These compositional differences may reflect regional metallurgical traditions, access to diverse mineral resources, and evolving economic integration within early South Asian polities. The presence of trace elements such as Cr, Ni, and Fe hints at specific ore signatures, supporting hypotheses of multiple supply zones and long-distance exchange networks that included silver mining and circulation routes across ancient Bengal and possibly beyond. By combining punch-mark typologies and socio-economic histories,

these archaeometallurgical findings offer valuable insights into possible coin provenance, technological choices, and the broader dynamics of trade, resource procurement, and political economy in early South Asia.

21. Medieval Copper and Copper-Alloy Circulation at Unguja Ukuu around the Western Indian Ocean

Authors: Jingyuan (Yvonne) Zou (School of Archaeology, University of Oxford)
Format: Oral

Located on Zanzibar's south coast, Unguja Ukuu (c. 6th–17th centuries CE) provides a key context for examining how copper and copper alloys circulated and were reworked within early Swahili coastal communities. This paper applies an integrated archaeometallurgical approach, combining metallography, trace-element analysis, and lead isotope analysis, to investigate metallurgical practice, material variability, and metal provisioning within a region embedded in Indian Ocean exchange networks. The study draws on a representative selection of non-ferrous artefacts from controlled excavations. Analytical attention is directed toward compositional diversity, working histories, and isotopic variability, with the aim of assessing how different forms of metal entered circulation and were transformed through use and reworking. Rather than presupposing coherent supply systems, the analysis evaluates the extent to which metallurgical evidence reflects heterogeneity in materials, practices, and knowledge transmission. By situating laboratory data within broader archaeological and historical discussions of exchange, the paper explores how metal circulation can be used to interrogate connectivity and technological decision-making along the Swahili coast. More broadly, it demonstrates the value of integrated archaeometallurgical approaches for examining economic and social processes in early Indian Ocean contexts, while foregrounding methodological questions relevant to fragmentary and possibly recycled assemblages.

299. Revisiting the metal artifacts excavated by the French Expedition at Enkomi

Authors: Edi Grabar (University of Cyprus) – Andreas Charalambous (The Cyprus Institute) – George Papasavvas (University of Cyprus)
Format: Oral

The French Expedition, which was led for its better part by Professor Claude Frédéric-Armand Schaeffer, conducted archaeological excavations at the site of Enkomi in Cyprus during the middle part of the 20th century, starting in 1934 and resuming in 1946 until 1974. Even though a good portion of the many metal artifacts from these excavations have been published, numerous other examples had not undergone any conservation or study and, therefore, remained unpublished. The repertoire of the unearthed copper-based artifacts is varied, including numerous types of tools (adzes, axes, awls, chisels, drills, knives, shovels, and sickles), weapons (arrowheads, daggers, spearheads, and swords), vessels (mainly hemispherical bowls), objects of personal use (bracelets, fibulae, mirrors, pins, razors, rings, spiral rings, and tweezers), statuettes, and even fragments of copper ingots. There is an additional problem in this situation that the excavation records do not provide sufficient information of their context. This is why a thorough revision of these bronzes, stored in the Cyprus Museum in Nicosia, including detailed presentation, measurements, metal analysis, and interpretation of well-preserved objects, will largely contribute to the understanding and reconstruction of the social and cultural environment of Enkomi and, given the importance of this site, for Cyprus in general. To reach the most reliable results, it is important to include and combine traditional methods and available typological studies, together with more advanced methodological and scientific approaches, as applied in the study of archaeological material. With the use of non-destructive X-ray fluorescence analysis (XRF) in this research, it will be possible to obtain crucial data on the elemental composition of the copper-based artifacts, which will provide new insights into metalworking activities, technological achievements, and social dynamics during the Late Bronze Age in Cyprus. With the complete XRF analysis, it's possible to interpret and present the final results of metal analysis.

1423. Density-Based Classification and Iron Content Estimation of the Bloomery Iron Semi-Products: An Experimental Approach to Post-Reduction Technological Characterization

Authors: Tena Karavidovic (Institute of Archaeology, Zagreb) – Ádam Thiele (Budapest University of Technology and Economics, Budapest)
Format: Oral

The study presents a framework for estimating metallic iron content and the degree of refinement in archaeological iron semi-products using non-destructive bulk density measurement. Visual inspection, simple metrics and conventional structural analysis reveal aspects of bloomery technology but seldom yield comparable quantitative indicators of technological practice. Moreover, structural analysis frequently includes invasive sectioning. To address this limitation, changes in semi-product density during post-reduction refining—from iron sponge to purified bars—were evaluated through a programme of experimental refining, density measurement, structural analysis and predictive modelling. On this basis, a four-stage typology with indicative density ranges is proposed: (1) uncompacted sponge, 3–4 g/cm^3; (2) compacted bloom, 3.5–5 g/cm^3; (3) reheated/consolidated bloom, 5–6 g/cm^3; and (4) purified bars with slag inclusions - 7.5 g/cm^3. A linear relation between bulk density (ρ) and metallic iron content (Fe%) was derived ($Fe\% \approx 9.2\rho + 27$), permitting estimation of metallic iron content and mass of a semi-product at any given density i.e. post-reduction processing stage. The framework standardises technological characterisation of iron production stages and supports comparative analysis across diverse archaeological contexts through a replicable, scalable protocol linking experimental archaeology with morphology-based artefact analysis.

985. Mastering metalwork: Progress and new perspectives on a recently discovered Roman armour decoration technique

Authors: Matej Kmosek – Martijn Wijnhoven (Institute of Archaeology of the Czech Academy of Sciences, Brno)
Format: Oral

Roman military equipment frequently employed tin coatings on copper alloy surfaces to create visual contrast. This decoration has traditionally been interpreted as a by-product of embossed ornamentation, with tinning confined to recessed areas. New interdisciplinary research of a Roman chest plate from Mušov (Czech Republic) challenges this interpretation and demonstrates that partial tinning could also function as an independent decorative technique. Micro-XRF mapping, SEM/EDS, metallography, and traceological analysis enabled to observe the original tin distribution and indicate that selected areas were deliberately masked during the tinning process. Experimental reconstructions tested possible masking methods using materials available in the Roman period, showing that mechanically applied organic substances can successfully reproduce archaeological material. The Mušov armour highlights a sophisticated chaîne opératoire and suggests that masked partial tinning represents a broader, previously unrecognised decorative practice in Roman military metalwork. Following its identification in the Mušov example, additional pieces of Roman military equipment were examined with similar methods, indicating that the technique is more widespread, although not always easily recognised by the naked eye. This study demonstrates the value of combining analytical techniques with experimental archaeology to better understand ancient manufacturing technologies.

1740. Expressing Personal Identity through Non-Ferrous Metal Jewellery Decoration: Silver and Tin in 5th–10th Century Lithuania

Authors: Egle Rimkiene – Audronė Bliujienė (Insitute of Baltic Region History and Archaeology, Klaipėda University)
Format: Oral

Drawing upon recent archaeometallurgical analyses and contextual archaeological data, this study presents an overview of changes in the elemental composition of copper and silver alloys over the period under discussion. Integrating compositional analyses with archaeological context, the research explores how choices in alloy composition and decorative surface treatments, including silver plating and tinning, shaped the visual appearance and social meanings of ornaments worn by communities across present-day Lithuania. Particular attention is given to silver jewellery, especially neck rings, which represent one of the most significant ornament types throughout the period. The study examines how variations in alloy quality, weight and size may have influenced the expression of personal and social identity. Silver circulation is considered in relation to Migration Period processes and the appearance and subsequent decline of Arabic dirhams in the eastern Baltic region. Analytical results obtained through portable XRF and metallographic examination of brooches, dress pins and pendants demonstrate the deliberate use of ornamented silver foil plates alongside soldering and tinning techniques to enhance the visual impact of jewellery. Such technological solutions enabled craftsmen to produce visually striking and fashionable objects. Regional variation in decorative schemes and metallurgical practices indicates the coexistence of local production traditions with wider networks of technological knowledge exchange. By integrating material analyses with archaeological interpretation, it is argued that technological decisions were not purely economic or functional but were embedded in social communication practices. The manipulation of alloys and surface treatments thus emerges as a deliberate strategy for negotiating identity within dynamically changing social structures over a long chronological span. The recurring preference for bright, silvery surfaces suggests that colour symbolism played an important role in expressing status, participating in social ceremonies and reinforcing personal and communal identities.

272. Rethinking socio-economic dynamics through metal analysis in Megara Hyblaea (Syracuse, Italy)

Authors: Beatrice Risposi (University of Rome Tor Vergata)
Format: Oral

Over the past decade, research on metal artefacts in Greek Sicily has expanded considerably. Scholars have shed light on patterns of circulation and use, as well as the role of metal objects in exchange, social interaction, and votive practices. These advances stem from the contextual analysis of typological data. Recent work at Selinus has been especially important: its agora has yielded the largest published assemblage of metal finds currently known from a Greek city in the western Mediterranean. At Megara Hyblaea, however —founded by Megarians in the late 8th century BCE on Sicily's eastern coast— this evidence remains limited. Current knowledge of metal artefacts derives mainly from necropolis contexts, leaving their role within the urban sphere poorly understood. A doctoral project launched in 2025 at the University of Rome Tor Vergata seeks to address this gap. The research examines largely unpublished metal finds from the urban area, particularly the agora and the South Plateau settlement, both excavated from the 1950s onwards by the École française de Rome. The project aims to identify supply networks for metal resources and to clarify the economic, social, and cultural processes that shaped their circulation and use at both local and regional scales between the 7th and the 3rd centuries BCE. This paper presents the project's methodological framework and discusses its first results. It focuses on the integration of typological, metrological, and use-wear analyses with spatial and contextual data to reassess the functional and contextual distribution of metal artefacts across the urban landscape over time. Preliminary evidence highlights a significant diversity of production origins and a small proportion of artefacts of Greek manufacture. This contrasts with the picture emerged from studies of the necropoleis, and points to more complex forms of access to metal resources than previously assumed for Archaic and

Classical Megara Hyblaea.

1944. Workshop origin of precious metal artefacts from Early Medieval Croatia

Authors: Mirja Jarak (University of Zagreb, Faculty of Humanities and Social Sciences) – Damir Doračić (Archaeological Museum in Zagreb) – Maja Petrinec (Museum of Croatian Archaeological Monuments in Split) – Petra Jeršek (University of Zagreb, Faculty of Humanities and Social Sciences)
Format: Oral

The paper is devoted to the recent researches into workshop origin of metal artefacts from Dalmatia, dated to the 8th and 9th century. The researches have been planned in the frame of the Croatian Science Foundation project entitled „The 8th and 9th century workshop production and imports at the territory of Northern Dalmatia". The metal objects have an important place among the project aims. Interpretations regarding their supposed origin (especially of those ascribed to the Carolingian and Byzantine workshops) will be supplemented by analyses of material and tools used in their production. The project includes different analytic methods (SEM-EDS, XRF, PIXE. PIGE, FIB SEM-EDS+EBSD) that will provide new data important for conclusions on workshop origin. In the paper, the results of investigation of several precious archaeological objects obtained so far, will be presented and discussed. That kind of knowledge has been missing in the Croatian archaeological literature, so the new data could significantly improve our insights into the provenance of Early Medieval metal objects from Croatia.

71. Analyses and interpretations of selected examples of Wielbark Culture metal jewelry from settlement zone C (DGB UŁ IDUB No. 63/DGB/2024)

Authors: Wojciech Rutkowski (University of Lodz, Institute of Archaeology) – Irena Podolska-Rutkowska (University of Lodz, Doctoral School of Humanieties)
Format: Oral

This poster presents partial results of a project involving research on Wielbark Culture jewelry discovered in women's graves dating from the 2nd and 3rd centuries AD. The proposed project is related to the Wielbark Culture settlement zone C, which encompasses several contemporary regions of Poland (the Greater Poland Lake District, the Krajeńskie Lake District, and the Tuchola Forest). Zone C is associated with the presence of Wielbark Culture cemeteries with rich graves furnished with women's jewelry made of copper, silver, and gold alloys (fibulae, S-shaped clasps, pendants, beads, bracelets, pins, and rings). The chronology of this phenomenon stretches from the early settlement of this zone by the Wielbark Culture population in phase B2a to its gradual abandonment, which concluded in phase C1b. During the study of Wielbark crafts, the trace-tracing method was applied to artifacts, based on microscopic and macroscopic analyses, which plays a key role in the interpretation of production traces, including tools and traces of use. Examining an object under multiple magnification allows one to see both craftsmanship errors and similarities in the marks left by tools. Another positive aspect of this method is the ability to determine the specific characteristics of a goldsmith's workshop inventory. Finding identical flaws or ornamental defects on different artifacts provides evidence of undeniable production using a single tool, which was tested through archaeological experiments. Also crucial to the project is the analysis of the elemental composition of metal alloys for selected artifacts using X-ray radiofrequency (XRF) spectrometry. The research resulted in a more precise definition of the craftsman's (goldsmith, foundryman, and blacksmith) production strategy and the techniques used to achieve a satisfactory result—the finished object. The overall characteristics discovered during the research allow for a broader understanding of the biographies of the objects studied.

192. Addressing gaps in understanding the metal provenance of KGK VI copper artefacts from Southeastern Romania

Authors: Adelina Darie (Archaeosciences Platform, Research Institute of the University of Bucharest | Bucharest Municipality Museum) – Dragoș Mirea (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering) – Robert Tykot (Department of Anthropology, University of South Florida) – Valentin Parnic (Lower Danube Museum, Călărași) – Cătălin Lazăr (Archaeosciences Platform, Research Institute of the University of Bucharest)
Format: Oral

Recent analysis of radiocarbon dates distributions across the Balkans indicates significant demographic growth between approximately 4560 - 4281 BCE (Eneolithic/Chalcolithic/Copper Age), coinciding with the expansion of Kodžadermen-Gumelnița-Karanovo VI (KGK VI) communities on both sides of the Danube River by c. 4500 BC. This demographic and spatial dynamism was accompanied by increased mobility, which stimulated the production and circulation of metal artefacts through established exchange networks linking the Danube corridor, Northeastern Bulgaria, and the Black Sea coast - routes previously used for the movement of domesticated animals, flint, ceramics, and other materials. Metals were not uniformly available across the Balkans, requiring prehistoric communities to transport raw materials over considerable distances. In this context, the geological characteristics of southeastern Romania are particularly relevant, as the region lacks metal-ore deposits. Archeometallurgical research over the past three decades has documented the existence and exploitation of copper sources by prehistoric communities in the Central and Eastern Balkans. A selection of tools as well as ornaments from the Romanian plain KGK VI sites (Chitila-Fermă, Gumelnița, Glina, Măriuța-La Movilă, Sultana-Malu Roșu, Sărulești, Vidra) were the subject of XRF and PIXE analyses and a number of them will provide samples for the lead isotope analyses in order to identify the possible raw material sources used in the manufacturing process of the Gumelnița copper artefacts. The results will be correlated with the existing data on the copper ores exploited during the Eneolithic times and the copper-based artefacts from the KGK VI area, located in Northeastern Bulgaria. This work is supported by ICUB Fellowship for Young Researchers, at the Research Institute of the University of Bucharest, within the project "The impact of lead isotopic analyses in the provenance of copper objects belonging to the Kodžadermen-Gumelnița-Karanovo VI cultural complex of the last half of the 5th millennium BC" (grant no. 8227/03.09.2025).

689. Exploring Mobility and Trade Networks in the Early Bronze Age: An Interdisciplinary Investigation of an Early Bronze Dagger from Horsens

Authors: Marie Rasmussen (Museum Horsens) – Heide Noergaard (Moesgaard Museum)
Format: Oral

During an archaeological excavation near Horsens Fjord in East Jutland, Denmark, a grave dating to the Early Bronze Age (1700-1500 BC) was uncovered. While no human remains were found, three significant artifacts were recovered from the burial, offering a glimpse into the material culture of that time. These artifacts included a battle axe made of sandstone – a replica of a Fårdrup-style bronze axe, a flint dagger of Type VI, and a bronze dagger, which still retained some preserved organic material from its scabbard and handle. To unravel the mysteries behind the identity of the buried individual, a team of archaeologists and material scientists conducted several analyses. A mix of archaeological, typological and archaeometallurgical investigations (metallographic analyses, lead isotope analyses) combined with use-wear trace analyses were performed on the bronze dagger to shed light on the trade networks and active connections during this period. These analyses provided valuable insights into the dagger's materials and origins, highlighting its special position within the material culture of the early Bronze Age and suggesting long-distance interactions and trade. The results not only support the hypothesis of significant mobility and connectivity within the Danish Early Bronze Age but also emphasize the role of metal artifacts as tangible evidence of the complex networks that influenced the social and economic dynamics of Bronze Age societies.

72. Disc shaped strap-end fitting from Siemkowice. Reconstruction of the decorating process

Authors: Irena Podolska-Rutkowska (University of Lodz, Doctoral School of Humanieties) – Wojciech Rutkowski (University of Lodz, Institute of Archaeology)
Format: Poster

In the spring of 2021, a belt end fitting was accidentally discovered near Siemkowice in the Pajęczno district using a metal detector. The artefact is dated to phases D1–D2 of the Migration Period and classified as type C according to M. Sommer's typology. The find formed the basis of an experimental study aimed at reconstructing the manufacturing sequence and decorative techniques used in the production of this type of fitting. The production process began with marking the centre of the disc-shaped element and punching a reference point to ensure symmetry. Circular guidelines were drawn using a compass to assist in the placement of stamped ornamentation. Almond-shaped borders were then carved, followed by the application of almond motifs, a repeating tonsil pattern, and an S-shaped design. Additional decoration was created with a triangular punch, producing alternating triangular motifs. The upper part of the fitting was embellished with a small fan-shaped ornament. The sides were filed to form diagonally sloping edges, and the surface was finally polished with an iron needle. The experiment employed reconstructed tools based on Roman and Central European Barbaricum finds, providing insight into Migration Period craftsmanship.

185. Reproducing early Renaissance casting technologies: monumental statues

Authors: Marianne Mödlinger – Bastian Asmus (Universität Innsbruck) – Martin Fera (University of Vienna, Department of Prehistoric and Historical Archaeology) – Marc Gener-Moret (National Center for Metallurgical Research - CENIM–CSIC, Madrid) – Ursula Marinelli (Independend researcher, art historian) – Cristina Thieme (Universität Innsbruck)
Format: Poster

The 28 "Schwarze Mander" rank among the most splendid monumental copper-alloy sculptures of the Renaissance. Commissioned by Holy Roman Emperor Maximilian I for his funerary monument in the early 16th century, they were completed more than three decades after his death. Complementary study of original manuscripts and correspondence between Maximilian I and the participating artists further illuminates the enterprise. The copper and brass statues were cast using the lost wax technique. During the course of the project, we will recover and reproduce historical foundry practices. In our presentation, we will showcase the initial practical studies on recreating one of the statues: the Statue of Albert IV, Count of Tyrol (1197–1239), which was cast by Stefan Godl in 1518. Reference: Mödlinger, M., Asmus, B., Ghiara, G. The "Schwarze Mander" of the court church in Innsbruck, Austria: manufacture and production of monumental brass statues in the Renaissance. International Journal of Metalcasting 2024. doi: 10.1007/s40962-024-01299-4.

295. The earliest spur featuring a zoomorphic motif from the slavic lands. Reconstruction of the casting process

Authors: Wojciech Rutkowski (University of Lodz, Institute of Archaeology) – Irena Podolska-Rutkowska (University of

Lodz, Doctoral School of Humanieties) – Magdalena Piotrowska (Institute of Archaeology and Ethnology, of the Polish Academy of Sciences)
Format: Poster

In 2014, a fragment of a spur was discovered at the archaeological site in Kwiatków, located in the Turek District, Brudzew Commune. The artefact was found in section G75 within mechanical layer I and is believed to originate from a nearby early medieval burial ground. Typological analysis assigned the object to technotype I according to J. Żak, indicating a date between the 8th and 9th centuries, which corresponds with the pottery assemblage from the site. The spur was produced using the lost-wax casting technique. In the first stage, half of the wax model was covered with clay, and the contact surface was greased before applying the second half of the mould. In the next stage, the mould was fired to remove wax and moisture, joined with fresh clay, and filled with molten metal. After cooling, the mould was opened and the casting removed. The semi-finished spur was then filed, the pivot cut off, and finishing techniques applied to achieve its final form.

318. Intentional or accidental? The use of Steel in medieval crossbow bolts

Authors: Filip Vološin (Archaeology Institute of Slovak Academy of Sciences)
Format: Poster

This poster investigates whether the presence of steel in medieval crossbow bolts from the Czech lands (13th–15th centuries) represents intentional technological choices or incidental outcomes of ironworking practices. The study adopts an interdisciplinary archaeometallurgical approach combining metallographic analysis with typological assessment and archaeological context. A total of 46 crossbow bolts were subjected to metallographic examination. Samples were sectioned along their typological length to evaluate internal material structures, including the distribution and proportion of iron and steel components. Mechanical and chemical properties were analysed to assess forging techniques and the application of heat treatment, and to explore how material choices corresponded to functional requirements imposed by different types of crossbows. The assemblage originates from several castle sites (Rokštejn, Cornštejn, Vranov nad Dýjí, Skály, Bítov, Červená Hora, and Mokřice) and from the deserted medieval villages of Stančice and Střenčí, enabling both regional and contextual comparison. While many bolts were manufactured from relatively homogeneous iron, others display deliberate combinations of iron and steel as well as evidence of controlled heat treatment, suggesting a higher level of technological awareness. Based on these observations, the bolts were classified into several technological categories reflecting different approaches to the use of steel. These patterns can be interpreted as indicators of intentional design decisions, distinct production traditions, or local blacksmithing practices rather than accidental material variability. By integrating metallurgical data with typological and historical perspectives, the study offers new insights into medieval military technology and craft organisation, shedding light on the technological reasoning behind the manufacture of one of the most widespread weapons of the High Middle Ages.

2441. Metallurgical activities in the rock-cut coastal landscape of Myrina Kastro, North Aegean

Authors: Yorgos Facorellis (University of West Attica) – Christina Marangou (Independent scholar)
Format: Poster

On the western coast of the island of Lemnos, a long-lasting study of the Myrina Kastro hilly peninsula is carried out with the permit of the Greek Archaeological Service, the Local Council of Monuments and the Greek Ministry of Culture. The volcanic rocks of the headland have been carved at least since late prehistory and during antiquity into various structures and petroglyphs. Rock-cut features are observed in all sectors and altitudes, often suggesting symbolic behaviours, but also concrete practical uses. The study included subsurface research in selected zones (2002-2007), which allowed the collection of various mobile finds, including metal artefacts, as well as carbon14 dated organic samples. Furthermore, study and physicochemical analyses permitted to identify, in at least two areas of the peninsula, traces of iron metallurgical activities apparently related to rocky carved formations. This seems particularly promising, due to the proximity and interconnection of the site with the coast and the sea, on the island which was the "dearest of all lands" for Hephaistos, the god of metallurgy. The paper endeavours to briefly present the results of these analyses (pXRF, XRD, SEM/EDS) and suggest possible interpretative directions of the findings.

284 KEY TESSERAE OF MEDITERRANEAN HISTORY FROM ANCIENT MACEDONIA

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Nick Angeloff – Jessica Morris (Cal Poly Humboldt) – Engin Nasuh (Institute and Museum Bitola)
Keywords: Mediterranean, Macedonia, Lyncus, Demir Kapija, Sociopolitical, Environmental
Format: Regular session

SESSION ABSTRACT

Upper Macedonia of antiquity is a relatively under published region when compared to the literature from our colleagues studying Lower Macedonia. Partnerships between Museum Bitola, Institute Prilip, Center for Archaeological Research Skopje and Cal Poly Humboldt are producing research in two distinct regions of the Republic of North Macedonia, Lyncus and Demir Kapija. The results of this ongoing research are significant to our understanding of the Hellenistic era and the role of ancient Upper Macedonia in shaping our shared history. We present our research at Demir Kapija, a Hellenistic military fortress at a key strategic location, its architectural design, the archaeological evidence for its construction by Cassander, its operation, and ultimate destruction by the Celts within the social, political and environmental context of the late Argead and early Antigonid kingdoms. From Crnobuki, we present an analysis of a large cache of late Roman Republic coins, and the results of geoarchaeological, environmental, textile, remote sensing and ceramic analyses. This region acted to provide resources and defense of the northern borders of ancient Macedonia. From Crnobuki we see a development of trade networks linked to the Mediterranean, whether it be imported ceramics from Egypt and other coastal exchange networks, the manufacture for export of various goods, or evidence tying the location to the provision of resources to the Macedonian Kingdom and Roman Republic. The site is a significant location within the seat of power in Upper Macedonia, providing a view of social and political change from the Eneolithic through the Roman empire from a perspective outside of Pella but inextricably tied to Macedonian power. We present our combined research in the context of political and social organization from regional and global perspectives. This research represents a key tessera in the mosaic of European history.

CONTRIBUTION ABSTRACTS

2635. Markova Kula: A Hellenistic Fortress from Demir Kapija

Authors: Justin Carlson (Cal Poly Humboldt) – Ordanche Petrov (Institute for Old Slavic Culture - Prilep) – Nick Angeloff (Cal Poly Humboldt)
Format: Oral

We present the results of 2016 and 2025 excavations at Markova Kula, a Hellenistic fortress overlooking the Demir Kapija Gorge. Markova Kula lies along a major trans-Balkan Road route that connects continental Europe with the Mediterranean basin. The Demir Kapija Gorge is the last and most formidable obstacle on this route before reaching the Aegean basin. The fortress is one of the best-preserved and northernmost examples of Hellenistic architecture on the Balkan mainland. The goals of the excavations were to determine the building plan, chronology, and construction methods at both entrances of the fortress. The excavations demonstrate that the military outpost was built using ashlar masonry techniques during a single construction phase. The fortress has symmetrical measurements, rectangular layout and sharply defined wall edges, suggesting that it was built following an original architectural plan fully executed during this single phase of construction. During the fieldwork, the building plan was fully documented with scale drawings and drone imagery. Analysis of artifacts, including coins and ceramics, provides a relative chronology indicating that the fortress was erected during the reign of the Macedonian king Cassander (317/305–297 B.C.) and likely abandoned following the Celtic raids in the Balkans in 279 B.C. Because Markova Kula was located along a major transportation route, and occupied for a short period of time with no later construction episodes, it is significant for our understanding of Hellenistic military strategies and architecture during late 4th century-early 3rd century B.C.

1659. Archaeological Perspectives on Celtic Movement in the Vardar (Axios) Valley

Authors: Mollie Kauderer (Cal Poly Humboldt) – Kolbe Anderson – Asli Erem (Cal Poly Humboldt)
Format: Oral

This paper examines Celtic movement through the Vardar (Axios) Valley in Upper Macedonia. The study focuses on excavations at Markova Kula, a Hellenistic military fortress overlooking the Iron Gates gorge, alongside archaeological and historical evidence from the surrounding region. The Iron Gates represent a constricted section of the Vardar Valley, forming a strategic corridor that linked Upper Macedonia with the Aegean and facilitated movement between the Mediterranean world and the northern Balkans. At least seven known fortresses, including Markova Kula, are located in the Demir Kapija region, reflecting sustained efforts to control this landscape across multiple periods. Archaeological evidence suggests that during the early third century BCE, Markova Kula was impacted by conflict associated with Celtic movements into Upper Macedonia dated around 279 BCE. This paper highlights patterns of interaction between Celtic groups and the local Macedonian population. Emphasis is placed on how environmental features—particularly the Vardar River and its surrounding terrain—shaped migration routes, military strategy, and cross-cultural contact.

1707. Layers of Continuity: Site Formation, Landscape Use, and Cultural Persistence at Crnobuki Gradishte, Upper Macedonia

Authors: Jessica Morris (Cal Poly Humboldt) – Engin Nasuh (NI Museum and Institute Bitola) – Nick Angeloff (Cal Poly Humboldt)
Format: Oral

This paper presents the results of a multi-year investigation of site formation processes at Crnobuki Gradishte, a multi-period acropolis in the Pelagonia region of Upper Macedonia near Bitola, North Macedonia. Drawing on stratigraphic analysis, sediment and

soil studies, remote sensing, and targeted excavation, the research examines how human activity and environmental processes interacted across long-term cycles of occupation, reuse, and abandonment. Evidence points to occupation at the site spanning from the Eneolithic through the Roman Empire, providing a rare opportunity to examine continuity and transformation at a long-lived inland center. Stratigraphic sequences and depositional contexts reveal patterned rebuilding, landscape modification, and sustained use of the acropolis that reflect both local practices and broader regional dynamics. These findings are contextualized through high-resolution LiDAR, photogrammetry, and ground-penetrating radar data, which situate Crnobuki Gradishte within wider networks of settlement, resource management, and exchange across Upper Macedonia. Evidence from material culture, including ceramics, coinage, and production-related remains, further demonstrates the site's integration into Mediterranean trade networks while maintaining strong ties to regional modes of production and land use. By foregrounding site formation and landscape archaeology, this paper argues that Crnobuki Gradishte functioned as a persistent node of social, economic, and political significance over millennia. The results contribute to broader discussions of Upper Macedonia's role in shaping Hellenistic and Roman-period social and economic networks and highlight the importance of inland landscapes as active participants in Mediterranean history. This research represents a key tessera in understanding cultural continuity and transformation in ancient Macedonia.

1698. Tools of the Trade: Investigating Textile Production on the Macedonian/Roman site of Crnobuki, Macedonia - Updates from the Field

Authors: Barbara Klessig, Ma (Cal Poly Humboldt)
Format: Oral

Globally, textiles are one of the most common threads we have with other human beings. Humans have developed an intricate and amazing process in textile production that includes a variety of tools, materials and technologies. The tools used in ancient textile production may seem simplistic and crude, but in actuality, are feats of ingenuity and creativity. As ancient textiles themselves do not survive as frequently as other forms of artifactual evidence, the tools used and the technologies behind them are a critical resource for understanding the processes involved in textile production. This presentation takes a preliminary look at the evidence of textile production at the site of Crnobuki, located near Bitola, Macedonia by examining the tools found and their distribution in the excavations from three seasons: 2023, 2024 and 2025. The data being collected includes LiDAR and GPR imaging, physical data on the tools and analysis of their distribution, and soil and phosphate analysis. The aim of this research is 1) to support the proposition that textile production was a large contributor to the economy of the Crnobuki site, 2) gain a better understanding of gender dynamics, and 3) and examine the raw materials and forms used in both the creation of the tools and the production of textiles, to determine whether the materials used were sourced locally or brought in from outside the community.

2634. Lyncesti and Lyncestida A Macedonian Tribe

Authors: Engin Nasuh (Institute and Museum Bitola) – Nick Angeloff (Cal Poly Humboldt) – Slobodon Stojkoski (Institute and Museum Bitola)
Format: Oral

Lyncesti and Lyncestida –Macedonian tribe that around the 7th century BC broke through Eordaya and settled the territory around Lerin and Bitola. As the main center, Lynx is mentioned as capitol center but, we cannot say that it was a developed urban center. The archaeological site of Gradishte near village of Crnobuki could be that center, considering its strategic location, and its assumed size. During the 2021-2025 excavations, among other things, a total of 76 coins were found. To these we can add another 42 coins found in 2011/2012. during reconnaissance and excavations by Viktor Lilčić. These are coins of the Macedonian kings Philip II, Alexander III, Philip V, Perseus, coins of the autonomous cities, the Roman Republic, and of course coins of Octavian Augustus minted in Macedonian during the time of Roman reign in Macedonia. Also included here is the hoard of 217 silver Roman Republican coins found in 2022, which gives us a solid overview of coinage in the last century of the Roman Republic. In this paper, these coins will be presented typologically, and their concentration will also be presented in an attempt to identify the primary economic and civilizational routes in this region.

2605. Lynkus a City of Mediterranean Influence

Authors: Nick Angeloff (Cal Poly Humboldt) – Engin Nasuh (Institute and Museum Bitola) – Slobodon Stojkoski (Institute and Museum Bitola) – Justin Carlson – Jessica Morris – Nyah Hawkins (Cal Poly Humboldt)
Format: Oral

The capital of Upper Macedonia in antiquity has not been confidently identified in the archaeological record. The unification of Upper and Lower Macedonia is solidified with the marriage of Eurydice I, princess of Lynkestia, and Amyntas III. This event leads not only to the unification of the Macedonian Kingdom but represents the establishment of women's power and authority within the kingdom, a power that persists throughout time in Macedonia. Without Eurydice I we don't have Phillip II nor Alexander III, and not just because of the physical act of birthing, but due to the exertion of power and authority to preserve the kingdom by the women of Macedonia. The Roman and Greek sources indicate that the capital of Lynkestia was the City of Lynk or Lynkus but do not provide detailed locational information. It is clear that Upper Macedonia had only one major city, limiting the number of possible locations significantly. Cal Poly Humboldt and Institute and Museum Bitola has been conducting research at the gradishte of Crnobuki, a strong candidate to be the location of Lynkus. We have added a new partner to the team in 2025/2026, Dr.

Viktor Lilchik of the Center for Archaeological Research, Skopje. The Center for Archaeological Research provides a landscape scale perspective to the research having surveyed and tested hundreds of locations in North Macedonia. Their partnership in this research has presented a holistic view of the territory of Lynkestia and insights into the archaeological record that no one else can afford. This presentation provides our assessment of the known potential candidates for the City of Lynkus.

286 UNTANGLING RESILIENCE AND CONTINUITY ACROSS THE ARCHAEOLOGICAL RECORD

Theme: 7. Interaction, connectivity and mobility
Organisers: Giacomo Bilotti (Aarhus University) – Roberto Ragno (McDonald Institute for Archaeological Research)
Speakers: Simon Carrignon (University College London)
Keywords: Resilience, Continuity, Persistence, Settlement Archaeology
Format: Round table

SESSION ABSTRACT

Resilience research has gained momentum to understand how societies withstand and adapt to shocks, particularly given increasing climate change impacts. Archaeologists have been keen to add to this growing compendium, particularly as the archaeological record demonstrates human societies in greater time depth and diversity than provided by solely contemporary studies. This roundtable focuses on Eurasia from prehistory through late antiquity, but we welcome broader comparative perspectives (e.g., the Americas). However, establishing what is resilient, and what is not, in the hyper-heterogeneous archaeological context, is fraught with issues in operalisation, measurement, and inference. Specifically, de-tangling the relationship between the continuity of particular social forms, be it settlements, or cultural groups, and their resilience requires careful consideration. Consider these three cases: Rome started as a combination of small hilltop settlements into a single entity (synoecism) small settlement and grew to 1-1.5 millions at its peak in the 1st century BC-AD, while its size changed in lateantiquity and medieval times, the city was continuously occupied, and continues to be so to do this. In contrast, the predecessor of Ulaanbaatar, the capital of Mongolia, was a mobile monastery town, Orgoo, before settling on the location of modern Ulaanbaatar, Orgoo moved around several times in the Selenge valley. While a key characteristic of agrarian villages is their longevity and spatial fixedness, Neolithic and Bronze Age (ca. 4000 - 500 BC) northern European villages feature the consecutive rebuilding of houses, at slightly different locations, that nonetheless continue to be owned and operated by a family, living in the area continuously. How can we establish resilience when presented with the diversity of the archaeological record? How can we move away from simplified operalisations of resilience, striking the right balance between context-specificity and generalizability? What measurements, and at what resolution, are key in these efforts?

287 BREAKING BOUNDARIES: WOMEN, RELIGION, AND MOVEMENT IN THE ANCIENT MEDITERRANEAN

Theme: 7. Interaction, connectivity and mobility
Organisers: Angela Bellia (University of Palermo) – Erica Angliker – Tais Pagoto Bélo (University of São Paulo)
Keywords: women and religion, movement, ancient Mediterranean, gender/mobility
Format: Session with keynote presentation
Affiliation: Archaeology and Gender in Europe - AGE

SESSION ABSTRACT

The dissemination of religion in antiquity has drawn a great deal of scholarly attention in recent years. The phenomenon relied on the mobility of people, objects, knowledge, and ritual practices. Trans-regional cults, such as that of Isis, depended on extensive maritime and terrestrial networks linking distant Mediterranean communities. By contrast, local traditions, such as the cult of Artemis Amarysia in Euboea and neighbouring regions, were shaped by short-distance, inter-community movement. Yet in both instances, mobility was the key mechanism by which religious practices were spread, adapted, and transformed. The role of women in these processes remains underexplored. As archaeological evidence increasingly shows, the movement of women—temporary or permanent, voluntary or constrained—was central to shaping religious practices and constructing sacred landscapes across the ancient Mediterranean. This panel thus uses archaeology as the primary lens for examining female mobility in religious contexts, while drawing on epigraphy, iconography, textual studies, and digital methods whenever these can enhance the interpretation of material evidence. We invite contributions that are grounded in archaeological evidence from the Bronze Age to Late Antiquity and highlight women's active role in sustaining cult practices, transmitting religious knowledge, and transforming sacred landscapes. Relevant questions include: Who were the women who travelled, and how can we detect their presence archaeologically? Which divinities, sanctuaries, and ritual spaces drew female pilgrims, and how did spatial patterns shape their devotional experiences? What material indicators reveal the movements of priestesses, musicians, healers, prophetesses, and other ritual specialists across sacred landscapes? How do dedicatory practices, iconography, funerary assemblages, and sanctuary deposits reveal women's movement

and their ritual agency? In which contexts did women introduce, sponsor, or reshape cults through travel, diplomatic marriages, migration, and displacement? How did mobility differ across status groups—elite women, artisans, migrants, enslaved women, etc.?

CONTRIBUTION ABSTRACTS

1701. Women as Brokers, Movers, and Shakers: Facilitating Change in Bronze Age Aegean Ritual Practice

Authors: Lauren Alberti – Natalie Abell (University of Michigan)
Format: Oral

Iconography throughout the Late Bronze Age (LBA) shows women involved in ritual practices, while Linear B texts demonstrate that women could hold important religious positions in the later part of the LBA. Yet the role of women as mobile agents who could spur changes in religious ideologies or ritual practices across LBA regional networks has not been explored in much detail. Agents involved in encouraging regional changes in ideology and ritual practice are seldom analyzed through an explicitly gendered lens, and as such, are often implicitly assumed to be male. Recent explorations of mobility in the LBA Cyclades, however, suggest that women were moving between settlements, and as such, should be considered as potential agents for major changes in ritual practice, especially as part of the so-called Minoanization phenomenon. In our analysis, we consider the ways in which mobile women, who were integrated into local households, may have contributed to changes in ritual practices and ideologies. For example, as craft specialists, they would have provided important equipment for ritual and religious events. At the same time, they would have had the opportunity to facilitate ritual practice by coordinating between participating households, local organizers, and visiting participants. Through their contributions in labor and expertise, mobile women could connect different participating groups of people at multiple scales. They had significant potential to act as knowledge brokers who bridged different geographical communities and would have been deeply entangled within Aegean-wide networks. These networks witnessed increased short-term mobility in this era, driven by new patterns of exchange but also probably the development of new ritual calendars. In this environment, women would have had opportunities to shift ideologies and practices in ways that were different from the male merchants, administrators, and elite ambassadors who are usually assumed to be the primary agents of change.

174. The Persian women in attic departure scenes

Authors: Amabile Zanco (State University of Campinas)
Format: Oral

The depiction of a warrior's departure was a very common theme in Attic pottery, particularly in fifth-century Athenian red-figure ceramics. Within a domestic context, the Greek hoplite is shown putting on his equipment, performing the ritual of libation, and taking leave of his family. Although a quintessentially Greek motif, in the second half of the fifth century it is possible to find examples in which a Persian warrior — an enemy much present in Athenian memory after the Greco-Persian Wars — is depicted in this setting, surrounded by female figures who assist him throughout the ritual. Despite the frequent portrayal of Persian women as cruel and scheming in classical literature, as reported by many authors, this rather negative view is not reflected in the women depicted in Attic ceramics in the decades following the conflicts between the Greek city-states and the Achaemenid Empire. Instead, their depiction closely resembles that of the Athenian aristocratic woman, who was responsible for the proper management of the oikos.

1235. From Myth to Cult: Female Religious Mobility in Sinope

Authors: Eleni Mentesidou (International Hellenic Unverisity)
Format: Oral

The ancient Greek city of Sinope, on the southern coast of the Black Sea, emerged through processes of mobility, having been founded as a colony founded by Miletus. Ancient literary sources associate the city with the myths of the Nymph Sinope and the Amazon Sanape, whose stories of arrival at the site later occupied by the city relate to its foundation, the formation of local identity, and its religious traditions. At the same time, the funerary inscription of the priestess Saitta, whose name suggests an eastern origin rather than local Sinopean descent, documents her movement to Sinope and her association with the cult of Leucothea, a deity whose worship was probably introduced by Milesian settlers. The theological profile of Leucothea, characterized by chthonic, nurturing, fertile, and marine aspects, as well as her association with Poseidon Helikonios, situates this cult within the Ionian religious tradition. This paper examines female mobility, from the mythic figures of the Nymph Sinope and the Amazon Sanape to the cultic sphere of Leucothea and her priestess Saitta, as a mechanism in the transmission of cult practices and the formation of sacred landscapes in Sinope, integrating archaeological, epigraphic, and mythological evidence. The narratives of the Nymph Sinope and the Amazon Sanape are approached as accounts of movement that reflect the appropriation of landscape and its connection with the religious life and identity of the city, while the role of female mobility within established cult structures is explored through the case study of the cult of Leucothea and her priestess Saitta. The Sinopean evidence thus demonstrates how the movement of women operated across both symbolic narratives and formal religious structures, shaping local cult practice and sacred landscapes.

297. Rethinking Seafaring Religion: Women, Mobility, and Maritime Sanctuaries in the Hellenistic Aegean

Authors: Sabine Neumann (University of Marburg)
Format: Oral

Maritime mobility shaped the early Hellenistic Aegean, transforming not only economic and political networks but also the religious landscape of the islands. Maritime cults and seafaring deities such as Isis, Aphrodite Euploia, or the Dioscuri have long been studied as predominantly male-coded phenomena, yet women's roles within these religious interaction spaces remain underexplored. This paper argues that women were not passive participants in maritime religion. They played an active and, at times, formative role in founding, sustaining, and reshaping cults across the Aegean. Drawing on archaeological and epigraphic evidence, the paper examines women as cult founders, dedicants, and ritual agents in maritime sanctuaries and port-related cult places, as attested through dedicatory inscriptions, titles, and gendered votive signatures as well as foundation and benefaction contexts. Particular attention is paid to early Hellenistic foundations of Isis cults on Aegean islands. It asks: where do women become visible, and what kinds of action do their traces imply? Mobility here is understood in practical terms. It includes short passages between islands, repeated crossings, and temporary stays in port communities, alongside longer-distance travel. The paper asks how these forms of movement through residence, marriage, migration, or seasonal presence structured cult communities and supported the localization of transregional deities. By foregrounding women's ritual practice and founding initiatives, the paper reframes seafaring religion as a field in which female mobility mattered as a constitutive force. It offers a materially grounded way to think of seaways as gendered religious spaces in the ancient Mediterranean.

2657. Beyond Dance: Female Collective Movement in Ancient Greek Visual Culture

Authors: Marta Nicolás-Muelas (Catalan Institute of Classical Archaeology)
Format: Oral

This paper investigates women's collective movement in ancient Greece through a contextual analysis of dance and processional imagery from the Archaic and Classical periods. It examines how recurring bodily configurations in visual culture can be interpreted as indicators of structured patterns of group movement, rather than as exclusively ritual displays. The study draws on a range of material evidence, including votive plaques, architectural reliefs, and serial figurines from major civic sanctuaries and smaller local cult sites. Particular attention is given to contexts associated with Artemis and the Nymphs in mainland Greece and Magna Graecia. These assemblages frequently depict female groups arranged in ordered sequences, such as circular formations, linked-hand chains, and processions, often in the absence of explicit markers of formal dance. Rather than reading these scenes as performative spectacles, the paper approaches them as visualisations of regulated collective movement rooted in local ritual practice. Special emphasis is placed on colonial contexts in southern Italy and Sicily, where recurrent choreographic schemata appear to be adapted to new landscapes, including extra-urban sanctuaries and mixed communities. Material from sites such as Francavilla, Metaponto, Taranto, and Crotona illustrates the mobility and adaptability of these visual patterns, suggesting flexible modes of collective movement rather than fixed ritual forms. The analysis further considers internal differentiation within female groups, focusing on age categories, such as girls, parthenoi, and adult women, as well as on dress elements, including the polos. These features are interpreted not only as markers of social identity but also as dynamic visual devices that structure hierarchy and emphasise movement. By foregrounding repetition, seriality, and spatial context, the paper advances a materially grounded approach to dance imagery and demonstrates how non-canonical visual evidence can shed light on the organisation, sequencing, and social significance of female collective movement within ancient ritual landscapes.

2114. Women Playing the Aulos in Italiote Vase-Painting: Mobility, Cult, and Funerary Rituals

Authors: João Pedro Fabri – Fabio Vergara Cerqueira (Federal University of Pelotas)
Format: Oral

Italiote vase-painting, produced between 440 and 270 BCE, constitutes one of the most important iconographic corpora of the Late Classical and early Hellenistic periods. This production was organized into regional industries across Magna Graecia, conventionally identified as Apulian, Lucanian, Campanian, Paestan, and Siceliote wares. This paper examines representations of women playing the aulos in religious and funerary contexts. The analysis is structured in two parts. The first offers an overview of the types of scenes in which female aulos-players appear, focusing specifically on Apulian vases. This corpus, being numerically more substantial, allows for a broader and more quantitative assessment of iconographic patterns. The second part expands the discussion to vases from different workshops of Magna Graecia, concentrating on scenes of religious cult and cult of the dead in which women perform music. Particular attention is paid to the ways these images reflect female mobility within ritual frameworks—whether through participation in processions, attendance at sanctuaries, funerary ceremonies, or mythological settings that evoke movement between spaces, both geographical and symbolic. As a distinctive feature of Apulian vase-painting, the paper highlights the emergence of an Ariadne depicted as an auletris in the company of Dionysos during a banquet scene. This imagery not only underscores the association between women, music, and Dionysiac cult, but also suggests forms of ritual and mythological travel, in which female figures mediate between domestic, civic, and sacred spaces across the landscape of Magna Graecia.

2607. A Mother to Whom? | The Goddess Isis and Territorial Maternity

Authors: Shiro Burnette (New York University: Institute of Fine Arts)
Format: Oral

In 1979, Friedrich Solmsen claimed that, contrary to Greek deities, the Goddess Isis lacked "roots" that situated her in a particular location. This presumed freedom facilitated her mobility across the Mediterranean and her assimilation with deities such as Demeter and Aphrodite. Solmsen's characterization is not entirely incorrect as the cult of Isis spread rapidly beginning in the early 3rd c. B.C.E. Apuleius famously recounts a Roman intrigue into this goddess of magic, protection, and motherhood, and 20th century scholars, like Solmsen, similarly investigate her reception in new environments. These works build from a supposed hyper-mobility of the Goddess across space. This attribute grounds her later attestations as a "universal" mother goddess, thus allowing new groups to be adopted into her maternal aegis. Nevertheless, the identifying features of Isis defy a universal application as her throne-adorned headdress connects to her maternity over the rightful King of Egypt. Kingship in Egypt is reified for one's ability to unite the two lands of Upper and Lower Egypt; thus, Isis' dominion can be defined by the geographic parameters of local kingship. How, then, does such rigid territoriality become malleable and stretched to fit larger cultural systems? This paper argues that the agents in the diffusion of the Isis cult used the Goddess' maternal nature to uproot her from one landscape to another. The sacro-political landscape of Republican Rome, specifically, facilitated epistemic violence against its enemies through expansion and conquest. Applying evidence regarding the siting, distribution, and activity of Isis cults in Roman territory, this project underscores how the Goddess' foreign and maternal qualities rendered her suitable for extraction and diffusion. The result broadens our understanding of Roman epistemic and gendered violence against foreign ontologies.

1175. The Sibylline tradition in the Ancient Mediterranean through coins

Authors: Tais Pagoto Bélo (University of São Paulo)
Format: Oral

This presentation is about the Sibyls, priestesses of the god Apollo, who helped shape Rome during the Republic and the beginning of the Empire, through the Sibylline Books. Augustus attempted to use the figure of the Sibyl to form an imperial identity, facing a republican and Mediterranean tradition. The oracular legacy of the Sibyl is observed in the minting of coins with the Sibyls and/or elements linked to them that point to places of Apollonian oracles in various parts of the Mediterranean, such as Cyme, Erythrae, Gergis, Magna Graecia, Sicily, including Rome. This tradition was important in several places in this sea, giving a respectable character to the Sibyls. According to written sources, such as those of Livy, Virgil, Cicero, Dionysius of Halicarnassus, and Tacitus, there seems to have been an anti-Roman character in the Greek and Asian oracles, suggesting that in Rome the Sibylline Books were respected, but not the Sibyls. Through coins, it is possible to identify that this activity was common in various regions of Southern Italy, but with an overseas tradition. In this way, it is necessary to think beyond the regional to understand local issues and how this traditions and Sibyl came from the East, then Greece and finally to Rome. Such analysis will elucidate a cultural interaction within the Mediterranean and a dynamic that will allow us to understand the power relations and the acceptance of Sibylline oracular agencies locally and globally, stemming from intense connectivity and interactions between different regions over time and space. Coins will highlight how this oracular tradition was important in making Sibyls as protagonists agents in a religious legacy over a long duration and in different places of Mediterranean, emphasising contacts, connections and movements.

528. Women, sistra and inscriptions: what information and what developments?

Authors: Arnaud Saura-Ziegelmeyer (Institut catholique de Toulouse, UR CERES)
Format: Poster

This proposal focuses on ancient sistrums bearing inscriptions, both in Egypt and in the Mediterranean basin. These cult objects often feature hieroglyphic inscriptions on their handles, but also in other languages such as Greek, Latin and Meroitic. These inscriptions provide information about the gods and men who communicated through this instrument. In the traditional Egyptian context, the sistrum is most often used by women, whose status sometimes remains ambiguous, inside Egyptian temples. For examples found outside Egypt, an association with femininity can be identified, but seems to relate to different meanings and contexts. Consequently, this poster takes a diachronic approach, ranging from Pharaonic Egypt to the Greco-Roman period, in order to better understand the changes observable through the inscriptions on sistra, whether made of faience or metal. The proposed collective approach allows us to draw on a range of expertise in Egyptology and classical studies, enabling us to grasp the subject in its broad temporal context.

289 CRETAN SANCTUARIES BETWEEN MARGINALITY AND CONNECTIVITY: NEW ARCHAEOLOGICAL EVIDENCE AND REASSESSMENTS

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Manolis Petrakis (University of Patras) – Anna Bertelli (Ruhr-Universität Bochum)
Keywords: Crete, sanctuaries, insularity, connectivity, Mediterranean Entanglements networks
Format: Regular session

SESSION ABSTRACT

Crete—from the collapse of the Minoan palaces to the Roman Imperial era—stands out as a region that followed its own path of cultural development. The island has been viewed both as a communication hub within the eastern Mediterranean and as an insular, introverted landscape. These seemingly opposing tendencies are eloquently reflected in the material culture of Cretan sanctuaries, which occupy a distinctive place in the study of ancient religion. Within the broader framework of Mediterranean connectivity recent attention has been directed, especially toward Early Iron Age Crete. On one hand, we see the persistence of Minoan traditions, singular temple architecture, local particular pottery, and the island's distinct trajectory in the major developments of Greek history. On the other hand, the import of luxury items, influences from Egypt and West Asia, and technological innovations in jewelry production, metallurgy and terracotta production with moulds from the Early Archaic period onward underlines Crete's participation in wider Mediterranean area. The architectural and cultic particularities of Cretan sanctuaries continue into the Classical and Hellenistic periods, while we register a relatively smooth incorporation into the Roman Empire marked by cultural flourishing. New evidence has substantially revised the view of Cretan sanctuaries as isolated, modest places, revealing instead a complex picture of interaction and transformation, both within Crete and beyond. This session aims to explore these dynamics across a broad chronological span, understanding Cretan sanctuaries as focal points of social negotiation, economic exchange, and symbolic performance. We particularly welcome papers addressing the tension between marginality and connectivity. Contributions may, for example, present new excavation data, re-examinations of legacy material, or archaeometric analysis illuminating the materialities and practices of Cretan cults; provenance and petrographic studies tracing object biographies; epigraphic and iconographic studies exploring multicultural entanglements; and landscape approaches situating sanctuaries within routes of movement and visibility.

CONTRIBUTION ABSTRACTS

753. Material Elements of Cult: EIA Pottery and Terracotta Animal Figurines at the Peak Sanctuary of Mt. Juktas

Authors: Valia Tsikritea (University of Cincinnati)
Format: Oral

This paper presents the Early Iron Age (EIA) (12th-7th centuries BCE) cult practices at the peak sanctuary of Mt. Juktas in central Crete on the basis of a comprehensive examination of unpublished pottery and terracotta animal figurines. Building upon the results of the 1970s-1980s excavations, which showed that, unlike most Minoan peak sanctuaries, Juktas persisted in the EIA, my research demonstrates that frequentation at the sanctuary was uninterrupted and regular until the Protoarchaic period. Shaped like a bearded, upward-facing head, Juktas served as a prominent landmark, a familiar and stable reference point in the Knossos region, within shifting sociopolitical landscapes. Dictated by the site's strong connection with Knossos and subsequent lack of neutrality, Juktas assumed a subregional status in the EIA. The EIA assemblage from Juktas is characterized by local pottery and terracotta figurines and excludes any expensive dedications indicative of the mobilization of wealth which is attested in Pancretan sanctuaries. Figurines, especially bulls, dominate during the LM IIIC period, while in later phases figurines decline and pottery – particularly cups – increases, signaling a shift of the primary ritual toward communal drinking practices. Notwithstanding the local character of the ceramics deposited, the practice of rendering post-firing incisions on copious Late Geometric-Protoarchaic cups, including a few early attempts at the rendition of letters, situates the sanctuary within a greater Mediterranean context, suggesting that it partook in complex and multicultural interactions. Therefore, the absence of imports and rich dedications at the site cannot be taken to signal isolation. Instead, I argue that, as a subregional sanctuary, freed from the anxiety of extensive interregional social status negotiations, Juktas offers an insight into a less staged cult practice, away from the spotlight, where competitive, conspicuous consumption is neither needed nor chosen, a glimpse directly into the core of EIA Crete.

2178. The Sanctuary of Apollo Pythios at Gortyn in Crete along the Mediterranean crossroads

Authors: Anna Bertelli (Ruhr University Bochum) – Jacopo Bonetto (University of Padova)
Format: Oral

Over the last decade, archaeological investigations within the sanctuary of Apollo Pythios at Gortyn have produced significant new evidence concerning both the architectural and cultural development of the complex, as well as the presence of material with an unexpectedly early chronology. These findings provide an opportunity to reassess the origins, evolution, and role of the sanctuary within the polis of Gortyn. Beyond this, they invite a shift in scale, moving beyond an internal reading of the sanctuary to situate it within the wider Cretan and Mediterranean contexts. In this light, particularly during the Protoarchaic phase, the sacred spaces of

Gortyn display a number of features that stand out within the Cretan archaeological landscape. These include distinctive aspects of architectural layout of the buildings, the adoption of distinctive decoration, the presence of monumental legal inscriptions, and—according to recent excavations—votive assemblages that currently lack close local parallels. By presenting a revised chronology for the architectural phase of the sanctuary of Apollo Pythios and selected categories of material culture, this paper situates these features within a broader comparative framework, exploring whether these elements should be understood as the result of internal developments rooted in local traditions, or whether they reflect broader Mediterranean connections. Comparisons with material and architectural practices from other regions of the Mediterranean are used to assess the possible movement of people, technical knowledge, and ritual practices.

2172. Reassessing the "Tympanon" from the Idaean Cave: Iconography and Resemanticization in the Idaean Cave

Authors: Manolis Petrakis (University of Patras)
Format: Oral

This paper offers a reassessment of the famous bronze "tympanon" from the Idaean Cave. Since its discovery in 1884 by Halbherr, the object has attracted sustained scholarly attention and has become central to debates concerning its chronology, origin, function, and meaning. Although it belongs to the large group of bronze shields (over 2000 fragments) recovered from the cave, its iconography, combined with its shape and findspot, has led scholars to regard it as a unicum within the assemblage. Scholarly discussion has focused on the central bearded male figure who steps on a bull and grasps a lion, and especially on the two winged male figures flanking him, each preceded by two discs interpreted as drums. The scene has long been associated with the myth of the birth of Zeus and the Curetes who, according to Callimachus, clashed their weapons against their shields to drown out the infant's cries and conceal him from Cronos. The object's, drum-like form, its iconography, and the identification of the Idaean Cave as one of Zeus' birthplaces have led to the widely accepted interpretation that the image visualizes the foundational myth of the sanctuary. Given the Assyrian stylistic features of the composition, scholarship has debated whether the object was an eastern import, the product of itinerant craftsmen trained in Near Eastern traditions, or a local work under strong eastern influence. This paper re-examines the object within its broader archaeological and historical context, arguing for a Near Eastern origin while moving beyond ethnic or diffusionist models. Employing contemporary theoretical tools and drawing on the concepts of cultural memory, it approaches the "tympanon" as a medium of mnemohistory: a Near Eastern product that was resemanticized and integrated into the long-term cultic memory of the sanctuary, reshaped according to the religious needs and narrative traditions of its Cretan worshippers.

751. Shields for the Gods: Mapping Rituals and Connections through Miniature Shield Offerings in Early Iron Age Crete and the Mediterranean

Authors: Annalaura Pegoraro (Università degli Studi di Padova) – Giulio Da Villa (Sapienza Università di Roma | Università degli Studi di Padova)
Format: Oral

Between the 8th and 7th centuries BC, Cretan sanctuaries witnessed the spread of a distinctive class of artifacts: miniature terracotta shields, small-scale reproductions of bronze prototypes. Traditionally interpreted as votive offerings, these objects provide an insightful lens for examining and understanding the ritual practices, symbolic dimensions, and cultural connections that characterized Cretan Early Iron Age places of worship. Starting from the sanctuary on the acropolis of Gortyn – whose votive deposit has yielded nearly 6,000 miniature terracotta shields, the largest corpus known in the Mediterranean – this contribution offers a systematic analysis of the geographical distribution, morphological and decorative features, and ritual meanings of this category of material, with particular attention to their associations with specific deities and the cult practices connected with them. The collected data are organized and presented through a WebGIS platform, designed as a tool for analysis, sharing, and dissemination. The graphical visualization of the attestations of miniature terracotta shields allows mapping their distribution across Early Iron Age Cretan sanctuaries, facilitating comparison of ritual aspects and the identification of similarities and differences in cult practices. In conclusion, from a broader perspective, this contribution aims to contextualize this phenomenon within a Mediterranean framework. Miniature shield offerings from sanctuaries in mainland Greece, the Aegean islands, Anatolia, Magna Graecia, and Sicily, together with the probable export of Cretan examples to the eastern (Al Mina) and western (Megara Hyblaea) Mediterranean, reveal a pattern of diffusion that extends beyond Crete itself. Therefore, these findings provide further support for the view that Crete was not a marginal periphery but fully integrated into the complex network of connections that characterized the Mediterranean world during the 8th and 7th centuries BC.

1478. About Man and God: Masculine Ideologies in Early Cretan Sanctuaries

Authors: Filippos Roussos (University of Oxford)
Format: Oral

Cultic activity in Greek sanctuaries offers a valuable context for examining the construction, performance, and negotiation of gendered identities beyond the domestic and funerary spheres. Despite increasing interest in gender in Greek archaeology, early sanctuaries have rarely been approached from a predominantly gender-based perspective. This paper addresses this gap by tracing continuity, change, and regional variation in the articulation of masculine ideologies in Cretan sanctuaries from the Early Iron Age through the Archaic period (11th–6th centuries BC). The contribution draws on the exceptionally rich archaeological record of sites such as the Idaean, Psychro, and Inatos caves, the sanctuaries of Hermes and Aphrodite at Syme Viannou and of Athena on the acropolis of Gortyn, and Temple B at Prinias, to examine monuments and votive offerings that depict male figures or evoke warfare, hunting, athleticism, and other culturally constructed aspects of the Cretan male experience. The range is broad, encompassing architectural sculpture, metalwork, jewellery, pottery, and coroplastic production. These materials are analysed as active expressions of masculine ideology, communicating, among others, ideals of physical prowess, martial readiness, and group affiliation. Particular attention is paid to the social identities of the dedicants, exploring the relationship between individual self-representation and collective ideological frameworks, as well as the visibility of alternative masculinities beyond dominant elite norms.
By situating material remains from Cretan sanctuaries within their performative ritual contexts, this study highlights how dedications contributed to the shaping and perpetuation of diverse male-related ideals in some of the island's most prominent cult places. Cretan sanctuaries thus emerge as key venues for the public negotiation of masculinity, where individual and group gendered aspirations were embedded and enacted within communal systems of value and belief.

291 GENERAL SESSION I

Theme: 1. Widening perspectives in material culture studies
Chairs: Nikolas Dimakis – Vassilis Petrakis (National and Kapodistrian University of Athens)
Keywords: Archaeology, Heritage, Research, Methods, Innovation, Interdisciplinary
Format: Regular session

SESSION ABSTRACT

This session is organised by the EAA rather than external session organisers and is chaired by a selected EAA Member, representing the Belgrade Scientific Committee. The session does not focus on a specific theme but instead brings together contributions on a variety of topics, providing authors with the opportunity to share their research with a broad audience.

CONTRIBUTION ABSTRACTS

136. The "Shardana Project", Pirates and navigators in the eastern Mediterranean in the Late Bronze Age: perspectives and research

Authors: Giacomo Cavillier (University of Cairo)
Format: Oral

The Shardana project, launched in Egypt in 2008, is dedicated to Egyptian sources on the Sea Peoples and has highlighted the Pharaonic view of this phenomenon in the Ramesside period. Egyptian iconographic and textual sources reveal the role of these warriors as pirates and mercenaries as part of the international commercial and economic "system" of the time. Piracy and mercenary activity seem to have been indirect but effective instruments of conflict between the great empires of the time and the smaller kingdoms in which entities interconnected with the sea, such as the Levantines, Cypriots and Mycenaeans, operated. Egyptian sources on the subject offer interpretations of events from the Battle of Kadesh to the famous "invasion" of the Sea Peoples that reveal this state of affairs. In the aftermath of the end of internationalism, it seems that the phenomenon of piracy became more widespread, partly due to the transformation of the entire political structure of the Near East and the emergence of other civilisations in the West.

1520. Egyptian religious ideas in the Mediterranean during the Early Iron Age: the funerary and votive aspects of Egyptian amulets

Authors: Electra Apostola (University of the Aegean)
Format: Oral

This essay examines how amulets used in ancient Egyptian funerary contexts were distributed and reinterpreted across the Mediterranean during the Early Iron Age. Ancient Egyptian funerary texts and ideology revolve around death, judgement, rebirth and eternal life. This paper focuses on amulets depicting deities and symbols (e.g. Ptah-Pataikos, Osiris, Horus, Isis, Taweret, the scarab and the wedjat eye), associated with these beliefs and important funerary compositions, such as the Book of the Dead. These artefacts were originally intended to provide protection in the Egyptian afterlife, and so they were commonly found in Egyptian tombs. However, their archaeological context varies across different Mediterranean regions (e.g. the Aegean, Cyprus, Italy and Sardinia), as they were used as both votive offerings and grave goods. The funerary and apotropaic ideas associated with these objects may persist or gradually transform into new religious concepts when entering different cultural settings. This study aims to compare and interpret distribution patterns and investigate reinterpretation prompted by changes in cultural and archaeological contexts, based on statistical data and references to specific objects or groups.

378. Visibility and reconstruction of timber and daub architecture in prehistoric tell sites: the case of

Chalcolithic Yunatsite, South Bulgaria

Authors: Kamen Boyadzhiev – Tsvetana Popova (National Archaeological Institute with Museum – Bulgarian Academy of Sciences) – Mila Andonova-Katsarski (Institute of Biodiversity and Ecosystem Research – Bulgarian Academy of Sciences | University of Sofia "St. Kliment Ohridski") – Yoanna Katreva (Institute of Biodiversity and Ecosystem Research – Bulgarian Academy of Sciences)
Format: Oral

Understanding and reconstructing prehistoric architecture is a long and usually difficult process that requires the collaboration of multiple specialists and the application of different analyses. However, it always starts in the field, and proper on-site identification, excavation, and documentation are the keys to every step further. This interdisciplinary study addresses both methodological issues related to the identification of timber and daub architecture in burnt and unburnt structures on prehistoric tell sites, along with their interpretation. The case study focuses on the recent excavations of the Chalcolithic (5th millennium BC) layer at tell Yunatsite in southern Bulgaria. In the last twelve years remains of several buildings from at least four consecutive stratigraphic levels (BII – BV) have been excavated. In all of them, the use of timber and daub architecture was attested, which contrasts with the suggestion by previous excavators of the use of clay constructions in the latest Chalcolithic settlement (level BI). The state of preservation and, consequently, the basis for further interpretation and reconstruction differ a lot. However, differences in the building techniques used in different houses have been observed. Especially interesting is a partially burnt building from level BIII (No BIII-3). Well-preserved burnt elements of it provide insights into materials and techniques used in the construction of walls and ceilings, while comparison with the unburnt features is important regarding the visibility of timber and daub architecture in different archaeological conditions. Among the ceiling construction, a designated craftsman's choice was recorded: the combination of broad-leafed deciduous species along with conifer timber and monocotyledonous plants, used perhaps in at least two different techniques, while constructing the roofing structures.

1295. Early Neolithic Pit Houses in the Central Balkans: New Insights from Međureč

Authors: Olga Bajcev – Slaviša Perić – Đurđa Obradović – Ivana Dimitrijević – Ružica Savić (Institute of Archaeology, Belgrade)
Format: Oral

Pit houses are among the most characteristic architectural forms of the Early Neolithic in the Central Balkans, yet they remain poorly understood. Often treated as uniform domestic units, these structures display considerable variation in size, layout, and internal organization, raising key questions about their function, duration of use, and role within settlement life. Do they reflect permanent habitation or more mobile, seasonal, or episodic ways of life? Such ambiguities are closely linked to methodological challenges related to excavation strategies, formation processes, and the identification of occupation-related evidence. Focusing on methodological challenges and the strategies developed to address them, this paper examines the excavation methodology, formation processes, and architectural features of a pit house excavated at the site of Međureč in central Serbia. Dating to around 6200 BCE, the site represents one of the earliest Neolithic settlements in the region and occupies a key position within broader Neolithisation processes in the Central Balkans. For this reason, it is investigated within the long-term project Permanent Archaeological Workshop – Middle Morava Valley in the Neolithisation of Southeast Europe. Based on targeted excavation and a range of interdisciplinary analyses, including micromorphology, archaeobotany, archaeozoology, and absolute dating, we examine the organization of interior space, evidence for above-ground elements, oven construction and use, patterns of indoor and outdoor activities, and the life history of the pit house, including phases of occupation, abandonment, and subsequent activity. By addressing these issues, the paper contributes to a more nuanced understanding of pit houses and their role within Early Neolithic settlements, while also highlighting the challenges involved in excavating and interpreting this architectural form in the Central Balkans.

502. Say Cheese! About a special type of vessel from the Vinča settlement at Şoimuş-La Avicola (Ferma 2), Romania

Authors: Cristian-Eduard Stefan ("Vasile Pârvan" Institute of Archaeology, Romanian Academy)
Format: Oral

In this contribution we analyse a special category of clay containers, so-called strainers or sieve-vessels in the literature. They were found in good contexts (pits, pit-huts, enclosing ditches, ovens) in the Vinča settlement at Șoimuș-La Avicola (Ferma 2), Romania. The site was explored in 2011 as a rescue excavation on the route of A1 Motorway, revealing a multilayered settlement consisting of pits, pit-huts, ovens, enclosing ditches, dwellings, etc. with a huge quantity of archaeological material recovered (pottery, anthropomorphic figurines, clay altars, silex, obsidian and stone tools, bone and antler tools, animal bone, human bones scattered in different features, etc.). The radiocarbon dates place our settlement in the second half of the VIth millennium and the beginning of the Vth millennium BC. We try to document the strainers recovered from this site from the point of view of technology, morphometric attributes, but also of their most important trait: the function. A couple of them (but also some other types of vessels from Șoimuș and Radovanu-La Muscalu, another Eneolithic settlement from southern Romania) were the subject of a small project carried out by the University of Wisconsin-La Crosse (Departments of Archaeology and Anthropology and Chemistry and Biochemistry) together with Vasile Pârvan Insitute of Archaeology (Romanian Academy) a few years ago, revealing some intersting results involving some

lipids related with cheese-making. Each sample had any possible surface contaminants removed by surface ablation with a dremel tool. 5-10 gram subsamples of the pottery were taken and pulverized in a mortar and pestle. The lipid extraction and GC-MS was conducted by Dr. Desouza-Machado and his team at the University of Wisconsin-La Crosse. Lipids were extracted following methods established by Evershed and his colleagues, using ultra-sonication with an organic solvent (dichloromethane). The dominant lipids were two saturated fatty acids, palmitic acid (C16) and stearic acid (C18).

204. Clay and stew: Testing Cucuteni-Trypillia Foodways through Experimental Cooking in Coarse Ware

Authors: Maria-Cristina Ciobanu – Elena-Camelia Pintilie (University „Alexandru Ioan Cuza" Iasi, Faculty of History)
Format: Oral

The Chalcolithic Cucuteni-Trypillia culture (5th–4th millennia BC) is renowned for its splendid painted pottery, yet a distinct, coarser category – the so-called type C pottery – is ubiquitous in settlements, comprising vessels tempered with crushed shell (and other organic materials), often associated with cooking. While previous studies focused on typology or debated the "foreign" origin of this category, recent research has reoriented towards understanding its technology and function through an interdisciplinary approach. This paper presents the results of an ongoing experimental project aimed at reconstructing the prehistoric culinary chaîne opératoire, connecting materials science with the sensory experience of food. Building on initial experiments which demonstrated that the specific paste recipe (clay, organic matter, and crushed shell) confers superior thermal shock resistance and allows for slow, uniform cooking, our current endeavour shifts focus from the vessel to the actual culinary preparation. By integrating archaeobotanical and archaeozoological data from Cucuteni sites (attesting to the presence of cereals such as wheat, barley, and millet, as well as pork or game meat), we propose a "catalogue" of experimentally tested prehistoric recipes. We explore new variables such as ingredient processing (grinding vs. whole grains), vessel waterproofing methods (animal fats vs. dairy products), and thermal management in open-fire contexts. The goal is not merely to test the vessel's durability, but also to evaluate energy efficiency, cooking times, and the resulting flavours and textures. Furthermore, these experiments serve to generate a reference collection for organic residues and use-wear traces, essential for the correct interpretation of archaeological ceramics. Ultimately, "cooking up the past" allows us to bridge the gap between static artifacts and the dynamic daily life of prehistoric communities, offering a tangible perspective on how Cucuteni communities interacted with their environment and resources.

2026. Prehistoric Tumulus Architecture and Burial Organization: Evidence from Dollc (Kosovo)

Authors: Sedat Baraliu (University of Pristina) – Premtim Alaj (The Archaeological Institute of Kosova)
Format: Oral

This paper examines the spatial organization, construction typology, and architectural characteristics of tumulus necropolises in the territory of Kosovo, with a particular focus on the tumulus necropolis of Dollc. The study aims to analyze the structuring of the funerary space and the construction elements of the tumuli in order to contribute to the interpretation of prehistoric ritual practices and social organization. The necropolis consists of three tumuli located in a hilly, mountainous landscape, on a rocky plateau oriented north–south, covering an area of approximately 0.10–0.12 ha. Their close spatial arrangement forms an almost regular triangular configuration, suggesting intentional planning of the funerary space. Architecturally, the tumuli are semi-spherical and constructed mainly from locally sourced stones with minimal soil content, reflecting adaptation to the rocky geological substrate. Each mound comprises a central cairn covering the primary burial, enclosed by a circular ring of large and medium stones and overlaid with smaller stones and a humus layer (0.05–0.10 m). The tumuli measure 12–15 m in diameter and 0.50–0.85 m in height. A total of 21 stone-built graves were recorded, exhibiting oval, circular, quadrangular, and irregular plans, with side linings of one to two stone rows, slab coverings, and pebble bedding. Cremation was the exclusive burial rite, while the absence of skeletal remains prevented precise determination of funerary orientation. The spatial organization and construction typology of the Dollc necropolis show clear analogies with other tumulus necropolises in Kosovo and northern Albania, indicating a well-established architectural and ritual tradition. In conclusion, the Dollc tumulus necropolis represents a well-structured funerary unit in which spatial planning, architectural standardisation, and ritual practices intersect, making it a reference case for the study of tumulus organisation and architecture in Kosovo.

712. Practical Function of Barrel-shaped Vessels: Experimental Archaeology and Analytical Methods

Authors: Barbora Němcová (University of South Bohemia Institute of Archaeology) – Eva Samková – Eva Baldíková – Tereza Janů (University of South Bohemia Faculty of Agriculture and Technology)
Format: Oral

It is generally assumed that most ceramic vessels were associated with food at some point in their life history – whether for storage, preparation, or consumption. The functional interpretation of specific vessels often relies on ethnographic and ethnohistorical analogies. When reconstruction based on these fields is not possible, vessels are typically classified into categories based on their morphology and distinct attributes. Determining the practical function of specific ceramic forms remains one of the key themes in the study of material culture. This paper focuses on so-called "barrel-shaped" vessels appearing in Central Europe during the Late Bronze Age (1300-800 BC). In archaeological literature, these vessels are interpreted based on three primary functional hypotheses: fermentation vessels, beehives, or butter churns. To evaluate these hypotheses, a multi-stage study was conducted, combining a review of literature, experimental archaeology and laboratory analyses. In the first phase, ceramic replicas were produced based

on archaeological finds. These replicas were subsequently used in an experiment testing the feasibility of butter production and the specific function of internal knobs present in some vessels. The experiment confirmed that butter can be successfully churned in barrel-shaped vessels. For comparative purposes, the same process was conducted using a modern electric butter churn. To gain deeper understanding of entire process, the intensity of physical labour was monitored. The research also includer the determination of the physical and chemical properties of both the cream used and the resulting product, complemented by a sensory evaluation of the butter.

505. Tribal rivalries and the narrative of the sanctuaries of Gaul

Authors: Béatrice Fleury (Paris I)
Format: Oral

Tribal rivalries and the narrative of the sanctuaries of Gaul. Archaeology as a discipline closer to exact sciences, an orthodox path limiting results to the descriptive, timid interpretation lead to creeping asceticism with fewer possibilities to formulate new research hypotheses. Suggestions that description could be followed by a separate interpretation were made. As alternative, "dissident" schools may express in the form of recital; hiatus in interpretation may lead to recourse to the mythic, since lacuna underside the "Imaginaire" produces desire to seek the sensational. Renewed studies of sanctuaries responds to a rational exploration closer to narrative, as recipient of the world of thought and Collective Imaginary. Research on sanctuaries explodes after the discovery of Ribemont, as content belongs to the world of thought as well as the world of war. Traditional infatuation to study the Roman Army concurrently reniewed, albeit in relation with the instability across which Gaul is represented to us, more than a glorification of armies. The excavation of the Gallo-Roman site at Ribemont lead to the discovery of fantastical order of the Gallic sanctuary, hence reorients research previously favouring the question of the origins of towns of the Gallic civilisation. Amidst a Roman agglomeration and sanctuary dedicated to the god Mercury, a mysterious ossuary of the Gallic period comes to the fore. Calls are made on the "hard" sciences. Functionality of the sanctuary at Gournay interpreted as site of Victory rituals, imposed on Ribemont, adversely influences the modelisation of the latter. Results at Ribemont may imply differing political structures. Constraints of publication, curtails of models for sensitive ideological contexts, limits renewed methods, ways of sampling, ground investigation. To overcome a recurrent hiatus, facilitate the formulation of new research hypotheses, I praise the virtues of exploration and confrontation of myths related by authors closest to those sites.

2396. Bulls Between Eastern Hallstatt and Greece – Transfer of Ideas and/or Common Traits

Authors: Mila Erceg (Centre for Prehistoric Research) – Hrvoje Potrebica (University of Zagreb, Faculty of Humanities and Social Sciences)
Format: Oral

In the narratives of the Greek world, there are well-known instances in which Greeks, when founding new colonies, attributed a mythical ruler to a newly established territory. The connections between Central Europe and Greek cultural space were reflected in material culture from the Late Bronze Age and throughout the Iron Age. The most visible are prestigious objects that outlined the network of communication between the Iron Age elites that covered most of Europe. In most cases, these are elements of costume and personal ornaments, as well as weapons. However, the connection of Iron Age communities in this wide area is not only visible in material culture, but also in some symbolic and mythological contexts that they share. A good example is the symbolism of waterfowl that often appears in chthonic and solar motifs in the Late Bronze Age of continental Europe, as well as in Greek mythology and religion. This paper will take as an example the area of the Eastern Hallstatt circle and the bull motif that appears in the exceptional Iron Age ceramics in that area. Given that area no written sources on the religious aspect of the Hallstatt culture, the bull symbolism can only be discussed in terms of find contexts. Motifs of bulls in the Hallstatt culture are mostly represented in the form of protomes on bodies or decorations on the handles of vessels found in funerary contexts. Vessels decorated with bull motifs that may have been part of a feast set within a funerary context suggest a similarity to the chthonic and Dionysian aspects of the bull in Greek religion. The question is whether the communication between these two areas remained at the level of material goods, or cultural traits were also transferred. Using Greek narratives about the role and meaning of this animal in the religious and mythological sphere, we will show if and how the bull's cultic and mythological symbolism was shared by these two spaces.

32. PHOENSET: searching new insights into the first Phoenician communities in Lisbon, Portugal

Authors: Elisa Sousa (Uniarq - Center for Archaeology - University of Lisbon) – Benjamín Cutillas-Victoria (Complutense University of Madrid) – Alberto López López (University of Murcia) – Francisco Gomes – Patrícia Jordão – Petra Pinto (Uniarq - Center for Archaeology - University of Lisbon) – Paulo Rebelo – Ricardo Ávila (Neoépica, Lda - Arqueologia e Património) – João Luís Cardoso (Icarehb - Universidade do Algarve)
Format: Oral

PHOENSET (2026–2027), a Foundation for Science and Technology-funded project, explores the earliest phases of Phoenician activity in Lisbon and the Lower Tagus region (Portugal), aiming to reconstruct the origins, movements, and adaptations of these early settlers in an Atlantic context. The initiative builds on groundbreaking archaeological discoveries from 2014 at Lisbon's historic center, at the present-day Hotel Aurea Museum, where excavations uncovered the region's oldest dated Phoenician remains, from the second half of the 8th century BCE. The pottery assemblage comprises nearly 200 ceramic individuals, including both handmade

and wheel-thrown vessels. In this regard, our first preliminary data reveal that the wheel-thrown pottery originates from Phoenician sites in southern Iberia and potentially other regions of the Mediterranean Sea, reflecting Lisbon's integration into extensive trade networks. PHOENSET adopts a multidisciplinary framework, combining conventional archaeological methods with advanced physicochemical and petrographic analyses applied to the entire ceramic assemblage. By situating these results within Mediterranean-wide reference datasets, the project aims to trace artifact provenance, chart early Phoenician mobility, and provide new insights into how these communities adapted socially, economically, and culturally to the Atlantic periphery of the Western Mediterranean.

868. Sacred Serpents and Maternal Fertility in Macedonia: Eurydice's dedications to Eucleia and the serpent sire of Alexander as two case-studies

Authors: Stefano Paciolla (University of Siena)
Format: Oral

In this communication, the tale of the serpent sire of Alexander the Great is taken as an example of a textual representation of motherhood that is actually rooted in a broader network of beliefs, practices, and narratives that focus on the serpent as a paradigm of productive and reproductive fertility. This is due to the unique affordances of the serpent, understood, according to James Gibson, as the potential of an object to lend itself to a human project, whether symbolic or intellectual. In many cultures around the world (Mesoamerican, Australian Aboriginal, Togolese, Indian, and so on), the serpent is associated with fertility and birth. By comparison, the specificity of Greek culture in the classical and Hellenistic periods, which has similar beliefs, emerges even more clearly. This is demonstrated by narratives about the birth of illustrious figures (beyond Alexander, Aristomenes of Messenia, Aratus of Sicyon, Alexander of Abonuticus, Dionysus Zagreus), as well as some iamata from Epidaurus where the encounter with Asclepius, in the form of a snake, propitiates birth and is a cure for female infertility. The aim of this communication is to demonstrate that beliefs of this kind also belonged to macedonian religious-medical sphere concerning motherhood, through the analysis of archaeological, epigraphic, and literary sources. In fact, this interpretation seeks to reevaluate the dedications of Queen Eurydice at the sanctuary of Eucleia in Aigai, where a marble snake was also found. The hypothesis to be discussed is that in a public place such as the sanctuary of Eucleia, the self-representation of the queen and her own agency is intimately connected to the kleos of her being a mother.

78. Formalizing the Kanon: A Transferable Forensic Method for Reconstructing Proportional Systems in Ancient Sculpture

Authors: Joshua Jacobo (New Masters Academy)
Format: Oral

The Kanon of Polykleitos, a lost fifth-century BCE treatise on human proportions, is frequently described by ancient authors as a foundational articulation of a proportional ideal and is widely believed to have been paired with a didactic statue, most plausibly the Doryphoros. In prior work, we presented the full orthographic proportional measurement tables based on a cast of the Naples Roman copy and the resulting reconstructed nested grid template organizing the figure through commensurate modules, including finger breadth, palm breadth (across the knuckles), and foot depth, coordinated within a nested circle-square scaffold. The present paper builds on that established reconstruction in two ways. First, we convert the reconstruction into a repeatable construction procedure by formalizing the proportional relationships as an executable modular method rather than leaving them as a descriptive dataset. This includes a modular breakdown of key body regions, with focused treatment of the head and foot. Second, we introduce a newly reconstructed neutral reference pose presented in orthographic front, rear, and side views, designed as a stable base state for comparative analysis across copies and for controlled reposing while preserving the system's modular logic. The resulting model is intended as a practical instrument for researchers, artists, and art historians. It enables the proportional system to be reposed into new configurations while maintaining its commensurate structure, and it provides a transferable forensic methodology for reconstructing proportional programs in other classical and post-classical sculptures, including works not conceived as explicit pedagogical templates. In doing so, it supports a clearer account of how proportional systems were produced, transmitted, and transformed in ancient art.

428. Comparative Regional Behavioral Typomorphological Analysis of Byzantine Glass Goblets: Holy Land (Israel), Anatolia (Turkey) and Italy

Authors: Ofer Gat (Kaye Academic College of Education | Beit Berl Academic College)
Format: Oral

This study presents a comparative typomorphological and spatial analysis of Byzantine glass lighting vessels from church assemblages in Israel, Turkey, and Italy. Focusing on hanging goblets and standing or suspended lamp cups, the research examines how typological variability, technological choices, and spatial distribution reflect regional liturgical practices and religious conceptions of light. Using a regional behavioral typomorphological model, the study integrates quantitative and qualitative data to reconstruct patterns of lighting use within ecclesiastical spaces, particularly the nave and apse. The findings reveal both shared traditions and regional distinctions: Turkey exhibits a highly standardized and centralized lighting system linked to Constantinople, while Israel demonstrates greater functional flexibility and liturgical pluralism. Italian evidence, though limited, aligns with broader Mediterranean patterns. The study highlights glass lighting vessels as cultural mediators, carrying religious, social, and symbolic meanings across regions, and emphasizes the active role of material culture in shaping ritual experience, spatial hierarchy, and religious perception

in Byzantine church architecture.

1025. Examination of the production-distribution system in the 9th–13th centuries: observations on ceramic assemblages from Visegrád and Budafelhévíz

Authors: Dóra Csepregi Horváth (Pázmány Péter Catholic University)
Format: Oral

The examination and analysis of ceramic material from the 9th–13th centuries present a significant challenge for Hungarian archaeology. During this period, the dominance of household production resulted in substantial variability within ceramic assemblages; consequently, such material can only be interpreted within a regional framework. In the 9th–13th centuries, vessels were produced on hand-turned wheels and decorated with combinations of wavy and straight lines. From the 12th–13th centuries onwards, decoration became increasingly standardised, with most pots bearing a single line running around the vessel surface and wavy lines disappearing. Our understanding of contemporary potters and their techniques relies almost exclusively on archaeological evidence. As a result, we often face more questions than answers concerning the social background of pottery production, which explains why this subject rarely appears in publications. Approaching this issue from a production-distribution perspective can introduce new directions for further research. This approach focuses on defining production and distribution systems in the 9th–13th centuries and analysing available evidence, such as proportions of pottery types, and site context. Taken together, these allow conclusions to be drawn. For this purpose, a new-perspective study will be conducted on ceramic assemblages from two medieval sites: Visegrád, an 11th century power centre, and Budafelhévíz, located near a major port adjacent to Buda, the capital established from the 13th century onwards. At Visegrád, ceramic production took place in the suburbium surrounding the centre. Comparison of the typological and material (petrographic) characteristics of assemblages from the suburbium and the centre allows reconstruction of the local production and distribution system. Budafelhévíz predates the foundation of Buda, so it provides an opportunity to examine how this system changed before and after the establishment of the capital.

313. Reconstructing Early Buddhist Landscapes through Inscriptional and Spatial Analysis: An Archaeological Reassessment of Jambudīpa and Taprobane

Authors: Lakshman Fernando (Independent Researcher)
Format: Oral

This study presents an archaeological reconstruction of early Buddhist landscapes in Sri Lanka through a systematic analysis of pre-Christian Brāhmī inscriptions (Inscriptions of Ceylon, Vol. I), integrated with spatial mapping and landscape correlation. The inscriptional corpus is treated as a primary dataset: sites are georeferenced, distributions mapped, and clustering patterns identified across regions including Mihintale, the Vavuniya (Erupotana/Periya Puliyankulam) zone, and the Dambulla–Nalanda corridor. Recurrent personal names and monastic affiliations (e.g., Ānanda, Upatissa/Śāriputta) are examined in aggregate, revealing networked monastic landscapes that align with topography, hydrology, and route systems when plotted against one-inch Survey maps. Within this material–spatial framework, distance relationships are tested using a recalibrated early historical yojana (c. 4.5 miles), producing cartographically verifiable correspondences between inscriptional distributions and landscape features. Textual sources—Pāli canonical and commentarial traditions, together with early Greek accounts—are then evaluated against these archaeological patterns, rather than serving as primary drivers of interpretation. Greek geographical testimony, especially the description of Taprobane by Megasthenes and Arrian as a landmass separated from the mainland by a river, is reassessed in light of this dataset. Differences between nineteenth-century translations by J. W. McCrindle and later twentieth-century facsimile editions, in which the phrase 'from the mainland' is omitted, are examined solely to assess how the textual descriptions align with mapped archaeological patterns. The integrated analysis demonstrates that Jambudīpa corresponds to a spatially coherent and archaeologically recoverable landscape within Sri Lanka, with Lankādīpa (Tambapaṇṇi/Taprobane) representing a geographically coherent regional entity when measured using early historical units. By prioritising inscriptional distributions and landscape correlation, the study advances a methodological shift from text-led reconstructions towards archaeologically grounded spatial models in early Buddhist geography.

946. Constructing the Sacred: Contextualising the Buddhist Materiality of the Kushana-Period Buddhist Complex at Sanghol

Authors: Antareepa Mandal (Pondicherry University)
Format: Oral

In the study of the religious transformation of Buddhism, Archaeology presents a very different perspective in the early South Asian context. Compared to conventional historical writings, Buddhist Archaeology helps to uncover diverse aspects of the past associated with the material remains. The crucial element in the Asian landscape was the religious shrine, and it is important to situate it in a cultural context and to unravel the multiple levels at which sacred sites interacted with diverse communities and negotiated among them. The present paper focuses on the cultural tradition of the Kushana period (c.1st–3rd CE) Buddhist site of Sanghol (present-day Fatehgarh Sahib District, Punjab, India) belongs to the Mathura School of Art. This study explores the role of the "causative factors" in the formation of the 'sacred geography' of early historic Sanghol and its environs by examining the material remains. This examination helps contextualise and interpret the site's unique artistic manifestation. Using critical, analytical, and descriptive methods, this study historically analyses relevant archaeological sources, including spiritual and secular material remains, inscriptions, coins, and architectural remains. In search of the "causative factors," the essay seeks answers to the following interrelated questions: the importance of Sanghol's geographical location; its history of human habitation; its political environment; the economic activities prevalent there; its socio-cultural milieu; its cultural repertoire, the patronage of that culture, and the culture's rooted regionality. Buddhism's inherently syncretic character enabled it to absorb folk traditions or non-canonical artistic forms. By contextualising the visual remains of the Sanghol Buddhist site, the paper provides a comprehensive understanding of Buddhist materiality within socio-cultural practices in a pluralistic approach.

1504. Buddhist Landscape Archaeology of East Coast of Tamil Nadu from the Early HIstoric to the Medieval Period

Authors: Selvakumar Veerasamy (Tamil University, Thanjavur)
Format: Oral

Buddhism has been one of the important early religions to arrive along the Southeast coast of India and Sri Lanka. In the region of Tamil Nadu, Kaverippumpattinam and Kanchipuram are the two important early Buddhist centres, and in the medieval period Buddha images appeared in the hinterland across the trade routes in Tamil Nadu. The important maritime trade with Southeast Asia, cities, communities and the Buddhist ideology are described in the Tamil kappiyam (kavya) texts of Cilappatikaram and Manimekalai. In the Medieval period, Nagapattinam became an important centre of trade and it was supported by the initiatives of Sri Vijaya king who built the Culamanivarma Vihara at Nagapattinam with the support of Chola king Rajaraja I. This paper explores the nature of the Buddhist landscapes of east coast of Tamil Nadu from a temporal perspective from the early historic to the medieval period using text and archaeology. While the texts build a narrative of people with diverse interests, motives, and intentions existing in this period and the concepts of dharma and human existence, history and archaeology present another version of human existence and realities of life. We do notice that the Buddhist texts highlighting an idealized lifeways in the early historic and early medieval periods, while in the mid-medieval period Buddha images and Viharas have been idolized to witness the rituals, politics and diplomacy, embracing the reality of human existence.

1391. Up and Around the Mountains, the Lone Spruce Site and the Lithic Trade Routes of Paleoarchaic Colorado

Authors: Robert Rowe (Retired)
Format: Oral

The Lone Spruce Site (5GD126) is a series of resource processing camps and quarries within the upper reaches of the Colorado River Basin in north-central Colorado, at 2,500 meters AMSL. The site was partially excavated in 2017 with over eight thousand lithic artifacts, 32 percent of which were identified as various types of scrapers, ninety-five percent of which are locally obtained Table Mountain jasper and Troublesome chert were recovered, both of which are readily locally available. Both the Table Mountain jasper and Troublesome chert were both mined within the southern reaches of the site. Material originating out of the basin is identified as "Parker Wood" a ubiquitous material that is obtained east of the Front Range. which probably was brought into the Colorado River Basin along the seasonal "Grand Circuit of the Front Range". Radiocarbon dating from hearths and post holes place the site within the late Paleoarchaic (10,000 to 9,000 BP) into the Archaic Mountain period (9500 -1800 BP). In tracking the raw material for formal tools indicates the site supports the hypothesis of indigenous lithic trade routes from the plains to the interior mountain valleys along the river, which brings the two sources of toolstone together. Mountain sheep bones and high-altitude plant remains also gives indications of Altitudinal Transhumance occurring at the site with these activities being well established by the late Paleoarchaic period.

1705. Making Legacy Ceramic Profiles FAIR: Metadata Enrichment and a Reproducible Shape-Analysis Workflow

Authors: Yidan Zhang (University of Oxford)
Format: Oral

Many ceramic assemblages on the eastern rim of the Tibetan Plateau are known mainly from legacy excavation reports, where inconsistent terms, sparse figure metadata and variable publication scales hinder reproducible comparison and studies of inter-regional interaction. We present a FAIR-oriented workflow that enriches object-level metadata and converts unevenly published profile drawings into reusable datasets for ceramic shape comparison. We compile complete vessels with published profiles and at least one reliable metric for pixel–centimetre calibration; we record the calibration dimension and source, document missing scales as a reuse bottleneck, and exclude such cases from quantitative analysis. An image manifest captures provenance and paradata (source identifier, figure ID, page, DPI, extraction method, checksum) and links persistent record IDs to bibliographic sources and vessel entries. Interoperability is improved through a versioned controlled vocabulary (vessel class, rim form, components) and a term-mapping table aligning local labels to canonical codes with confidence scores and rule versions. Profiles are normalised (orientation, scale), vectorised, and encoded as geometry descriptors; computed measurements and derived ratios (e.g., CI, DR) are stored alongside reported values with script and vocabulary versions and calibration references for traceability. The pipeline logs parameters and outputs interoperable tables and vector contours suitable for repository ingestion and reuse. Unsupervised clustering offers an auditable comparison layer; robustness is assessed via repeated subsampling and alternative normalisation. Clusters only

partly reproduce legacy types, revealing continuous shape variation that blurs degree labels (e.g., "slightly/strongly bulging") and cross-site correspondences relevant to exchange. We summarise what worked and failed—caption inconsistency, layout variation, contour-extraction errors and manual correction costs—and show how paradata flags and vocabulary governance increase transparency for downstream reuse. By foregrounding these practices, the paper offers a transferable blueprint for turning legacy ceramic archives—whether in Europe or elsewhere—into FAIR resources that support cross-project synthesis and future contributions.

2181. A Colourful Connection: Trade, Trends and Identity through Lombard-Period Beads

Authors: Benedict Seidl (University of Vienna) – Bendeguz Tobias (Institute for Medieval Research of the Austrian Academy of Sciences)
Format: Oral

During the 5th and early 6th centuries, beads display remarkable diversity in material, size, colour, shape, production technique and decoration. Archaeological find circumstances show a wide spectrum ranging from small necklaces and bracelets with only a few beads to long, visually striking compositions featuring large polychrome beads. In graves from Lower Austria, large necklaces combine amber beads from the Baltic with millefiori and drawn beads from the Mediterranean, and some also include glass beads that may originate from the Indo-Pacific region. Beyond questions of provenance and the reconstruction of long-distance exchange networks, the beads and necklaces allow insights into social status, gender and representation of the buried individuals within their communities. The specific combinations of beads and recurring combination patterns observed within necklaces do not only reflect contemporary preferences and aesthetic trends but also form a basis for establishing relative chronologies. This presentation discusses the systematic analysis of 658 beads from eight Lombard-period burial grounds from the 5th and early 6th centuries in Lower Austria. Using typological methods, correspondence analyses, and seriation, it explores how bead choices and combinations reflect chronological patterns, identity, social connectivity, and long-distance trade networks.

201. "Shardana Project": the impact of the Sea Peoples in Egypt: perspectives and research

Authors: Giacomo Cavillier (Cairo University)
Format: Poster

The "Shardana" research project focuses on the Sea Peoples and, in particular, the warriors and navigators most frequently mentioned in Ramesside Egypt. Traces of the Shardana are also found in important Western contexts such as Sardinia and Corsica, likely used as bases and headquarters for piracy. Research conducted so far at various sites supports the hypothesis that these warriors and navigators were hired as mercenaries by the great Near Eastern empires in the Late Bronze Age and were an essential part of a "system" of trade, diplomacy, and warfare managed by kingdoms such as Mycenae, Cyprus, Ugarit, and Byblos. The Battle of Kadesh between the Egyptians and the Hittites marked a clear separation between Mycenae and Egypt, and the massive presence of these "pirates" in the Mediterranean intensified. With the collapse of internationalism and the rise of "nation states" in Syria-Palestine, this phenomenon was redefined towards territorial and cultural assimilation of the Sea Peoples.

311. What the Greeks Knew, and the 19th Century Forgot: Re-mapping Taprobane within Sri Lanka

Authors: Lakshman Fernando (Independent Researcher)
Format: Poster

Early Buddhist sources describe Jambudīpa and Lankādīpa (Tambapaṇṇi), while ancient Greek and Roman authors refer to a maritime destination known as Taprobane, situated within the Indian Ocean trade networks. The long-standing misidentification of Lankādīpa/Taprobane as the entire island arises from a twelfth-century miscalibration of the yojana value as a unit of linear measurement, compounded by the adoption of this value without sufficient critical examination by nineteenth-century British historians. While the Chinese pilgrim Fa-Hien explicitly identified the entire island as the Country of Sinhala. However subsequent historical and archaeological reconstructions failed to locate these regions, leading to distorted cartographic interpretations and the misplaced sacred geographies. This study demonstrates that recalibrating the yojana value is essential for restoring these misinterpretations. This study employs an interdisciplinary archaeological approach to address and resolve these inconsistencies by integrating Early Brāhmī inscriptional evidence, canonical and commentarial Buddhist texts preserved in Sri Lankan ola-leaf manuscripts, classical literary accounts, and independent cartographic data. According to early Indian sources, including the Arthaśāstra and the Lalitavistara, the yojana is defined as a linear measure of 4,000 dhanu, each dhanu being six feet in length—amounting to 24,000 feet, or approximately 4.5 miles. The Dīpavaṃsa describes Lankādīpa / Tambapaṇṇi as measuring 32 × 18 yojanas (144 × 81 miles), but it represents only a part of island's land mass. Fa-Hien's account of the Country of Sinhala 50 × 30 yojanas (225 ×135 miles) corresponds well to the full dimensions of the island's land mass. Independent corroboration is also provided by nineteenth-century one-mile-to-one-inch Survey of Ceylon maps, in which three sheets horizontally and eight sheets vertically reproduce precisely the 144 × 81 mile dimensions recorded in Dīpavaṃsa Chapter XVII(4th century AD). This convergence of textual, archaeological, and cartographic evidence demonstrates that ancient geographical descriptions were precise, internally consistent, and regionally grounded.

752. Mierzyn, site 1. The largest burial ground of the Pomeranian culture in Central Poland?

Authors: Magdalena Piotrowska (Institute of Archaeology and Ethnology Polish Academy of Sciences)
Format: Poster

Archaeological research at the site was carried out in the years 1972–1976 and as a result, a total area of 32 ares was surveyed, leading to the discovery of 123 graves. Some of the features had been destroyed by the road construction, sandmine, and robbery activity, which allows us to assume that originally the cemetery may have contained about 150 burials. The cemetery stands out in terms of its size compared to other necropolises of the Pomeranian culture and with high probability has been studied in its entirety. The archaeological data from this site is being analyzed now and the preliminary research results can only be presented. The discovered burials were graves in the form of stone cists as well as urns only encircled with stones, and simple urn graves. Pottery was mainly discovered in these features. Only a few metal artefacts were documented. The chronology of the cemetery points mainly to the older pre-Roman Iron Age. In future the spatial structure of the burial site, the variability of graves and urn forms, and osteological studies will be analyzed, which will allow us to supplement the state of research on the burial rituals of the Pomeranian culture's population – this is the largest "Pomeranian" cemetery known from central Poland.

1072. Developing and Applying THR-FRD: A Long-Term Flood Resilience Dataset for the Tea-Horse Road Area

Authors: Mei Ai (Department of Geography, Ludwig-Maximilians-Universität München)
Format: Poster

Historical and archaeological materials are increasingly mobilised in environmental and climate-change discussions, yet their use is often constrained by fragmented records, inconsistent terminology, changes in place names and administrative boundaries, and opaque transformations from narrative sources into structured data. The Tea-Horse Road region in southwest China spans the Hengduan Mountains and the eastern margin of the Tibetan Plateau. Over the past two millennia, the region has experienced floods of varying scales while demonstrating notable flood resilience. Although some efforts have compiled historical flood materials, they are largely presented in Chinese, dispersed across different media, and focused mainly on floods themselves; as a result, they are difficult for international scholars to discover and reuse, and long-term datasets suitable for flood-resilience analysis remain scarce. To address this gap, we developed the Tea-Horse Road Flood Resilience Dataset (THR-FRD), compiling flood-related records from AD 0 to 2025. This poster presents THR-FRD's strategy for metadata enrichment and interoperability. First, THR-FRD adopts a provenance-centred metadata model: the dataset is organised in 50-year temporal bins and uses county-level historical administrative units as its spatial framework; each entry is linked to its original source (e.g., local gazetteers, archival documents, ethnographic surveys, archaeological evidence, and observational records) and records evidential type, citation details, and interpretive confidence. Second, we provide a structured schema organised around three core components—Exposure, Vulnerability, and Risk—supported by a field-level data dictionary (variable definitions, coding rules, missingness conventions, and uncertainty annotations) to ensure consistent interpretation across users. Third, the poster outlines publication and reuse measures: the dataset will be released in downloadable open formats with full documentation and citation guidance, accompanied by clear licensing and reuse boundaries. Through bilingual (Chinese–English) presentation and structured organisation, THR-FRD lowers barriers to cross-linguistic and interdisciplinary reuse.

2615. Inland Amber-Working in the Eastern Baltic: Insights from the Zvidze Settlement (Latvia, 4th Millennium BC)

Authors: Agnese Cakare (Faculty of Humanities, Institute of Latvian History, University of Latvia)
Format: Poster

Neolithic amber-working in the Eastern Baltic region produced jewellery such as pendants, elongated and button-shaped beads, rings and discs. The production of these items took place not only along the coast but even more extensively inland, requiring access to coastal raw material. Zvidze settlement, located at the Lake Lubāns basin (Latvia), provides one of the most abundant amber collections in the region from the Middle Neolithic (c. 4th millennium BC). A technological analysis of amber rough-outs and finished products from the settlement reveals variation in the processing sequence, specifically in the stage at which drilling occurred, a pattern that has also been observed in assemblages from coastal sites in the region. In contrast, inland amber-working suggests a production focus on more technically demanding jewellery forms and a higher occurrence of repaired items. The results reveal technological nuances that may reflect differences in participation in exchange networks, resource utilization strategies, and the experience of craftspeople involved in amber working.

292 GENERAL SESSION II

Theme: 1. Widening perspectives in material culture studies
Chairs: Nikolas Dimakis – Vassilis Petrakis (National and Kapodistrian University of Athens)
Keywords: Archaeology, Heritage, Research, Methods, Innovation, Interdisciplinary
Format: Regular session

SESSION ABSTRACT

This session is organised by the EAA rather than external session organisers and is chaired by a selected EAA Member, representing the Belgrade Scientific Committee. The session does not focus on a specific theme but instead brings together contributions on a variety of topics, providing authors with the opportunity to share their research with a broad audience.

CONTRIBUTION ABSTRACTS

257. Ancient DNA from stone cities records genetic origins and kinship practices in Neolithic China

Authors: Zehui Chen (Institute of Vertebrate Paleontology and Paleoanthropology)
Format: Oral

The early big settlements that emerged from the Yellow River basin were considered to play a vital role in early society. At the same time, ancient cultures outside the Central Plain were thought to have had a modest impact, sparking a lasting debate because they lacked corresponding genetic evidence. The discovery of Shimao city (ca. 2,300–1,800 BCE), a premier state-level Neolithic fortified settlement in Shaanxi, China, played an important role in helping us understand the emergence of socially stratified urban societies. However, key questions remain regarding how ancestry and kinship shaped the hierarchy of this class-based society characterized by human sacrifice. The origins of the founding populations of Shimao and other Loess Plateau settlements, and their interactions within the broader ancestral landscape, remain to be determined. By sequencing 144 ancient genomes from Shimao city and its satellites, we present pedigrees among tomb owners spanning up to four generations. These findings reveal a predominantly patrilineal descent structure across Shimao communities and sex-specific sacrificial rituals. We also characterize the population history, revealing that Shimao culture-related populations originated mostly from a Yangshao culture-related population present at least one thousand years earlier in the local region, and the lasting inflow of Yumin-related population from Inner Mongolia did not interrupt regional genetic continuity. Which in line with the long-term influence of the steppe-related pastoralist, evidenced by continuous stone tool traditions and increasing incidence of herding animals. Broader genetic influence from southern mainland ancestry over Shimao culture-related populations supports evidence of rice farming expanding further north than previously expected. Taken together, these results uncover fine details of the regional peopling and social structure of early state establishment.

725. Reassociating Commingled Archaeological Human Remains Using 3D Geometric Morphometrics: A Quantitative, Non-Destructive Approach

Authors: Myrsini Voulgari (Kean University) – Ioanna Anastopoulou (National and Kapodistrian University of Athens) – Konstantinos Moraitis (National and Kapodistrian University of Athens)
Format: Oral

It is not uncommon in various archaeological contexts to observe commingling and fragmentation of human skeletal remains due to secondary burial practices, collective tombs, ossuaries and post-depositional disturbances. This presentation will explore the application of 3D geometric morphometrics as a quantitative, non-destructive tool for the reassociation of commingled human remains, both from archaeological material and modern cemeterial remains collections. Based on previous validated morphometric research, this study applied 3D shape analysis to the thoracic vertebrae (T2-T9) that show no morphological difference to assess anatomical compatibility and morphological similarity. This approach was used to provide an objective means where traditional visual comparison is constrained by fragmentation, handling, or limitations of distances. A total of 98 individuals from three skeletal collections in Greece were included in this study. All vertebrae were digitized using a handheld 3D scanner, and landmarks were placed on the generated models. The coordinate data resulting from the landmark placement were standardized through Procrustes superimposition to eliminate size effects and allow comparison through shape variation. Identification performance varied across all thoracic vertebrae in question, with the highest accuracy observed for T2, frequently exceeding 81% and the lowest for T6 vertebrae. To further assess sorting potential, the research focused on the two most frequently occurring adjacent vertebral pairs of the sample, T4-T5 and T5-T6. Pairs exhibiting the smallest Procrustes distances were interpreted as belonging to the same individual, with 66.2% of the cases being correctly associated within the first three possible matches. The results of this study indicate that 3D geometric morphometric methods could substantially improve the objectivity, consistency, and reliability of sequencing and reassociation of thoracic vertebrae. This approach has strong potential for application in both forensic and bioarchaeological contexts, although further research is necessary to assess its robustness and broader applicability fully.

326. Buried in iron shackles: Non-normative burial at the Greek colony Himera

Authors: Britney Kyle (Department of Anthropology, University of Northern Colorado) – Laurie Reitsema (Department of Anthropology, University of Georgia) – Mustafa Quadir (University of Wisconsin School of Medicine and Public Health) – Alissa Mittnik (Department of Human Evolutionary Biology, Harvard University | Department of Genetics, Harvard Medical School | Max Planck Harvard Research Center for the Archaeoscience Ancient Mediterranean | Department of Archaeogenetics, Max Planck Institute Evolutionary Anthropology) – David Reich (Department of Human Evolutionary Biology, Harvard University | Department of Genetics, Harvard Medical School | Max Planck Harvard Research Center for the Archaeoscience Ancient Mediterranean | Howard Hughes Medical Institute, Harvard Medical School) – Stefano Vassallo (Regional Archaeological Superintendence, Palermo)
Format: Oral

We examine three individuals buried in iron shackles at the Greek colony Himera (648-409BCE). Although funerary practices vary widely across time and space, culturally structured mortuary responses are near-universal, with well-documented ritual traditions in the Greek world. Denial of normative burial and retention of punitive shackles therefore suggest not only social marginalization, but intentional emphasis on the deviance of the deceased. At least 19 shackled individuals/groups have been identified across the Greek world, but this form of non-normative burial is rare. Interpretations in other contexts suggest individuals were political prisoners/mutineers, enslaved, prisoners of war, convicts, and/or condemned. Thoughtful interpretation of shackled individuals must be grounded in local historical and archaeological context and informed by osteological evidence of lived experiences. Using multiple bioarchaeological approaches, we reconstruct the life histories of three shackled individuals from Himera. All died in late adolescence or young adulthood and were interred in simple pit burials lacking grave goods, other than their fetters. Isotopic data indicate local origins, while ancient DNA identifies all three as biologically male with Aegean and/or Italian ancestry. One individual shows genetic evidence of recent inbreeding, indicating the parents were closely related—likely at the level of cousins—and originated from a small population with limited genetic diversity. None exhibit skeletal trauma, but evidence of physiological stress varies among individuals. These findings indicate distinct life histories and tentatively suggest the individuals were either enslaved at Himera for much of their lives and/or Himeran citizens who later became prisoners. At a large colony occupied for more than two centuries and represented by nearly 13,000 excavated burials, the presence of enslaved individuals, convicts, and prisoners would be expected. The exceptional nature of shackled burials within this extensive mortuary sample indicates that restraints were intentionally maintained in death to convey a message to the living.

533. Underwater Archaeology of the Žeimena River, Northeastern Lithuania

Authors: Gytis Piličiauskas – Elena Pranckėnaitė – Kęstutis Peseckas – Aldas Matiukas – Lukas Gaižauskas – Divonis Piličiauskas (Archaeology Department, Lithuanian Institute of History) – Grzegorz Osipowicz (Archaeology Department, Lithuanian Institute of History | Institute of Archaeology, Nicolaus Copernicus University) – Giedrė Piličiauskienė (Archaeology Department, Lithuanian Institute of History | Faculty of History, Vilnius University)
Format: Oral

Archaeological sites within the beds of present-day rivers, including fishing sites, are very rare across Europe; therefore, riverine fishing in the Holocene is known incomparably less well than fishing in lakes, lagoons, or even the sea. It would seem that the main reason for this situation is the much greater scale of bank and bed erosion in rivers caused by current action. But is this really the case? To address this question, between 2015 and 2025 we carried out a complete visual survey of the riverbed along the entire 80 km length of the Žeimena River. The river flows in northeastern Lithuania and belongs to the Baltic Sea basin. We identified 22 sites with at least 35 concentrations of wooden piles (remains of fishing weirs), dated from the Mesolithic to the Middle Ages. While medieval and Iron Age fishing sites yielded almost no other finds, the Stone and Bronze Age sites produced about 1,500 artefacts made of bone, antler, flint, and other lithic materials, as well as wooden objects and pottery sherds. The results of the research on the Žeimena suggest that the channel sediments of present-day European lowland rivers, flowing through landscapes shaped by the last glaciation, still preserve numerous archaeological sites—sometimes dating to the Stone Age and sometimes with excellent preservation of organic materials—but they remain undiscovered because systematic surveys of riverbeds are rarely undertaken.

463. The Benares Shipwreck (1872) in Okinawa: Reconstructing Maritime Histories through Material Traces

Authors: Chiaki Katagiri (Cultural Assets Division, Okinawa Prefectural Board of Education | Faculty of Social and Cultural Studies, ISGS, Kyushu University) – Hiroki Miyagi (Okinawa International University) – Miki Watanabe (University of Tokyo) – Yumiko Nakanishi (Kansai Gaidai University)
Format: Oral

The British merchant ship Benares wrecked off Okinawa Island in 1872 provides a material starting point for examining late nineteenth-century maritime circulation. The investigation began not underwater but on land, with a grave locally known as a "Dutch grave"—a conventional term applied to Western burials. Subsequent research has revealed a diverse assemblage of material culture associated with the wreck, which can be grouped into three categories. The first consists of objects salvaged after the wreck and recontextualised in terrestrial settings, including granite monuments and a recovered anchor at a nearby port. The granite elements display standardised dimensions and working techniques, suggesting a shared origin. As granite does not occur naturally on Okinawa Island, these stones are best understood as ship-related materials selectively recovered. The second category comprises artefacts discovered on the seabed that likely represent materials transported aboard the vessel, including Chinese ceramics alongside

European-manufactured items such as cutlery and ceramics. The third category consists of structural components of the hull including iron fastenings, copper sheathing plates, and a wooden pulley. Archival research has clarified that the Benares was en route from Hong Kong to San Francisco when it was wrecked in Okinawa. Further investigation in Britain has revealed that the vessel was originally constructed in the United States, adding another layer to its transoceanic biography. By integrating terrestrial remains, underwater evidence, and archival and artefactual research, this paper reconstructs the Benares not as a single maritime incident but as a set of materials whose trajectories continued across land and sea. It demonstrates that material traces associated with the wreck were reused and sustained in terrestrial contexts prior to the archaeological identification of the shipwreck itself, allowing the event to be remembered within the local landscape and ultimately contributing to the identification of the wreck site.

449. Standardizing Legacy and Newly Acquired Underwater Cave Data: A Long-Term Methodological Framework for Archaeological Analysis and Reanalysis

Authors: Julien Fortin – Samuel Meacham – Andreas Rosland (CINDAQ) – Dominique Rissolo – Loren Clark (UCSD) – Wetherbee Dorshow (Earth Analytic)
Format: Oral

Submerged karst cave systems in Mexico's Yucatán Peninsula represent repositories of cultural heritage preserving Pleistocene human and animal remains, ochre mines, Maya artifacts, and paleoenvironmental records documenting thousands of years of interaction between people, animals, and landscape. For more than 25 years, the Centro Investigador del Sistema Acuífero de Quintana Roo (CINDAQ) has conducted systematic exploration and documentation of these underwater systems, generating extensive datasets through the work of numerous divers with varied backgrounds, languages, and levels of scientific specialization. Data were collected using heterogeneous methods, including manual and semi-automated survey, sketch mapping, comments, photography and videography, photogrammetry, and Geographic Information Systems (GIS). We present a structured approach to transforming long-term, heterogeneous legacy datasets into usable and reproducible scientific resources. The workflow is organized along four axes: (1) curating legacy data through deduplication, indexing, and the establishment of Single Sources Of Truth; (2) defining standards for legacy translation and new data acquisition, such as controlled vocabularies for survey comments and image tagging; (3) developing tools integrating old and new data while enforcing standards, including image search engines, GIS analyses, automated validation scripts, and photogrammetry pipelines; and (4) documenting paradata through knowledge bases and open, software-agnostic formats ensuring long-term usability. Examples cover the reuse of standardized observations to model halocline depth and assess how environmental dynamics influence cave accessibility and preservation ; the normalization of decades of legacy comments related to ochre, calcite, and charcoal in the study of submerged prehistoric ochre mines ; and the classification of photographic archives to relocate animal and human remains sites for archaeological and paleontological documentation. This work shows how systematic standardization of heterogeneous datasets can enable new analyses while improving quality and reproducibility, and how these methods can be transferred to other fields beyond cave-related studies to any discipline managing complex, long-term field data.

690. Constructing Narratives from Clay: Integrating LIBS,0p XRF, and Archaeobotany to Decode Settlement Dynamics

Authors: Ondrej Štastný – Tereza Šálková (University of South Bohemia, Institute of Archaeology)
Format: Oral

Reconstructing the complexity of prehistoric settlement dynamics requires bridging the gap between static analytical data, spatial configurations, and the human behaviors that produced them. This contribution explores how a multi-proxy approach—integrating inorganic geochemical analyses with dual-mode archaeobotany—can transform fragmented material residues and culturally constructed soil features (choma-facts) into a coherent narrative of technological choice. We present a case study from southern Bohemia, spanning the transition from the Late Bronze Age to the Late Iron Age (ca. 1250 BC – 50 BC). The research focuses on two distinct categories of clay finds: structural daub and mondidols (fired clay objects). To reconstruct the chaînes opératoires and the spatial dimensions of these materials, we employed portable X-ray fluorescence (pXRF) for bulk characterization, and Laser-Induced Breakdown Spectroscopy (LIBS) for high-resolution surface analysis. These chemical datasets were integrated with two parallel botanical lines of evidence. We analyzed plant imprints preserved on the surfaces and matrices of both daub and mondidols to identify intentional technological choices. These results were systematically compared with standard archaeobotanical assemblages (plant macroremains) obtained via systematic flotation of the settlement features. This juxtaposition allows us to distinguish specific "recipes" used for construction materials from the broader agricultural and environmental background. We demonstrate that integrating LIBS, pXRF, and this comparative botany enables us to construct robust narratives about the spatial dynamics of resource management, specialized production, and regional adaptation, moving beyond simple typology to a deeper understanding of prehistoric decision-making.

857. How to recognise and locate the clay source through mineralogical and chemical characterisation: A case study from Rakhigarhi

Authors: Amit Ranjan (Ashoka University)
Format: Oral

This paper focuses on the mineralogical and chemical characterization of clayey raw materials to identify clay sources and address

questions of ceramic provenance at the Harappan site of Rakhigarhi. In the first part of the study, the geological origin of clays was examined through a systematic field survey designed to locate and sample potential local raw material sources within the surrounding landscape. Clay sampling was carried out in relation to sedimentary contexts relevant to ceramic production. In the second part, an ethnoarchaeological approach was employed to document traditional practices of clay procurement and preparation, providing contextual insight into raw material selection and variability. In the third part of the study, experimental replication and controlled firing tests were conducted on locally collected clays to investigate mineralogical phase transformations and firing temperature ranges. Archaeological ceramics, geological clays, and experimentally fired briquettes were analyzed using an integrated multi-analytical approach combining FTIR spectroscopy, SEM–EDX, and ICP-MS trace-element analysis, allowing the establishment of mineralogical and geochemical reference frameworks. Finally, a comparative analysis of experimentally fired briquettes and archaeological ceramics was undertaken. The results indicate a strong mineralogical and chemical correspondence between local clays, experimental products, and most red ware ceramics, particularly from the Mature Harappan phase, suggesting predominantly local production. In contrast, selected Early Harappan and Hakra ceramics, especially mud-appliqué and grey ware, exhibit mineralogical and chemical signatures distinct from the local clay baseline, indicating the use of compositionally different or non-local raw materials.

2221. Digging Geophysics Out of the Bin

Authors: Peter Turner – Andy Boucher – Sam Harrison – Lei Ding – Jacob Adams (Headland Archaeology)
Format: Oral

Geophysical techniques have been used extensively in both academic and commercial archaeology as a prospection tool to locate areas of archaeological potential and guide further investigation. However, after initial prospection, the involvement of geophysical specialists often ends and a wealth of potentially useful information contained within that data is lost. Headland archaeology has been pioneering an integrated approach to excavation where geophysicists return to survey sites that are in the process of active investigation. This allows us to uncover new details with higher resolution surveys performed closer to horizons of interest, and without the interference of soils and materials present within the plough soils. Novel mechanisms to provide this clearer data to excavators and curators in a timely and useful fashion, can allow us to identify the functions of structures, target interventions more efficiently by locating features that are invisible to excavators as well as identifying areas where cultural material may be concentrated. Detailed information about complex features can be used to inform excavation strategies. Furthermore, iterative feedback between surveyors and excavators can be used to improve geophysical interpretations both at the level of individual sites and within the wider practice of archaeological geophysics. Here we will evaluate the potential of this approach through case studies at a number of sites in the United Kingdom, and discuss the implications for interdisciplinary understanding of sites and presentation of digital data.

943. More than gift: Glassmaking in medieval Kyiv

Authors: Olena Zhurukhina (The Museum of History of the Desiatynna "Tithe" Church)
Format: Oral

The emergence of glassmaking in Kyiv is an interesting phenomenon related to the political and economic development of the new medieval state. Diplomatic and trade bonds between the Early Rus and Byzantine Empire, the adoption of Christianity as the state religion, laid the foundation for the emergence, development and spread of glassmaking production, which evolved into a large-scale industry. Intensive archaeological excavations of the city have yielded a wealth of material for research. These include equipped areas for glassmaking activities and numerous production remains, such as collapsed furnaces, tools, raw materials, production waste (e.g. slag and probes), defective and finished products, etc. which indicate the development of production. Currently, we can discuss various aspects of the glass industry: from working with finished trade/imported glass ingots to the recycling of glass products for reuse glass mass. Also, the study of natural raw materials — the main glass-forming components used in glass production — is ongoing. Sand, limestone, carbonates and so on are important for identifying the basis of local production, as well as clarifying the location of raw material deposits outside the borders of modern Ukraine (for example, lead). By using archaeometric research methods such as chemical analyses of glass, petrographic methods, mineralogical and geochemical studies of minerals and rocks, we will be able to draw conclusions about the origin of Kyiv glass, how glassmaking processes were organised, about the directions of trade routes and spread of Kyivan glass products in the 11th—13th c.

8. Monuments, memories and ritualsA case study of megalithic sites in some villages in Kerala, India

Authors: Rajan Koyu (Sree Neelakanta Government Sanskrit College, Pattambi)
Format: Oral

Death being an ever present reality, people whether in the past or present have taken utmost care to bury their dead with rituals. Megalithic building had occurred in times distant from our memory. Oral traditions from the early historic phase have been used by archaeologists and historians in south India to argue that megalith-building was undertaken as part of a wider cult of the dead, especially of the heroes and have listed some rituals associated with the monuments. This paper does not intend to reject them. The author finds the early historic Tamil poems to be of limited nature in comprehensively analyzing burial rituals. The magnificent presence of the monuments in their midst have definitely influenced people living around them. Ethnographic data collected from people from people in megalithic sites show that memories of megalithic building could not be carried into the past. There

are some traces of them, however. The same thing applies to rituals. Hill tribes seem to have maintained some rituals, distinct from the more Aryanised peoples in the plains although they too were not living in complete isolation. Megalithic monuments in some places are regarded as cult spots, while in some other places they have evoked fear. On the other hand, people generally regard their ancestors' burial mounds in their house compounds with veneration. It implies that burial centres, removed from memory, have come to be feared and worshipped. Cult of the dead itself is a legacy from cultures including that of the megaliths. Colonial ethnographic reports suggest wider prevalence of burial among people. Cremation, earlier practiced by the Brahmins and the associated castes, is now slowly catching up among the other groups. An indepth analysis of burial rituals in villages in megalithic centres is attempted in this paper.

244. The Archaeological and Cultural Landscape of Tamsa Region: From Ayodhya to Ballia (Uttar Pradesh, India)

Authors: Pushp Lata Singh (Dept. of AIHC & Archaeology, Banaras Hindu University, Varanasi)
Format: Oral

The objective of the present paper is to synthesize the archaeological and cultural landscape of the Tamsa Region from the Protohistoric Period to the Early Medieval Period. These landscapes are vital for understanding the interplay between human activities and the natural environment over time in the Tamsa Region. The Tamsa River area, stretching from Ayodhya to Ballia, covers a rich archaeological and cultural landscape with continuous human settlements from the Protohistoric through the Early Historical to the Medieval period. The Tamsa River originates from a lake in Mawai Tehsil, District Ayodhya, and passes through Ambedkar Nagar, Azamgarh, Mau, and Ballia. The confluence place of the Chhoti Saryu and Tamsa is Sahroj in Mau District. The river finally meets to the south-west of the Ganges River in Ballia District of Uttar Pradesh. The archaeological material from excavated sites of Khapura, Lakhneshwar Dih, Pakkakot, Waina, and other explored sites such as Sipah, Narsinghpur, Nahush ka Kot, Mahadeva, and Singhpur reflects broader cultural interactions through land as well as river routes from Ayodhya to Ballia/Ghaghara-Tamsa Region. The cultural milieu of the study area is represented by diverse ceramic assemblages and other artefacts, which together reveal cultural evolution across successive phases to understand both cultural continuity and change in the Tamsa/Tons Region. The ceramic remains and associated material culture of the occupational phases reveal a complex and dynamic settlement pattern in the region during the Protohistoric Period to the Early Medieval Period. Thus, the Tamsa-Ghaghara Region emerged in the past as a vibrant cultural zone integrated through the networking of ancient routes.

1341. Cultural Narrative and Material Heritage of Malana in Kullu, Himachal Pradesh : Towards a Cross-Cultural Framework

Authors: Sheetal Rana (Banaras Hindu University)
Format: Oral

Malana, a secluded village in Himachal Pradesh, has long been associated with narratives of sacred authority, cultural distinctiveness, and contested heritage. This paper, "Cultural Narrative and Material Heritage of Malana in Himachal: Towards a Cross-Cultural Framework ", explores how material culture—ritual artefacts, architectural forms, and oral traditions—mediates identity and sustains collective memory in contexts of marginality. By situating Malana within comparative heritage frameworks, the study examines resonances between local narratives of divine sanction and ancestral continuity and broader cross-cultural paradigms, particularly the thought, which emphasizes legitimacy, authority, and the transmission of cultural meaning across time. The paper argues that Malana's material heritage can be understood not only as a repository of local identity but also as part of a wider dialogue with ancient traditions of cultural legitimacy and narrative construction. Through ethnographic insights and comparative analysis, the research highlights how Malana's practices of ritual continuity, spatial organization, and mythic storytelling intersect with external perceptions of authenticity, exoticism, and heritage value. In doing so, it foregrounds the dynamic interplay between indigenous epistemologies and global heritage discourses, revealing how cultural narratives are continually reconstituted through negotiation and selective remembrance. Ultimately, the paper proposes a cross-cultural framework that bridges Himalayan and classical traditions, offering new pathways for understanding heritage governance, identity formation, and the ethics of representation. This approach underscores the importance of integrating local agency with comparative perspectives to foster inclusive and sustainable heritage practices.

349. Lambaesis during the Algerian War of Independence

Authors: Anna Walas (Institute of Classical Studies, London)
Format: Oral

Following the Algerian War of Independence (1954–1962), the future of French archaeology in Algeria, including at the Roman legionary base at Lambaesis became less certain. With its excavation history rooted in the period of French conquest of Algeria in the nineteenth century, Lambaesis offers a revealing lens through which to examine the colonial foundations of archaeological practice on Roman frontiers in Algeria, in particular, the involvement of the French Foreign Legion. This paper argues that the Algerian War of Independence constituted a second important, and largely overlooked episode in the site's modern history. As conflict intensified, the Foreign Legion once again became militarily active in the region surrounding Lambaesis, reactivating the physical and ideological proximity links between Roman frontier remains, modern military presence, and political authority. The

war meant that archaeology, decolonisation, and armed conflict intersected again, sometimes reviving older colonial patterns, and at time creating new narratives. This paper explores how Roman frontier heritage was cared for, mobilised and reinterpreted during this period. The paper focuses on how colonial administration, archaeological administration, and the Foreign Legion operated in proximity to one another, negotiating access, authority, and the use of the Roman past within shifting political and security contexts. Finally, I consider the implications of these entanglements for understanding Roman frontiers simultaneously as ancient heritage and as landscapes marked by modern conflict. In doing so, the paper contributes to broader debates on histories of archaeological missions in countries formerly colonised by European powers, cultural diplomacy, and the ethical challenges of narrating Roman frontier heritage in anti-colonial contexts.

532. Roman Algeria and the Colonial Ownership of the Classical Past

Authors: Samir Belgacem (Chris Blandford Associates Ltd)
Format: Oral

This paper examines the colonial construction of Roman heritage in Algeria as a political and archaeological project through which the French colonial state sought to legitimize territorial control, cultural authority, and historical continuity to justify colonization. Drawing on archives, conservation policies, archaeological missions, and restoration practices, it analyzes how Roman antiquity was selectively mobilized as a "classical" ancestry for French Algeria, framing the country as inherently Mediterranean, Latin, and European, while marginalizing Islamic, Arabic, Berber, and vernacular cultural histories. The paper situates French archaeology in Algeria within broader logics of imperial governance, cultural diplomacy, and identity engineering. Roman sites were not only excavated and studied, but ideologically reframed through stylistic restoration, museum display, heritage tourism, and urban monumentalization, producing a hierarchy of pasts in which Roman antiquity was elevated as civilizational heritage, while living and intangible cultures, and other types of Algerian built heritage, were rendered peripheral. In parallel, writings of French authors and officers exalted the military use of surviving Roman infrastructure, framing the invading French army as modern conquering centurions by painting the false image of undisturbed antiquity, which later required retrofitting these sites to match ideological narratives through intervention. This process transformed archaeology into a technology of political legitimacy and cultural occupation. By interrogating who was authorized to interpret, restore, and narrate the Algeria's Roman past, this paper addresses the question of ownership of heritage in colonial and post-colonial contexts. It argues that Roman archaeology in Algeria functioned as a form of cultural possession, producing enduring institutional and epistemic legacies that continue to shape heritage governance and historical narratives today. The Algerian case offers a critical perspective on how "classical" pasts are constructed, circulated, and instrumentalized within colonial and post-colonial frameworks, contributing to contemporary debates on decolonizing archaeology and rethinking the politics of cultural ownership globally.

715. From the archaeological site to the museum: French military and religious men and the objects of early Christian Tunisia

Authors: Chiara Cecalupo (University of Malta)
Format: Oral

Some museums are undoubtedly imperial institutions, spaces where colonial and Eurocentric conquest was propagated and justified, and non-European objects were exhibited in displays derived from racist political views. Archaeology also played an important role in serving colonial aims: a particular case in point is certainly that of French expansion in North Africa from the 1880s onwards. The French institutions, strengthened by their Napoleonic legacy and, above all, by the experience of the Louvre as the cornerstone of a constantly expanding universal museum, made extensive use of Algerian and Tunisian heritage for colonial purposes. The aim of this presentation is to contribute to a reflection on the rediscovery of Tunisia's early Christian heritage by French military and religious figures during the Protectorate period. In particular, the presentation will focus on the little-known history of the collection of archaeological finds from the excavations of the early Christian sites, discovered between 1880s and the 1930s. These finds were then moved to France, or to local museums that French founded in North Africa. These foundations served to reinforce the themes of French colonial policy of expansion in the southern Mediterranean. The talk will present documents and images from the period, commenting on this museum operation according to the assumptions of critical museology.

685. Unearthing Mesopotamia: Soviet Expeditions in the Middle East

Authors: Elena Vorobyeva (Koç University)
Format: Oral

This paper examines the Soviet Mesopotamian expeditions to Iraq (1969–84) and Syria (1988–2010), a body of work that remains largely absent from broader disciplinary histories and critical scholarship. Conducted under the USSR's foreign archaeological program established by the Institute of Archaeology of the Academy of Sciences in 1961, these campaigns positioned Soviet scholars in a region central to contemporary research on civilizational origins. In doing so, they enabled the projection of scientific parity with Western archaeology while simultaneously advancing cultural diplomacy with strategically significant countries during the Cold War. Drawing on archival materials, excavation reports, and scholarly publications, this paper analyzes Soviet archaeology in the Middle East through its research questions, methodologies, site selection strategies, contributions to the field, and key actors. It synthesizes a comprehensive perspective on Soviet approaches to Mesopotamia by juxtaposing the work of these expeditions with

that of Western counterparts, examining how Soviet archaeology functioned both epistemologically and politically in the landscape dominated by Western scholarship for over a century. Situated in the context of the post-Second World War expansion of foreign archaeological research in the Middle East and the development of Soviet foreign relations, this study traces a legacy that continues to shape archaeological practice in the region today.

48. Social revival of the "Kujawian Megaliths" in Poland

Authors: Lech Kościelak (FASS Academy)
Format: Oral

Many Neolithic researchers speculate that there were numerous megalithic burials in what is now Poland. This was associated with the Funnelbeaker culture. Members of this culture buried their significant members in large, trapezoidal or triangular-shaped barrows. In the 19th and 20th centuries, many of these sites were degraded and destroyed. The most interesting megalithic tombs to date have been preserved in the Kujawy region in central Poland. It is generally accepted that these barrows contained men around 40-50 years of age, clearly significant figures in these communities. At least, this was the conclusion of archaeological research initiated before World War II by Professor Konrad Jażdżewski. As it turned out, this was an erroneous hypothesis, as a woman aged 50-70 was buried in one of the barrows. Therefore, it can be assumed that women also played important roles among the Funnelbeaker culture. Megalithic sites in Kujawy are considered the best preserved, but also the most ingrained in local consciousness. In one village, a Landscape Archaeological Park was established, with designated educational trails. The burial mounds in this area are marked and well-described, allowing local residents and tourists to decipher the history left behind by people who lived here four thousand years ago. Already in the 21st century, the local government has undertaken numerous initiatives to revive this megalithic complex. A documentary film has even been produced. It can therefore be concluded that there has been a clear social revival of the "Kujawy boulders."

1503. How We Teach the Theory of Classical Archaeology in Poland at Adam Mickiewicz University (AMU) in Poznań

Authors: Ewa Bugaj (Adam Mickiewicz University in Poznań, Faculty of Archaeology)
Format: Oral

Abstract Classical archaeology has been part of the academic landscape in Poznań since 1919, initially as a secondary focus alongside prehistoric and medieval studies. In the 1970s, Poznań scholars emphasized the importance of archaeological theory, referencing indigenous methodologies from the 1980s while gradually incorporating external influences, particularly from the Anglo-Saxon academic tradition. By 1999, classical and oriental archaeology gained independent specialization, allowing for a balanced approach to archaeology theory and methodology across disciplines. The work of archaeologists at Adam Mickiewicz University (AMU) reflects a methodological diversity, spanning humanistic and natural science perspectives. Central to AMU's archaeological methodology is the understanding that research procedures and theoretical frameworks shape cognitive outcomes. This duality highlights the significance of theory as a lens through which the past is interpreted and represented. Despite some archaeologists' reluctance towards theoretical frameworks, there is a growing recognition of theory's essential role in contemporary archaeological practice, especially in understanding the nature of archaeological sources. The Poznań approach emphasizes the cultural context of archaeological findings, arguing that these sources are not merely empirical data but are imbued with meaning shaped by the archaeologist's interpretive choices. Furthermore, there is a notable inclination towards integrating humanistic analysis with natural scientific rigor, aligning with contemporary trends such as new materialism. AMU archaeologists advocate for a constructivist perspective, underscoring the symbolic significance of archaeological sources and the necessity of theory in crafting narratives about the past. This interpretive orientation aims to transcend simplistic realism, recognizing the complex interplay between culture and archaeology, ultimately enriching the field's epistemological framework.

1169. Sex-based Differences in Oral Pathologies in the Greco-Roman World: A Meta-Analytical Perspective on Methodological Potential and Limitations

Authors: Antonio Caruso (Polish Centre of Mediterranean Archaeology, University of Warsaw) – Efthymia Nikita (The Cyprus Institute)
Format: Oral

Meta-analysis is a statistical approach used to synthesize results from independent studies in order to explore broader patterns. In this study, we conducted a meta-analysis of differences in proportions to synthesize data from 45 studies investigating sex-based patterns in carious lesions, dental calculus, antemortem tooth loss, periodontal disease and periapical cavities from assemblages dating to the Hellenistic and Roman periods (~4th century BCE–4th century CE) in Italy and the Eastern Mediterranean and Middle East (EMME). The aim was to gain a better understanding of dietary practices and gender-based social differentiation as reflected in sex-based variation in oral health. The results revealed no significant differences between males and females across all examined oral conditions, a pattern that holds for both BCE and CE chronological subsets. However, our study also highlighted significant methodological limitations affecting the meta-analysis of published bioarchaeological data. A substantial number of potentially relevant studies had to be excluded due to insufficient reporting, and several analyses exhibited high heterogeneity, likely reflecting differences in recording criteria and methodological approaches rather than actual differences in disease prevalence among populations. Overall, our findings indicate that meta-analysis holds considerable yet underutilized potential in bioarchaeology; however, current research and reporting practices substantially limit its effective application.

312. The STI–ECA Model in Metacognitive Archaeology:A Poly-Theoretical Inclusive Design Technology for Higher Education Systems

Authors: Alexander Rusetsky (Georgian Technical University)
Format: Oral

This paper conceptualizes metacognitive archaeology as a theory of archaeological knowledge management and simultaneously as a technological framework for cultural heritage management. The proposed approach focuses on the accumulation of existing research, its theoretical and epistemological structuring, the initiation of new knowledge, and the integration of independently produced research into a coherent scientific and educational system. Metacognitive archaeology is defined as a meta-theoretical framework whose internal operational mechanism is the syncretic model, enabling the systematic coexistence and comparative analysis of categorically different archaeological theories without reducing their internal logic. A central theoretical pillar of the paper is the STI–ECA model, which positions scientific research and education within a six-phase system: (1) scientific research and novelty, (2) technology, (3) innovation, (4) education, (5) culture, and (6) administration. This model is applied as a metacognitive tool for understanding the cyclical movement, translation, and institutionalization of archaeological knowledge. Using the archaeological site of Gonio–Apsaros as a case study, the paper demonstrates how systematic theoretical knowledge and multi-theoretical analysis directly improve the quality of fieldwork, research decision-making, and the legitimacy of archaeological interpretations. The proposed framework is integrated across all three levels of higher education—Bachelor's, Master's, and Doctoral—establishing a stable connection between theory, practice, education, and cultural heritage management. The paper argues that the integration of metacognitive archaeology and the STI–ECA model enhances research quality, strengthens field methodologies, and contributes to the positive transformation of theoretical conflicts within archaeology.

519. From traction-complex rituals to Rappendam, paths to Nerthus in Tacitus Ger. 40

Atuhors: Frank Battaglia (College of Staten Island / CUNY)
Fromat: Oral

Tacitus described (c.98 CE) a ritual involving a cattle-drawn vehicle that carried a numen of Mother Earth. The disc wheel sacrificed at Rappendam, Seeland c.150 CE, was the youngest of some 40 specimens dating back to c.300 BCE. Ritual procession with a cart may well have originated about 3,500 BCE in northern Europe as animal traction – an innovative complex that included plows, sledges and wheeled vehicles ¬– gained widespread use. It transformed food cropping, transportation and communication between different areas, and gave rise to new rituals. As early as 4,000 BCE, ard marks, from 'scratch' plows drawn by oxen, are known all over South Scandinavia. Late in the 4th millennium BCE, symbols of yoked cattle, seen as early representations of a Nerthus cult, were inscribed in a communal gallery-grave in Züschen, Germany. Flintbek LA 3, a barrow near Kiel, Schleswig-Holstein, constructed during about a century and a half until 3360 BCE, encodes within it funeral observances with both plow and cart, and possibly a procession. Thus, Flintbek recorded rituals of cart and plow in the same monument. More than 200 stendyngegrave, "stoneheap graves," entailing the burial of cattle pulling a cart bearing a deceased, were dedicated around 3000 BCE in Northern Jutland. Over time, traction-complex materials and art began to be featured in non-mortuary contexts. Sacrifices of wagon and plow materials in areas of current Denmark and northern Europe continued for millennia, and, including some Dejberg-type wagons in bogs, were still being made at the beginning of the 1st millennium CE. Many of the ceremonies H.M. Chadwick ascribed to the Cult of Nerthus "in ancient and modern times" are connected with the northern European areas of traction-complex sacrificial deposits.

335. Tracing Pregnancy in Early Medieval Czechia: Rethinking Methodological Assumptions in the Identification of Gestation

Authors: Katarína Kapustka (University of Pardubice) – Eliška Zazvonilová – Nikola Koštová (Institute of Archaeology, Czech Academy of Sciences, Prague, v.v.i.) – Drahomíra Frolíková – Jan Frolík (University of Pardubice)
Format: Poster

Pregnancy remains one of the most methodologically elusive aspects of past human life, as gestation rarely leaves clear or direct traces in the archaeological record. This poster critically examines how pregnancy and perinatal death may be identified in early medieval Bohemia through an integrated bioarchaeological framework. The study draws on material from five burial grounds representing diverse social and spatial contexts, including peripheral rural cemeteries (Přezletice, Zeleneč, Dobrovíz), a central elite site (Prague Castle – Jízdárna), and a cemetery in its hinterland (Prague–Triangl). A key focus is placed on the widespread but often untested assumption that adult females buried with foetal or neonatal remains are necessarily the biological mothers of these individuals. By combining osteological assessment with ancient DNA analysis and radiocarbon dating, we critically evaluate this assumption and explore a broader range of possible relationships, including non-biological kinship, social motherhood, caregiving roles, or alternative funerary practices. The poster further addresses differential preservation and recovery of perinatal remains across sites, highlighting the role of taphonomy, burial customs, and excavation methodology in shaping the archaeological visibility of pregnancy. By questioning normative interpretative frameworks, this contribution advocates for a more nuanced and reflexive approach to pregnancy, motherhood, and reproductive vulnerability in early medieval societies.

1183. Preliminary results of weaning patterns at a Late Bronze Age site in Latvia

Authors: Anna Batraga – Gunita Zariņa (University of Latvia, Faculty of Humanities, Institute of Latvian History) – Lauma Buša (University of Latvia, Department of Chemistry)
Format: Poster

Historical weaning practices for infants have had significant implications for birth spacing and survival rates, thereby influencing population levels and growth in various socio-economic contexts. It is believed that breastfeeding was more prolonged among hunter-gatherers, at least partly due to a lack of suitable weaning foods compared to those available to agriculturalists. Research on Neolithic populations in Latvia shows that the average age at which children were fully weaned was around three years. Following the introduction of farming in the Bronze Age (1800 – 500 cal BC), all aspects of everyday life changed, including the health of the population, particularly women. However, little attention has been given to the impact on breastfeeding. To investigate how these changes manifested in weaning patterns during the Bronze Age, stable isotope analyses were performed by measuring carbon (13C) and nitrogen (15N) of sequential dentine samples from the first permanent molars. This method aligns tooth sampling with age by following a scheme based on average growth rates in dentine regions. The preliminary results consist of analyses of individuals from the Late Bronze Age Ķivutkalns site (800 – 680 cal BC). These results show that the period of exclusive breastfeeding was very similar to that in the Neolithic period. However, the age at which weaning is completed is approximately eight months younger overall. This suggests that the interval between pregnancies was shorter, placing an additional burden on mothers' bodies, as reflected by the higher incidence of dental pathologies in women at the Ķivutkalns site compared to hunter-gatherer communities in previous periods. Nevertheless, further studies are needed to evaluate the extent to which farming impacted weaning practices and women's health.

1301. An Analysis of Frontal Sinusitis in three Ancient Populations from the Turpan Basin, Xinjiang, China

Authors: Qingxin Fu – Quanchao Zhang – Jiaqi Jin – Dargye Lobsang (Bioarchaeology Laboratory, Jilin University)
Format: Poster

This study used computed tomography (CT) to investigate pathological manifestations of frontal sinusitis in three populations from the Bronze Age to the Early Iron Age in the Turpan Basin, Xinjiang. CT analysis of 119 individuals from the Yanghai, Jiayi, and Shengjindian cemeteries revealed a high prevalence of frontal sinusitis, with rates of 60.6% at Yanghai, 58.1% at Jiayi, and 50% at Shengjindian. Statistical analysis showed no significant differences in prevalence by sex, age group, or the three cemetery population. These findings suggest that the ancient Turpan Basin populations were exposed to comparable respiratory health risks. The development of frontal sinusitis was likely influenced by multiple environmental and cultural factors: the Turpan Basin climate, marked by arid climate, frequent dust storms, and high levels of airborne particulates, likely exacerbated the condition. In addition, exposure to animals and plants during hunting, herding, and farming, together with smoke from indoor fires, may have further contributed to the disease. Although no significant sex-based differences were detected, the underlying pathogenic exposures may have varied between males and females. Female individuals, who likely engaged more in domestic tasks, may have experienced greater exposure to indoor smoke and pollutants from cooking and textile production. Male individuals, more frequently involved in herding, hunting, and metalworking, were probably exposed to dry, dusty outdoor conditions and fumes from metallurgical activities. This study demonstrates that CT scanning is an effective, non-invasive method for identifying pathological changes in ancient human remains. The non-invasive nature of CT not only preserves skeletal integrity but also greatly increases accessible sample sizes, offering valuable insights into the respiratory health of Bronze and Iron Age populations of Xinjiang.

1476. From Household to Landscape: Multi-Depth pXRF Signatures across Chalcolithic Settlements in Eastern Romania

Authors: Radu Pirnau (Romanian Academy, Iasi Branch, Center for Geographical Research) – Felix Tencariu – Andrei Asandulesei – Vasile Cotiuga (Alexandru Ioan Cuza University of Iasi) – George Bodi (Romanian Academy, Iasi Branch, Institute of Archaeology)
Format: Poster

This paper presents a multi-scalar geochemical investigation of several Chalcolithic settlements (ca. 4500–3500 BCE) in eastern Romania. Portable X-ray fluorescence (pXRF) analyses were conducted on soils from the eponymous site of Cucuteni-Cetățuia and nearby settlements during systematic archaeological excavations, as well as on deep stratigraphic profiles (2–4 m) exposed during wind turbine foundation excavations undertaken within a preventive archaeological monitoring project. Settlement contexts display distinct geochemical signatures indicative of domestic activities, craft production, and organic waste accumulation. In contrast, deep profiles from adjacent areas establish a geochemical baseline for local lithological variability and provide insight into substrate conditions and potential raw material sources for construction and ceramic production. A methodological insight emerges from comparing pXRF-derived total P with wet-chemical extractable mobile P. Total phosphorus alone does not adequately capture anthropogenic inputs, as it is strongly influenced by lithological background. The bioavailable fraction, however, provides a more sensitive indicator of occupation-related deposition. The mobile/total P ratio increases from 4.7% in natural horizons to 7.5% in occupation layers, reaching 8.8% in krotovinas, suggesting that bioturbation has redistributed and preserved organic-derived phosphorus in deeper soil contexts. Despite these limitations, the integration of occupation-layer chemistry with multi-depth subsurface data enables the differentiation of anthropogenic signatures from geological background across spatial scales. The results demonstrate how field-based pXRF can trace cultural practices from intra-settlement organization to landscape-level resource exploitation. More broadly, the study contributes to methodological discussions on the geochemical detection of past practices in archaeological soils and Chalcolithic landscape organization in eastern Romania.

1939. A bioarchaeological case study of a 7th Century BC burial from Morenii Vechi (Republic of Moldova)

Authors: Vasilica-Monica Groza ("Olga Necrasov" Center of Anthropological and Biomedical Research, Iași | Romanian Academy, Iași Branch, Institute of Archaeology, Iași, Romania) – Sergiu Popovici (National Archaeological Agency, Chișinău) – Mariana Popovici ("Olga Necrasov" Center of Anthropological and Biomedical Research, Iași) – Alexandru Berzovan (Romanian Academy, Iași Branch, Institute of Archaeology, Iași, Romania) – Luminița Bejenaru ("Olga Necrasov" Center of Anthropological and Biomedical Research, Iași | Faculty of Biology "Alexandru Ioan Cuza" University of Iași)
Format: Poster

This paper presents a bioarchaeological analysis of a male individual recovered from Burial 1 (M1) at Morenii Vechi, Republic of Moldova, dated to the 7th century BC and attributed to the Early Iron Age in the north-western Pontic region. The study reconstructs the individual's biological profile through a detailed examination of the skeletal and dental remains, with particular emphasis on age at death estimation, morphological characteristics and pathological conditions. The osteological analysis reveals age related skeletal changes, including the presence of spina bifida occulta affecting the S3-S5 sacral segments. Dental assessment reveals the absence of carious lesions and dental calculus, while non-pathological characteristics such as dental abrasion and a diastema of the maxillary anterior teeth are observed. The diastema, occurring in the absence of antemortem tooth loss, is considered a non-pathological dental variation, indicative of genetic and dento-alveolar diversity rather than pathological alteration, and may provide information relevant to physiological development and biological affinity. Considered within their funerary and archaeological context, the combined skeletal and dental data contribute to a detailed life history reconstruction of an Early Iron Age individual and offer a detailed comparative case for bioarchaeological research in Eastern Europe. This work was supported by a grant of the Ministry of Research, Innovation and Digitization, CNCS – UEFISCDI, Funerary landscapes in the Carpatho-Dniestrian area at the beginning of the Late Iron Age, PN-IV-P2-2.1-TE-2023-0015.

293 STREAMLINING ARCHAEOLOGICAL WORKFLOWS: DIGITAL DATA ENTRY, ANALYSIS, AND PUBLICATION WITH ARCHEOBASE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Emmanuel Clivaz – Jean-Philippe Clivaz (ArcheoBase)
Keywords: Digital archaeology, Archaeological data management, Vectorized drawing, GIS and spatial analysis, Collaborative digital workflows, Archaeological publication and dissemination
Format: Workshop

SESSION ABSTRACT

This workshop presents ArcheoBase, a web-based digital infrastructure designed to address persistent challenges in archaeological data management: fragmented documentation practices, time-consuming post-excavation processing, limited interoperability between tools, and difficulties in long-term preservation and publication of archaeological data. Building on extensive consultations with cantonal archaeological services, universities, museums, and private institutions, ArcheoBase was developed as an end-to-end workflow environment, covering field documentation, post-excavation analysis, spatial interpretation, and scientific dissemination within a single coherent system. Participants will follow a complete documentation chain, starting with structured digital data entry in the field using customizable forms on mobile devices, progressing through stratigraphic reasoning and analysis (including the creation of stratigraphic units, sectors, and Harris matrices), and concluding with GIS-integrated interpretation, vectorized drawing tool, and publication workflows. Practical exercises will demonstrate how archaeological data, spatial geometries, images, drawings, and metadata remain interconnected throughout the process. Participants will explore ArcheoBase's innovative web-based drawing tool, which allows teams to create georeferenced vector illustrations collaboratively without requiring specialized CAD software. The workshop will also demonstrate publication workflows that support version control, editorial validation, multilingual dissemination, and seamless web embedding via iFrames. Finally, we will address critical issues of data sustainability and long-term reuse, emphasizing FAIR data principles, complete export capabilities, and structured metadata standards. The session is intended for archaeologists, researchers, and institutional practitioners seeking practical, transferable approaches to modernizing archaeological workflows, improving collaboration across teams, and ensuring durable, reusable digital research outputs. By the end of the workshop, participants will be able to: • Understand how integrated digital workflows can reduce fragmentation between fieldwork, analysis, and publication. • Use a digital recording tool that adapts to any archaeological methodology. • Create and interpret stratigraphic relationships and Harris matrices within a connected data environment. • Link GIS data, drawings, photographs, and contextual metadata into a single analytical framework. • Evaluate practical approaches for FAIR-compliant publication and long-term preservation of archaeological data.

294 BRIDGING HERITAGE AND HOPE – WORK IN CONFLICT ZONES THROUGH THE EARLY CAREER ARCHAEOLOGIST'S LENS

Theme: 2. Crossing the divide. Archaeology and the open world

Organisers: Isber Sabrine (Milá and Fontanals Institute for Humanities Research, Spanish National Research) – Eszter Bánffy (ELTE Research Centre for the Humanities) – Elin Dalen (Independent Heritage Manager) – Carsten Paludan-Müller (Cambridge Heritage Research Centre) – Hamoudi Khalaily (Israel Antiquities Authority)

Speakers: Mohammed Maher Mousa Al-Nuaizi (Première Urgence Internationale) – Maryam Aljunaid (University of Aden) – Abdulrahman Khafaji (Iraq Museum) Hassan – Hajj Ali (Sapienza University of Rome) – Ghinwa Saba (Independent researcher) – Abdallh Alhamed (University of Aden) – Fatma Salem Saleh Mohammed (University of Aden) – Ristam Abdo (Association of the East for the Protection of Syrian Cultural Heritage) – Salwa Burgeia (University of Benghazi) – Hadi Ibrahim (Pázmány Péter Catholic University) – Hanan Faroq Abdul -Wahid (University of Aden) – Issa Zaghab (Ministry of Tourism and Antiquities, Jericho & Jordan Valley)

Keywords: safeguarding heritage, post-war conflict zone, war conflict zone

Format: Round table

SESSION ABSTRACT

This EAA initiative is rooted in the belief that archaeology and cultural heritage can serve as powerful tools for peacebuilding by fostering network-building and connecting also younger generation representatives. The EAA therefore offers an opportunity for young professionals who face barriers to connect with one another and access international academic networks due to conflict, displacement, or limited resources. 12 early career colleagues present their work in current or post-conflict zones. The goal is to share their knowledge and discuss how working for our common archaeological heritage can foster dialogue and peaceful cooperation. This EAA initiative is rooted in the belief that archaeology and cultural heritage can serve as powerful tools for peacebuilding by fostering network-building and connecting also younger generation representatives.
