32nd EAA Annual Meeting (Athens, 202) – Abstract Book (online pdf)

Contents

Abstracts 10

1 Local knowledge, resilience and adaptation in landscapes from antiquity to the recent past 12

2 Benefits and Challenges: Celebrating Interdisciplinary Archaeological Collaboration in the Carpathian Basin and the Balkans 16

3 Phaleron Delta Bioarchaeological Workshop 21

4 Resonant Elements of Cultural Astronomy 27

5 Housing the Court – Infrastructures, Communities, and Power in Palatial Environments 30

6 Reassessing the Role of Palaeolithic Rockshelters: Archives of Human Behaviour and Environmental Change 35

7 Athens, Aden, Arikamedu – Research on Europe-South Asia relations 30 years on 38

9 Shifting Political Landscapes: Archaeology's Response to Nationalism, Populism and Identity in Europe 40

11 Rediscovering Neglected Voices in the Making of Archaeology 47

12 "Living on the Edge": investigating subsistence strategies in remote regions 50

13 Crossing the Divide: a conversation with CIfA Research and Impact Group on collaboration in professional, academic, community, and commercial archaeology 53

14 Material and Surface Design in Ancient Greek Architecture. Creating and Perceiving Visual Effects from the Archaic to the Hellenistic Period 54

15 Marginality and environmental shifts: from socioecological perspectives on the ancient Mediterranean to present-day ramifications 57

16 Weapons, Bodies and Identities: Rethinking warrior burials in late prehistoric Europe 61

17 Bringing together zooarchaeology, archaeogenomics and morphometry: shaping the future of interpretation 66

18 Wealth and (In)equality in Prehistory: Impacts, Extents, and Mechanisms 70

19 Archaeology supporting mental health and wellbeing – how could a Europe-wide connected approach better improve people's lives? 77

20 The social life of funerary megaliths: the construction of identity through stones 77

21 Visualizing Archaeology: Constraints and Sources of Innovation in Research 79

22 Collaborative Synthesis to address major research questions with broad relevance 83

23 Scaling up the Small: Assessing Microarchaeological Assemblages and Methodological Frameworks in Southeast Europe and Eastern Mediterranean 87

24 Touching the Past: Exploring the Cognitive, Emotional, and Social Value of Archaeological Heritage in Contemporary Society 90

26 Burials and Cemeteries in the 12th–13th Century AD Eastern Mediterranean: Perspectives from Archaeothanatology and Bioarchaeology 96

27 Collections in the Shadows: People, Places, Possessions and Purpose in Dormant Collections and Heritage Infrastructures 99

28 Archaeology as Performance: Excavating, Displaying, and Reimagining the Past 103

31 Fortifications and Frontier Networks in the medieval Aegean: Exploring Defensive Strategies, Connectivity, and Regional Dynamics Across Shifting Boundaries and Periods 107

32 Past Human Practices and Plant Diversity: Archaeobotanical Perspectives on Biodiversity 109

33 Travelling Gods and Heroes: Resonant Pathways in the Ancient World 114

35 Illustrating the Past: Gender Representations in Prehistory and Protohistory 120

36 Seafaring Modelling as Part of Inter- and Intradisciplinary Inquiry 123

37 Resonant Landscapes: Sacred Places, Material Affordances, and Cosmological Orientations in the Ancient Mediterranean 126

38 Rethinking the Long House–Matrilocality Nexus: Cross-Cultural Comparisons and Archaeological Evidence 129

39 Macrolithic tools in late prehistoric Eurasia: Distribution, context, and cultural practices 131

40 The Distribution of Power and Inclusiveness across Deep Time: Archaeological, Historical, and Comparative Perspectives on Governance and Well-Being 134

42 Burial Practices and Funerary Architecture in the Levant (5th c. BCE–7th c. CE) 139

43 Scientific dating of architecture: from methods and case studies to social impact 141

45 Anchors of Memory: Sanctuaries, Monuments and Votives in the Construction of Cultural Identity in the Ancient Greek World 147

46 The lure of Mediterranean waters: ancient mariners, ancient shipwrecks and contemporary communities 151

47 Genes, Bones, and Trade: Bioarchaeological Perspectives on Ancient Mobility 153

48 Skills and crafts in ritual contexts: objects biographies in East Mediterranean sanctuaries/cult centres (Late Bronze Age - Hellenistic period) 155

49 Practice makes perfect - Human Experience and the Morphological Evolution of Material Culture 159

50 Traceology of bone artefacts: state of the art and research perspectives 163

51 Where the Wild Things Are – The Stone Age in Science and Society 166

52 Connecting Cave Archaeologies: Shared Practices and Challenges across the Mediterranean 167

53 Divine Bureaucracies: How Temples Worked in the Roman Eastern Mediterranean - Economy, Organization and Management 175

54 Re-wilding the Neolithic: unlocking the disruptive potentials of current research 177

56 Entangled Ecologies: New Integrative Approaches to Understanding Past Human–Environment Systems 183

57 Holocene Rock Art in the Iberian Peninsula: Graphic Expressions, Mobility and Communication Networks 187

58 Localism and imperialism in the foodways of empires 191

60 Landscapes in Motion: Change and Resilience in Mediterranean Landscapes across the Longue Durée 194

62 The Nicosia Convention: session of the EAA Illicit Trade in Cultural Material Community 198

63 Continuity, Innovation, and the Making of the Mycenaean World: Rethinking Middle Helladic (Pottery) Traditions 202

64 Coastal-Inland Interactions during the Third Millennium BCE in the Southern Balkans 206

66 Timeless or Trending? Gemstones and Their Cultural Values from an Archaeological and Scientific Perspective 209

67 MERC Forum: Appropriating Medieval Heritage in the Contemporary World 212

69 Interaction, Connectivity & Mobility in the Balkans: Diachronic Perspectives on Land Use and Human–Landscape Relations 213

71 Community in Context: Integrating Archaeological and Biomolecular Evidence from Medieval Cemeteries 216

72 Highland Lives, Hidden Landscapes: Archaeological Research in the Mountains of Grevena 221

74 The Futures of Communicating Archaeology 226

75 Reviving the present past: Current perspectives on ethnoarchaeology 231

76 Artists and Craftsmen in Ancient Greece: Technology, Status, and Production Dynamics 236

77 Engagements with Stone Worlds in the Americas 240

78 Decorative Practices in the Roman World: New Perspectives on Materiality, Function, and Meaning 243

79 Burials of Prominent Women in Prehistoric Societies: The Archaeology of Social Inequality and the Female World 247

80 Brick building in the medieval north – Techniques and traditions 252

82 Beyond Bond 4: Climate Pulses and Societal Dynamics across the Mediterranean and Eurasia (7000–5200 cal BP) 255

83 Exploring Public Archaeology: Methods, Trends and Societal Impact 258

85 Pottery function and Past societies: A multi-disciplinary perspective 259

86 From Decay to Data: Integrating Taphonomy, Forensic Archaeology, and Digital Technologies in Human Decomposition Research 266

88 Making Archaeology Accessible: Education, Outreach, and Engagement in the Field and the Museum 270

89 Micro-Agencies, subalternity and causality in archaeological thinking 279

90 Integrating Micromorphology: emerging trends and research transformation in the application of Archeological soil micromorphology 284

91 Resonant Custodies: Restoring Past Identities through Forensic and Archaeological Collaboration 289

92 Hands, Clay, and Fire: People, Practices and Productions 294

93 Tracing the Flow: New Perspectives on Ancient Irrigation Systems and Their Legacies 301

94 Land-use Change (LUC) and archaeological heritage: Key concepts and considerations; working towards guidelines for best practice 305

Abstracts

Abstracts are organised according to the ID of the session which they are associated with. Each entry contains the session abstract, followed by the abstracts of related oral presentations and posters. Oral presentations appear in the order they are scheduled in the conference programme, while poster abstracts are listed at the end of each session. When consecutive authors share the same affiliation, the affiliation is listed in brackets after the last author in the group.

1 LOCAL KNOWLEDGE, RESILIENCE AND ADAPTATION IN LANDSCAPES FROM ANTIQUITY TO THE RECENT PAST

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Sam Turner (Newcastle University) – Natalia Moragas (University of Barcelona)
Keywords: climate change, societal change, agriculture, historical archaeology, Middle Ages
Format: Regular session

SESSION ABSTRACT

Social transformations have been key to archaeology since its beginnings. The interest is usually on the macro level: 'cultures', societies or early states. In this session, however, we ask how local societies reacted to large-scale changes in natural and social conditions (e.g. climate change or urbanization). For this, we suggest to understand small-scale cultural landscapes on the village-level as products of rural collective practices through time, anchored in a specific local knowledge. By this approach it should be possible to investigate a broad range of local reactions to external natural and social changes and thus to contrast with the usual, strongly unifying view on the macro level. We suggest a longue durée approach, starting in antiquity (or beyond), covering the Middle Ages and early modern times until the recent past to expand the possibilities of our societies for necessary local adaptations. Research questions of this session: 1. Did small-scale societies throughout Europe over the last two thousand years respond to changing environmental and societal conditions through landscape transformation? 2. What decision-making processes could have enabled small-scale societies to adapt and how were innovations introduced? 3. How do environmental and societal changes and responses to them manifest in the material fabric of local landscapes? 4. How effective were the adaptations made by small-scale societies in the long term? We encourage theoretical and methodological papers as much as case studies throughout Europe and the Mediterranean world.

CONTRIBUTION ABSTRACTS

1485. The Residential History of a Small Hellenistic Settlement through Accessibility Patterns: The Case of Jebel Khalid

Authors: Stefanos Karampekos (Philipps-Universität Marburg | Universität Bern)
Format: Oral

Jebel Khalid on the Euphrates is a small Hellenistic settlement of about 70 ha in present-day Syria. It was probably founded around 305 BCE, likely as a military outpost within Seleukos I Nikator's urbanisation programme and abandoned around 69 BCE following the Roman annexation of Syria. Since Roman occupation had little impact on the urban layout of the settlement, Jebel Khalid represents one of the most informative case studies for a small Seleucid foundation in northern Mesopotamia. This paper focuses on a residential block excavated since the 1980s by an Australian mission in a central part of the settlement. On the basis of a new space syntax analysis carried out as part of a binational PhD project in Classical and Near Eastern archaeology, the paper examines accessibility patterns within the houses and their development through different building phases. The analysis allows a discussion of how domestic space was organised at the household level, how movement within houses was structured, and how notions of access, privacy, and reception were negotiated within a local community. The results suggest that the organisation of residential space at Jebel Khalid was not static but adapted over time to broader social and historical conditions. Shifts in accessibility patterns point to changing household strategies during the history of the settlement, from its foundation as a thriving community in the core of the Seleucid Empire to later phases, when the settlement faced increasing insecurity during the turbulent period of imperial contraction. These spatial adaptations are interpreted as expressions of local knowledge developed within a small and probably culturally heterogeneous community, reflecting the interaction between Greek and Mesopotamian traditions in everyday domestic life. The paper contributes to broader discussions of local responses and adaptive practices in Hellenistic settlements in the eastern Mediterranean and Mesopotamia.

1502. Echinos (Phthiotis) through the Ages: Landscape, Connectivity and Community Resilience from Prehistory to Byzantium

Authors: Aristea Papastathopoulou (Ephorate of Antiquities of Pthiodida and Evrytania. Greek Ministry of Culture) – Oleh Vus (Independent Researcher)
Format: Oral

The modern village of Achinos occupies the site of ancient Echinos, a settlement strategically located on the northern shore of the Malian Gulf, at the foothills of Mount Othrys. Archaeological research of recent decades reveals a landscape of remarkable long-term continuity, with habitation attested from the Final Neolithic period through the Middle Byzantine era. This paper examines Echinos as a resilient cultural landscape, shaped by local knowledge and adaptive practices in response to environmental, political, and seismic challenges. Situated along the coastal route connecting Thessaly with southern Greece, Echinos developed in close interaction with its natural setting and regional communication networks. Drawing on approaches from landscape archaeology and resilience theory, the study focuses on how local communities repeatedly reconfigured urban space, infrastructure, and economic activities to ensure continuity rather than rupture. Fortification systems, first established in the 4th century BC and repeatedly repaired and reused in Late Antique and medieval periods, exemplify adaptive responses to military pressures and recurrent earthquakes. Local environmental knowledge played a crucial role in sustaining the settlement. Archaeological evidence for viticulture, farmsteads, wineries, and metallurgical activity points to a diversified rural economy grounded in soil fertility and access to coastal and inland routes. Funerary assemblages, coroplastic production, and epigraphic material further attest to strong local identities embedded within wider political and cultural frameworks. By integrating data from long-term and rescue excavations, this paper presents Echinos as a dynamic landscape, where resilience was achieved through the cumulative transmission of local knowledge across centuries. Ongoing research and heritage management initiatives seek to enhance the legibility of this multi-layered landscape and to support its sustainable engagement with the present.

1050. Long-term archaeobotanical perspectives on agricultural resilience under environmental and political precarity in (post)medieval Serbia

Authors: Ana Smuk (Independent researcher)
Format: Oral

Archaeobotanical evidence for medieval and post-medieval Serbia is scarce, unevenly distributed, and only partly published, yet it provides a rare material basis for examining agricultural decision-making in a highly dynamic setting shaped by shifting environments, diverse landscapes, and major political and cultural transformations. This paper investigates diachronic change in crop spectra from the medieval centuries into the Ottoman period, asking how far observed patterns can be attributed to ecological constraints, socio-political pressures, or their interaction. The analysis draws on a limited multi-site dataset from Serbia that includes settlements, fortifications, and monastic complex, integrating published and previously unpublished archaeobotanical material. Crop assemblages are compared across ecological settings and chronological phases to identify continuity and changes in cultivation strategies. The Ottoman period is approached as a context of heightened institutional constraint, in which fixed taxation and associated socio-economic precarity may have favored risk-spreading choices, including a potential intensification of short-season crops such as millets. These propositions are evaluated through joint reading of archaeobotanical evidence and written sources, especially fiscal documentation, to examine how environmental variability and institutional demands co-shaped cultivation, and how material and textual records align, diverge, and complement one another. A central component is evidential. The paper separates patterns supported by the current corpus from those that remain provisional, and uses this assessment to define priorities for future sampling and publication. By combining archaeobotanical and historical evidence while foregrounding limits of inference, it contributes a long-term perspective on agricultural resilience and precarity in (post)medieval landscapes.

2249. Impact of socio-economic and climate changes on the land use in East Crete from the Venetian Period to the Present

Authors: Rafal Bienkowski (System Research Institute Polish Academy of Science)
Format: Oral

This presentation aims to examine how socio-economic transformations and climatic factors have reshaped patterns of land-use in selected areas of Crete, leading to profound changes in the function and structure of the landscape. Particular attention is given to three key chronological moments: the Venetian period, the Ottoman period, and the modern era. The reconstruction of past land-use is based on a multidisciplinary approach that integrates historical records, archaeo-ethnographic evidence, and GIS documentation from the study area. These sources make it possible to identify former economic activities, settlement patterns, and long-term interactions between local communities and their environment during the Venetian and Ottoman periods. The assessment of contemporary land-use relies primarily on the analysis of satellite imagery and recent field photographs. Remote sensing data enable the identification of current land cover and land-use patterns, as well as the scale and dynamics of recent transformations. The results indicate that the combined influence of socio-economic change and climatic variability has significantly altered the ways in which the landscape is utilised, in some cases resulting in a complete functional redefinition of the studied areas. The study highlights the value of integrating archaeological, historical, and geospatial data in order to investigate diachronic landscape change and to better understand the processes driving long-term human–environment interactions in the Mediterranean region.

1148. Living Heritage - Agricultural Systems in Jordan. Case Study of Wadi al-Hasa

Authors: Grzegorz Sochacki (Univeristy of Warsaw)
Format: Oral

For several decades, research in the Negev Highlands has significantly advanced the reconstruction of ancient desert agriculture, particularly through the study of agricultural infrastructure associated with major centers such as Shivta and Avdat. These studies have demonstrated the development of highly adaptive runoff-based agricultural systems, originating in the Nabataean period and reaching their peak during the Byzantine era. Building on this research framework, the present study applies a comparable methodological approach to the Wadi al-Hasa region in southern Jordan, an area characterized by similar environmental constraints, geomorphology, and historical trajectories. The project focuses on the archaeological site of Khirbet edh-Dharih and its surrounding landscape, combining remote sensing analyses, GIS-based spatial observations, and systematic surface surveys within an established buffer zone. Emphasis was placed on identifying agricultural terraces and stone retention walls that rely primarily on natural runoff rather than modern irrigation infrastructure. Archaeobotanical evidence from Khirbet edh-Dharih indicates long-term continuity

in mixed agro-pastoral strategies, closely aligned with regional patterns observed across the Southern Levant. The results allowed for the reconstruction and typological classification of four principal agricultural system types in Wadi al-Hasa, reflecting both continuity and divergence from systems known in the Negev Highlands. While similarities include the optimized use of terrain morphology and stone-enclosed fields for fruit and olive cultivation, a notable regional distinction lies in the prevalence of agricultural installations developed directly within valley floors, employing characteristic U-shaped retaining walls to capture runoff and fertile alluvial sediments. Beyond reconstructing ancient agricultural practices, the study highlights the persistence of traditional land-use strategies as a form of "living heritage," demonstrating long-term human adaptation to semi-arid environments and offering valuable insights into sustainable agricultural practices in arid landscapes.

902. Harsh environment, tough people: Human Adaptation in the High-Alpine Valley of Schnals from Prehistory to Modern Times

Authors: Andreas Putzer (South Tyrol Museum of Archaeology)
Format: Oral

The Schnals Valley is located in the Bolzano province in northern Italy, and is characterised by its steep terrain. It is surrounded by high mountain ranges, with peaks reaching up to 3,600 metres. Consequently, it boasts a continental climate and is the warmest and driest valley in the eastern Alps. A key feature is the valley's isolation and challenging accessibility, which was possible only through alpine passes and a mule track before 1875. These natural conditions, coupled with the absence of raw materials, make the Schnals Valley an exemplary model for developing adaptive subsistence strategies in this inhospitable environment. Research conducted over the last 15 years has focused on the impact of human activity and/or climate change on the natural environment, including archaeological excavations and archaeobotanical analyses. Analyses of botanical macro remains as food residue served to clarify prehistoric subsistence strategies and compare the data with historical written records. The development of the natural and cultural landscape began in Schnals in the 2nd millennium BC, when social and economic exchanges increased throughout Europe, leading to social upheaval. During the Roman period, the intensive use of the high alpine valley ceased, and it was not until the 11th/12th century AD that the natural landscape was cultivated again. The dataset obtained in Schnals from archaeological and historical sources enables the cultivation processes in the Bronze Age and the Middle Ages to be compared, as well as the different motivations behind them.

767. Shaken but Unbroken: Resilience and Adaptation in Teotihuacan

Authors: Natalia Moragas (University of Barcelona) – Raul Pérez-López (IGME-CSIC Spain) – Pablo Silva (USAL Spain) – Javier Élez (USAL)
Format: Oral

This presentation examines the cultural dynamics of the Teotihuacan valley from antiquity to the present, highlighting the inhabitants' responses to natural agents inherent to the climate and hazardous geological processes of the Mexico Basin. It identifies and analyses various adaptive strategies that enabled a stable population over time. The urbanisation of the area presented numerous technical challenges, particularly in relation to intense rainfall, droughts, and seismic activity. It is not surprising that the environment of the Teotihuacan valley and its relationship with the population have been researched for several years. However, other natural phenomena, such as earthquakes, have been noted but remain relatively underexplored. Recent research by Pérez-López et al. (2024) have identified five significant earthquakes that not only impacted the buildings but also necessitated a re-evaluation of the local environment by the Teotihuacanos. These adaptations, however, transcend mere technical solutions; they are also deeply embedded in the symbolic life of the inhabitants. As occurs today, the ancient cultures of the Valley of Mexico had to face cope several strong earthquakes (and other calamities) per century, and perhaps their resilience and resistance were overwhelmed by urban growth and overpopulation. It is easy to imagine that in their religious view of nature, conventional practices against natural disasters became unsuccessful as small societies grew larger and land-use planning necessarily required the abandonment of large settlements, the reorganization of the territory and starting from scratch. From a long-term perspective, it is essential to consider the deep impact of the colonisation of Mesoamerica, which initiated a process of acculturation that affected traditional knowledge while also allowing for the persistence of these cultural practices.

1181. Global climate change, regional environmental impact, and local adaptation strategies: Challenging the "Stormy Little Ice Age" narrative

Authors: Raphael Kahlenberg (Durham University | Heidelberg University) – Karen Milek (Durham University)
Format: Oral

During the Little Ice Age (ca 1300–1850 CE), a period of increased climate instability in wide parts of Europe, coastal landscapes around the North Sea basin were exposed to enhanced storminess, resulting in sand inundations caused by transgressive dunes. While it has long been acknowledged that the impacts of large-scale atmospheric circulations varied between different regions, many geomorphologists, archaeologists and historians still tend to adopt deterministic frameworks for studying human-environment interactions during this period. This paper questions the validity of these approaches by evaluating to which degree "climate" proxies in sedimentary archives carry mixed climatic and anthropogenic signals. It argues that coastal landscape modifications and land use patterns have a significant impact on many types of deposits frequently used for reconstructing local storminess, rendering

them problematic for microclimate reconstructions. When such records are interpreted uncritically, correlations between archaeological or documentary evidence and inferred climatic events risk becoming self-reinforcing narratives. We present an alternative approach centred around a geoarchaeological case study from Holy Island (Lindisfarne), a tidal island off the coast of North-East England. By integrating sedimentological data with archaeological evidence, historic maps, and documentary sources, we demonstrate how a multi-proxy approach enables more nuanced interpretations of coastal dune destabilisation and local strategies of adaptation during the medieval and modern periods.

353. Legal and Fiscal Landscapes as Long-Term Local Adaptations in the Czech Lands

Authors: Jana Mazackova (Masaryk university) – Petr Vachůt (Brno City Museum)
Format: Oral

This paper examines how rural communities responded to major social, economic, and institutional changes through the long-term stabilisation of cultural landscapes. The case study draws on the central Bohemian–Moravian Highlands, with broader relevance for newly settled areas of the Czech Lands during the High Middle Ages. Colonisation developed as a controlled process directed by seigneurial authorities aiming to establish a stable economic base for emerging estates. It combined the agricultural transformation of sparsely settled, forested landscapes with extractive activities, including gold mining in the early phase and silver mining in the thirteenth century. A key element of this process was a structured colonisation package including systematic land measurement, regular parcel systems, and a parcel-based fiscal regime embedded in medieval land-administration frameworks. From the outset, the parcel functioned as the basic legal and fiscal unit, linked to hereditary leaseholds and obligations in labour, payments in kind, and later monetary dues. Although introduced top-down as an instrument of estate management, the system's long-term stability depended on the capacity of village communities to sustain agricultural production. The parcel framework was not spatially rigid but showed differentiated stability. Village intravilans display locational continuity combined with building dynamism, while the highest degree of structural stability is observed in the immediate agricultural hinterland, where parcel systems persisted over the long term, in some cases into the present. Towards cadastral margins, greater dynamics reflect the abandonment of settlements and central places. The agricultural land of deserted villages was remeasured and leased to peasants from neighbouring settlements as part of pragmatic estate management. Interpretation relies on integrating LiDAR analysis and systematic field survey with archival and cartographic evidence. The study demonstrates that cultural landscapes function as long-term archives of economic and legal-fiscal systems, whose continuity can significantly outlast individual settlements, centres, and institutions.

317. Adaptive Land use strategies in the ironworking landscapes of the Slovak Ore Mountains from the middle ages

Authors: Filip Vološin – Josef Petráš (Archaeology Institute of Slovak Academy of Sciences)
Format: Oral

This presentation is aimed to showcase the ironworking landscapes of the Slovak Ore Mountains as products of long-term local knowledge, collective practices, and adaptive strategies of small-scale rural societies. Focusing on a longue durée perspective from the Middle Ages to the recent past, the study examines how local communities responded to changing conditions, resource availability, and broader socio-economic transformations through repeated change of land use. Iron mining, ore processing, charcoal production, and agriculture formed an interconnected system in which activities alternated or coexisted according to local needs and external pressures. Periods of intensified mining often replaced agricultural land use, while phases of decline in iron production allowed the re-establishment of agricultural cultivation. These adaptive strategies are materially visible in the cultural landscape, where mining relics such as shafts, extraction pits, and charcoal platforms intersect with and disrupt medieval and early modern field systems. The presentation draws on archaeological surveys, analysis of landscape relics, and historical sources to investigate local decision-making processes and the transmission of technical and environmental knowledge. Particular attention is paid to how innovations in iron production and resource management. By analyzing landscape transformation at the village level, this contribution highlights the resilience and flexibility of rural communities and demonstrates how environmental and societal changes are inscribed in the material fabric of local ironworking landscapes in Central Europe.

609. Resilience and adaptation of early medieval populations: what funerary practices and complexes of Bordeaux (Fr) tell us (4th-12th centuries)

Authors: Tiphaine Joseph Balaguer (Ausonius, Bordeaux Montaigne University)
Format: Oral

The relationship between landscape and societies is a central topic for the understanding resilience and adaptation through centuries. Funeral practices and complexes are a good clue to grasp these concepts through the relation between the living and their dead. The study of early medieval funeral spaces in Bordeaux (France) and their territory has made it possible to highlight the strong resilience of these sites in both their topography (installation on pre-existing non-funerary sites, environmental determinism ?) and their function, because many funeral sites show significant continuity from the early medieval period to the contemporary period. Some poles permanently mark the landscape. We will explore the reasons for this resilience (natural topography and/or the installation of a powerful structuring entity ?). We will also see that these big poles can cause landscape changes by polarizing graves and provoking the abandonment of nearby sites which quickly lose their funerary function. The period between the end of Antiquity

and the 12th century is particularly revealing because it straddles two social and organizational logics. It will be about navigating between resilience and adaptation, two phenomena sometimes complementing each other.

1619. Between Wilderness and Community: Uncovering the Lost Cultural Landscape of Senokos Village, Serbia

Authors: Mila Mitrovic (University of Belgrade - Faculty of Architecture | Neozoik Foundation) – Jelena Mihailović (University of Belgrade - Faculty of Architecture) – Nemanja Pavlović (University of Belgrade - Faculty of Philosophy | Neozoik Foundation) – Boris Rančev (University of Niš - Faculty of Civil Engineering and Architecture | Center for Sustainable Spatial Development "BalkanARHitrav") – Vera Petronijević – Stanislav Paunović (University of Belgrade - Faculty of Architecture)
Format: Poster

This research is conducted within the interdisciplinary, NGO-led project Let's Not Grind the Past, which explores watermills as endangered elements of rural cultural landscapes and as material evidence of local knowledge, resilience, and long-term adaptation. The project is based on the premise that watermills are not isolated architectural objects, but landscape-based systems shaped through continuous interaction between communities and natural environments. The study focuses on watermill heritage through an in-depth analysis of the last surviving watermill in the village of Senokos, located along the Vodenička River in southeastern Serbia. Dating from the late nineteenth to the early twentieth century, the watermills of this area once formed a network of 23 structures, reflecting a historical landscape in which hydropotential was actively harnessed as a key resource for subsistence and local economy. Until the mid-twentieth century, Senokos had approximately 650 inhabitants whose livelihoods depended heavily on watermills as essential sources of flour and food security. Processes of urbanization and rural depopulation in the second half of the twentieth century led to a drastic demographic decline, leaving only eight residents in the village today. The relationship between people and landscape is examined through construction materials and building techniques as expressions of local knowledge and sustainability, as well as through the spatial positioning of watermills within the river system. Archaeological reconnaissance documents both standing and collapsed mills, later analyzed using QGIS software, while ethnological research collects oral histories, legends, and local perceptions of nature and heritage. Positioned between wilderness and community, the Senokos watermill landscape reveals strategies of "taming" natural forces and adapting to mountain environments. By integrating this multidisciplinary approach, the project contributes to reconstructing the cultural landscape of the area and offers insights into local practices, spatial organization, and everyday life in nineteenth-century Senokos.

1962. Living through 150 years of war – Rural communities in the Hungarian border zone between the Ottoman and Habsburg Empires

Authors: Ágnes Kolláth – Bianka Kovács – Gyöngyi Kovács (ELTE Research Centre for the Humanities, Institute of Archaeology)
Format: Poster

The 16th-17th centuries were a tumultuous time in Hungarian history, stuck between the two most significant powers of the era. The middle of the medieval kingdom came under Ottoman rule by the 1540's, while the northern and western counties belonged to the Habsburgs. County Fejér, the study area of the present poster had been a flourishing centre of the country between the Danube River and Lake Balaton, then became a border zone of the two warring empires during these 150 years. The civilian population faced constant skirmishes, not to speak of the devastation brought on by large military campaigns. They also had to live under double administration and taxation, as their former Christian and new Ottoman lords could both enforce their demands in the unstable environment. These factors took great toll on the rural settlement network. Many villages have been abandoned, other places became scarcely inhabited due to population loss, while some communities managed to get through. Thanks to numerous past and ongoing projects mapping the archaeological topography, the material culture and the historical sources of the region, we have an extensive knowledge on these processes. Our examples show the most typical tendencies. Dwindling communities that merged to be able to maintain their livelihood. People that fled to more secluded villages or established temporary refuges in the wilderness during dangerous times, then moved back near the main roads. An agriculture that shifted gradually towards animal husbandry in a region with excellent arable lands, as livestock was easier to keep, hide, transport and sell than crops. In summary, extreme mobility, efficient information exchange and code switching in communication were keys to survival, and this study shows how rural communities managed or failed this near-impossible adaptation.

2 BENEFITS AND CHALLENGES: CELEBRATING INTERDISCIPLINARY ARCHAEOLOGICAL COLLABORATION IN THE CARPATHIAN BASIN AND THE BALKANS

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Attila Gyucha (University of Georgia) – William Parkinson (Field Museum of Natural History) – Roderick Salisbury (University of Bratislava)
Keywords: Carpathian Basin, Balkans, Collaborative research
Format: Regular session

SESSION ABSTRACT

The Hungarian–American Körös Regional Archaeological Project marks its 25th anniversary of fieldwork in Hungary. To celebrate this milestone, the session's aim is made explicit: it seeks to showcase international archaeological projects operating in the Carpathian Basin and the Balkans, to highlight their principal research results and methodological or theoretical contributions, and to offer critical reflections on the advantages, challenges, and broader implications of international cooperation in these regions. Over the past decades, scholars from varied academic and cultural backgrounds have worked together to explore the complex historical trajectories of Southeast Europe, producing new insights into the social, economic, and cultural dynamics of ancient communities. Presentations in this session will not only highlight key archaeological findings but also examine innovative approaches and consider how international collaborations have informed these methods. Special emphasis will be placed on how cross-border cooperation has shaped field practices, interpretive strategies, and the development of long-term research agendas across southeastern Europe. The organizers welcome contributions on both prehistoric and historic periods, provided they engage substantively with international cooperation. Equally important, the session invites discussion of the practical, institutional, and intellectual challenges encountered throughout such collaborations, from logistical and administrative constraints to differences in academic traditions and expectations. By bringing these perspectives together, the session aims to foster a constructive dialogue about how international partnerships enhance research potential, expand interpretive possibilities, and strengthen scholarly networks, while also identifying lessons that may guide future collaborative efforts across the Carpathian Basin and the Balkans.

CONTRIBUTION ABSTRACTS

637. Advancing Archaeological Research Through International Collaboration: Reflections from the Körös Regional Archaeological Project

Authors: Attila Gyucha (University of Georgia) – William Parkinson (University of Illinois at Chicago)
Format: Oral

International collaboration constitutes a critical mechanism for the advancement of archaeological research, facilitating the development of innovative methodologies and the refinement of interpretative frameworks. The Körös Regional Archaeological Project (KRAP) offers an illustrative case study, demonstrating the transformative potential of sustained, cross-cultural partnerships. This presentation examines KRAP's collaborative trajectory over the past quarter of a century, elucidating how enduring international cooperation can generate theoretical and methodological contributions to the discipline. KRAP's multidisciplinary research design integrates geophysical prospection, systematic surface collections, targeted stratigraphic excavations, and a suite of advanced analytical methodologies. By synthesizing diverse academic traditions and methodological paradigms, the project has enhanced our understanding of the Neolithic and Copper Age in Southeastern Europe while simultaneously catalyzing the development of independent, yet highly interconnected, research programs. These scholarly collaborations have fostered an expansive academic network that transcends geopolitical boundaries. A salient insight derived from KRAP's sustained research activities is the demonstrable value of long-term, regionally focused investigations in generating nuanced reconstructions of past sociocultural dynamics. Our experiences suggest that research partnerships grounded on mutual respect, equitable intellectual exchange, and shared scholarly objectives yield outcomes that surpass those attainable through isolated investigative endeavors. Such collaborations enable archaeologists to address complex anthropological questions with a degree of analytical depth and comparative breadth that would otherwise remain elusive. This presentation emphasizes the importance of cultivating and sustaining international collaborations. By sharing resources, expertise, and diverse perspectives, international, truly collaborative projects not only advance knowledge about the ancient past but also contribute to the broader discourse on global heritage and cultural interconnectedness.

953. Neolithic Archaeology and Soilscapes in the Körös Area; you don't just step inside to 18 years

Authors: Roderick Salisbury (Comenius University Bratislava | Austrian Archaeological Institute) – Gábor Bácsmegi (Múnkácsy Mihály Museum)
Format: Oral

The Hungarian-American Körös Regional Archaeological Project (KRAP) recently marked its twenty-fifth anniversary. For two decades of that history, a second international collaboration has been active in the Körös Basin. This paper presents some results, as well as ongoing challenges, emerging from the collaborative Hungarian-American (Austrian, Slovakian) NASKA project. A child project, NASKA developed from KRAP, with shared methodological interests and common questions concerning Neolithic prehistory. These convergences have contributed to a better understanding of human–environmental interactions, cultural resilience, and changes in social organization over the course of the Neolithic. A mutual emphasis on geoarchaeological approaches and on intra- and inter-site settlement patterns has been enriched by differing intellectual backgrounds and theoretical perspectives. The productive tensions arising from these differences have shaped both the trajectory of the project and the personal friendship of the authors. Drawing on recent fieldwork, we summarize evidence bearing on the early stages of settlement nucleation during the middle-to-late Neolithic transition, with particular attention to the relationship between fluctuating groundwater levels and human

settlement decisions. The paper concludes by outlining future research directions and considering their implications for the development of new international collaborations.

137. On the Shoulders of Giants: Improvements to Archaeological Methods and Techniques in Southeastern Hungary as a Result of International Collaborations

Authors: Danielle Riebe (University of Georgia) – János Dani (University of Szeged | Déri Museum)
Format: Oral

As the result of international collaborations, archaeology in Hungary uniquely has been shaped by the blending of different traditions (Hungarian, German, Russian, British, and American). Following the symbolic commencement of collaborative archaeological research in the Körös-Berettyó region in 1927 by Cambridge professor L. C. G. Clarke and Lajos Márton, Ferenc Tompa, and Lajos Zoltai, it would be decades before other researchers pursued similar cooperative efforts. From the 1970's onwards, collaborations in southeastern Hungary between Hungarian scholars and foreign colleagues has advanced prehistoric research to make this region not only one of the best studied from the Neolithic to the Bronze Age, but also one of the most innovative regarding implemented investigatory and analytical techniques. Early remote sensing techniques were first utilized to study prehistoric settlement layouts in the Körös region by István Torma and Andrew Sherratt. In the 1980's, collaborations between Ferenc Horváth and John O'Shea carried out systematic radiocarbon analyses at Bronze Age sites to model cultural change over time. In the following 2000's, directors of the Körös Regional Archaeological Project, Attila Gyucha and William Parkinson, combined both remote sensing techniques and radiocarbon dating to model settlement developments at Early Copper Age and Late Neolithic sites. Building on and improving these methodological approaches in the 2010's was the Prehistoric Interactions on the Plain Project (PIPP) directed by János Dani and Danielle Riebe, which sought to reconstruct Late Neolithic interactions and socio-cultural boundaries at various scales. These projects and the collaborations have advanced anthropological knowledge and created a lasting legacy of transformative archaeological research in the region.

1649. Collaborative Research in Transylvania: Past and Future of BATS and MARBAL Projects

Authors: Elizabeth Arnold (University of California, Los Angeles) – Colin Quinn (University at Buffalo) – Horia Ciugudean (Muzeul National al Unirii-Alba Iulia) – Jess Beck (University College Dublin) – Sophie Chorek (University at Buffalo)
Format: Oral

2026 marks the 16th anniversary of the creation of the Bronze Age Transylvania Survey (BATS) Project, an international research project designed to better understand the Bronze Age period in the Transylvanian region of Romania. Since the first field season in 2011, BATS Project members have conducted months of fieldwork nearly every summer, identified and excavated dozens of newly discovered archaeological sites, contributed almost 100 new radiocarbon dates that have helped to rewrite the regional chronology, and analyzed tens of thousands of artifacts. In 2016, BATS expanded and initiated the Mortuary Archaeology of the Râmeț Bronze Age Landscape (MARBAL) Project, an interdisciplinary collaboration focused on the intersection of mortuary archaeology and bioarchaeology to better understand the origins of inequality and the role of human mobility in Late Prehistoric Transylvania. This presentation outlines the origins and contributions of the BATS and MARBAL Projects to our understanding of the Bronze Age in Transylvania and the surrounding regions. By incorporating GIS, geophysics, radiocarbon dating, osteological analyses, isotopic analyses of diet and mobility, ancient DNA, network analysis of ceramics, and soil chemistry into our projects, we have been part of the larger scientific transformation of Romanian Bronze Age research. Our projects have provided training opportunities for Romanian and American students at all academic stages and expanded the visibility of Transylvanian archaeology, both in Europe and internationally. We have employed community-based research approaches and engaged in activism around contemporary mining issues. In this presentation we highlight the most recent discoveries from the project, including avenues of future research as we move our collaborations in new directions.

1306. Collaborating for a CLEARer picture of the Copper Age (4500-3600 BC) in the Carpathian Basin

Authors: William Ridge (University of North Georgia) – Iride Tomažič (University of Michigan)
Format: Oral

Shortly after c. 4500 BC, there was a sweeping change in the social landscape throughout the Great Hungarian Plain as tells and other larger centers were abandoned. The following centuries were characterized by significant transformations in social organization and cultural traditions. However, despite recent research, explanations of the period remain vague. Part of the limitation stems from a comparatively sparse and sporadic archaeological record for the Copper Age, a pattern repeated throughout much of Southeastern Europe. Building on their own research examining shifting settlement patterns in southeastern Hungary and the environmental impacts of technological intensification in Serbia and Romania, the authors developed the Copper Age Lifeways and Environmental Archaeology Research program (CLEAR). Viewing the Copper Age as potentially representing a fundamental shift in how societies interacted with both their social and physical landscapes, CLEAR incorporates archaeological and paleoenvironmental data to illuminate regionally diverse patterns in mobility, economic strategies, and landscape use. By examining these processes with a rigorous sampling strategy and methodology, patterns will emerge from the noise at the local and regional scales. It is also a primary goal of CLEAR to cross-cut historical barriers among the region's research traditions (i.e., Hungary, Serbia, and

Romania) and to generate collaborative efforts to produce meaningful interpretations of the Copper Age.

1253. From Mokrin to Crna Bara: 60 years of International Archaeological Collaborations in Serbia's North Banat

Authors: Miroslav Maric (Institute of Balkan Studies Serbian Academy of Sciences and Arts) – Neda Mirković Marić (Intermunicipal Institute for the heritage protection Subotica) – Lidija Milašinović (Narodni Muzej Kikinda) – Barry Molloy (University College Dublin, School of Archaeology) – Amy Nicodemus (University of Wisconsin, La Crosse)
Format: Oral

International cooperation has played an important role in advancing archaeological research in Serbia's North Banat region. The earliest collaborative effort began in 1969 with investigations at the Mokrin necropolis, establishing a foundation for cross-border partnerships in the study of prehistoric communities. Building on this legacy, renewed cooperation in 2015 brought together Serbian researchers from the Subotica Heritage Protection Institute, National Museum in Kikinda and Balkan Institute of SASA toogether with University College Dublin to examine Late Neolithic and Late Bronze Age settlement of Gradište Idjoš. This project emphasized the questions of first settlers, emerging complexity of Neolithic settlements and Late Bronze Age megaforts, offering new perspectives on social organization and community development during these transformative periods. Further collaboration followed in 2018 at Anka Siget, where teams from the University of Wisconsin and the University of Michigan joined Serbian archaeologists to explore an Early Bronze Age tell. The research focused on the site's role within broader regional network of the Maros culture, highlighting its significance in understanding intercommunity connections and exchange systems across southeastern Europe. Most recently, in 2020 and 2022, other projects with Michigan University and UCD investigated the transition from the Late Neolithic to the Early Copper Age at Crna Bara and Bronze Age settlement network in the Lower Tisza River valley. Together, these projects demonstrate how international partnerships expand interpretive possibilities, enrich methodological approaches, and strengthen scholarly networks. By integrating diverse academic traditions and expertise, cooperation has not only deepened knowledge of specific sites but also contributed to broader narratives of social, economic, and cultural change in the Carpathian Basin and the Balkans. The North Banat case illustrates how sustained collaboration - across institutions, disciplines, and generations - continues to enhance archaeological research potential and foster innovative perspectives on the prehistoric past.

2560. Interdisciplinary approaches and their integration in Late Bronze and Early Iron Age studies at the SE fringes of the Alps

Authors: Matija Crešnar – Tamara Leskovar – Petra Vojaković – Branko Mušič – Luka Gruškovnjak – Agni Prijatelj – Helena Grčman (University of Ljubljana) – Ian Armit (University of York) – Carina Gerritzen – Christophe Snoeck (Vrije Universiteit Brussel)
Format: Oral

Monumental hillforts and extensive cemeteries are among the most iconic prehistoric features well beyond the region between the Alps and the Danube. Their research has a long tradition reaching back to the antiquarians, when the foundations of prehistoric archaeology and its classical methodological toolkit were established. While these approaches continue to play an important role in our discipline, recent decades have seen the introduction of numerous innovative and adapted methods that have significantly expanded our research potential. This paper focuses on the research collaborations, which brought about substantial changes in the approaches especially to late prehistoric sites and landscapes from the late prehistoric periods at the SE fringes of the Alps and reviews major interdisciplinary advances and also their impact on existing interpretative frameworks. The extensive application of airborne laser scanning and geophysical prospection has greatly improved the understanding of archaeological landscapes, allowing archaeological sites and site complexes to be interpreted as integral elements of their wider environmental and cultural contexts rather than as isolated monuments. Further progress has been achieved through geoarchaeological approaches that enable more detailed reconstructions of site formation processes and the complex biographies of prehistoric sites and features. In addition, advances in artefact studies and bioarchaeological analyses—particularly stable isotope and genetic research—have opened new perspectives on individual life histories, social relations, and demographic patterns at unprecedented scales. There are also current research initiatives as the MATRES project and the newly established GreenHer CoE that will shape our research in the nearest future. We are also integrating our research results into heritage promotion, as for instance into the Iron Age Danube Route, a certified Cultural Route of the Council of Europe. Nevertheless, despite all the excitement about new interdisciplinary pathways, which seem more open than ever, all that glitters is not gold…

376. Unraveling Urban Change: Ten Years of the Nadin-Gradina Archaeological Project

Authors: Gregory Zaro (University of Maine) – Martina Čelhar (University of Zadar)
Format: Oral

In 2015, the Nadin-Gradina Archaeological Project (NGAP) was launched as an internationally collaborative program of research and education between the University of Zadar (Croatia) and the University of Maine (USA). From its outset, the overarching aim of the project was to investigate millennial-scale urbanization and landscape change in the eastern Adriatic. This broad scope would ensure that a variety of shared, and sometimes distinctive, interdisciplinary interests would find a place within the overall

conceptual framework. The Nadin-Gradina site is centrally located in Ravni Kotari, a heavily urbanized region of Dalmatia in Antiquity. Archaeological excavation has documented well-preserved, albeit palimpsestic, architecture and cultural deposits dating to at least the Late Bronze or Early Iron Age, with continuous occupation lasting approximately 1,500 years into Late Antiquity. The fortified settlement was abandoned during the Early Middle Ages but witnessed revitalization by the Late Middle Ages and Early Modern Era. The integrity of the archaeological record, which spans nearly 3,000 years, has afforded the opportunity to explore architectural continuity and change, domestic spaces, long-distance exchange, changes in wider geopolitics, faunal assemblages, and the botanical record as a reflection of landscape and environment. Here, we elaborate on some of these key findings while also reflecting upon methodological strategies and innovations, interdisciplinarity, and the value of cultural exchange in such programs.

757. Loving the Alien: the international cooperation in the research of local prehistories

Authors: Goce Naumov (Center for Prehistoric Research)
Format: Oral

Since its inception as a discipline, archaeology was both international and national. From the very beginnings the European monarchies engaged archaeologists for research in their colonies, so in a way a notion of internationalism could be traced since the inception of archaeology. On the other hand, with the development of archaeology and the integration of identity concept, the governments employed this discipline as a tool for emphasizing the relationship of the nation with the past communities, sometimes going back to classical and even prehistoric times. Fortunately, since the aftermath of the World War II the archaeology is far from these gloomy periods and the international cooperations witness mutual benefits while the nationalistic perceptions are set aside…although some ghosts of the past are still lurking, and particularly in the Balkans. The last few decades evidence an intensified scientific cooperation between institutions and specialists from the Balkans, European Union and United States of America which substantially advanced and expanded the knowledge on prehistory. As result to the foreign collaborations the groundbreaking multidisciplinary methodology was applied and the awareness of prehistoric cultural heritage was much better promoted. Therefore, this paper will sum up the international cooperation in prehistoric archaeology of North Macedonia with particular focus on decadal anniversary of the Center for Prehistoric Research and the implemented projects in the regions of Pelagonia, Lake Ohrid and Lake Prespa.

1582. Between Steppe and Carpathians: Yamna and Corded Ware Barrows in the East Slovakian Lowland

Authors: Pawel Jarosz (Institute of Archaeology an Ethnology Polish Academy of Sciences) – Anita Szczepanek (Institute of Archaeology an Ethnology Polish Academy of Sciences | Department of Anatomy Collegium Medicum Jagiellonian University) – Eva Horváthová (Archeologický ústav SAV)
Format: Oral

Since 2021, a Polish-Slovak expedition carried out field research of barrows in Východoslovenská nížina (East-Slovakian Lowland). The research was made possible by a grant from the National Science Centre in Poland, awarded to a project entitled "Transmission of steppe influences in the Carpathian zone in the 3rd millennium BC" (NCN 2020/37/B/HS3/03816). At that time, an agreement was concluded between the Institute of Archaeology and Ethnology of the Polish Academy of Sciences and the Institute of Archaeology of the Slovak Academy of Sciences. The project had two main objectives: (1) organising archival data and performing specialist analyses of various kinds, and (2) conducting excavations of burial mounds dated to the 4th/3rd millennia BC. Considering the importance of the analysed region for studies on steppe communities, the sources previously available from Východoslovenská nížina barrows were very modest, both in terms of their amount and the quality of the finds. By 2026, seven barrows have been investigated with interdisciplinary analyses of human remains. According to radiocarbon signatures the investigated barrows are dated to the Late Eneolithic and Early Bronze Age. In the region of southeastern Slovakia, they can be associated with impact of the Yamna culture communities from the south (3100–2600 BC) as well as the Corded Ware culture from the north (approx. 2800–2400 BP). Barrows of both cultures are situated at the same sites. Their nearest surroundings were used as necropolises in chronologically younger periods as well: Early Bronze Age, Košťany culture (2000–1700 BC) and Early Middle Ages (10th century).

858. Foodways and Landscapes of the Middle Danube in the Early Iron Age: A Multinational PhD

Authors: Caleb Ranum (University of Alabama | Univerzita Konštantína Filozofa v Nitre) – Maria Hajnalova (Univerzita Konštantína Filozofa v Nitre)
Format: Oral

Archaeobotanical studies from the Early Iron Age in the Middle Danube Region are limited. My dissertation research seeks to address this lacuna by examining archaeobotanical remains from seven previously excavated archaeological sites across Central Europe in order to better understand how human plant relationships structured daily life and interaction with the landscape. This research is only possible thanks to the cooperation of multiple institutions across 5 countries: The United States, Slovakia, Hungary, Austria, and the Czech Republic. The highlight of this international cooperation was the development of a cotutelle agreement between the University of Alabama and Constantine the Philosopher University in Nitra. This paper will focus on four aspects of the project: archaeobotanical results, cross-pollination of research agendas, extent and benefits of international collaborations, and institutional and academic challenges of developing a cotutelle. A particular focus will be on research in the Carpathian Basin, including partnerships with the Institute of Archaeology of the Slovak Academy of Sciences, Fulbright Slovakia, and the Hungarian National Museum (alongside the Institute for Archaeological Heritage in Brno (Czechia), the State Collections of Lower Austria and the University of

Innsbruck (Austria)). These collaborations have been instrumental in the development of my research agenda and demonstrate the value of smaller scale collaborations in creating international networks and opportunities for research.

3 PHALERON DELTA BIOARCHAEOLOGICAL WORKSHOP

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Claire Zikidi – Paraskevi Tritsaroli (American School of Classical Studies at Athens | National and Kapodistrian University of Athens) – Jane Buikstra (School of Human Evolution and Social Change, Arizona State University | American School of Classical Studies at Athens)
Keywords: Bioarchaeology, Mortuary Practices, Archaeological Science, Archaic Greece
Format: Other

SESSION ABSTRACT

This full-day workshop presents the Phaleron Bioarchaeological Project, showcasing an integrative bioarchaeological study of one of the largest and most complex burial grounds from Archaic Greece. The workshop is organised into four thematic sessions reflecting the project's multi-disciplinary approach: a. Context and Overview, which introduces the archaeological setting, site significance, and conservation challenges; b. Burial Practices and Social Structure, exploring mortuary variability across age, sex, and social identity; c. Bioarchaeological Analysis, focusing on trauma, pathology, and dental evidence; and d. Specialised Studies, which applies advanced isotopic, genetic, and morphological analyses to reconstruct mobility, diet, and behavior. Each session features collaborative presentations by archaeologists, osteologists, conservators, and scientists, fostering dialogue through dedicated Q&A periods. The workshop format emphasises integration across disciplines, promoting holistic interpretations of social organisation, identity, and ideological transformation at Phaleron. By highlighting methodological innovations and the interplay of archaeological and bioarchaeological data, this workshop offers new insights into early Attica's complex social dynamics and serves as a model for collaborative research on large mortuary assemblages.

CONTRIBUTION ABSTRACTS

1190. The Phaleron Bioarchaeological Project: Archaeological Questions and Bioarchaeological Answers

Authors: Jane Buikstra (Center for Bioarchaeological Research, Arizona State University | Center for American Archeology)
Format: Oral

This presentation will introduce the symposium, beginning with a brief history of the Phaleron site excavations as background to the Phaleron Bioarchaeological Project (PBP). We then define site structure relevant for bioarchaeologial analyses. Human remains recovery and conservation of the more than one thousand individuals, has been designed for current and future research needs has anchored the project, as discussed in this morning's session. Others in this session will detail further background information, including the mortuary landscape of Attica, the site's setting from a geoarchaeologial perspective, and the significance of ceramic associations. The following sessions consider the archaeological questions that have driven bioarchaeological methods choice and analyses for the PBP. These include defining burial practices in relationship to social structure, including comparing those interred in individual pit grave with less common interment forms. An important part of our research has focused on describing patterns of injury and the empirical bases for identifying peri-mortem trauma. In addition, explorations of health for adults and children have considered both biochemical and grossly visible indicators of diet and evidence of metabolic diseases, such as scurvy. We also combine dental, ancient DNA, long bone shape, and isotopic signatures of heritage and mobility in characterizing the people of Phaleron, who are the centerpiece of our project.

2806. Attica's Mortuary Landscape in the Eighth and Seventh Centuries BCE

Authors: Annarita Doronzio (Humboldt-Universität zu Berlin) – Anna Maria D'Onofrio (Università di Napoli "L'Orientale")
Format: Oral

This paper offers a comprehensive reassessment of funerary practices in Attica during the eighth and seventh centuries BCE, challenging traditional models that posit a sudden eighth-century "renaissance" followed by a seventh-century decline. We argue that the eighth century represents primarily a shift in archaeological visibility rather than a simple demographic explosion, marked by the expansion of age groups represented in formal cemeteries. In particular, the increasing presence of infant and child burials—often through specialized practices such as pot burials—points to fundamental changes in the organization of burial grounds and to shifting practices of social affiliation and identity formation at the level of domestic and community units. Special attention is devoted to the seventh century BCE, a phase frequently described as a "nadir" or a "notoriously ill-documented period," yet one that reveals a coherent and dynamic funerary logic. The paper examines emerging spatial arrangements and ritual expressions, bridging the gap between well-published contexts, such as the Athenian Agora, and more fragmentary evidence from rescue excavations. By integrating demographic observations with site-based spatial analysis, this contribution provides essential archaeological and topographical context for mortuary behaviour in Attica. We demonstrate that funerary practices reflect a long-term process of social

transformation that laid the foundations for the early Greek polis.

2804. Depositional history and landscape evolution of the Phaleron Burial Ground

Authors: Panagiotis Karkanas (American School of Classical Studies at Athens)
Format: Oral

The Phaleron Burial Ground, located near the coast of Phaleron Bay in Athens, offers a rare glimpse into how an ancient community adapted to a constantly changing shoreline. By studying the soils and sedimentary deposits uncovered during excavation, we reconstructed how this landscape evolved over time. The lowest layers show that the area was once a quiet coastal lagoon. Gradually, shifting courses of Ilissos and Kifissos rivers and local alluviation transformed the lagoon into dry land. It was on this newly formed, firm ground that people began burying their dead around 700 BCE. Most burials were placed in areas where the soil substrate had become increasingly dry and clay-rich, creating stable surfaces for graves and cremation pyres. Around 550–520 BCE, a hard crust formed in the soil, signaling a pause in the use of the cemetery. Later burials cut through this crust or were placed in overlying coastal sandy deposits. By about 450 BCE, the area was abandoned as a burial ground, likely because the sea was encroaching and the water table was rising, turning the land into the marshy area known in antiquity as the Alipedon. The story preserved in the soil and sediment layers shows how natural forces—rising seas, shifting rivers, and changing coastlines—shaped not only the environment but also where and how ancient Athenians buried their dead.

2805. Integrated Analysis of Laboratory Challenges, Limitations, and Methodological Approaches in Conservation

Authors: Zoi Chalatsi (American School of Classical Studies at Athens)
Format: Oral

The presentation sheds light onto the large-scale Conservation project for the treatment of more than 1000 human burials of various burial types from the Phaleron Delta Burial Ground in Phaleron, Attica. It outlines the process of planning for and equipping a conservation laboratory to cater the needs of this undertaking, the challenges faced during the arrival and storage of the material, as well as the development of protocols and methodologies to allow for their secure handling while not compromising their future study by bioarchaeological researchers. The scale and complexity of this project surfaced the necessity for training of students, interns and professional conservators for an adequate approach of the material since it involved the presence of blocks of soil, loose bones and jar burials. That said, microexcavations needed to be applied and the preservation of these blocks varied, challenging the decision for the best approach. Additionally, there was the preparation of selected material for further analyses such as isotopic, bone tissue, aDNa, C-14 and X-ray analysis. After the completion of the conservation of the material each burial had an overall conservation report and was stored in a secure way to make the future handle of the material safe for the material itself and the users. To conclude, this presentation aims to be useful as a general guide for the Conservation of future Bioarchaeological assemblages.

399. Demographic and Structural Dimensions of Burials in the Phaleron Burial Ground

Authors: Claire Zikidi (Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA | National and Kapodistrian University of Athens) – Julianne Stamer – Elizabeth Hannigan – Jessica Rothwell (School of Human Evolution and Social Change, Arizona State University) – Aviva Cormier (Department of Anthropology, Vassar College) – Jessica Cerezo-Román (Department of Anthropology, University of Oklahoma) – Bronté Cunningham (School of Human Evolution and Social Change, Arizona State University)
Format: Oral

The Phaleron Burial Ground (PBG) provides a robust long-term record of patterns in burial and demographic variation. This study focuses on two central questions: How can the organisation of the PBG be meaningfully approached? And how is the site structured according to burial type, body orientation, body position, biological sex, and age? By analysing these patterns in relation to chronological phases, spatial distribution, and other observable characteristics, we investigate the temporal and demographic dimensions of this complex site. Exploring spatial and categorical variation reveals the reasoning behind specific burial choices, the potential social or symbolic significance of these arrangements, and the ways in which broader cultural practices are reflected in the organisation of the burial ground. Attention to patterns of clustering, positioning, and variation highlights consistent practices as well as shifts over time, offering insights into how different individuals or groups were treated. This approach demonstrates how the careful study of burial structure in relation to demography can illuminate aspects of past lives and deaths that would otherwise remain unseen, providing a detailed understanding of the complexity and variation present across the site.

488. Cremation Rituals and the Deceased of Phaleron, Attica, Greece

Authors: Jessica Cerezo-Román (University of Oklahoma) – Jane Buikstra (Arizona State University) – Anna Alexandropoulou (National Archaeological Museum of Athens) – Paraskevi Tritsaroli (Malcolm H. Wiener Laboratory for Archaeological Science) – Thomas Fenn (Acacia Heritage Consulting) – Stella Chryssoulaki (Ephorate of Antiquities of East Attica) – Claire Zikidi (Malcom H. Wiener Laboratory for Archaeological Science)
Format: Oral

In this research, we explore the performative aspects of cremation rituals from the archaeological site of Phaleron (ca. 750-480 BCE), located in the Phaleron Delta, Attica, Greece. On this site, cremation was found at a lower frequency than inhumation. We will investigate the two following overarching research questions: 1) who were the cremated individuals found at Phaleron; and 2) how were cremation rituals performed? The research explores these questions while also considering the agency of the mourners and the deceased, as well as performative aspects of cremation rituals. Using the archaeological contexts and bioarchaeological analyses of the human remains, we reconstruct the chaînes opératoires from details associated with creation of the context, thermal alterations, and the biological profiles of the individuals recovered at the site. Preliminary analyses suggest that cremation rituals varied more often between individuals than previously thought, possibly related to the identities of the individuals and their families.

607. Population dynamics of 1st millennium BCE Attica through the archaeogenetic evidence of Phaleron burial ground

Authors: Eirini Skourtanioti (Max Planck Institute for Evolutionary Anthropology | Ludwig Maximilians University of Munich | The Francis Crick Institute) – Philipp Stockhammer (Ludwig Maximilians University of Munich | Max Planck Institute for Evolutionary Anthropology)
Format: Oral

The analysis of 107 genomes from the Archaic and Classical cemetery of Phaleron (7th–4th c. BCE) provides the first extensive genetic insights into the population of Attica during the formative period of the Athenian polis. Combined with newly generated archaeogenetic data from Athens and other Attic cemeteries during the late 2nd and 1st millennium BCE, our results reconstruct a process of demographic expansion and repopulation of Attica through networks of mobility with neighboring areas in the Greek mainland. Furthermore, the data shed light on the social dynamics of the communities that used the Phaleron burial ground throughout the centuries. Approximately 15% of the sampled individuals display genetic origins spanning North Africa, the Mediterranean, the Balkans, Iran and Central Europe. Based on the available dating information, this genetic diversity is not associated with the earliest phase of the burial ground, when the port of Athens was in the same area. Additionally, there is no correlation between ancestry and the so-called deviant burials. Notably, comparable levels of genetic diversity are observed in other Attic sites, although genomic data from Athens remain limited. Alongside inter-site genetic links among individuals with varying degrees of mixed Aegean and non-local ancestry, these results underscore an ongoing interplay between long-distance mobility and emerging concepts of social identity and belonging during a period of profound political and cultural transformation.

425. Genetic and Population Relationships from Biodistance Studies and a-DNA

Authors: Christopher Stojanowski (School of Human Evolution and Social Change, Arizona State University) – Eirini Skourtanioti (Max Planck Institute for Evolutionary Anthropology)
Format: Oral

The size and preservation of the Phaleron burial ground allows researchers with different areas of expertise to address key questions of archaeological interest from multiple perspectives. In this paper we consider the insights provided about Phaleron's peoples from two complementary perspectives – 1) biodistance analysis of a large sample of individuals based on cranial nonmetric and dental morphological data, and 2) genetic analysis of a smaller subset of individuals based on ancient DNA. Genomic data offer finely-resolved assessments of ancestry and affinity at the individual level of variation, offering unparalleled insights into patterns of migration into the Attic peninsula during the Archaic period. Phenotypic data lack the resolution of genomic data at the individual level, but instead offer larger sample sizes due to ease of data collection. The former is a much more nuanced and powerful tool for ancestry assessment; the latter is more comprehensive by virtue of its inclusion of many more individuals from the site. For example, ancient DNA has been able to identify a number of individuals with ancestry outside of the Attica peninsula, providing critical insights into patterns of migration at the time. To the contrary, phenotypic analysis of the spatial structure of the Phaleron burial ground has identified specific areas of the burial ground that were phenotypically distinct from others, including the Esplanada burial group. Here, we explore the correspondence between results obtained from these two approaches and discuss how the scalability of biodistance analysis can inform and optimize ancient DNA sampling strategies.

482. Demography and Paleopathology of the D-Group: Contemplating the Distinctive Burials at Phaleron

Authors: Aviva Cormier (Vassar College) – Jane Buikstra (Arizona State University) – Stella Chryssoulaki (Archaeological Museum of Heraklion)
Format: Oral

During the excavations of the Phaleron Burial Ground (PBG), many mortuary contexts were identified beyond the expected burial forms and consequently were designated as a part of the "D-Group." In addition to the well-known Archaic Period "Esplanada" mass burials of 79 shackled young adult men, the D-Group includes 84 individuals who also experienced distinctive deaths and burials, many of whom were interred in a prone position, in mass graves, and/or were restrained by metal shackles or perishable restraints (referred to as "desmotes"). In this paper, we consider the variation within the D-Group, exploring the diversity of lived experiences in the mass burials and single interments. In particular, we query the eight mass burial contexts, assessing the differences and similarities in burial treatment, demographic profile, and paleopathology. While nearly all those in mass burials were bound or

shackled in death ("desmotes"), 23 individuals were also restrained but interred alone. We question the possible identities of these desmotes and what led them to have been restrained in death. Finally, we turn to the 14 individuals in the D-Group estimated to be likely females and explore the possible connections between their lived experiences and their distinctive burial treatment. Through the contextualized exploration of those buried in distinctive graves, we can understand the diversity of life histories among those who experienced marginalization and violence during life and death in the Archaic Period.

661. The Women of Archaic Greece: Perspectives from the Phaleron Burial Ground

Authors: Paige Schmitt (Great Basin Institute) – Elizabeth Hannigan (Arizona State University) – Kerri Widrick (Smithsonian Institution, Museum of Natural History)
Format: Oral

While there have been significant contributions since the late 20th century to the study of women in ancient Greece, scholars infrequently study Archaic women distinctly from the Classical period, and even less so non-elite women. The Phaleron Burial Ground offers a unique opportunity to analyze Archaic period (700-480 BCE) women of varied social statuses. We use an intersectional framework from Black feminist theory to emphasize how interconnected social identities generate different life and death experiences for ancient Greek women. Using osteological data, historical contextual information, and statistical analyses we aim to answer the following questions about Phaleron: 1) Are there differences in burial practices along the axis of sex? 2) Are there differences in skeletal stress indicators according to sex? 3) What do these patterns reveal about the identities, roles, and experiences of women in Archaic Attica? 4) How do these patterns at Phaleron compare to the Early Iron Age and Classical period? Through these research questions, we seek to shed light on the understudied and overlooked experiences of Archaic period women and examine the influence of Archaic sociopolitical change on life and death experiences for past marginalized peoples.

739. The Children

Authors: Paraskevi Tritsaroli (American School of Classical Studies at Athens | National and Kapodistrian University of Athens) – Jessica Rothwell (Arizona State University)
Format: Oral

Non-adult inhumation burials (n = 405) make up almost 30% of the overall assemblage studied within the framework of the PBP. These burials span the period from the second half of the 8th c. to the first half of the 5th c., thus representing all phases of use of the burial ground. The majority were inhumations in jars, followed by inhumations in pits, and a small number of deposits in cists and larnakes. Most of these burials contained individuals younger than three years old. Considering the chronological, taphonomic, and other challenges arising from the excavation and analysis of these non-adult funerary contexts, our contribution has three aims: to explore temporal changes in the representation of juveniles in the burial ground; to examine age-related variations in burial modes for juveniles over time; and to investigate the involvement of juveniles in the formation of wider groups over time and across space (sector 5 vs. sector VI; the core area and beyond).

421. Punished in Death or Different in Life? Oral Health Evidence of Social Identity at Phaleron, Greece

Authors: Julianne Stamer – Christopher Stojanowski – Jane Buikstra (Arizona State University)
Format: Oral

The Phaleron Burial Ground (PBG) is unique in Archaic Athens (c 700-480 BCE) for both its scale and diversity of burial treatments. Most adult inhumations are interred in simple pit graves. Other treatments include multiple interments of restrained individuals and prone individuals, among others. Many explanations of the social meaning of these burial positions focus on events occurring at the end of life— punishment for a crime or the acknowledgement of an inauspicious death. However, it is equally important to explore who these individuals were throughout their life course. This study assessed carious lesions, antemortem tooth loss (AMTL), dental wear, periodontal disease, calculus, and abscesses for 197 individuals from multiple burial contexts at PBG. 159 individuals came from pit grave contexts. These are compared to 22 individuals buried in multiple interments, often positioned casually and with perishable restraints, as well as 16 individuals buried prone. We found that those buried in central sector mass burials had significantly less tooth wear and AMTL than their counterparts interred in simple pit graves, a relationship independent of age. Male individuals who were interred prone had significantly greater tooth wear than those buried in central sector mass burials, but not significantly more than those in pit grave contexts. Female individuals overall had greater rates of carious lesions and AMTL but neither were significant. Female individuals who were buried prone had significantly fewer carious lesions as compared to female individuals buried in simple pit graves. Together, these results suggest that burial treatment at Phaleron reflects patterned differences over the life course. Central sector mass burials appear to represent a distinct group whose daily activities differed materially from those interred in pit graves or prone positions.

509. A Bioarchaeological Analysis of Injury Patterning in the Phaleron Burial Ground

Authors: Leigh Hayes (University of Wisconsin Oshkosh) – Jane Buikstra (School of Human Evolution and Social Change, Arizona State University) – Hannah Liedl (Novetus GmbH) – Voula Tritsaroli (Phaleron Bioarcheological Project)
Format: Oral

This study examines the prevalence and demographic patterning of observable injury within the Phaleron Burial Ground (PBG), one of the largest Archaic burial grounds in Attica (700-480 BCE).The PBG contains a wide range of burial types and treatments, including jar burials, pit graves, and biaiothanatoi, those suspected of dying a violent death. Previous research on injury at the PBG indicates that individuals interred in normative burials exhibit injury patterns more consistent with accidental and/or occupational causes and exhibit less evidence of punitive or targeted violence compared to the biaiothanatoi. Expanding on prior work, the present study further investigates injury patterning within the PBG to better understand the activities and lived experiences that may have contributed to these injuries. Additionally, this project compares these observed patterns of injury to several contemporary Archaic burial grounds across Attica. These comparisons serve to contextualize the trends observed in the PBG within broader regional patterns.

659. Distinguishing Perimortem Trauma from Postmortem Damage: Experimental Data Sheds Light on Interpretations of Execution at the Phaleron Delta Esplanada

Authors: Dawnie Steadman (University of Tennessee)
Format: Oral

The burial context of individuals in the Phaleron Delta Esplanada of the Phaleron Cemetery have evoked images of political violence, torture and mass execution, and theories abound concerning how these men were killed. Many of the crania exhibit fragmentation of the lateral vault, suggesting that death was largely due to systematic bludgeoning to the side of the head. This interpretation is troubled, however, by a lack of biomechanical literature documenting how the lateral cranium responds to blunt force trauma. Moreover, centuries of taphonomic changes of the burials could replicate or obscure any evidence of trauma endured by these individuals at the hands of others. The purpose of this study is to apply experimental data derived from blunt force trauma to the lateral cranial vault of contemporary human donors as well as the taphonomic and historic literature to address three questions: 1) How do the fracture dynamics of blunt force trauma applied to the side of the skull differ from trauma of the superior and posterior cranium and how does it compare to lateral cranial defects observed in the Esplanada remains? 2) What role could taphonomic factors, such as salt water and sand compaction, potentially play in producing postmortem damage that may be confused with trauma? 3) How were mass executions structured in the ancient Eastern Mediterranean and how does this compare with other times and places? Thus, this study combines experimental data with biomechanical, archaeological and historical literature that may help establish a theoretical framework to interpret mass death at Phaleron.

756. Cranial Trauma: Insights into Violence and Life

Authors: Ioanna Anastopoulou – Konstantinos Moraitis (School of Medicine, National and Kapodistrian University of Athens) – Dawnie Steadman (Anthropology, University of Tennessee) – Fotios Alexandros Karakostis (Paleoanthropology, University of Tübingen)
Format: Oral

The Phaleron cemetery includes a subset of individuals exhibiting cranial trauma, often interpreted as executed captives. Previous bioarchaeological analyses suggested widespread perimortem cranial trauma among these burials, implying violent deaths linked to political conflict. This study critically reassesses those interpretations through a forensic-informed approach that integrates documented modern trauma cases, standardized diagnostic criteria, and multivariate statistical analyses. Nineteen crania from Phaleron were evaluated using seven established indicators for assessing trauma timing, including fracture patterning, edge morphology, and coloration. These were compared with a reference sample of confirmed perimortem and postmortem forensic cases, including remains from water-rich environments. Independent assessments by two experienced forensic practitioners demonstrated high inter-observer reliability. Statistical testing identified four traits with significant discriminatory power, which were further evaluated using multiple correspondence analysis. Results indicate that clear evidence of perimortem cranial trauma is limited. Only two crania from the restrained burial group exhibited strong perimortem traits, and even these cases show fracture distributions consistent with taphonomic processes related to soil pressure and prolonged moisture exposure. Several fractures previously interpreted as violent injuries are more parsimoniously explained as postmortem damage occurring under water-rich burial conditions. These findings underscore the critical role of environmental context in trauma interpretation and caution against direct associations between skeletal fractures and cause of death in archaeological settings. More broadly, the study highlights the value of comparative forensic datasets and multivariate approaches for refining interpretations of violence in the past.

657. Investigating Diet and Mobility at the Phaleron Burial Ground, Greece

Authors: Elizabeth Hannigan – Julianne Stamer – Kelly Knudson – Jane Buikstra (Arizona State University)
Format: Oral

The social identity of past peoples, especially those whose remains have been discovered in remarkable burial contexts, is enhanced by biogeochemical analyses, including dietary and mobility reconstructions. Thus archaeologists can interpret the life histories and identities of these individuals, as well as those from within more common burial forms. Such methods have proved valuable in studies of the archaic period Phaleron Burial Ground, widely known for the presence of mass graves with bound individuals. In this investigation, we employ both δ13C apatite and radiogenic strontium stable isotope techniques to answer the following questions:

1) Do the dietary patterns of the Phaleron individuals from mass graves vary by geographic origin? 2) Does diet vary according to sex? 3) Does diet vary according to burial form? Through this study, we seek to reconstruct dietary and mobility patterns at Phaleron and highlight potential social identities of those buried between the asty and the sea.

2012. Reconstructing Malaria Risk in Ancient Athens Using Paleoclimate-Driven Mosquito-Month Models

Authors: Jordan Wilson (Georgetown University) – Johnny Uelmen – Julia Horn – Feng He (University of Wisconsin) – Judith Littleton (University of Auckland)
Format: Oral

Prior to its eradication in the mid-twentieth century, Greece was considered the most malarious country in Europe; however, characterizing the burden of the disease in the ancient past remains complex. We present an interdisciplinary framework that couples paleoclimate reconstructions with archaeological and paleopathological evidence to quantify when and where malaria transmission could have been seasonally feasible in the Athenian basin and comparable Mediterranean settings. Referencing historical data, we consider how in environments of high human density, altered mobility, and other stressors, even seasonal malaria could have materially increased morbidity and mortality, particularly among children and nutritionally stressed groups. Using gridded paleoclimate outputs, we operationalize a "mosquito month" index based on conservative thermal–hydrologic thresholds (minimum temperature ≥50°F, maximum temperature ≤95°F, and relative humidity ≥42%). Monthly suitability is summarized to annual months per year and mapped across Europe and the eastern Mediterranean, with targeted 50 km buffers around key urban centers. Preliminary results indicate widespread seasonal suitability across the Mediterranean during the period spanning 1000 BCE to 1000 CE, with, in a targeted example, Athens showing approximately 3–4 suitable months per year on average in the 450–400 BCE window. This is comparable to other coastal cities in southern Europe, and a northward envelope of ≥1 month suitability extending into parts of central Europe. Highly persistent suitability (≥6 months/year) is limited in this time window, emphasizing seasonality rather than year round transmission. We outline next steps integrating landscape reconstruction (wetlands, drainage, land use), paleopathological indicators of anemia at the macro and micro-structural levels referencing new advanced scientific imaging of children from Phaleron cemetery, and targeted biomolecular screening (aDNA/proteomics) to test and refine this ecological plausibility model. This cross-disciplinary methodology translates paleoclimate data into interpretable transmission windows, providing a reproducible bridge between climate history and archaeological inference about ancient disease burden.

649. A view from the terrace: femoral diaphyseal morphology reflects complexity in mobility and labor at the Phaleron cemetery, Attica, Greece

Authors: Daniel Temple (Department of Sociology and Anthropology, George Mason University) – Claire Zikidi (Phaleron Bioarchaeological Project, Athens School of Classical Studies) – Jane Buikstra (School of Human Evolution and Social Change, Arizona State University)
Format: Oral

This work uses femoral cross-sectional geometry to reconstruct habitual activity at the Phaleron Cemetery, Attica, Greece (ca. 700-400 BCE). Remains included in this study date to a relatively narrow timeframe of site occupation (ca. 650-550 BCE). Cross-sectional geometric measurements were estimated using PQCT scanning, collected at the femoral midshaft, and standardized according to body size. Cross-sectional measurements include Ix (anteroposterior strength/rigidity), Iy (mediolateral strength/rigidity), J (overall strength/rigidity), and Ix/Iy (femoral strength ratios). Femoral strength ratios were compared to a database of European communities spanning the Upper Paleolithic to mechanized/industrial groups and within/between groups from Phaleron. Comparisons were performed using violin plots and randomized permutation tests (9,999 permutations) of mean differences. Male femoral strength indices were bimodally distributed: one group had elevated femoral strength indices and were comparable to Mesolithic European hunter-gatherers, while a second group had reduced femoral strength indices and were comparable to Neolithic and mechanized/industrial European communities. Elevated femoral strength indices were associated with accentuated anteroposterior strength/rigidity, slightly reduced mediolateral strength/rigidity, and comparable overall femoral strength/rigidity across burial clusters. This variation is associated with a division of labor that produced interaction with diverse landscapes (complex versus flat terrain), possibly among individuals working locally versus those engaged in terrace agriculture or shipping. Female mobility indices were normally distributed, reduced, and comparable to mechanized/industrial European communities. This morphology likely reflects interaction with comparatively flat terrain and limited mobility, possibly in relation to household production, kinship labor, and funerary ritual. These findings illustrate the complex network of mobility within the Phaleron community and diversity of labor patterns across cemetery clusters.

467. "Shackled individuals with a hard life?" Virtual anthropological evidence of strenuous labor in hand and foot remains from Archaic Phaleron

Authors: Fotios Alexandros Karakostis (University of Tübingen | Senckenberg Research Institute | University of Basel) – Manolis Papadakis (University of Tübingen)
Format: Oral

Until the early 5th century BC, Phaleron Bay was the main port of ancient Athens (Greece) and hosted one of the largest Archaic cemeteries discovered in the region. Within the framework of the interdisciplinary Phaleron Bioarchaeological Project, this paper

synthesizes previous and ongoing research aimed at reconstructing habitual physical activity patterns using novel virtual 3D anthropological approaches, whose reliability has been demonstrated through experimental laboratory studies and analyses of human skeletal samples with extensively documented life histories. These approaches primarily include the Validated Entheses-based Reconstruction of Activity (VERA) method and its recent semi-automated variation, "VERA 2.0." To date, in this project, the VERA and VERA 2.0 methods have been used to infer differences in manual (Karakostis et al., 2021) and pedal activities (Papadakis et al., in prep.) among individuals from normative and non-normative ("D-group") burials, across different age-at-death groups, estimated statures, excavated sectors, and varying states of entheseal preservation. Overall, the results have revealed significant differences in entheseal patterns between burial groups, with D-group individuals displaying indications of more physically demanding activities involving both the upper (manipulation) and lower (locomotion) limbs, even after accounting for systemic factors such as biological age and body size. These findings provide valuable insights into the everyday activities of the Phaleron population, enabling improved intrasite comparisons and forming a basis for integration with other lines of evidence concerning their origins and behaviors. More broadly, they contribute to a more holistic bioarchaeological understanding of daily life in the Greek Archaic Period, which remains largely elusive in the current literature.

469. Health, Trauma, and Lived Experience in Phaleron Burial Ground in the Early Archaic Period

Authors: Paraskevi Takorou (University of Groningen)
Format: Poster

The Phaleron Burial Ground (PBG) is considered to be one of the most significant ancient burial sites in Attica (Buikstra et al., Hesperia, n.d.), as it provides insights into the Archaic period (700-500 BC), and the political and social transformations that led to the emergence of the city-state and the establishment of democracy. This poster presents a selection of the earliest burials unearthed at Phaleron (700–650 BC; 650–600 BC), focusing on lived experiences within the broader socioeconomic context of the Early Archaic period, marked by demographic growth, unequal access to resources, and political instability. The Early Archaic period is characterized by population growth, as evidenced by the concept of "στενοχωρία", which signifies the scarcity of land and food resources (Parker 2014, Ραμού-Χαψιάδη 1982). This phenomenon gave rise to a considerable number of survival challenges. Moreover, the shifting power dynamics among the aristocrats and the rising class tensions led to various conflicts and upheavals throughout the period (Hall 2014; Parker 2014). Within this frame, this study applies a bioarchaeological approach by considering the manifestation of structural and interpersonal violence on the human body and skeleton (e.g., skeletal trauma, nutritional deficiencies, infectious diseases, funerary marginalisation, food inequality etc.) to be an expression of state force, social stress, power hierarchies, and social inequality. The results suggest that the political shifts and social transformations of the Early Archaic period profoundly influenced the lived realities and funerary treatment of the individuals interred at Phaleron.

4 RESONANT ELEMENTS OF CULTURAL ASTRONOMY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Jose Balbi (Colchester Archaeological Group UK) – Javier Gonzalez Fras (Universidad Nacional Autonoma de Honduras) – Stanislaw Iwaniszewski (National School of Anthropology and History, Mexico.) – A. César González García (Incipit - CSIC)
Keywords: Astronomy, Cultural Astronomy, Archaeoastronomy, Landscape, Skyscape, interdiscipline
Format: Regular session
Affiliation: Archaeology & Astronomy in Culture - SEAC

SESSION ABSTRACT

The enduring elements of Cultural Astronomy Current research projects in archaeology and Cultural Astronomy are interdisciplinary, combining different research traditions, questions, perspectives, and data types. We at the Archaeology and Cultural Astronomy Community have applied these approaches, which we consider essential for answering complex questions; however, they also require a demanding practice. Combining and correlating the results of various disciplines, as well as adequately representing them, can be particularly difficult. During the session, our aim will be to examine how to address the challenges of combining different scales and data types, as well as analyze how they culturally impact both archaeological and astronomical research. These ways of combining disciplines for research are necessary, but are our studies truly complete? Do our astronomical observations, combined with archaeology and landscape, contribute new elements to what we call Cultural Astronomy? In general terms, we will also explore how data obtained at the microscale can be transposed to the mesoscale or macroscale, and how results from different disciplines can be correlated. It is also conceived as a forum for archaeologists, astronomers, and landscape researchers, focusing on how to approach our own results and how to relate them to other scales and disciplines. Over the past seven years, we have sought to answer these questions and have succeeded in enabling our Community to present its unique vision of archaeology, making our past more resonant.

18. Alexandria in Egypt. The ancient city and the stars

Authors: Jose Balbi (Colchester Archaeological Group UK)
Format: Oral

The city of Alexandria is linked to that of its Library, which served for centuries as the heart of the city. Created in the Hellenistic Period around the 3rd century BCE, it was the fundamental element with which the satrap Ptolemy I Soter continued the diffusion of Hellenism as it was conceived by Alexander. Possibly the Library was finished later, but the idea of cultural expansion was in place since the arrival of the Hellenes in Egypt. There are no great certainties as to the place of its foundation, but it is determined by various authors and chroniclers of the time that there was a main one and a smaller one next to the Serapeum. This indicates to us from the beginning not only the cultural but also the religious relationship of the Library. Some authors understand the issue in such a magnitude that they think that the Library had the objective of making Alexandria the successor of Athens in the cultural aspect of the future Hellenistic World. We will study the current city of Alexandria and the plan of what was presumably the ancient city. We have to highlight the most emblematic places and the possibility of locating them in the current city. Our research takes us to places in the city that are mostly not advertised for tourists, where archaeological remains from different periods can be found today and which allow us to reconstruct the experiences of ancient culture as recounted by both Historians and Historical Figures who lived in this city.

337. Star-Story Almanacs beneath Gilgamesh and Beowulf: Sahelian Skies, Precession, and Epic Structure

Authors: Marilyn Gottlieb-Roberts (Independent researcher)
Format: Oral

This paper proposes that the epic structures of Gilgamesh and Beowulf preserve fragments of much older oral star-story almanacs originally tuned to the seasons and skies of the Inland Niger Delta in present-day Mali. Drawing on cultural astronomy, archaeo-astronomy, comparative literature, and climate history, I reconstruct a sequence of eleven northern-hemisphere constellations that metaphorically illustrate Tablets I–IX of the Standard Babylonian Gilgamesh when mapped onto the annual cycle of the Sahelian floodplain. A parallel mapping shows that Beowulf reuses nine of these same constellations as seasonal place-markers for its feasts, labors, and heroic confrontations. In both epics, the narrative ring structure, the ordering of key episodes, and selected sky images match a coherent seasonal cycle that fits today's Inland Niger Delta with striking precision but does not match northern European or Mesopotamian climates as closely. Because axial precession slowly shifts the relationship between stars and seasons, this fit implies that the underlying stellar template was first calibrated in the Delta during an earlier precessional phase, plausibly as far back as c. 52,000 years ago, when regional hydrology already resembled the modern flood–retreat–Harmattan sequence. While the conjectural nature of the transmission chain is explicit, the convergence of star-maps, seasonal patterns, and poetic structure suggests that both epics adopted, reshaped, and localized a shared, much older Sahelian story-almanac. The study illustrates how interdisciplinary methods can recover deep-time environmental knowledge and migratory memories embedded in canonical texts.

1581. Pecked cross figures from the Floor of Markers and the materialization of time in Teotihuacan

Authors: Stanislaw Iwaniszewski (no hay) – Jesús Galindo Trejo (Institutu de Investigaciones Estéticas, Universidad Nacional Autónoma de México)
Format: Oral

In September 1994, at the excavations directed by Eduardo Matos Moctezuma, new pecked cross figures were unearthed on a stuccoed floor at the foot of the southern wall of the "U-shaped-Platform" surrounding the Pyramid of the Sun at Teotihuacán. These findings received attention from Rubén Morante López (1996, 1997), Anthony F. Aveni (2005), and Stanislaw Iwaniszewski (2006), who discussed possible meanings of these figures. In the present paper, we will attempt to provide a more comprehensive understanding of the functioning of cross-circle figures. Our task is to demonstrate a meaningful link between a horizon calendar at Teotihuacan, numerology encoded in its layout, and the numerical structure of cross-circle figures. We develop our interpretations as follows: first we review the meaning of concept of the solar calendar horizon as it has been developed in the recent work on Mesoamerica, then we briefly present the basic data on cross-circle figures from the Floor of Markers and compare them with the intervallic calendrical computations in some of the prehispanic codices, we apply the concepts of time indication, synchronicity and schemata to shed more light on means by which Teotihuacan sunwatchers could render their particular understanding of the world.

1672. Interdisciplinary practice in Cultural Astronomy: Lessons learned and perspectives

Authors: Javier Mejuto (Universidad Nacional Autónoma de Honduras)
Format: Oral

Since its creation more than 16 years ago, the Department of Archaeoastronomy and Cultural Astronomy at the Faculty of Space Sciences at Universidad Nacional Autónoma de Honduras has accumulated extensive experience in research, teaching, outreach and engagement with diverse social actors. As is common in the discipline, professionals dedicated to the various subdisciplines of cultural astronomy come to the field from diverse backgrounds. In the case of this department, these include Engineering, Architecture, Astronomy, Biology, and Geographic Information Science and Technology. Some of these backgrounds are typical among professionals in the field and contribute an interdisciplinary perspective when addressing disciplinary development, both in terms of approach and methodology. This has been both a motivation and a challenge in the development of the Bachelor's Degree in Cultural Astronomy, representing a truly innovative advancement in academic training. Ultimately, professionals in the discipline will help establish educational and methodological standards within the field. This paper explores the opportunities, challenges, and lessons learned that this interdisciplinary practice has brought to professional performance over more than a decade of scientific research, outreach, and teaching. It also concludes by discussing the perspectives that this new training approach opens up for the field.

2655. New Lunar Light on Stonehenge from Ancient Greeks & Modern Computers

Authors: Vance Tiede (Astro-Archaeology Surveys)
Format: Oral

Two British astro-physicists proposed that Stonehenge was designed as a lunar-solar observatory capable of predicting danger periods when eclipses were possible (Hawkins 1964, Hoyle 1966), an interpretation rejected by a prominent British archaeologist (Atkinson 1966). This study analyzes the eclipse prediction hypothesis by comparing Stonehenge's architecture with ancient Greek references and modern computer simulations. Stonehenge's architectural elements correlate with six "numerical artifacts" found in ancient Greek calendars, viz.: 19 Dolerite Bluestones Horseshoe: Meton of Athens' Lunar Phase Cycle of 19 years and Diodorus of Sicily's spherical temple of Apollo on the Beyond North Wind (Hyperborea) island about the size of Sicily, and visited by the Moon Goddess (Selene) every 19 years; 29 Z Holes + 30 Y Holes: Solon, Archon of Athens, Double Month of 59=29+30 days; 29.5 Sarsen Uprights (Sarsen #11=0.5 Length/Width/Height): 29.53 Lunar Synodic Period days; 30 Unit Perimeter and 30 Unit sq. Area of Station Stones: Pythagorean 5:12:13 Triangle ≈ Lunar Synodic Period integer days; 56 Aubrey Holes: Eudoxus of Cnidus, Lunar Eclipse (Typhon) 56-sided polygon, where 56/3=18.6 years (Regression of the Lunar Nodes); 59 Bluestone Circle Stones: Solon, Archon of Athens, Double Month of 59=29+30 days; Modern computer programs provide new evidence with Lunar and Solar Eclipse Calendars (Espenak, www.EclipseWise.com) which confirm that Stonehenge could have predicted both the majority of all (Total/Partial/Penumbral) locally observable lunar eclipses and 100% of lunar and solar eclipse-free days. For example, there were 11 Midwinter and Midsummer Total Lunar Eclipse Tetrads (four consecutive eclipses each separated 6 synodic months apart) 3000-1500 BCE. Of these 44 eclipses, 29 (66%) were visible at Stonehenge as modeled in a digital planetarium (Starry Night Pro+6). Moreover, Midwinter Total Lunar eclipses occur whenever the Full Moon rises over the Heel stone every 18+19+19=56 years before going out of phase every 336 (=6 x 56) years.

20. Mr. Nail, or Why Nail Typology Matters in an Archaeological Excavation

Authors: Jose Balbi (Colchester Archaeological Group UK)
Format: Poster

There are many typologies for classifying ancient nails found in excavations. In my case, as a specialist in the history of the Roman occupations of Palestine and Britannia in the 1st and 2nd centuries CE, the most common classification table is the one designed by archaeologist W.H. Manning and published in 1976 in the Journal of the British Museum. This poster will show how the discovery of nails in an excavation and their arrangement can indicate very important things, such as the existence of a roof, the alignment of a building, and many other elements. I will present images of iron nails and the process by which they are revealed to the archaeologist, from their electronic detection to their development for measurement, photography, and weighing, which will determine their classification. And an additional case study: Can the type of nails determine the possibility of finding the site of a crucifixion? The work will be based on my excavations since 2015 to the present at the Roman Villa at Fordham, 6 km from Colchester, the ancient Roman capital of Britannia, in what is today the United Kingdom. The Mr. Nail thing is a joke. I've been excavating Roman sites for over a decade, teaching about nails and instructing on the importance of these small finds, that's my nickname, and I wear it with pride.

1529. History, Calendar and Skylore of the Incas at the Time of the Spanish Conquest: an overview

Authors: Mariusz Ziólkowski (Centre for Andean Studies, University of Warsaw)
Format: Poster

This poster summarizes a book by the author, currently in print, entitled „History, Calendar and Skylore of the Incas at the Time of the Spanish Conquest" (Springer 2026). It presents a reconstruction of the state calendar used in the Inca Empire for programming, coordinating, and controlling various social activities at the imperial scale. The work also discusses the techniques of astronomical observations during the Inca period and Andean specialists' predictions based on the interpretation of extraordinary phenomena, such as the appearance of comets or eclipses. The historical section presents the European and Inca calendar systems in parallel, focusing on the main events of the Conquest and the subsequent existence of the state of Vilcabamba until 1572. Although the correlation between Mesoamerican calendars and the Julian calendar has long been used to interpret events in Mesoamerica, this work is the first of its kind for the Andean region. This work presents a reconstruction that is diametrically opposed to the late Professor Thomas Zuidema's "khipu calendar" (Zuidema, 1995), the model most widely used in Andean studies to date. Online supplementary resources convert dates between Julian and Inca calendars for the period from 1500 to 1572.

5 HOUSING THE COURT – INFRASTRUCTURES, COMMUNITIES, AND POWER IN PALATIAL ENVIRONMENTS

Theme: 1. Widening perspectives in material culture studies
Organisers: Thea Ravasi (Newcastle University) – Sofia Vagnuzzi (University of Caen) – Laura Bottiglieri (Sovrintendenza Capitolina di Roma)
Keywords: Imperial Residences and Court society, Non-elite communities in Roman imperial residences, Working communities and labour organisation in Roman imperial residences, Imperial residences as laboratories of urban and social planning
Format: Regular session

SESSION ABSTRACT

This session investigates the residential and infrastructural dimensions of imperial residences, redirecting attention from ceremonial spaces to the largely overlooked architecture of housing and service infrastructure. Beyond rulers, their families, and the immediate courtly elite, such complexes were intricate environments hosting diverse populations that included high-ranking officials, administrators, and servile staff, whether permanently settled or temporarily engaged in residence and labour. Yet, the archaeological, spatial, and social dynamics of these quarters remain insufficiently explored. Central to this enquiry is the question of how imperial residences were planned to accommodate, organise, and regulate their diverse human and infrastructural needs, and how these arrangements materialised power, hierarchy, and social permeability. Addressing this question requires the integration of structural, documentary, and environmental evidence, framed within comparative perspectives across the Roman Empire and beyond. By foregrounding residential and infrastructural components, the session encourages dialogue on imperial residences from Rome to the provinces, set within the broader traditions of Byzantine, Islamic, and early modern courts in Europe and beyond. These complexes were not merely ceremonial backdrops but inhabited environments where service populations, court officials, and military units coexisted under carefully regulated conditions. Comparative perspectives underline both the specificity of Roman approaches and the wider challenges faced by monarchical powers across time: sustaining working communities, managing water and sanitation, controlling access to rulers, and integrating palaces with their productive landscapes. In doing so, the session reframes palatial environments as laboratories of urban and social planning and raises broader questions about how past societies conceived, inhabited, and controlled spaces of power. Contributions may address themes such as housing, sanitary, productive, and care and disposal practices for working communities, labour organisation, the presence of the military, patterns of access and mobility, links with production landscapes, and the wider role of palaces as laboratories of urban planning.

CONTRIBUTION ABSTRACTS

990. Housing the Court – A Methodological and Theoretical Framework for a Reconceptualization of Infrastructures, Communities, and Power in Palatial Environments

Authors: Sofia Vagnuzzi (Université de Caen Normandie, CIREVE - ERLIS, UR 4254) – Thea Ravasi (Newcastle University) – Laura Bottiglieri (Sovrintendenza Capitolina, Roma)
Format: Oral

Power is not sustained by rulers alone. It is produced, stabilised, and reproduced through systems of labour and dependency embedded within residences of power. Palaces, courts, and elite compounds were not simply ceremonial settings, but densely inhabited environments whose functioning relied on permanent and semi-permanent working populations. This paper introduces the session by reframing such complexes as architectures of authority: built systems in which social hierarchy, obligation, and control were materially organised through space and infrastructure. Drawing on perspectives from infrastructure studies and labour archaeology, the paper foregrounds the often-invisible labour that sustained court life. Residences of power concentrated diverse working populations, such as administrative personnel, soldiers, skilled and unskilled workers, carers, and servile dependants, bound into relations of obligation and dependency. Housing, circulation, water and sanitation, storage, waste management, and productive facilities formed interconnected infrastructural systems that regulated access, movement, and proximity to authority. These were not neutral technologies, but mechanisms that disciplined bodies, structured dependency, and normalised hierarchy through everyday practice. Adopting a comparative perspective beyond the Roman world, this paper highlights shared challenges faced by power-holding institutions: sustaining labour forces at scale, maintaining complex infrastructures over time, integrating residences with wider economic landscapes, and disciplining bodies through space. By foregrounding labour, maintenance and infrastructural dependency as constitutive elements of the built environment, the session reframes residences of power as laboratories of social and spatial organisation, where authority was continuously enacted through work, maintenance, care, and controlled mobility, as much as through spectacle and representation. The paper establishes a theoretical framework and methodology for exploring the various dynamics that underpin the functioning of architectures of authority across different geographical and chronological contexts, providing a broad comparative lens and a flexible approach for understanding how power systems were enacted, sustained, and organized in diverse historical and cultural settings.

2768. Officials, soldiers and courtiers in the palace: domestic spaces and imperial administration offices in the Palatine residence (Rome)

Authors: Paola Quaranta – Fulvio Coletti – Aura Picchione (Parco archeolgico del Colosseo)
Format: Oral

The large complex of the imperial residence on the Palatine, built from the Neronian age, extends on the top of the hill from the northern sector, known as Domus Tiberiana, to the southern sector, the complex known today as Domus Severiana. The central quarters - Domus Augustana/Domus Flavia - have often been interpreted as the central nucleus of the emperor's residence and his family, a place for ceremonial spaces and the exercise of power. Below the "noble" floor, the palace develops on several floors, expanding along the slopes, with a complex architectural structure intended to house offices, services and community, from the highest officials in rank to servants, necessary for the daily life and operation of the entire complex. In view of the intimate relationship between architecture and society, this paper addresses, on the one hand, the relationship between the public and private spaces frequented by the emperor and his court and the underground contexts, cryptoporticus and viae tectae (covered walkways inside the building) which on the other hand, served as a means of communication between the various pavilions of the Palace, but also as a sorting and control centre for the security of the imperial family. A second aspect that our paper intends to address is that of the activities carried out in the buildings located on the slopes of the hill, architecturally organised according to the insulae typology with the structural function of containing the steep hillsides. These complexes, which were architecturally developed on several levels and designed according to a fixed and recurring spatial organisation, were, in our interpretation, intended for domestic life and to house the economic and administrative activities of the palace chancellery offices, according to the interpretative key of the social and organisational structure of the imperial court.

2803. "Even in a palace, a right life is possible..." – Rhythms and Realities in the Great Palace in Constantinople

Authors: Christian Rollinger (Trier University)
Format: Oral

The late antique Great Palace in Constantinople accommodated not only the imperial family, but also the court as a social, political, and administrative institution, as well as working communities (soldiers, servants), whose presence shaped its organization and whose comings and goings shaped the rhythms of palace life. This paper attempts – and given the considerable challenges of the evidence, it can be no more than an attempt - to consider the Great Palace as an inhabited microcosm (in addition to a ceremonial complex). Drawing on archaeological evidence, topography, and late antique literary sources, it will examine how the palace was spatially integrated with, yet selectively separated from, both the surrounding city and other administrative centres within the city, and how this ambivalent relationship structured life and work within the imperial residence, and the performance of administration. Particular attention is paid to mechanisms of access control, including the deployment of military guards, gates, and thresholds.

362. Beyond Ceremony: Peopling Roman Palaces and the Infrastructural Design of Hadrian's Villa (Tivoli, Rome)

Authors: Thea Ravasi (Newcastle University)
Format: Oral

This paper examines innovation in the architectural and infrastructural design of Roman imperial residences, shifting attention away from ceremonial and representational spaces to focus on the residential, productive, sanitary and leisure environments intended for low- and mid-ranking members of the imperial court. It argues for a fundamental reorientation in how architectural innovation in imperial contexts is understood. Rather than equating innovation solely with novel forms, striking volumes or exceptional technical solutions, the paper proposes that innovation also lay in the creation of articulated and adaptive systems capable of accommodating and sustaining large, heterogeneous communities of permanent, visiting and seasonal workers, whether free or enslaved. Such systems were designed to respond to fluctuating court demographics and changing logistical requirements, and this adaptability, it is argued, underpinned the long-term resilience of many imperial residences. Innovation, therefore, is approached not as an aesthetic or technical endpoint, but as a dynamic process embedded in planning strategies, spatial organisation and infrastructural connectivity. Hadrian's Villa provides an ideal context in which to explore these issues. Although brick stamps attest to multiple construction phases, the villa was conceived as a unified project under Hadrian and preserves staff accommodation and service spaces on a scale unparalleled in the Roman world. These spaces, together with dense networks of roads, corridors, water-supply systems, latrines and thermal installations, formed the connective tissue that allowed the villa's architecturally diverse complexes to function as a single operational organism. Despite the abundance of archaeological and epigraphic evidence relating to the villa's working population, no systematic study has yet examined how these working spaces were planned, used and transformed over time, or how they articulated with ceremonial quarters and the surrounding productive hinterland. This paper addresses that gap, situating service infrastructures at the centre of debates on imperial architecture, labour and long-term resilience.

1673. Behind the Scenes at Hadrian's Villa: The Macchiozzo Buildings and Their Inhabitants

Authors: Francesco De Angelis (Columbia University)
Format: Oral

Since 2014, Columbia University's Advanced Program of Ancient History and Art (APAHA Tibur) has uncovered three previously unknown residential edifices at Hadrian's Villa: a medianum building and two courtyard buildings. Located in the so-called Macchiozzo, in close proximity to some of the site's main reception and dining spaces—from the Piazza d'Oro to the Winter Palace—these buildings were not meant for imperial frequentation, as evidenced by their architectural typologies and their floor, wall, and ceiling decoration, among other things. This talk addresses the question of the identity of the inhabitants and users of these buildings. In particular, it attempts to determine their sociocultural level by comparing the buildings' layout and decoration to those of similar structures at Hadrian's Villa and elsewhere, especially at Ostia. Spatial and access analysis is employed to investigate the nature of the routes that connected the Macchiozzo to other sectors of the villa, as well as to the outside. The possible statuses and specific roles of the people who lived in these buildings are examined with the help of epigraphic evidence from other imperial residences.

1404. From the Horti Spei Veteris to the Palatium Sessorianum: a picture of the residential housing of the palace

Authors: Laura Bottiglieri (Sovrintendenza Capitolina)
Format: Oral

The Horti Spei Veteris, which became imperial property under Septimius Severus, hosted an extensive architectural complex, of which imposing agonistic structures and a monumental atrium still survive, conveying the grandeur of the original ensemble. Far less visible, however, are the traces of the residential quarters—sometimes obliterated by modern urbanisation, sometimes brought to light only partially or misunderstood in interpretation. Through a re-examination of the surviving remains, the interpretation of new data, and archival analysis, an attempt has been made to reconstruct the residential occupation of the area across the historical phases of the palatial complex. Beginning with the structures traditionally identified as domus of the Constantinian period, built against the Aqua Claudia, a reassessment of their chronology has been proposed on the basis of recent excavation data. This reinterpretation places the first building phase in the Severan period and reconstructs subsequent phases of renovation up to Late Antiquity, corresponding to restoration works on the aqueduct and the castellum aquae located located in the northern part of the complex. The strip of land along the aqueduct appears to have been occupied by residential buildings since the Antonine age. High-status dwellings are attested in the north-western sector, showing continuity of use up to the post-Constantinian phase. From the Severan period onwards, further dwellings of medium and small size were built, yet showing well-crafted decorative finishes. These same houses later underwent a reorganisation process marked by the subdivision of interior spaces and the systematic installation of sanitary facilities of uniform size and type—features also found in new houses built by reusing structures from the recently abandoned Circus Varianus.

105. Toilet Placement, Sanitation, and Spatial Control in the Dunnu at Tell Sabi Abyad

Authors: Sergio Remon Alvarez (Leiden University/Utrecht University)
Format: Oral

The Dunnu complex at Tell Sabi Abyad offers a rare opportunity to explore the infrastructural and spatial organisation of an Assyrian imperial residence beyond ceremonial architecture. Positioned within the administrative and possibly palatial sphere of the Middle Assyrian state, the Dunnu functioned as a fortified estate housing not only elite occupants but also a working community tasked with sustaining the site's logistical and social operations. This study examines the spatial logic underlying toilet placement within the complex, foregrounding sanitation infrastructure as a lens for understanding access, visibility, and social regulation. Using DepthmapX and space syntax methodologies such as Visibility Graph Analysis (VGA), axial maps, justified graphs and agent based modelling, this analysis demonstrates that toilet spaces at the Dunnu occupy areas of low visual integration and restricted movement. Their secluded placement reflects a deliberate effort to manage bodily practices discreetly, while maintaining their accessibility to select occupants. These spatial arrangements suggest a built environment calibrated to uphold social hierarchies and control circulation within the estate, balancing the needs of privacy, functionality, and authority. By focusing on sanitation infrastructure, often neglected in archaeological narratives, this study contributes to a more nuanced understanding of imperial residences as lived environments. The Dunnu exemplifies how infrastructural planning extended into the regulation of non-elite activities, supporting broader systems of labour, hygiene, and spatial segregation. Situating these findings within wider imperial traditions, the paper highlights the role of infrastructural design in materialising power and organising courtly and servile coexistence in palatial settings.

1958. Architectural Experimentation and Construction Solutions for the Heating of Residential Spaces between Hadrian's Villa and the Imperial Palace of Rome

Authors: Giuseppe Restaino (University of Cassino and Southern Lazio)
Format: Oral

Recent scholarship has highlighted the innovative character of Hadrianic architecture, emphasising the experimental approaches that produced some of the most structurally ambitious and iconic buildings in Roman architecture. Among these innovations, the strategies adopted for heating residential spaces are particularly revealing. At Hadrian's Villa, the challenge of heating entire residential blocks occupied by the emperor – such as the "Winter Palace" and the "Greek Library" – led to the creation of a sophisticated network of service corridors and substructures beneath the main living areas. These spaces enabled service personnel to circulate discreetly throughout the residence, ensuring the operation of the hypocaust system while remaining largely invisible from the representative spaces above. A comparable – yet overlooked – development occurred on the Palatine Hill in the same period, within the Domus Augustiana and the so-called Domus Flavia of the Imperial Palace. Here, the installation of hypocaust systems in the great Banquet Hall (triclinium) and in other newly constructed rooms required the construction of sub-floor corridors that provided constant access to furnaces and service areas. By comparing these two complexes, this paper examines how heating infrastructure shaped the organisation of residential and service spaces and structured the circulation of servile staff. It argues that such systems were not merely technical solutions but key instruments in the management of labour, the regulation of access, and the spatial articulation of hierarchy, revealing imperial residences as carefully planned environments designed to combine comfort, efficiency, and the control of working communities.

2265. Reconstructing hydraulic systems in palatial contexts with fragmentary evidence: methodological approaches from the Sessorian Palace and the Patriarchium in Rome

Authors: Elettra Santucci (Newcastle University)
Format: Oral

Hydraulic infrastructures were a fundamental component of imperial and ecclesiastical palaces, sustaining residential quarters, service spaces, ceremonial architecture, and the daily needs of courtly and working communities. In many palatial contexts, however, especially in long-lived urban centres such as Rome, the study of water systems is severely hindered by the extreme fragmentation of the archaeological record. Systematic spoliation, repeated architectural transformations, and long-term reuse of infrastructures have erased large portions of original networks, often limiting analysis to isolated and ambiguous remains. Focusing on the case studies of the Sessorian Palace in the Santa Croce area and the Lateran Patriarchium, two key architectural and institutional complexes in the eastern sector of Rome, this paper investigates the water management infrastructures associated with these environments, with particular attention to systems of supply, distribution, storage, and wastewater disposal. Both complexes are deeply embedded in the political and ecclesiastical landscape of Rome, yet their hydraulic systems have rarely been analysed as integrated components of architectural design, daily functioning, and urban organisation. Through the combined analysis of archaeological remains, architectural evidence, topographical data, written sources, and comparative hydraulic examples, the study examines the strategies adopted in imperial and ecclesiastical palatial contexts, highlighting their role in sustaining inhabited environments and a wide range of water uses. The paper argues that hydraulic systems, even when only partially preserved, provide a powerful analytical tool for investigating the organisation, resilience, and transformation of palatial residences as complex infrastructural and social systems, with their own internal organisation yet deeply linked to the broader urban water network.

1726. The infrastructure of Romuliana-Gamzigrad

Authors: Christoph Rummel (independent) – Stefan Pop-Lazić (Archaeological Institute Belgrade)
Format: Oral

The Roman remains near the village of Gamzigrad in Eastern Serbia have long been identified as a fortified palace and memorial complex designed for the Tetrarchic Emperor Galerius and were inscribed as a UNESCO World Heritage Site as such in 2007. Whereas research traditionally focused on the ideological, ceremonial and memorial programmes of the site – indeed, the OUV of the site is based primarily on these – a joint Serbian-German research programme has researched the site's hinterland and more functional aspects. Large scale geophysical research and targeted excavation of identified structures, as well as systematic excavations, have highlighted problems of supply and storage, construction and craftsmanship but also bathing and water supply. In addition, this work has shown that the non-representative elements of the site are significantly more complex, and more extensive, than had been credited in the 20th century. This paper presents the approaches and results of this research project that identify and seek to understand the less "imperial" and more "mundane" aspects of this important site for our understanding of elite and imperial residences during the Tetrachic period.

1272. Settlement topography of Ingelheim in the Carolingian period

Authors: Matylda Gierszewska-Noszczynska (Forschungsstelle Kaiserpfalz Ingelheim)
Format: Oral

Ingelheim – now a town in southwestern Germany- was one of the most significant Frankish seats in the Early Middle Ages. The landscape featured three settlement areas, which now form part of the town. The main area of Nieder-Ingelheim comprised several distinct settlement sites with differing functions and levels of importance. The central and most representative part was the palatium, whose construction began in the late 8th century during the reign of Charlemagne. It was built about 3 km from the Rhine River, on the middle terrace near the main route between Mogontiacum and Bingium. This location had already served as a royal court of the Merovingians from the late 7th century onward. To the west of the palatium laid the sacral district, which included the

Church of St Remigius and its associated cemetery. The church was donated to the Diocese of Würzburg in 741/742; nevertheless, it continued to play an important role for secular authorities as a venue for significant events. Three further settlements were also located in the vicinity of the royal residence and the Church of St. Remigius, serving both economic and residential purposes. Two additional settlement areas existed in Ober-Ingelheim and Frei-Weinheim, the latter situated directly on the Rhine. The settlement and church in Ober-Ingelheim are documented in the Breviarium Sancti Lulli, a list of the possessions of the monastery in Bad Hersfeld, dating to the period between 802 and 815. The existence of a harbour in Frei-Weinheim is also presumed based on a poem by Ermoldus Nigellus. Ingelheim during the Early Middle Ages should therefore not be understood as an isolated area centred solely on the palace complex, but rather as a multi-part settlement landscape that developed on Merovingian foundations and gained new impetus during the Carolingian period.

1959. The Carolingian Palatium at Ingelheim Inspired by Roman Architectural Exemplars

Authors: Ramona Kaiser (Forschungsstelle Kaiserpfalz Ingelheim)
Format: Oral

Charlemagne regarded himself as the successor of the Roman emperors. This ambition was reflected in the architecture of the palatium he commissioned at Ingelheim on the Rhine, located between Frankfurt and Cologne, in the late eighth century. Several examples of Roman influence can be identified in the palatium at Ingelheim. The exceptional character of the complex is evident in its floor plan. Measuring approximately 150 × 115 metres, the palatium formed a monumental, symmetrically organised ensemble with clear axial relationships, based on simple geometric forms—a square and a semicircle. The buildings were arranged along the outer edges, enclosing spacious inner courtyards. At the western end stood the Aula Regia, a single-nave hall with an apse that functioned as the king's representative assembly hall. The influence of late antique apse halls is evident here, such as the Constantinian Aula Palatina in Trier. The eastern side was defined by a monumental semicircular structure with a diameter of 89 metres. Although unique in the Carolingian period, this design closely recalls Roman forum architecture familiar to Charlemagne and his architects. The northern side was marked by a long building connected to the semicircular structure by a transverse building. Colonnades along the inner sides of this north wing and the semicircular building transformed the courtyards into peristyles. Roman influence is also evident in the technological infrastructure, notably in an early medieval long-distance water supply system constructed according to Roman aqueduct principles, as well as in the extensive reuse of Roman spolia. The lecture examines the architectural complex of the palatium at Ingelheim with particular regard to the extent to which its distinctive architectural design was related to its function, as well as the location of the possible residential quarters of the ruler and his entourage and the management of vital resources such as water.

1085. Visualising movement in the Flavian palace: The role of domestic staff and guardsmen

Authors: Benjamin Kelly (York University, Toronto) – Dominik Lengyel (Brandenburgische Technische Universität Cottbus-Senftenberg) – Harrison Forsyth (Durham College, Oshawa, Ontario)
Format: Oral

Few sustained scholarly analyses of human movement through Roman palatial spaces exist. Those that have been attempted tend to extrapolate movement purely from the architectural layout of spaces. In this paper, we add a crucial human element to the equation. We consider the roles of servile domestic staff and guardsmen in regulating the movement of people who visited the Flavian Palace to participate in the social rituals of the court. We begin the paper by exploiting literary accounts and epigraphic sources to suggest three ideal types pertaining to how domestic staff and guardsmen could channel movement through palatial space. These are: (1) guiding – when domestic staff or guardsmen would escort visitors all the way to their destinations; (2) gatekeeping – when static staff or guardsmen would block or control access through particular entrances and doorways, thus directing movement; and (3) cordoning – when configurations of staff or guardsmen would control movement through relatively open areas, such as porticos and large ceremonial rooms. The paper then explores these ideal types in the context of the Flavian Palace in Rome, with special attention to the great ceremonial rooms and their surrounds. Our analysis employs both archaeological plans and 3D computer visualisations of the spaces, abstracted in a sophisticated and highly developed manner, in keeping with the uncertainty of knowledge. We examine how the manpower requirements would have varied depending on the desired route and the number of visitors. We also consider how the flexible deployment of domestic staff and guardsmen could generate different routes to the same destination – and hence give different visitors different impressions of the same ceremonial space.

552. Imperial residences in motion: court logistics between circulation patterns and route hierarchy

Authors: Alice Poletto (John Cabot University)
Format: Oral

Recent scholarship has highlighted the role of Roman imperial residences—both the palaces in Rome and the suburban and extra-urban villas—as centres of government where emperors could fulfil the functions that their role entailed, such as receiving embassies, listening to petitioners, adjudicating lawsuits, and holding banquets or spectacles. In their role as centres of power, imperial residences were peopled by heterogeneous communities—the imperial family, the court, the household personnel, and the external subjects with whom the emperor interacted—whose simultaneous presence required an accurate spatial design, that ensured that occupants and visitors circulated within imperial residences without interfering with each other's activities and threatening the emperor. This paper will investigate circulation patterns within imperial residences, to understand how the movement of different categories of individuals was channelled to ensure the smooth functioning of these micro-universes. Building on a comparative analysis of three case studies—villa of Livia ad Gallinas Albas, villa of the Quintilii, and Villa Magna—architecture is treated not as a static backdrop, but as a lens through which we can gain insights on the functioning of these villas and on the infrastructures that allowed the staff to operate them. Priority is given to outlining the routes reserved to different categories of individuals, which are reconstructed through the features employed to channel and enforce movement (decoration, doors, screenings, security staff). Across the villas under consideration, this paper will investigate the relationships between the staff routes and the privileged paths reserved for high-ranking users, adopting a route-based approach that shifts attention from room typologies to circulation. The management of movement and the resulting spatial design of imperial residences are so-far little employed viewpoints from which these sites can be examined under a different light, that of a "working court", a hive of activity whose functioning depended highly on the personnel who operated them.

589. Between cleanliness and power: fullonicae and Imperial Properties in Rome

Authors: Valentina Pescari (Pisa University, Florence and Siena University)
Format: Oral

Previous studies highlighted the role of fullonicae within the economic and social fabric of Roman society, emphasising their function as predominantly client-oriented establishments. While the fullonicae of Ostia and Pompeii have been examined within broader interpretative frameworks that situate them in their urban context, Rome has hitherto lacked an overarching and systematic investigation aimed at a comprehensive understanding of the fullonicae and their functioning in relation to the city. My PhD research seeks to address this lacuna. The methodological approach adopted is multidisciplinary, integrating archaeological and topographical evidence with literary, epigraphic, and iconographic sources. The initial combination of these datasets outlines an intriguing scenario, in which the presence of fullonicae is attested within imperial properties and residences. With particular regard to Rome, this evidence is further enriched by the recent archaeological discoveries brought to light through the excavations at Piazza Pia, where a fullonica belonging to Horti Agrippinae was found. This constitutes a particularly stimulating line of enquiry, as it raises a series of broader questions: first, whether and how the organisation and management of these fullonicae differed from those documented so far; secondly, the nature of their intended clientele; and finally, the role of these structures within the textile production chain, as well as the social implications of such activities within imperial residences.

491. Enforcers and Rebels: The Evolving Lives of Women in Medieval Valencia

Authors: Ella Zeiders – Laura Jakubczak (Arizona State University)
Format: Poster

This poster applies gender archaeology methods more commonly used to study medieval England as a model for a more holistic understanding of womanhood and female agency in medieval Valencia (1300-1500 CE). The study of the symbolic vs. actual use of spaces such as private households, gardens, castles, and public city domains allows for a picture of the medieval past that explores the social dynamics of all women of the city, not only those of the privileged classes that tend to be the focus of historical texts. A survey of the historical and legal documents, combined with new archaeological research, reveals that while women were prescribed to remain in privacy through the spatial division of the castle, household, and city, their lives involved enhanced agency throughout the private sphere and permeable access to the public that is often undiscussed. Looking at the moments when women of different classes and different religions crossed these spatial boundaries helps illuminate the lived experience of women during times in which the dominant historical trend seemed to be the division of the kingdom and the persecution of various religious groups.

6 REASSESSING THE ROLE OF PALAEOLITHIC ROCKSHELTERS: ARCHIVES OF HUMAN BEHAVIOUR AND ENVIRONMENTAL CHANGE

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Mariana Nabais – Luís Gomes (UNIARQ – Centre for Archaeology, University of Lisbon) – Miguel Bel – Álvaro Martínez-Alfaro (PREMEDOC-GIUV2015-213, Universitat de València)
Keywords: rockshelters, palaeolithic archaeology, palaeoenvironments, stratigraphy, site formation processes
Format: Regular session
Affiliation: Palaeolithic and Mesolithic Community - PaM

SESSION ABSTRACT

Palaeolithic rockshelters represent some of the most critical archives for reconstructing and understanding human prehistory, offering uniquely stratified records of human occupation, environmental change and cultural development across vast temporal scales. These natural formations serve as repositories of both archaeological material and palaeoenvironmental data, these sites allow for multi-disciplinary investigations spanning lithic technology, subsistence strategies, symbolic and ritual behaviour, human occupation dynamics and human responses to climatic and ecological shifts. Despite their centrality to Palaeolithic research, rockshelters

face increasing threats from natural erosion, human activity and climate-driven processes, demanding renewed methodological and theoretical approaches. This session invites contributions that highlight the analytical potential of rockshelter contexts, present novel fieldwork or excavation results, and engage with current debates on site formation processes, stratighraphic integrity, conservation and interpretative frameworks. Submissions from archaeology, lithic analysis, zooarchaeology, archaeobotany, geoarchaeology, palaeoanthropology and related disciplines are especially welcome, with the aim of promoting a robust, comparative dialogue on the continuing significance of rockshelters as windows into deep-time human history and behaviour.

CONTRIBUTION ABSTRACTS

1937. Abric de la Ratlla del Bubo (Alicante, Spain): an old (un)known site. New data on its Early Upper Palaeolithic sequence

Authors: Álvaro Martínez-Alfaro – Miguel Ángel Bel (Universitat de València) – Jaime Cuevas-González – Davinia Díez-Canseco (Universitat d'Alacant) – Carmen M. Martínez-Varea – Nahúm Méndez – Cristina Real (Universitat de València) – Ana Luisa Rodrigues (C2TN/DECN, Instituto Superior Técnico, Universidade de Lisboa) – Valentín Villaverde – Aleix Eixea (Universitat de València)
Format: Oral

The Abric de la Ratlla del Bubo is one of the key rockshelters for understanding the Early Upper Palaeolithic in the central Iberian Mediterranean basin and a potential site to unravel the Middle to Upper Palaeolithic transition in the region. The sequence has also provided evidence from Solutrean occupations, but these will not be analysed in this presentation. Despite its relevance, the site been subjected to interpretative limitations arising from its complex excavation history, encompassing early clandestine interventions and subsequent scientific excavations conducted in separate sectors. These circumstances have resulted in the partial publication of the archaeological record. The following presentation offers a renewed assessment of Abric de la Ratlla del Bubo as a complex stratified archive, integrating the revision of legacy collections with new fieldwork that was initiated in 2024. Through a preliminary geoarchaeological approach—including stratigraphic and sedimentological data—we identify and analyse the main stratigraphic units and sedimentary facies of the site. In addition, the present study incorporated analyses of lithic technology, raw material procurement strategies, archaeobotanical and faunal remains, and absolute chronology. The integration of these datasets allows a more detailed reconstruction of occupational dynamics, resource exploitation, and cultural behaviour during the Early Upper Palaeolithic. From a chrono-cultural perspective, Abric de la Ratlla del Bubo provides essential data for discussing the onset of the Upper Palaeolithic in the Valencian region. The new data contribute to the refinement of regional models of cultural dynamics and challenge earlier assumptions based on incomplete or poorly contextualised assemblages. In conclusion, this contribution points out the necessity of re-examining classic rockshelter sites such as Abric de la Ratlla del Bubo through updated methodological and theoretical frameworks. This evaluation emphasises the fact that these sites have the potential to serve as dynamic archives for the reconstruction of long-term human behaviour and cultural change.

2377. The Upper Palaeolithic occupation at Curva da Bezelga Karstic Canyon (Torres Novas, Portugal)—Preliminary data from Gruta 3

Authors: Maria Melo – Luís Gomes – Sara Martins (UNIARQ – Centre for Archaeology, University of Lisbon) – Filipa Rodrigues (UNIARQ – Centre for Archaeology, University of Lisbon | Câmara Municipal de Torres Novas)
Format: Oral

Curva da Bezelga (Assentiz, Torres Novas, Portugal) is a small karstic canyon located at the northeastern end of the Serra d'Aire, part of the Iberian Western Limestone Massif. It lies at an ecotonal boundary between the limestone uplands and the adjacent alluvial plain of the Tagus basin. This geomorphological and environmental setting likely shaped patterns of human occupation, resource exploitation, and mobility. Furthermore, the abundance of caves and rockshelters formed on the Jurassic Limestone bedrock constitutes optimal depositional environments, where archaeological records of Palaeolithic human occupations are often well preserved. Gruta 3 da Curva da Bezelga provides the first evidence of Palaeolithic occupation in the area. Identified in 1999 and subject to diagnostic test-pits in 2006, it displays two distinct geomorphological sectors: (1) a covered area with a small gallery interpreted as a remnant of a tubular fossil collector and (2) an exterior area composed by intra-karstic deposits currently exposed by escarpment retreat and roof collapse. This exterior area's topmost layer preserves a high density of lamellar blanks and retouched bladelets, with techno-typological traits characteristic of the Magdalenian, sensu lato, providing valuable data for discussions of regional site formation processes and occupation strategies. Fieldwork resumed in 2025 corroborated the predicted stratigraphic sequence: below the materially rich layer, a sterile clay level caps a horizon characterised by large boulder collapse. Such a sequence is identical to the one found at the top of the Upper Pleistocene sequence of the nearby Caldeirão Cave, strengthening the previous hypothesis on the site's chronology and archaeostratigraphic potential. This paper summarises the results of the most recent archaeological work in the Curva da Bezelga canyon, highlighting the data from Gruta 3, focusing on its regional significance for furthering our understanding of Magdalenian stone-tool management and possibly of the Solutrean-to-Magdalenian archaeological record.

2416. Abrigo da Senhora das Lapas (Tomar, Portugal): A New Upper Palaeolithic Rockshelter in Western Iberian Peninsula

Authors: Luís Gomes – Maria Melo (UNIARQ – Centre for Archaeology, University of Lisbon) – Filipa Rodrigues (UNIARQ – Centre for Archaeology, University of Lisbon | Câmara Municipal de Torres Novas) – Pedro Souto (STEA – Sociedade Torrejana de Espeleologia e Arqueologia) – Alexandre Varanda – Mariana Nabais (UNIARQ – Centre for Archaeology, University of Lisbon)
Format: Oral

Abrigo da Senhora das Lapas (ASL) is a rockshelter documenting several Upper Palaeolithic occupations. It is located in the karst canyon crossed by the Nabão river, at the eastern limit of the Estremadura Limestone Massif and a few km north of the city of Tomar. This small area is rich in prehistoric cave sites, but ASL is currently the only rockshelter found therein that preserves a multi-layered and well-preserved Upper Palaeolithic sequence. Identified in 2021 and test-excavated since 2022, the site presents several superimposed and easily discernible archaeostratigraphic units, each yielding a high density of lithic materials found alongside abundant faunal remains, colorants, and shell beads. AMS radiocarbon dating places the upper 50 cm of the sequence (Units 1-2) in the last few centuries of Greenland Stadial 1 (Dryas III), consistent with the Final Magdalenian typology of the stone tool assemblages. A major rockfall event separates these units from underlying Units 3-4, whose macrolithic points, bifacial thinning flakes and denticulated backed bladelets support attribution to the Upper Solutrean. This sequence follows the pattern observed elsewhere in Western Iberia whereby, as observed nearby at Caldeirão Cave, the intermediate chronostratigraphic phases (Solutreo-gravettian and Early Magdalenian) are missing. Unlike other contemporaneous sites currently known in the region, the stratigraphic integrity and high density of finds allow for extensive and deep inquiries concerning the techno-economic patterns prevalent during the latter stages of the Portuguese Palaeolithic. We will present the first, preliminary results of the ongoing excavation, alongside data derived from the ongoing analysis of the remains, framing them within regional chronostratigraphic and technological models. We further highlight the relevance of the ASL project for the development of new research programmes focused on the detection and study of Palaeolithic rockshelters in the region.

2732. Dynamic Contexts and Cultural Material Evidences from Late Paleolithic and Mesolithic Human Occupation in Eastern Sicily Caves and Rockshelters

Authors: Maria Rosa Iovino (Italian Institute Human Paleontology)
Format: Oral

This study concentrates on a comprehensive, challenging, re-evaluation of selected caves and rock shelters that bear witness to late Paleolithic and Mesolithic occupation across diverse geographic contexts, including mountainous location, inner plain and coastal area. Central to this research is the detailed reexam of cultural materials and fauna remains, that serve as valuable resources for shedding light on subsistence strategies and environmental conditions. By harnessing cutting-edge 3D modeling and photogrammetry reconstruction technologies, we analyze the geomorphological features of these sites, thereby enhancing our understanding of the complex issues related to geological processes. Cave and rock shelter deposits in Sicily, in the past and in recent times, have experienced alterations caused by both natural processes and biotic factors, including animal influences and human activities. For this reason this study aims to uncover also how post depositional alteration could have developed ambiguites and/ or compromised the integrity of the archaeological record, providing critical insights into the transformative dynamic processes at these sites.

435. Rockshelter Na Skalici (Bohemian Karst, Czechia): Stratified Archive of Repetitive Hunter-Gatherer Occupation across the Pleistocene–Holocene Transition

Authors: Katarína Kapustka (Institute of Archaeology, Czech Academy of Sciences, Prague | Anthropos Institute, Moravian Museum) – Olga Trojánková (Laboratory of Archaeobotany and Palaeoecology University of the Southern Bohemia) – Lenka Lisá (Institute of Geology of the Czech Academy of Sciences) – Michaela Ptáková (Laboratory of Archaeobotany and Palaeoecology University of the Southern Bohemia) – Karolína Pauknerová (Center for Theoretical Study, Charles University) – František Adámek (Institute of Archaeology, Czech Academy of Sciences, Prague) – Kristýna Budilová (Laboratory of Archaeobotany and Palaeoecology University of the Southern Bohemia) – Nikola Koštová (Institute of Archaeology, Czech Academy of Sciences, Prague) – Romana Kočárová (Department of Botany and Zoology, Faculty of Science, Masaryk University)
Format: Oral

Rockshelters are among the most informative yet taphonomically complicated archives for reconstructing long-term human behaviour and environmental change. In Central Europe, securely stratified rockshelter sequences spanning the Pleistocene–Holocene transition remain rare and methodologically underrepresented. This paper presents new and reassessed evidence from the rockshelter Na Skalici in the Bohemian Karst (Czech Republic), documenting episodic hunter-gatherer occupation from the Late Pleistocene to the Middle Holocene. The site preserves a well-defined stratigraphic sequence attributed to the Magdalenian, Late Palaeolithic and Mesolithic periods, allowing assessment of repeated short-term use within a karstic landscape highly sensitive to climatic and ecological change. The study integrates results of biostratigraphic excavations conducted between 1989 and 2016, followed by archaeological fieldwork initiated in 2025. A multi-proxy analytical framework combining detailed stratigraphic observations, lithic technological analysis, palaeoecological data (malacozoology and microfauna analysis), charcoal analysis, archaeobotanical macroremains analysis, geological sampling and radiocarbon dating is employed to evaluate site formation processes, depositional integrity and occupational dynamics. Eight radiocarbon dates obtained from small vertebrate remains identify two Late Glacial and Late Palaeolithic occupation phases (ca. 13,900–13,100 cal BC and 11,500–10,950 cal BC), followed by a Middle Holocene Mesolithic phase dated to ca. 5500–5000 cal BC. The chronological discontinuity between these phases supports intermittent site use rather

than continuous occupation. Stratigraphic integrity is corroborated by coherent palaeoecological assemblages and a hearth horizon indicating in situ human activity. Lithic assemblages dominated by local cherts reflect flexible raw-material procurement and technological continuity with adaptive change across the Pleistocene–Holocene boundary. Na Skalici demonstrates the analytical potential of rockshelters as stratified archives preserving high-resolution records of hunter-gatherer behaviour and environmental responses during major climatic transitions.

1383. The archaeological record preservation in an active karst system: the case of Coves de Sant Josep (Eastern Iberian Peninsula)

Authors: Jacopo Armellini (Departament d'Història, Geografia i Art, Universitat Jaume I | Departament d'Història i Arqueologia, Universitat de Barcelona) – M. Mercè Bergadà (Departament d'Història i Arqueologia, Universitat de Barcelona | Institut d'Arqueologia de la Universitat de Barcelona - IAUB) – Josep Casabó (Consejería de Educación, Cultura y Universidades. Generalitat Valenciana) – Maria L. Rovira (Museo Arqueológico de La Vall d'Uixó) – Dídac Roman (Departament d'Història, Geografia i Art, Universitat Jaume I)
Format: Poster

Caves are the most suitable depositional environments for studying prehistoric societies, due to their capacity to retain and preserve sediment, both geogenic, biogenic and anthropogenic. The preservation is due to the lower incidence of erosional dynamics, especially when compared to extremely dynamic environments, such as fluvial or slope environments. For this reason, archaeological material in caves is normally found in inactive karst systems, particularly in caves with absent or ephemeral hydrological activity. Here we present the Pleistocene to Holocene stratigraphic sequence of Coves de Sant Josep, a karst system characterised by high year-round hydrological activity. Despite that, a long stratigraphic sequence has been preserved within the cave, placing the human occupation between 22 ka and 6 ka cal BP. To reconstruct the site formation processes, we have applied geoarchaeological techniques, such as soil micromorphology, FTIR on bulk samples and µFTIR on uncovered soil thin sections. These analyses allowed us to reconstruct syn- and post-depositional processes that shaped the deposit and revealed how Sant Josep karst displays complex interactions between fluvial, slope and anthropic dynamics. We demonstrated that the grade of preservation in active karst can be high, allowing for the archaeological material to be preserved also in highly hydrological active environments.

7 ATHENS, ADEN, ARIKAMEDU – RESEARCH ON EUROPE-SOUTH ASIA RELATIONS 30 YEARS ON

Theme: 7. Interaction, connectivity and mobility
Organisers: Sophie Hueglin (University of Tuebingen | Newcastle University) – Sila Tripati (CSIR-National Institute of Oceanography)
Keywords: Indian Ocean, maritime trade, Maritime Silk Road, long-distance trade, cultural transfer, underwater archaeology
Format: Regular session

SESSION ABSTRACT

A famous collection of "Essays on the Interrelation between India, Arabia and the Eastern Mediterranean", published in 1994 and reprinted in 2005 (Boussac/Salles), is inspiring the title of our session. Just like Mark Horton then in his review "Mare Nostrum" in Antiquity (71, 1997, 753-755), almost 30 years later, the new evidence shall be assessed and an overview shall be given on the current state of archaeology in the Indian Ocean in relation to the Red Sea and the Mediterranean. Terminologies like that of the "(Maritime) Silk Road" serve political agendas rather than reflect the exchange across the Indian Ocean. William Dalrymple has shown this recently in his book "The Golden Road" (2024), where he tackles India's contribution to the world's transformation in Antiquity. There is new evidence that European concepts (Arora 2002, in: Proceedings of the Indian History Congress 63:29-85) and art motifs (Baumbauer et al. 2025, Nürnberg Global, online at arthistorium.net) also influenced South Asia. Diachronic perspectives as well as papers from all periods are welcome.

CONTRIBUTION ABSTRACTS

1277. Alexandria, Berenike, Socotra, Muziris – changing interpretations in the light of archaeological evidence

Authors: Sophie Hueglin (University of Tuebingen | Newcastle University)
Format: Oral

When assessing the excavation results at Arikamedu, it appears that this port did not have a permanent Roman settlement. On the other hand, Muziris, with its templum Augusti, has the look of a Roman colony. This is only one of the many aspects that have changed in our understanding of the trade relations in the Indian Ocean with the Mediterranean in the past 30 years. Similarly, Athens or Rome seems not to have played the same roles as Alexandria and later Cairo. Therefore, the title of a compilation today would not be "Athens, Aden, Arikamedu" (Boussac/Salles, reprinted in 2005) but rather, for example, "Alexandria, Berenike, Socotra, and Muziris". The Red Sea ports, with their exceptional preservation due to their dry climate, are like a magnifier for the products of trade that have decayed in the more moderate climates in the North or the tropical climate further south. Apart from the ports, underwater archaeology, namely the discovery of shipwrecks, has changed the picture significantly. This paper intends to assess the new evidence for the different time periods and, at the same time, tries to highlight the blind spots that still need to be addressed.

840. Sumhuram in the Indian Ocean trade network. Role and connectivity between the 3rd century BCE and the 5th century CE

Authors: Daniele Zampierin (Berlin Graduate School of Ancient Studies, Freie Universitat Berlin)
Format: Oral

Sumhuram (also known as Khor Rori, Oman) was founded between the late 3rd and early 2nd century BCE by the South Arabian kingdom of Hadramawt to manage the local frankincense production. However, its strategic position favoured its inclusion in the western Indian Ocean exchange system. In particular, its location guaranteed continuity of access to the commercial routes crossing the ocean to South Asia, the Persian Gulf, and the Red Sea until the site's abandonment in the 5th century CE. This paper presents results from a comparative ceramic study, conducted as a doctoral project, analysing the assemblage from Sumhuram in comparison with assemblages from Arikamedu (Tamil Nadu, India) and Tissamaharama (Sri Lanka). Through the detailed comparison of each published ceramic corpus and the identification and quantification of imported and exported ceramics, the study provides a data-driven and verifiable reconsideration of the mechanisms and intensity of maritime interaction across the western Indian Ocean from the 3rd century BCE to the 5th century CE. Rather than viewing exchange through simplified linear models, the paper highlights the complexity of multi-directional contacts and evaluates Sumhuram's role as both a regional trading centre and an active node within broader interregional trade networks. By presenting new results within a diachronic framework, the contribution refines current understandings of connectivity across the western Indian Ocean and contributes to the ongoing redefinition of long-distance exchange dynamics in the Indian Ocean.

736. Reconstructing Trade Connectivity in Early Historic South India: Ports, Rivers, and Inland Corridors (400 BCE–100 CE)

Authors: Sangeetha Raja – Gil Gambash – David Friesem (University of Haifa) – Marxia Gandhi (TN Dept. of Archaeology)
Format: Oral

Early historic South India formed a critical node within long-distance exchange systems linking the Indian Ocean world with the Mediterranean. While coastal ports such as Arikamedu, Alagankulam, Korkai, and Pattinam have long been interpreted as primary maritime interfaces, the connective infrastructures and mobility corridors that sustained these ports have received limited archaeological attention. This paper examines inland–maritime connectivity by reconstructing the land–river–sea networks that structured Indo-Mediterranean exchange between 400 BCE and 100 CE. Integrating archaeological data from coastal emporia with inland production sites including Kodumanal, Uraiyur, Kee=adi(Kīḻaṭi), and Karur. This study analyzes the spatial distribution of ceramics, beads, and craft debris to identify functional hierarchies within regional exchange networks. Methodologically, the research employs GIS-based spatial analysis and Least-Cost Pathway (LCP) modelling, factoring in seasonal hydrological fluctuations of the Vaigai, Thamiraparani, and Kaveri river systems. These digital models are cross-referenced with 'peruvali' (highways) referenced in Sangam Tamil literary traditions to map high-probability transit corridors. The results indicate that Indo-Mediterranean trade depended on a resilient, multi-scalar logistics system that integrated riverine transport with seasonal overland mobility. This study demonstrates that ports were not isolated gateways but terminal nodes within a deeply integrated hinterland. By foregrounding inland infrastructures, this paper challenges coast-centric models of the Indian Ocean trade and argues that Mediterranean-linked exchange was a primary driver for the socio-economic complexity of inland South Indian urbanism, extending the 'Mediterranean in motion' far beyond the shoreline.

1623. Maritime networks of Sri Lanka and South India between the 7th and the 12th century CE

Authors: Ariane De Saxcé (German Archaeological Institute, DAI - KAAK Bonn)
Format: Oral

From the time of the Arab conquests and the establishment of the Tang dynasty in China, Sri Lanka and South India find themselves at the center point of an extended trade network, that is accompanied by artistic and religious interactions. Particularly, Sri Lanka starts playing a pivotal role as a transshipment point for Arab and Persian ships travelling to China, as well as for the diffusion of Buddhism from India to Southeast Asia and China. After the 10th century, this direct long-distance connection is hindered by economic and political upheavals both in the East and West, so that a multi-segmented trade replaces the direct connection. The roles of Sri Lanka and South India evolve but remain a fundamental transit point in the exchanges of the Indian Ocean. This communication aims at emphasizing the evolution of trade and cultural networks in the western part of the Indian Ocean during this key period that sees the passage from 'globalized' exchanges to more regional segments. The focus will be especially on the links of Sri Lanka/South India with the Arabian Peninsula and the East African coast. It will include questions of navigation and routes as well as new discoveries concerning traceable types of products that were circulating, like glass for example.

55. From the Mediterranean to the Indian Ocean. Greek and Roman coins beyond

Authors: Philipp Schwinghammer (German Numismatic Society/Society of Thuringian Coins and Medals)
Format: Oral

This presentation deals with global economic networks in antiquity, which can be reconstructed based on finds of Roman and Greek coins, for example in Arabia, Central Asia and India. We encounter tetradrachms from Athens and coins of the time of Alexander the Great and his successors, the Diadochi, from Arabia to India, as well as Roman coins from the Mediterranean to the Indian Ocean. These coins flowed not only as foreign currency into these vast regions, but they also had an important impact on the images and nominal structure by inspiring imitations in local coinage. These imitations should be seen as a product of the cultural and economic fusion between the Mediterranean region, Arabia and India, which we encounter along the routes of the Incense Road and the Silk Road. Examples of coin circulation will be presented and local imitations of Greek and Roman coins in Arabia and India will be examined.

1442. Did the Romans maintain maritime trade contacts beyond Arikamedu, the east coast of India?

Authors: Sila Tripati (CSIR-National Institute of Oceanography)
Format: Oral

India's interactions with the Roman world during the early historical period were bidirectional. Greek contacts were mainly established with northwestern and northern India, while Roman interactions were primarily focused on South India. Maritime trade between India and the Romans began in the 3rd century BCE through ports along the Egyptian coast of the Red Sea. Egyptian ports such as Berenice, Myos Hormos, and Adulis maintained direct trade connections with Indian ports. Archaeological excavations at these Red Sea ports have uncovered Indian pottery, spices, coins, beads, sculptures, teak, textiles, and more. Conversely, Roman artefacts, including gold coins, amphorae, and Terra Sigillata (Arretine ware), are found in greater abundance in peninsular India than in other regions of the country. Evidence of marketplaces, bead and dyeing industries has also been discovered at Arikamedu. Roman ships journeyed directly to the ports of Arikamedu during sailing seasons, with their inward and outward travels relying heavily on monsoon winds. Roman goods were brought to Arikamedu and subsequently distributed throughout South Asia. Before the return journey, Roman merchants collected Indian products, undertook ship maintenance, and visited different ports and markets in India. Their return voyage typically began in November, aided by the Northeast monsoon winds. As a result, it is believed that the Romans did not venture beyond Arikamedu. However, the discovery of amphorae, Roman coins, and other artefacts beyond peninsular India suggests further investigation for confirmation. Additionally, understanding the causes behind the decline of trade warrants a more detailed examination.

2182. Managing maritime heritage: perspectives from India and Greece

Authors: Ioannis Poulios (Ionian University | Ahmedabad University)
Format: Oral

The presentation deals with the management of maritime heritage. Two ongoing grand government projects are used as case studies: the National Maritime Heritage Complex at Lothal, Gujarat, India, and the Museum of Underwater Antiquities in Athens, Greece. The following themes are discussed and reviewed: - what is the relevance and the importance of maritime heritage to the national history and identity; what is the role of the respective government in shaping this relevance and the associated policies? - what are the design ideas and how is the implementation of the two aforementioned projects in terms of the function of the two complexes; which buildings are being selected and built to accommodate the collections; which are the principles that guide the exhibitions, the associated complexities and the solutions sought? The ultimate aim is to draw good practices, as well as identify practices that could be better avoided, concerning the management of maritime heritage worldwide.

9 SHIFTING POLITICAL LANDSCAPES: ARCHAEOLOGY'S RESPONSE TO NATIONALISM, POPULISM AND IDENTITY IN EUROPE

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Andrew Whitefield (University of Galway) – Anna-Lena Jerg (University of Tübingen)
Discussant: Bettina Arnold (University of Wisconsin-Milwaukee)
Keywords: Nationalism, Populism, Identity, Politicisation, Archaeological representation, History of archaeology
Format: Regular session

SESSION ABSTRACT

The present era of populist nationalism has clear parallels with the intense nation-building of the earlier 20th century, which saw archaeology find its place in national institutions such as universities and museums, and in national legislation. The payback for investment in archaeology by the governments of nation states came in the form of archaeological narratives that provided 'scientific' underpinnings to imagined Golden Ages and origin myths. Resurgent nationalism, ideological polarisation, and the return of war to Europe, forces archaeologists to again face the challenge of navigating between competing interests and contested narratives. What historical narratives are being amplified or silenced in this new political climate? How can archaeologists resist being drawn into divisive identity politics while engaging in open, critical, and inclusive scholarship? How can the lessons from archaeology's entanglement with nationalism in the early 20th century help us avoid repeating the same mistakes? We invite contributions that explore how archaeology responds when political and ideological agendas seek to influence research topics, archaeological interpretation, and public presentation. We particularly welcome case studies that highlight politicisation (or its resistance) in museums, archaeological sites, universities, and the media—forums where the divide between scholarship and public discourse are negotiated, contested, and sometimes manipulated. Topics of interest include: • Parallels and differences between archaeological analysis, interpretation and representation in the early 20th century and today. • Authorised narratives: how monuments and sites are presented/co-opted/appropriated for public engagement, education, tourism, and international relations. • The impact of political agendas on data collection and analyses. • Case studies examining how archaeologists and heritage practitioners navigate populist, nationalist, or illiberal contexts. Proposed outcome: An edited volume that situates archaeology's response to the present political landscapes in the context of the history of the modern discipline.

CONTRIBUTION ABSTRACTS

456. A national science for the 21st century: the archaeological validation of national and cultural identities in Europe

Authors: Andrew Whitefield (University of Galway) – Anna-Lena Jerg (University of Tübingen)
Format: Oral

This paper explores the parallels between archaeology's role in shaping identities during the early twentieth century, and the discipline's predicament in the new era of populist nationalism. Archaeology's establishment in state institutions such as national museums and universities was achieved through the development of methods for measuring and codifying ancient remains. This ostensibly scientific approach enabled archaeologists to make categorical statements about the past. However, the inherent ambiguity and incompleteness of the archaeological record meant that preconceptions played a disproportionate role in the interpretation of often-meagre evidence. Assumptions were frequently grounded in the glorified and often fictive narratives of folklore and myth. Nationalistic politicians, however, saw value in a discipline with seemingly scientific credentials that could validate stories of ancient greatness. This yielded funding for archaeology and prestige for its leading practitioners, with often limited incentive for critical reflection. As the twentieth century progressed, and the discipline matured, critical engagement with the assumptions that underpinned archaeological interpretations increased. But in the early twenty-first century, the political cycle has turned, and populist nationalism is a resurgent force in European politics. How is archaeology responding to the new political reality? Is 21st century archaeological science critically engaging with the new politics, or simply finding new ways to reify old stories? Have archaeologists learnt the lessons of the discipline's past, or are we destined to repeat the same mistakes? By examining historical and present-day uses (and misuses) of scientific data in archaeology in Ireland and Europe, this paper seeks to highlight the role of disciplinary historiography in identifying the flawed reasoning that continues to underpin many nationalistic and ethnocentric interpretations of cultural identities before modern nations existed.

1266. The politics of chronology: Museum narration and nation building in 19th century Scandinavia

Authors: Johan Hegardt (Södertörn University)
Format: Oral

When Christian Jürgensen Thomsen (1788–1865), in the early 19th century, travels through parts of Denmark, a country that recently had been bombarded by the British and had lost in The Napoleonic Wars, he focuses on archaeological monuments. His journey marks the beginning of a study that laid the foundation to the Three Age System, which was first published by Oldskriftselskabet (The Royal Society of Antiquaries) in a book with the title Ledetraad til nordisk Oldkyndighed in 1836. The book begins with an introduction, followed by a text written by the Danish historian and linguist Niels Matthias Petersen (1791–1861). Thomsen's text is the second last, and the book ends with listings and work plans for Oldskriftselskabet. In the Introduction it says that "Our time is a very important transition period for the development of humanity and works as a whole towards a new and better future". It is Thomsen's text that sets this agenda. Petersen's perspectives, on the other hand, represent the past. In this paper I will depart from Ledetraad and show how chronology, through Thomsen's Three Age System, supported this agenda and became a central part of museum narration and nation building in 19th century Scandinavia. But this is only half of the story. The other half concerns the development of the spirit in line with the German philosopher Hegel. Hence, it will be argued, museum politics in the 19th century was not a simple nationalistic discourse, but rather a complex and complicated composite of reflections on nation, identity, the past and – not at least – the future.

971. The Harvard Mission to Ireland: Archaeology, Nationalism and Identity in the Irish Free State in the

1930s

Authors: Mairead Carew (Independent Scholar)
Format: Oral

The Harvard Mission to Ireland (1932-1936) was a five-year anthropological study of Ireland which included three strands: social anthropology, physical anthropology and an archaeology programme which included the excavation of eighteen sites. The object of the project was to study the races and cultures of Ireland and to determine who the Celts were, where they originated from and to establish who were their modern descendants in Ireland. The Government of the Irish Free State, independent since 1922, welcomed this study. While eugenics underpinned the Harvard Mission project it also fitted neatly into the nationalist cultural regeneration project undertaken by the Irish Free State. This embraced history, folklore, Celtic Studies, the Irish language and archaeology. It also dovetailed with other important archaeological initiatives which included new legislation to protect National Monuments, a new cultural policy document for the National Museum and the establishment of the Unemployment Schemes for archaeological research. Archaeology was central to nation-building in Ireland and a conduit for the creation of a state identity. It paralleled similar cultural regeneration projects in other nation states in Europe. It also placed Ireland in the forefront of innovative archaeological research during the 1930s. This paper will challenge the idea that the cultural nationalist project undertaken in the Irish Free State during the 1930s was an insular one. The Harvard Mission to Ireland gave an international dimension to this process and helped consolidate the idea of a Celtic Ireland in a global context through the medium of archaeology.

2717. The Portuguese medieval battle of Aljubarrota: the making of narratives

Authors: Ana Cristina Martins (IHC-Universidade de Évora / IN2PAST)
Format: Oral

The Battle of Aljubarrota was fought between the Kingdom of Portugal and the Crown of Castile on 14 August 1385. Forces commanded by King John I of Portugal and his Constable Nuno Álvares Pereira, with the support of English allies, opposed the army of King John I of Castile with its Aragonese and French allies, as well as Genoese mercenaries at São Jorge, in central Portugal. The result was a decisive victory for the Portuguese, ruling out Castilian ambitions to the Portuguese throne, ending the 1383–85 Crisis and assuring John's position as King of Portugal. Portuguese independence was safeguarded and a new dynasty, the House of Aviz, was established. Scattered border confrontations with Castilian troops would persist until the death of John I of Castile in 1390, but these posed no real threat to the new dynasty. In 1958, archaeologist Afonso do Paço organized the first campaign of excavations, revealing the complex defensive system consisting of about 800 pits and dozens of defensive ditches and revealing one of the best-preserved battlefields of the period of the Hundred Years' War. In March 2002, under the initiative of António Champalimaud, the Battle of Aljubarrota Foundation was created. The first of its activities was to recover the battlefield. Through a protocol established by the Ministry of Defense in August 2003, the Foundation received authorization to transform the Military Museum into a modern Interpretation Center of the Battle of Aljubarrota. As a prime example of an authorised narrative of national identity supported by different and subsequent political Portuguese regimes, from Constitutional Monarchy till Democracy, with a special focus during the totalitarian 'New State' (1927-1974), we will analyse how this "National Monument" is being presented and used from the 19th century onwards, and evaluating its scientific, political, educational, touristic, literary, and artistic impacts.

141. Unearthed but Unclaimed: Polish Archaeology in the Absence of Politics

Authors: Paulina Florjanowicz (Independent researcher)
Format: Oral

Archaeology is often used as a tool to reinforce national identity, yet Poland presents a unique exception. This paper will provide a critical review of the impact of political neutrality on Polish archaeology and how this has shaped the current state of research. When archaeology was emerging as a modern scientific discipline in the 19th and early 20th centuries, Poland had only just regained independence in 1918. Unlike neighboring Germany, which heavily invested in archaeology, Poland lacked the state support necessary to integrate the field into national narratives. During World War II, both Nazi Germany and Soviet Russia occupied Poland, imposing their own ideological frameworks on academia. However, Polish archaeologists largely resisted collaboration, engaging instead in underground education and rejecting Nazi racial theories. Under Soviet rule, Marxist ideology briefly influenced archaeology, but its impact remained superficial. Postwar Poland, much like the interwar period, did not recognize archaeology's potential for state propaganda. Any state-supported archaeological projects were initiated by scholars rather than authorities. Over time, Polish archaeology became isolated from politics but also from public interest. It developed into a highly specialized, insular discipline, focused on typological analyses rather than broader cultural narratives. In contrast, Mediterranean archaeology captured public imagination, reinforcing the perception that archaeology was about ancient Egypt or Greece rather than Poland's own past. As a result, Poland's archaeological heritage remains largely unknown to the public, illustrating that while independence from political influence safeguards scientific integrity, it also risks marginalization.

4. Materializing Modern Greece: The Reconstruction of the Panathenaic Stadium for the 1896 Olympic

Games

Authors: Miltiadis Kylindreas (Emory University | American School of Classical Studies at Athens)
Format: Oral

The Panathenaic Stadium played a significant role in the collective consciousness not only of the ancient Athenians but also of modern Greeks. Founded in the Late Classical period, monumentalized in the Roman period, and reconstructed in the late 19th century, the Stadium consistently served one overarching purpose: to provide a venue for large-scale public spectacles. In this paper, I argue that the reconstruction of the Panathenaic Stadium for the first modern international Olympic Games in 1896 aimed to culturally connect antiquity with modernity, thus marking the culmination of Greece's constructed national identity in the late 19th century. To demonstrate this, I first examine the significance of the Stadium for the Great Panathenaia in antiquity; second, I consider how the urban planning of 1830s Athens, during its transformation into the new capital of Greece, was influenced by the known presence of the—still unexcavated—Stadium, which ultimately led to its excavation in the 1860s; third, I make a brief reference to the 1894 Paris Congress, which determined that Greece would host the 1896 Olympiad, and examine the main figures involved and their roles leading up to the event; fourth, I interpret the key role of the reconstructed Stadium as a key element in the cultural connection between antiquity and modernity, focusing on its benefactors, Herodes Attikos and Georgios Averoff, and the Stadium's impact on the Olympic Games. Lastly, I evaluate how the monument integrates into the contemporary architectural landscape of Athens and consider its multifunctional use and emblematic value. The reconstructed Panathenaic Stadium––rooted in the Bavarian Neoclassicism of the 1830s––thus served as an ethno-symbol, a tangible landmark embodying the national cultural landscape of contemporary Greece.

1579. Material Legacies and Political Narratives from the Spanish Civil War and Dictatorship

Authors: Amalia Perez-Juez (Boston University) – Davide Zendri (MITAG Museo Storico Italiano della Guerra) – Alicia Torija (Boston University Madrid) – Octavio Torres (University of Barcelona)
Format: Oral

This presentation examines the cultural landscape of Las Merindades (northern Burgos, Spain) through the material and immaterial legacies of the Italian Corpo di Truppe Volontarie (CTV) during the Spanish Civil War, situating this case study within broader debates on nationalism, identity, and the politicization of the past. The CTV, a fascist expeditionary force deployed by Mussolini in support of the military uprising, was stationed in northern Spain in the summer of 1937. Their tangible and intangible legacy represents how propaganda, heritage, and historical narratives were mobilized to legitimize a nationalist and authoritarian regime. Through archaeological survey and excavation, archival research, and oral testimonies, the study adopts a multiscale approach to explore how a relatively brief period of military occupation followed by a 40-year dictatorship produced long-lasting transformations in both the physical landscape and its social meanings. These remains are analyzed as material practices through which power, identity, and belonging were physically inscribed onto space, forming the basis for later processes of symbolic appropriation. The presentation further examines how these landscapes have been subsequently reconfigured through Francoist monuments and memorials, interpreted, neglected, or silenced until today. The "official" narratives are contrasted with the present-day archaeological investigation of the same spaces, which has generated new data but also sparked opposition to what is perceived as the "reopening" of the past. By analyzing the tensions between material remains, state-sponsored monumentalisation, and contemporary research following democratic laws, this case study highlights the challenges faced by researchers working in politically charged landscapes. It argues for the importance of critically engaged research to expose silenced histories, combat simplifications, and contribute to a more accurate interpretation of the past. In doing so, it contributes to current debates on how archaeology can responsibly engage with conflict-related heritage in an era of resurgent nationalism and polarized identities.

2401. Great Moravia Between Past and Present: Images, Interpretations, and Social Ambitions

Authors: Marek Hladík (Institute of Archaeology Czech Acad Sci, Brno) – Katarína Hladíková (Slovak National Museum - Archaeological Museum, Bratislava) – Martin Neumann (Institute of History of SAS, Bratislava) – Jakub Tamaškovič (Institute of Archaeology Czech Acad Sci, Brno)
Format: Oral

This paper analyses how the image of Great Moravia (a major Slavic geopolitical entity in 9th-century Central Europe) has been formed, transformed, and strategically used across different historical periods as a resource for social identity, political legitimacy, and cultural memory. It argues that what began as an archaeological and historical concept gradually became a symbolic repertoire of "spiritual" and "national" beginnings, repeatedly adapted to shifting social needs - from nineteenth-century Romanticism, through ideologically charged twentieth-century interpretations, to contemporary memory politics in an era of renewed nationalist polarisation. Drawing on key frameworks of collective and cultural memory (e.g. Wertsch 2021), the paper conceptualises the past not as a stable set of facts but as something continuously "re-performed" through rituals, symbols, and narrative templates. This perspective helps explain why certain interpretive shortcuts endure, why ambiguity is often suppressed, and how coherent "Golden Age" plots acquire authority in public arenas. The paper asks which narratives about Great Moravia are amplified or silenced in changing political climates and how authorised storylines circulate between scholarship, museums, heritage sites, education, and the media. It concludes with practical implications for sustaining open, critical, and inclusive archaeology while remaining publicly

engaged: transparent handling of uncertainty, explicit separation of evidential claims from interpretive conjecture, and multi-vocal presentation strategies that reduce the risk of instrumentalisation and polarising identity politics. Wertsch, James V., How Nations Remember: A Narrative Approach (New York, 2021; online edn, Oxford Academic, 22 Apr. 2021), https://doi.org/10.1093/oso/9780197551462.001.0001, accessed 16 Oct. 2025. The study was supported by Czech Academy of Sciences by the Strategy AV21 research programme "Anatomy of European Society".

2306. A century later: What has changed in the former province of East Prussia, and what perhaps should remain unchanged?

Authors: Magdalena Kozicka – Joanna Ciesielska (Wojewódzki Urząd Ochrony Zabytków w Olsztynie)
Format: Oral

The Warmian–Masurian Voivodeship is a region in Poland characterised by a distinctive geopolitical position and a complex historical legacy. Most of its territory did not historically belong to Poland and, until the Middle Ages, was inhabited by Baltic tribes. Through selected examples, we demonstrate the significant changes in the protection of archaeological monuments in Warmia and Masuria over the past century. We examine the history of a former churchyard cemetery in a Masurian town, the issue of archival sites excavated during the era of the German province of East Prussia, and the contemporary challenge posed by the rapid and difficult-to-control expansion of built-up areas. Although the Prussian heritage protection system was politically motivated, it resulted in a significant increase in the detection of archaeological sites in the region, a level of discovery not surpassed until the introduction of LiDAR technology. During the socialist period in Poland, archaeology benefited from its political utility. However, in the Warmian–Masurian region, evidence of Polish heritage was scarce. Heritage protection services, constrained by limited resources, operated minimally, and many sites were documented with significant negligence. Following the restoration of democracy in Poland in 1989, heritage protection services encountered new challenges resulting from economic transformation and social change. Currently, the cultural heritage of Warmia and Masuria is undergoing a revival. The region attracts individuals seeking respite from urban environments. However, increased development pressure, combined with persistent attitudes from the previous system, contributes to the destruction of archaeological sites, particularly when limited awareness of heritage value is overshadowed by the pursuit of immediate profit. We contend that raising awareness is essential for safeguarding the future of cultural heritage.

9. In the Crossfire of Identity Politics. The Museo Egizio Between Nationalism and Cultural Belonging in Italy

Authors: Costanza Paolillo (New York University | Università IULM Milano)
Format: Oral

Founded in 1824 to enhance the prestige of the ambitious ruling House of Savoy, the Museo Egizio in Turin embodies a paradox: a museum devoted to non-local antiquity, yet central to local civic identity. As the city's most visited cultural institution, the Egizio has long served as a touchstone of civic pride, woven into narratives of uniqueness and belonging despite the extraneous origins of its collection. Over the past decade, the institution has responded to the city's demographic transformation—nearly 20% of Turin's residents today hold foreign passports —by advancing inclusivity initiatives that reaffirm its relevance within the global landscape of archaeological museums. The most visible of these efforts was the 2016 campaign "Lucky Those Who Speak Arabic," which offered discounted admission to Arabic speakers as a gesture of intercultural engagement. Modest in scope, the initiative nonetheless triggered fierce political backlash and quickly became a recurring trope in nationalist rhetoric, shifting from a local controversy into national political discourse and media campaigns that framed the museum as a symbol of the erosion of "Italian identity." The episode propelled the Museo Egizio to the forefront of broader national debates over migration, heritage, and cultural identity in Italy, where archaeological heritage has increasingly been mobilized in populist narratives opposing inclusionary practices in defense of so-called "national tradition". This paper examines how the museum has navigated this terrain over the past decade. Drawing on media discourse, interviews with community stakeholders and institutional sources, it traces how inclusive programming became politicized, how these controversies shaped funding and outreach, and how the museum strategically pivoted toward initiatives less vulnerable to populist attack—such as the 2023 "Museo Egizio Accessibile" project, a comprehensive accessibility program for physical, sensory, and cognitive disabilities, funded through the EU Recovery Fund (PNRR).

1027. Out of context? Archaeology and the moral drama of tabloid storytelling

Authors: Matthias Kalisch (University of Tübingen)
Format: Oral

Despite its location in the northwestern periphery of the Roman Empire, modern-day Germany has yielded a significant number of archaeological finds from the Roman period and beyond. However, such discoveries – whether made accidentally, through rescue excavations, or as part of systematic explorations – often reach broad audiences not through academic publications or museum exhibitions, but through mass-market media shaped by simplification, emotionalization, and political polarization. In these settings, archaeological knowledge does not simply become more accessible, it is fundamentally reframed. This presentation examines the portrayal of archaeology in Germany's largest tabloid newspaper, asking what these representations reveal about the intersection of heritage, populist rhetoric, and contemporary identity politics. Based on this framework, the presentation identifies recurring narrative patterns centered around entitlement and distrust of institutions, paying particular attention to the language

used to describe archaeological actors, expertise, and legal contexts. Selected articles serve as case studies illustrating how dramatization and emotionalization structure these stories, shifting attention away from archaeological context and heritage protection. The presentation concludes with a consideration of how archaeological disciplines might respond to such media environments in Germany and throughout Europe. Understanding these narrative transformations is essential for archaeologists to communicate more effectively, challenge distorted representations, and remain critically engaged in an increasingly polarized public landscape.

1960. The Conversion of Heritage and Landscape of Archaeology in Türkiye: Nationalism, Populism, and Cultural Identities

Authors: Hüseyin Soy (Middle East Technical University / Settlement Archaeology)
Format: Oral

I examine how political landscapes influence heritage discourses and archaeological practices in Türkiye from an archaeologist's perspective. I explore whether the Turkish Republic's nationalist ideology has utilized heritage ideas and archaeological practices for propaganda purposes. Have heritage and archaeology missions in Türkiye benefited from these nationalist influences in any way? I analyze this relationship within its historical context to answer these questions and to understand Türkiye's nation-building process and policy development through heritage discourses and archaeological practices. A notable example of this influence is the transformation of the Hagia Sophia Mosque into a museum by Mustafa Kemal Atatürk, the founder of the Turkish Republic, at the beginning of the 20th century, followed by its reconversion into a mosque in the 21st century by the ruling conservative party, which has held power in Türkiye for over 20 years. Additionally, there is a noticeable shift in government-sponsored projects towards the archaeology and the conservation of Islamic cultural assets—including Ottoman monuments abroad, mainly in Balkan countries—rather than focusing on "Anatolian" cultures, which was the common practice during the secular Early Republican Era of the 1920s-50s, following the nonsecular Ottoman Empire. The rise of popular, widely exported soap-opera-style TV series in contemporary Türkiye, which supposedly depict the so-called Turkish-Islamic heritage, contrasts sharply with the appreciation of Greek and Latin texts and the appropriation of "Anatolian" cultures in the 20th century, highlighting a significant shift in popular culture.

94. The Role of Archaeological Heritage in Shaping Local Identity: The Riace Bronzes Debate

Authors: Andrea Berettera (IMT School Advanced Studies Lucca)
Format: Oral

In recent decades, archaeological heritage in Italy has become a powerful tool in shaping and affirming local identity. While this connection dates back to the fascist era, its role in post-WWII Italy remained largely overlooked—until a resurgence in the early 2000s. This period saw a rise in autonomous movements, particularly in economically struggling regions, demanding recognition of their rights and cultural identity. A striking example is the Riace Bronzes, a couple of Greek 5th-century statues discovered near Riace Marina, Calabria, in the 1970s. Initially stored in various contexts – from restoration laboratories to the Regional Council Hall – and finally displayed in the National Archaeological Museum of Reggio Calabria only in 2013, their hypothesized removal on the occasion of national or international exhibitions – such as EXPO Milan 2015 – sparked a fierce debate. Local advocates demanded their permanence to the Museum of Reggio Calabria, emphasizing the statues' cultural and historical connection to the community. This highlighted the tensions between local identity, national interests, and international recognition. This study explores the deeply rooted debate over the statues' placement, revealing their ties to identity politics. Through a critical discourse analysis of regional and national newspapers and parliamentary speeches, the research examines how politicians, archaeologists, and communities constructed diverse narratives around the artifacts. Economic, logistical, and ideological arguments clashed, with rhetorical strategies used to advance competing visions of the statues' purpose and placement. Ultimately, the Riace Bronzes are more than artistic treasures; they serve as symbols of cultural identity and instruments of political discourse. This research challenges traditional approaches to heritage, arguing for greater recognition of how archaeological artifacts transcend their material and chronological significance. This work seeks to redefine the relationship between heritage, identity, and the public sphere by fostering awareness of their broader societal roles.

1005. Reaching Out and Looking In: Lessons on heritage and democracy from the far-right in Bulgaria

Authors: Petar Parvanov (National Archaeological Institute with Museum - BAS)
Format: Oral

The presentation will tackle the challenges to archaeology imposed by the resurfacing of far-right populism and nationalism in Europe in a conversation across the ideological and generational divide. The basis for this critical inquiry is an interview conducted by the author with a prominent medieval archaeologist who also happens to be one of the intellectual proponents and a former MP from a pro-Russian far-right party in Bulgaria. The conversation reviews the subtle connections between archaeology and politics, shared research interests and differing interpretations on notable heritage sites such as Pliska (the first capital of medieval Bulgaria) etc. This approach offers a rare opportunity to learn from the practical exercise of political ideas on research agenda and vice versa. Besides getting a grip on the low-key longevity of such ideologies, another essential takeaway is the exposure of structural gaps where they can operate. Perhaps the most prominent among them is the false division between democracy and some idealized historical identity propagated by populists. In the scale of globalized large-scale political units heritage and especially local heritage is neglected due to its perceived low monetization potential, thus creating an educational and cultural vacuum readily occupied by

these ideologies. This is among a series of uncomfortable realizations but also unexplored opportunities for archaeology to contribute to a fact-based democratic narrative about the past and the future.

612. Spectres of Ronald Fisher: The renaissance of population genetics in 21st century archaeology

Authors: Anna Källén (Umeå University)
Format: Oral

In the past decade, methodological developments in ancient DNA research have been accompanied by animated stories of ancient peoples. In the history of the Americas, there have been stories of ancient populations "blasting across the continent", and in stories of the European Bronze Age, the Yamnaya have been described as "migrants from Russia" and "the most murderous people of all times". This paper will present these impactful stories as products of a revived love affair between population genetics and archaeology – an affair that goes back to the 1920s, when leading figures such as Ronald Fisher at UCL developed the statistical models that remain foundational to population genetics, while also being a global spokesperson for eugenics and arguing that "the groups of mankind differ in their innate capacity for intellectual and emotional development". The paper will show how population genetics – with its statistical models rooted in the 1920s and its privileging of the nation-like concept of population – has been highly influential in the recent shaping of our ancient past in new, or revived, images and stories of human culture and identity. What are the potential consequences of the renaissance of population genetics in archaeology, in the shifting political landscapes of our times? How shall we navigate around the spectres of Ronald Fisher in current archaeology?

2446. Beyond the "Mirror of the Present": Feminist Critique as an Essential Methodology for Countering Narrative Inertia in Archaeology

Authors: Anna Eklund (Dept. of Archaeology, Ancient History and Conservation, Uppsala university) – Cecilia Holmberg (Dept. of Archaeology, Ancient History and Conservation, Uppsala university)
Format: Oral

Archaeological discourse frequently falls victim to "narrative inertia," where sensationalist, androcentric models of the past are reproduced despite conflicting empirical evidence. By prioritizing dramatic tropes—such as systemic violence or biological determinism—over nuanced data, the discipline risks functioning as a mirror for contemporary biases rather than a window into historical reality. This paper argues for the urgent integration of feminist critique, not as a supplementary "perspective," but as a fundamental methodological rigor. A feminist analytical framework exposes the "false consensus" that allows logically incompatible theories to coexist, often marginalizing evidence of historical female agency in favour of familiar victimhood narratives. By critically deconstructing pre-determined categories and subjecting all actors to symmetrical scrutiny, we can dismantle the gendered "blind spots" embedded in high-profile syntheses. Ultimately, a feminist-informed methodology is both a scientific and ethical necessity, ensuring that archaeology reconstructs the past's complexity rather than merely legitimizing the power structures of the present.

2771. From Past to Present: How Archaeology Helps Young Citizens Understand Migration in Switzerland

Authors: Ellinor Dunning – Camille Aeschimann – Ludivine Marquis (ArchaeoConcept)
Format: Oral

Switzerland is currently re-examining its post-migration identity, shaped by successive waves of migration since the 1950s — from seasonal laborers from Italy and Spain, to refugees from the Balkan wars, and more recently, from Ukraine. According to the Federal Statistical Office (2022), 40% of the Swiss population has a migration background. Cities like Geneva and Biel, whose identities are deeply rooted in their diversity, exemplify this reality. In response, the Federal Commission on Migration launched the "New Us – culture, migration, participation" call for projects, supporting innovative initiatives that foster cultural participation, social cohesion, and a sense of belonging in a migration society. Since 2020, many civil society projects have been submitted — only one with an archaeological dimension: "Stories of Migration: From the Past to the Present," led by ArchaeoConcept. This educational project aims to explore how children aged 10 to 12 experience migration, which is considered a universal phenomenon, and to share with them the archaeological knowledge about past migrations in Switzerland. It situates migration in a long-term context while linking it to recent individual and collective experiences. The project aims to develop students' reflexivity by encouraging dialogue between past and present perspectives and giving them a voice on these issues. Classroom interventions have resulted in a podcast created with and for the students. In our presentation, we will outline the project's participatory methodology, its measurable outcomes — including increased historical awareness, critical thinking, and self-expression. We will also discuss future perspectives, such as expanding the project to other regions or school levels. This initiative demonstrates how archaeology — often perceived as distant — can become a living educational tool to address contemporary societal issues, directly involving young people in building a shared, inclusive memory.

11 REDISCOVERING NEGLECTED VOICES IN THE MAKING OF ARCHAEOLOGY

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Janitha Kakulandala Vithanage (University of Kelaniya | University of Otago) – Chandima Bogahawatta (University of Kelaniya) – Vysakh Santhosh (University of Kerala) – Wang Tongling (Art Institute of Maijishan)
Keywords: Historiography of Archaeology, Colonialism, Decolonisation, Local Knowledge, Antiquarianism
Format: Regular session

SESSION ABSTRACT

Modern archaeology has developed through the efforts of numerous local pioneers—antiquarians, scholars, collectors, explorers, enthusiasts, and archaeologists—who sought to uncover and interpret the past of their own regions long before the discipline was formalised. Their work often reflected deep local engagement, intellectual curiosity, and cultural commitment, paving the way for the establishment of modern archaeology or offering alternative ways of imagining the past. Yet many of these individuals and their contributions have been neglected or erased from mainstream archaeological narratives due to colonial hierarchies and social or political marginalisation. This session seeks to recover and reassess the lives and legacies of those forgotten or overlooked figures whose work laid important foundations for regional and global archaeological knowledge. By revisiting their contributions, we can gain a deeper understanding of how knowledge was produced, appropriated, or silenced within different historical and political contexts. We invite papers that examine individual biographies, local traditions of antiquarianism, and the broader processes through which recognition and authority in archaeology were constructed. Through this collective effort, the session aims to restore visibility to neglected actors, highlight the diversity of intellectual traditions that shaped archaeology, and encourage critical reflection on how historical exclusions continue to influence the discipline today.

CONTRIBUTION ABSTRACTS

271. Reconstructing Herstories: The 'Liu Hulan Team' and Women Archaeologists of Xia-Shang Henan through Oral History

Authors: Shiyu Tian – Guoding Song (Beijing Union University) – Suting Li (Henan Provincial Institute of Cultural Heritage and Archaeology)
Format: Oral

Drawing on 27 oral-history interviews, private field diaries and previously uncatalogued institutional archives, this paper places gendered labour at the centre of the formation of Xia and Shang archaeology in Henan Province. It reconstructs the intellectual biographies of members of the PRC's first all-female excavation team—the "Liu Hulan Team"—and of succeeding scholars such as Zheng Zhenxiang, Liu Yiman, Chen Xu, Li Suting, Chen Chaoyun, Guo Yanli and Wu Qian. By triangulating life-narratives with excavation logs, site reports and policy documents, the study interrogates how revolutionary iconography, socialist state feminism and post-reform marketisation successively mediated access to trench, laboratory and publication podium. Their systematic regional surveys and large-scale excavations at Erlitou, Yinxu, Zhengzhou Shangcheng, Wangjinglou, Guandimiao and Xiaoshuangqiao provided the empirical backbone for dynastic chronology debates, while their concurrent work in museums, journals and education quietly expanded feminist praxis within Chinese archaeology. The findings reveal tacit strategies for negotiating fieldwork motherhood, institutional marginality and intellectual recognition, offering a gendered lens on the discipline's evolution from Mao-era inception to global engagement.The findings reveal tacit strategies through which scholars negotiate fieldwork motherhood, institutional marginality, and intellectual recognition, and offer a gendered perspective on the evolution of Xia–Shang archaeology from the founding of the PRC to the era of global engagement.

521. Labour, Language, and Power: Sharat Wattala in Sri Lankan Archaeological History

Authors: Chaamindri Fernando (University of Ruhuna) – Janitha Kakulandala Vithanage (University of Kelaniya | University of Otago) – Chandima Bogahawatta (University of Kelaniya) – Tharindu Pieris (Archaeo Boffins Consultants Services)
Format: Oral

At a time when archaeological work in Sri Lanka was controlled by colonial administrative systems and therefore carried out mainly in English, local participation in archaeology was largely limited to field labour and technical support. Although this work was essential to excavation and conservation, it was rarely acknowledged in official reports or academic writing. This paper focuses on Sharat Wattala, a Sri Lankan field archaeologist whose long-term involvement in excavation, verification, and chemical conservation work shaped key archaeological discoveries. However, his contributions remain underrepresented in archaeological historiography. Although Wattala worked closely with leading figures of the Department of Archaeology, such as Senarath Paranavitana, and played a central role in major discoveries and conservation efforts, including the discovery of the Panakaduwa copper plate of King Maha Vijayabahu, the scientific verification of the deteriorating wall paintings at Sigiriya and Hidagala, and leadership in excavations at key sites such as Mihintale, Anuradhapura, and Jetavana, his contributions were not popularised. This paper argues that this marginalisation is not incidental but reflects broader disciplinary hierarchies that honour English theoretical authorship and colonial-era scholarly frameworks over field-based and technical expertise. Even though Wattala attempted to record and explain

archaeology, his work often remained outside dominant scholarly narratives due to language barriers. He authored four publications in Sinhala, including the first attempt to explain archaeology to a Sinhala-reading audience: Puravidyawa Hadarima (පුරාවිද්‌‍යාව හැඳෑරීම). However, these writings did not circulate within English-dominated academic spaces. Featuring Wattala's work, the paper challenges dominant narratives of archaeological history and contributes to ongoing discussions on neglected voices, knowledge production, and power within the making of archaeology in postcolonial contexts.

776. Ven. Kamburupitiye Vanaratana: A Monk Archaeologist and the Vernacular Foundations of Sri Lankan Archaeology

Authors: Janani Merinnage – Chandima Bogahawatta (University of Kelaniya) – Janitha Kakulandala Vithanage (University of Kelaniya | University of Otago) – Tharindu Pieris (Archaeo Boffins Consultants Services)
Format: Oral

The historiography of Sri Lankan archaeology has been shaped predominantly by colonial administrators and English language scholars, resulting in the marginalisation of local intellectuals who contributed outside imperial academic structures. This paper addresses this historiographical gap by re-examining the life and work of Ven. Kamburupitiye Vanaratana Thero, the first Buddhist monk to systematically engage in archaeological research in Sri Lanka, was a pioneer of vernacular archaeological scholarship. The study aims to reassess Vanaratana Thero's contributions to the development of archaeology during the late colonial and early postcolonial periods, with particular attention to his role in knowledge production, institutional formation, and public engagement. Methodologically, the paper employs a critical historiographical approach, drawing on published Sinhala-language works, academic records, and institutional histories to analyse how authority and recognition were constructed within the discipline. Beginning with his 1940 Sinhala thesis on the ethnographic and archaeological history of Matara, Vanaratana Thero articulated an alternative archaeological practice rooted in local history and accessibility. His subsequent role as a founding lecturer of Sri Lanka's first four-year Honours Degree Programme in Archaeology (1963), alongside his scholarly works on Anuradhapura, Polonnaruwa, Buddha iconography, and the Panakaduwa Copper Plates, underscores his foundational impact. Despite these contributions, his absence from canonical narratives reflects enduring colonial, linguistic, and epistemic exclusions. Re-centring his legacy offers a critical intervention into the decolonisation of archaeological historiography in Sri Lanka.

597. Challenging Narratives, Revealing Truths: The Unacknowledged Archaeological Odyssey of P. Rajendran in South India

Authors: Vysakh Santhosh (University of Kerala)
Format: Oral

The paper aims to illuminate the scholarly legacy of Dr. P. Rajendran, a pioneering yet often neglected figure in the historiography of Indian archaeology, particularly in South India. Renowned for his ground-breaking research, Rajendran challenged prevailing myths that portrayed Kerala and the surrounding regions as inhospitable to early human habitation. Through meticulous fieldwork, he unearthed compelling evidence establishing Kerala's deep prehistoric roots, including Mesolithic implements, Palaeolithic tools, and unique fossilised hominid remains such as the Laterite Baby skull dating back approximately 1.66 lakh years. His discoveries of submerged artefacts, including Chinese coins, Roman pottery, and Lower Palaeolithic tools, beneath the seabed redefined notions of maritime trade and prehistoric connectivity in the region. Furthermore, Dr. Rajendran's identification of Brahmi inscriptions on Neolithic axes, petroglyphs at rock shelters, and palaeoart (Lion figurine) represented crucial breakthroughs in understanding early literacy and symbolic expression in South Indian prehistory, thereby dismantling myths of cultural stagnation. As a scientist and visionary, he helped develop the Department of Archaeology at the University of Kerala, fostering institutional growth and advancing interdisciplinary geoarchaeological methodologies. Despite his prolific academic contributions in journals and books, and numerous first-time discoveries his work remains underappreciated in mainstream archaeological discourse. This paper examines how Rajendran's scientific approach critically interrogated myths surrounding South Indian archaeology, revealing a vibrant, continuous human presence dating back to the Stone Age. It underscores the importance of recognising his efforts to rewrite Kerala's prehistoric narrative and emphasises the need to include his pioneering insights in broader historiographical debates. What does the neglect of Dr. Rajendran's contributions signify for the recognition of regional archaeological histories, and how can his scientific disproof of myths transform future research? Through this inquiry, the paper advocates for a re-evaluation of South Indian archaeological significance, positioning Dr. Rajendran as a crucial voice in Indian prehistory.

342. A Silenced Pioneer: Simon Casie Chetty and Early Sri Lankan Archaeology and Anthropology

Authors: Chandima Bogahawatta (University of Kelaniya) – Janitha Kakulandala Vithanage (University of Kelaniya | University of Otago) – Tharindu Pieris (Archaeo Boffins Consultants Services) – Chaamindri Fernando (University of Ruhuna)
Format: Oral

Modern historiographies of Sri Lankan archaeology and anthropology often locate the origins of these disciplines within British colonial institutions of the late nineteenth century, marginalising the intellectual contributions of indigenous scholars. This paper repositions Simon Casie Chetty (1807–1860) as the earliest Ceylonese intellectual to undertake systematic antiquarian, numismatic, epigraphical, and anthropological inquiry, challenging Eurocentric narratives that portray colonial civil servants as the sole pioneers

of archaeological knowledge in Sri Lanka. The study addresses the persistence of colonial silence within disciplinary histories. While British administrators are celebrated for institutionalising archaeology, Chetty's scholarly interventions, produced several decades earlier, remain largely absent from contemporary academic accounts. His work on inscriptions, coinage, historical geography, and the ethnography of communities such as the Veddas, Mukkuvars, Moors, and Tamils represents an early indigenous engagement with Sri Lanka's past, predating formal colonial archaeology. This marginalisation reveals a significant historiographical gap in the recognition of how local intellectuals negotiated colonial power structures to articulate autonomous interpretations of heritage and identity. Methodologically, the paper adopts a historiographical and archival approach, drawing on primary sources including The Ceylon Gazetteer (1834), Chetty's articles in the Journal of the Royal Asiatic Society (Ceylon Branch), and his editorial writings in the Morning Star. A comparative analysis examines Chetty's interpretations, such as his early reading of the Paramakanda Brahmi inscription and his analysis of the 1839 Calpentyn (Kalpitiya) coin hoard, in relation to later colonial scholarship. The findings demonstrate that Chetty functioned not as a subordinate informant but as an independent producer of knowledge. By restoring his scholarly visibility, this paper argues for a decolonised historiography of Sri Lankan archaeology and anthropology that foregrounds indigenous intellectual agency in shaping the discipline.

341. Colonial Science vs. Living Heritage: Walisinha Harischandra's Critique of Colonial Archaeology in Anuradhapura

Authors: Janitha Kakulandala Vithanage (University of Kelaniya | University of Otago) – Chandima Bogahawatta (University of Kelaniya) – Tharindu Pieris (Archaeo Boffins Consultants Services) – Chaamindri Fernando (University of Ruhuna)
Format: Oral

This paper examines Walisinha Harischandra's perspectives on the archaeology of Anuradhapura in Sri Lanka, articulated in the late nineteenth and early twentieth centuries. Although Harischandra (1876-1913) was neither formally trained nor officially recognised as an archaeologist, he played a significant role in shaping local responses to colonial archaeological practice. As a prominent nationalist figure opposing British colonial rule, he consistently criticised archaeological interventions carried out by colonial officers, while advocating the reclamation of historical narratives and the reinforcement of national and religious identity, particularly in relation to Anuradhapura. In the context of colonial interventions and perceived threats to sacred Buddhist sites, Harischandra argued that Anuradhapura should be understood as a living sacred city that requires a special methodology. He emphasised its cultural and religious significance to the Buddhist community and challenged approaches that prioritised monumentality and scientific excavation over religious sensibilities and local traditions. His activism extended beyond concerns for Buddhist heritage under colonial rule. It contributed to the formation of heritage politics in Sri Lanka, particularly in efforts to protect and restore Buddhist monuments in Anuradhapura. Despite these contributions, Harischandra's role has been marginalised in modern archaeological historiography, mainly because of the dominance of Eurocentric frameworks in interpreting the discipline's development. Through an analysis of his writings and publications, this study explores his perceptions of archaeology within the broader colonial context, foregrounding a neglected local voice and repositioning Harischandra within the historiography of archaeology in Sri Lanka.

844. Neglected Precious Legacy: Reassessing the Value of the 1958 Foreign Expedition's Findings at Maijishan Grottoes

Authors: Wang Ling (Art Institute of Maijishan Cave-Temple Complex)
Format: Oral

In the historiography of research on the Maijishan Grottoes, the achievements of domestic northwestern and central Chinese expeditions of the 1940s and 1950s have long dominated narratives of art history and conservation. In contrast, the 1958 expedition led by Sri Lankan art historian Anil de Silva—with the participation of French photographer Dominique Darbois and Indian scholar Romila Thapar—has remained largely neglected in Chinese academic discourse, despite its findings being specially approved by Premier Zhou Enlai. As the first foreign-led expedition to Maijishan Grottoes in the early years of the People's Republic of China, it represents a unique moment of Sino-foreign scholarly exchange under exceptional historical circumstances. The results of this expedition were later compiled by British sinologist and art historian Michael Sullivan and published in 1969 as The Cave Temples of Maichishan. This work integrates historical research, artistic analysis, cave documentation, expedition records, and rare photographic plates, offering both scholarly and historical value. Unlike domestic expeditions, this research introduced a multi-civilisational perspective shaped by scholars from Sri Lanka, France, India, and the United Kingdom. It occupies an "intermediate perspective" between early Chinese scholarship and later large-scale scientific investigations, providing an alternative framework for interpreting stylistic development and Silk Road cultural interactions at Maijishan. Darbois's photographic documentation preserves early visual records of cliff faces, murals, and sculptures—some of which have since deteriorated or disappeared—making it a vital resource for conservation history. Moreover, the expedition reflects the PRC's early diplomatic and academic cooperation policies, offering important insights into the origins of international collaboration in Chinese heritage research. The systematic translation, archival study, and reassessment of these materials not only recover a neglected scholarly legacy but also enrich global dialogue on grotto art, cultural exchange, and the interpretation of world heritage.

2268. Learned societies in the development of national archaeology from 16th to 19th century – the case

of Slovenia

Authors: Crtomir Lorber (Independent researcher)
Format: Oral

As modern European archaeological community considers its beginnings, we usually discuss the work of prominent individuals, development of national archaeological communities and their major institutions and historical development of major archaeological paradigms. In such a view it is natural that we often lose sight of the development on a local or regional level. This is true in Europe as well as in the development of a wider global archaeology, which leads us to neglect several important aspects of the development of our discipline, one of them being the development of local, regional, national and supranational semi-professional and professional scholarly networks as incarnated in different forms of learned societies from 16th to 20th centuries. These seem unglamorous, but they are a skeleton that historically allowed different scholarly disciplines to both form and spread in different environments, as their membership hailed both from actual scholarly disciplines as well as the general public. They played a major role in the processes of the popularisation of archaeological discipline and integrating the knowledge provided by archaeology into different popular movements and ideologies (including nationalism). In this paper we propose to examine a case study of modern-day Slovenia in the period between 16th and 20th centuries, which was historically a part of several multinational empires and states, such as Austria-Hungary and Yugoslavia. We intend to discuss how different learned societies helped form Slovenian national archaeology and how they helped situate archaeology in the public conscience as one of the national scientific disciplines. We will discuss how these processes correlate to the models of development of modern nations as discussed by Miroslav Hroch and Ernest Gellner as well as highlight how the legacy of said organisations still shapes modern Slovene archaeology today, even as their work is often overlooked by different scholars.

12 "LIVING ON THE EDGE": INVESTIGATING SUBSISTENCE STRATEGIES IN REMOTE REGIONS

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Kyriaki Karanikola (Vilnius University) – Ruta Karaliute (Lithuanian Institute of History) – Evanthia-Stefania Kourti (Université Paris 1 Panthéon-Sorbonne) – Giedre Motuzaite-Matuzeviciute (Vilnius University)
Keywords: palaeoenvironment, marginal regions, subsistence strategies, climate change
Format: Regular session

SESSION ABSTRACT

Humans are among the few species capable of inhabiting extremely diverse environments worldwide. As the population grows and the climate changes, more of us will be pushed to live "on the edge," or our current location will become less favourable for human habitation. By the edge, we mean arctic regions, hot and dry zones, islands, floodplains, mountain highlands, or other challenging ecological conditions. These marginal regions require greater adaptive strategies to inhabit and subsist. Yet, they hold a key to understanding human resilience and can serve as valuable guides for understanding humanity's enduring relationship with nature. In the face of climate change, these populations are particularly vulnerable. Understanding the adaptive successes or failures in marginal communities offers crucial insights into contemporary and future challenges. This session calls for multi-proxy approaches to the study of past subsistence strategies of human communities that inhabited environments "on the edge". The session aims to explore how and to what extent climatic fluctuations affected marginal and vulnerable populations, as well as their subsequent adaptation strategies. By addressing these questions, this session seeks to foster an interregional and intertemporal open dialogue on resilience, vulnerability, and the long-term entanglements of humans and their environments.

CONTRIBUTION ABSTRACTS

221. At Santa's dinner table? The past and the future of millet cultivation in northern latitudes

Authors: Giedre Motuzaite Matuzeviciut Keen (Vilnius University)
Format: Oral

Since domestication, plant and animal species have spread across a wide range of altitudes and latitudes, requiring continuous adaptation to changing climatic and environmental conditions. One of the earliest crops involved in the globalisation of food systems, broomcorn millet (Panicum miliaceum), possesses remarkable adaptive properties. Domesticated in northern China at approximately 42° N, millet was subsequently cultivated in high-altitude Alpine valleys as well as at northern latitudes across Europe. Archaeobotanical evidence indicates that broomcorn millet was cultivated at the southern shore of Lake Ladoga (60° N) during the 11th–12th centuries AD, likely introduced by Slavic settlers. However, during the initial phase of millet dispersal in the Bronze Age, its cultivation extended northwards only to approximately 56° N, where it appears to have halted at the cultural and linguistic boundary between Indo-European–speaking Baltic populations and Finno-Ugric groups. In this presentation, I will explore bioarchaeological evidence for past millet use, combined with experimental research on millet landraces, to examine the physiological limits of this crop's adaptation in the north. I will provide new insights into the environmental constraints shaping millet dispersal and highlight its potential for future cultivation in northern Europe.

2177. Back to Podgorie: New Results from a Prehistoric Lakeside Site in Albania

Authors: Patrick Willett (Vrije Universiteit Brussel) – Edlira Andoni (Albanian Institute of Archaeology) – Jana Anvari (Flinders University)
Format: Oral

Podgorie is an important Neolithic site in southeast Albania, probably spanning the Early Neolithic into the Bronze Age. Following excavations in 1982, much of the site was damaged by modern development. Our new research project at the site combines surface collection and geomagnetic survey (2022) with targeted excavations and coring to reconstruct the chronostratigraphy of the site (since 2025). This paper presents our preliminary results on the stratigraphy, chronology and material culture of the site. Our work at Podgorie forms part of our overall research program in the Korça Regional Neolithic Project on the cultural landscape of early farming sites in the Korça plain and adjacent mountains. Podgorie forms part of a small cluster of Neolithic to Bronze Age sites at the northern end of Lake Maliq, a lake with surrounding marshlands that existed in the northern/central part of the Korça plain during prehistory and into modern times until drainage works in the 1940s. Our project researches several of these sites—including Luadisht, only 2.5 km from Podgorie, which was excavated by us between 2023 and 2024—to understand the chronological relationship and interaction between these settlements, and their relationship to Lake Maliq through time.

2163. Millet agriculture, land-use intensity, and hydroclimate variability in Late Bronze Age lake basins of north-eastern Europe

Authors: Meiirzhan Abdrakhmanov (Department of Archaeology, Faculty of History, Vilnius University) – Jeremy Jacob (Laboratoire des Sciences du Climat et de l'Environnement, UMR CEA-CNRS-UVSQ 8212) – Piotr Kołaczek (Climate Change Ecological Research Unit, Adam Mickiewicz University in Poznań) – Jakub Niebieszczański (Faculty of Archeology, Adam Mickiewicz University in Poznań) – Monika Karpińska-Kołaczek (Climate Change Ecological Research Unit, Adam Mickiewicz University in Poznań) – Joanna Święta-Musznicka (Faculty of Biology, University of Gdańsk) – Kamil Niedziółka (Faculty of History, University of Gdańsk) – Miglė Stančikaitė – Neringa GastevičIenė (State Scientific Research Institute, Nature Research Centre) – Giedre Motuzaite Matuzeviciute (Department of Archaeology, Faculty of History, Vilnius University)
Format: Oral

Understanding how past communities structured subsistence in environmentally sensitive landscapes at northern latitudes is key to evaluating long-term human resilience. We investigate millet-related land use and hydrological and climatic dynamics in lake catchments of present-day Poland and Lithuania – areas where hydrology, soils, and climate variability strongly constrained human activity since the Early Bronze Age. In this study, we focus on the occurrence and relative abundance of miliacin, a pentacyclic triterpene methyl ether diagnostic of Panicum miliaceum (broomcorn millet), in sediment cores from Bruszczewo and Wierzchowo (Poland) and Bėlio, Želva, and Luokesa (Lithuania). The records are supported by absolute chronologies based on AMS ^{14}C dates and supplemented with pollen analysis. Moreover, to estimate hydrological and/or climatic variability, the hydrogen isotope compositions (δ^2H) of plant-derived fatty acid methyl esters (FAMEs) were analyzed. Sporadic low miliacin occurrences in several sequences during the early–mid 2nd millennium BCE predate most regional archaeobotanical evidence and are interpreted cautiously; similar signals in other European lakes suggest possible contributions from wild C_4 grasses. Continuous miliacin presence begins between ca. 1300–1100 BCE, with major peaks around 1000–900 BCE. These phases are associated with anthropogenic deforestations indicated by pollen data and profile lithologies. The evolution of δ^2H values allows discussion of changing environmental and hydrological conditions before, during, and after major miliacin phases. However, elevated inputs of millet- and other anthropogenic plant-derived fatty acids during peak miliacin intervals could have affected FAME δ^2H values, requiring cautious climatic interpretation. Miliacin concentrations decline after ca. 800–700 BCE but remain present at low levels, suggesting reduced importance of millet. This decline broadly coincides with regional cultural transitions and shifts in settlement organization. Together, the records demonstrate how biomarker and isotope tracers can help disentangle the evolution of human–environment interactions and subsistence intensity in climatically dynamic marginal landscapes at northern latitudes.

2371. Who would want to live on a floodplain? A pre-Roman Iron Age settlement in Brodno, Lower Silesia (SW Poland)

Authors: Joanna Markiewicz (Charles University Prague) – Przemysław Dulęba (The Godfryd Ossowski Foundation for Interdisciplinary Research)
Format: Oral

The paper examines the spatial setting and significance of a large pre-Roman Iron Age settlement (2nd–1st century BC) located on a sandy elevation overlooking the branching riverbeds and floodplains of the Oder River. In contrast to most contemporaneous communities in Silesia, the choice of this location does not appear to have been driven primarily by access to fertile soils or optimal agricultural conditions. Despite its considerable spatial extent, the settlement at Brodno seems to have been short-lived, functioning for only a few decades before being abandoned. Notably, the area attracted renewed habitation only in the Early Middle Ages,

a period when wetland and riverine environments were increasingly favoured for settlement. Although peripheral to the region's most intensively occupied settlement and farming zones, the site occupied a position along a major river corridor that facilitated the movement of people and goods. This setting endowed the settlement with a liminal character, mediating between local landscapes and supra-regional networks. The surrounding waterlogged micro-region also contained several smaller pre-Roman Iron Age sites, as well as a Celtic coin hoard discovered nearly two centuries ago, pointing to a broader pattern of activity in this marginal yet connective environment. The paper integrates spatial analysis with archaeobotanical and archaeozoological data, shedding new light on the role of riverine landscapes in pre-Roman Iron Age settlement strategies.

1768. Crop flexibility and adaptation in marginal environments: Late Bronze Age millet from Skala Sotiros, Thasos (northern Greece) in its regional context

Authors: Kyriaki Karanikola (Vilnius University, Faculty of History, Department of Archaeology) – Soultana-Maria Valamoti (Aristotle University of Thessaloniki) – Giedre Motuzaite Matuzeviciute (Vilnius University, Faculty of History, Department of Archaeology)
Format: Oral

Understanding subsistence strategies in environmentally variable and marginal ecological settings is central to the study of human adaptation. This paper examines archaeobotanical evidence from the site of Skala Sotiros (Thasos Island) and other sites in northern Greece during the Late Bronze Age (15th–11th centuries BCE), aiming to investigate agricultural strategies under conditions of environmental variability. Special emphasis is placed on millet as a resilient, low-risk crop that appears to have been adopted at several sites in northern Greece during this period. The data indicate a shift towards more diversified and flexible cropping systems, which seem to have strengthened agricultural risk management and the adaptive capacity of local communities. In contrast, contemporary sites in southern Greece display different agricultural choices, suggesting alternative socio-economic and environmental dynamics. The results highlight the role of crop flexibility as a key mechanism of resilience in marginal environments and under conditions of ecological stress, contributing to broader discussions on human–environment relationships in contexts of uncertainty.

1917. Making a Living on the Edge: Animal-Based Subsistence Strategies on Early Modern Madeira (17th-19th centuries)

Authors: Camille Lacorne – Ben Gruwier – Patxi Pérez Ramallo (Vrije Universiteit Brussel) – Jean-François Mousson – Alexandre Brazão (Centro de Estudos de Arqueologia Moderna e Contemporânea) – Manuel Biscoito (Museu de História Natural do Funchal | Agência Regional para o Desenvolvimento da Investigação, Tecnologia e Inovação | Oceanic Observatory of Madeira) – Bart Lambert (Vrije Universiteit Brussel) – Philippe Claeys (Vrije Universiteit Brussel | University of British Columbia) – Christophe Snoeck (Vrije Universiteit Brussel)
Format: Oral

Before the 15th century, the Macaronesian island of Madeira was characterized by geographical isolation, a limited land area and ecosystems lacking endemic terrestrial mammals. European colonization later triggered the rapid occupation of this marginal, previously uninhabited environment. Portuguese settlers had to develop adaptive subsistence strategies to ensure their long-term viability. The introduction of domestic animals from continental Europe was central to these adaptations. Animals contributed to food security and to the island's economic development. However, how these taxa were managed, exploited, and integrated into this fragile insular environment remains poorly documented. In particular, interactions between introduced species and local resources, and human responses to environmental constraints, are still little understood. This study uses a multiproxy bioarchaeological approach to explore early settler subsistence strategies in the early modern period in Madeira. Carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) isotope analyses were conducted on domestic fauna (cattle, sheep/goat, pig, and poultry) and wild fauna (birds and fish) from the 17th-19th-century archaeological site of Rua da Conceição in Funchal, Madeira. The results provide insights into subsistence strategies in this marginal context. They reveal animal feeding practices, degrees of confinement, and the spatial organisation of husbandry. They also shed light on the flexibility and resilience of colonial subsistence systems. This includes the differentiated use of local resources, which included marine inputs. Overall, this study contributes to the understanding of human-animal-environment interactions and adaptive strategies in peripheral, previously unexplored environments during the early modern period.

1312. To Remain Despite Everything: The Populations of Calabria After 1783

Authors: Carlo Citter – Assunta Campi (University of Siena)
Format: Oral

The 1783 earthquake had devastating effects, not only in physical terms but also in collective memory, though the 1905 one was even more dramatic. Entire cities were abandoned. Yet, as demonstrated by the case of certain sites in southwestern Calabria, populations remained within the same areas, relocating only slightly from the destroyed settlements. This raises a significant questions for archaeological research. The main one being why? Some of these sites were small castles, while others were actual cities, covering over 30 hectares, with complex urban and social structures. This contribution aims to present preliminary data from an ongoing study that seeks to explore the long transition from the medieval to the modern period, with a particular focus on this aspect that characterizes many of the historical sites in Calabria. In particular, we will focus on the sites of Castelmonardo, Briatico, and Mileto—three central places within a relatively small region when compared to Vibo Valentia, which was not abandoned at all.

1569. Per aspera ad astra? Difficulties in Colonizing of the edge of loess uplands by the first agricultural communities (S Poland)

Authors: Marcin Szeliga – Joanna Pyzel (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin) – Katarzyna Gawryjołek-Szeliga (National Museum in Lublin) – Jarosław Wilczyński (Institute of Systematics and Evolution of Animals PAS, Kraków)
Format: Poster

The colonization of the edge of the loess uplands and the neighbouring non-loess areas by early farming communities of the Linear Pottery culture (LBK) is a very important, as well as extremely intriguing and still enigmatic episode in the overall process of Neolithisation of the upland areas on the northern side of the Carpathians at the end of the 6th millennium BC. The analysed area is located on the border between two regions that are drastically different in terms of ecology and landscape (i.e. the loess Sandomierz Upland and the sandy-clay areas of the Iłża Foothills). This location completely deviates from the basic settlement preferences of the LBK communities documented in other upland areas of central and western Europe, including the upper Vistula river basin. Despite this, archaeological data to date indicate that the settlement processes initiated by the communities of this culture were intense and lasting in nature, and at the same time spread out over time, consisting of a series of smaller, short-lived settlement episodes within selected locations. An example of this is the short-lived, small settlement of the late (Želiezovce) phase of the LBK discovered in Wólka Wojnowska (Ćmielów municipality, Świętokrzyskie Province). The latest research at this site shows how complex and multi-stage the process of early agricultural colonization of these areas was. Their results confirm not only the extraordinary determination of the oldest farming communities to initiate and continue settlement in this unusual and much more demanding area, but also their very high adaptability to the conditions of the local areas, which are much less agricultural productive than the nearby loess areas due to significantly worse environmental conditions, including, in particular, soil conditions. This phenomenon has not been visible in the upland areas north of the Carpathians until now.

2650. Evaluating duration, seasonality, and mobility patterns of LGM foragers from lithics assemblages: micro-stratigraphy, raw-materials, spatial analysis, technology, and experimental Archaeology

Authors: Miguel Almeida (Dryas / Octopetala | Uniarq / Fac. Letras da Universidade de Lisboa) – Thierry Aubry (FCP - Fundação Côa Parque) – Bertrand Walter – Jean-Baptiste Peyrouse (SERAP Claise - Soc. Ét. Recherches Archéo. Paléo. Vallée de la Claise)
Format: Poster

The Maîtreaux site is characterised by successive occupations by small Solutrean groups who strategically exploited the nearby exceptional Upper Turonian flint source to produce extensive reserves of projectile points and blanks and backed bladelets, and large-sized laurel leaves, exported as unfinished preforms. The exceptional preservation of the site's stratigraphy, lithic remains, and spatial organisation supported a multi-faceted approach integrating geoarchaeology, lithic refitting, lithic technology, and spatial analysis, revealing the behavioural complexity of the occupations, certainly targeting the economic exploitation of the flint, but also including activities unrelated to tool production, as proven by Traceology analysis and the presence of unproductive operative chains, colorant processing, and symbolic objects. Intensive refitting and micro-stratigraphic and spatial analysis allow a detailed micro-historic reconstitution of the technical activities related to mineral raw materials, offering unprecedent insights into the social organisation of LGM's forager groups, their daily life, and intra-site use of time. An Experimental Archaeology programme was designed to provide a comparative referential, which includes, very cautiously, time-related variables. Moreover, a dynamic view of the group's seasonal economic strategy, derives from the consideration of (1) incoming objects and raw materials, (2) on-site activities, and (3) exported lithic tools and blanks. The goals of the Maîtreaux productive knapping (blanks and preforms) seem indicative of the group's time constraints at the site and seasonal economic strategy, as corroborated by further litho-technological analysis of much smaller, but complementary, flint remains from karstic sites showing the modification of imported blanks into projectile points and finishing of laurel leaf preforms (eg.: Roches d'Abilly, Abri Fritsh, and Petit-Guinards). Les Maîtreaux shows the possibility of assessing the (paleo)ethnological, rather than ethnographic, aspects of LGM foragers' time-use, duration, and mobility: time strategies can be derived from the available archaeological record, although the specific use of time by any "Solutrean" group remains inaccessible.

13 CROSSING THE DIVIDE: A CONVERSATION WITH CIFA RESEARCH AND IMPACT GROUP ON COLLABORATION IN PROFESSIONAL, ACADEMIC, COMMUNITY, AND COMMERCIAL ARCHAEOLOGY

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Colin Forrestal (CIfA RIG committee) – Evelyne Godfrey (Uffington Heritage Watch) – Leila Joensson (The University of Vienna)
Speakers: Colin Forrestal (CIfA RIG committee) – Evelyne Godfrey (Uffington Heritage Watch) – Leila Joensson (The

University of Vienna)
Keywords: Commercial, Community, Professional, Academic, Collaboration, Communication
Format: Workshop
Affiliation: Chartered Institute for Archaeologists (CIfA)

SESSION ABSTRACT

The Chartered Institute for Archaeologists Research and Impact Special Interest Group (CIfA RIG) focuses on promotion of commercial, community, and professional archaeological projects that engage with universities and established researchers, providing material for joint enterprises. This workshop session will consider what field archaeologists and specialists need to improve their research requirements and output. The workshop will provide a forum for attendees to express examples of good and not so good experiences of producing research outside a purely academic setting. The workshop will be structured around the following themes: - What role do university departments or academics play in research output that has a public impact? - How do you access the latest information, papers or ideas relating to your research area? - How do professional archaeologists develop writing skills, write research proposals, and publish (including innovative publishing)? - What would you like to happen to improve the future of research in professional archaeology? The aim of the workshop is to produce an actionable process to improve the experience and effectiveness of research projects undertaken beyond the academic training stage (e.g., Masters and Doctoral level) of archaeological careers.

14 MATERIAL AND SURFACE DESIGN IN ANCIENT GREEK ARCHITECTURE. CREATING AND PERCEIVING VISUAL EFFECTS FROM THE ARCHAIC TO THE HELLENISTIC PERIOD

Theme: 1. Widening perspectives in material culture studies
Organisers: Adrian Kröger-Hielscher (Kiel University) – Matthias Grawehr (Graz University) – Asja Müller (Kiel University)
Keywords: Greek Architecture, Material Agency and Affordance, Architectural Praxeology, Material Aesthetics, Material Semantics, Materiality and New Materialism
Format: Regular session

SESSION ABSTRACT

This session investigates how building materials and surface finish contribute to the design and perception of Ancient Greek architecture. It focuses primarily on the genuine intrinsic properties of limestone, marble and other building materials (e.g. metals, terracotta, gemstones) – their color, translucency, texture, reflectance – as well as the enactment of these properties by varying degrees of finish or paint. The aim is to examine how ancient architects orchestrated such qualities to stage certain materials, create contrast, rhythm, or coherence. The interplay of materials, textures, and surfaces with light and shadow played a crucial role in shaping not only the visual and tactile qualities of façades, thresholds, and interior spaces but also the overall spatial experience and architectural coherence of Greek buildings. By analyzing the materiality of Greek architecture with regard to specific materials and their functional, aesthetic, and semantic uses, the session seeks to clarify how choices of stone, cutting, and finishing were integral to the design process and affected both the formal structure and visual presence of buildings. Material combinations, contrasts and transitions served to enliven and differentiate architectural elements, mark hierarchies of space, and establish visual relations between architecture and its surrounding landscape. These material and visual strategies were not static but developed in response to different cultural, technological, and environmental contexts across periods and regions of Ancient Greece. We are inviting contributions that address these questions through detailed case studies, comparative perspectives or digital simulations/reconstruction. By combining close architectural observation with material analysis, participants will explore how the visual presence of matter itself shaped perception and meaning in Greek architecture, revealing a sophisticated understanding of materials as active components of architectural composition, aesthetic expression and semantic communication.

CONTRIBUTION ABSTRACTS

145. Building Materials and Surface Design in Ancient Greek Architecture: Introduction

Authors: Adrian Kröger-Hielscher (Kiel University) – Matthias Grawehr (University of Graz) – Asja Müller (Kiel University)
Format: Oral

This introduction provides an overaching framework for the entire session. The primary focus of this contribution is the materiality of Greek architecture. Materiality, defined as the material state of things, is the result of a decision made by an individual to utilise a specific material, as well as the historical, social and economic conditions that influenced this choice. A substantial amount of research has been done on stucco, paint and pigments in Greek sculpture and architecture. The purpose of this session is a close and intensive analysis of visible building materials, with a particular focus on the various stones – the defining matter of Greece monumental architecture. Against the theoretical backdrop of new materialism, materiality and praxeology, this introduction

develops a differentiated view on the question of how breccia, tufa, limestone or marble has been used, displayed and, in some cases, even staged in Greek building practice. This extends beyond a mere analysis of the technical properties of different stones and the logistics required for their extraction and transportation. It may be argued that this presupposes a conscious design process. This aesthetically oriented perspective considers the visual impacts of stones and their surface treatments, including pattern and colour effects, bi- and polychromy, brilliance, roughness, polishing, (faked) naturalness, and so on. Additionally, a semantic dimension can be incorporated to explore the social and cultural significations attributed to the diverse stones. This comprehensive perspective on the use of building stones integrates a variety of approaches, including archaeological, archaeometric, geological, historical and art historical methods.

2682. What stone should I use? Combinations of stones in monumental buildings

Authors: Therese Emanuelsson-Paulson (Stockholm University)
Format: Oral

When discussing Greek monumental architecture we often think of the traditional features of designs: the columns, the painted terracotta roof or the imported marble details. Other part of the building and their construction material are often less conspicuous. Rear and side walls are commonly constructed of local materials as for example limestone and mudbrick, which are seldom discussed in their own right or together with the decorative façade of the building. The architects or builders of many ancient Greek buildings put in a great deal of effort into the designs of their monumental buildings and they did not leave the design, material or the stone dressing of the wall out of this grand scheme. Sometimes these walls of local materials stand as a strong contrast to the imported materials used in the facades of the building. Correspondingly, the decorative stone dressing or roughly work walls were clearly distinctive from the polished or plastered columns in the facades of the buildings. Some of these walls, shows clear signs of trying to be distinctive from the walls of the neighbouring building, undoubtably by design. Regardless if all walls of a building are constructed in the same material and stone dressing or are differentiated by both, they need to be included in our discussion of the entire design of the building. Even when a building is preserved only in bits and pieces, the ancient viewer saw an entire standing building planed as one unity, were the combinations of different stones contributed to their respective parts of the building design.

2325. Material, Surface Finish, and Experiment in the Earliest Greek Ashlar Architecture: The Temple of Poseidon at Isthmia

Authors: Alessandro Pierattini – Khachatur Manukyan (University of Notre Dame)
Format: Oral

Discussions of materials and surface finish in ancient Greek architecture have long focused on mature stone monuments, often taking for granted both the origins of these practices and the adoption of cut stone. Yet the early history of stone construction—one of the most consequential transformations in Greek architecture—remains poorly understood and is still shaped by entrenched narratives that privilege structural explanations. This paper revisits that transition through a case study of the early Archaic Temple of Poseidon at Isthmia (Corinthia), among the earliest Greek temples built in cut stone. Erected in the first half of the seventh century BC using isodomic ashlars—the earliest attested in Greek architecture—the temple represents an exceptionally early and experimental use of stone, preceding the Doric and Ionic visual languages by decades. Its scattered remains, preserved after its destruction in the fifth century BC, offer a rare opportunity to examine how materials and surface finishes shaped design and perception at the transition from perishable to permanent construction. By combining close architectural observation with a range of material-analytical approaches, including X-ray diffraction, Raman, and Electron microscopy, this paper reconstructs the building process and the visual strategies of the earliest Greek ashlar walls: the treatment of limestone surfaces, the use of smoothing, plastering, and painting, along with their elemental composition. Particular attention is given to how stone was processed and staged alongside stucco and polychrome decoration, in dialogue with contemporary visual practices such as vase painting and local funerary stone-working traditions. Rather than viewing the adoption of stone primarily as a structural choice, the paper argues that material and surface design at Isthmia must be understood in perceptual and semantic terms, showing how materials functioned as active components of architectural composition, visual experience, and social representation in early Archaic Greek communities.

37. Building a Deliberative Aesthetic. Hammer-faced and bossed-faced blocks and two-storey fronts in Late Classical and Early Hellenistic Greek Bouleuteria

Authors: Jordan Voillot (UMR 7044 Archimède, University of Strasbourg)
Format: Oral

Some studies, such as those by Krischen (1941), McDonald (1943), Meinel (1980) and Gneisz (1991), examined bouleuteria, the Greek meeting halls. These studies focused particularly on the design of these structures and how they evolved from rectangular rooms and hypostyle halls to theatre-like buildings. Researchers were less interested in the shapes of the elevation of these buildings, except for the famous Milesian bouleuterion. Buildings such as the Old Bouleuterion in Athens and hypostyle halls, like those in Argos and Sicyon, used a prevalent aesthetic in Greek architecture – columns and entablures – to adorn their exteriors faces. This pattern, which derived from religious architecture, was disrupted by the emergence of theatre-like buildings in the second half of the 4th century BC. The sloping stone seats, which were often built in halls closed on all four sides by walls, caused these buildings to increase in height. Ornamentation is now supported only by the walls and their treatment. Building materials used and the treatment of the

outer face of the blocks adorned with bossed face or hammered finishes became an important decorative pattern. Finally, the walls' surfaces reflect the buildings' interior organisation of the buildings, which is now divided into a lower part containing the seats and a free upper part. The contrast in the treatment of the two parts of the walls – the lower with a bossed or a hammered face, and the upper with a smooth face – and the presence of large windows, which also form a part of the ornamentation, became characteristic of the Greek meeting halls, allowing a new aesthetic to develop: the two-storey fronts. Thus, this talk proposes to demonstrate how the use of a specific type of plan led to the development of a particular aesthetic, and how this was achieved.

2568. Material and Surface Design at the Temple of Hemithea at Kastabos (Asia minor)

Authors: Christine Wilkening-Aumann (Philipps-Universität Marburg)
Format: Oral

This paper focusses on the temple of Hemithea at Kastabos on the Karian peninsula in Asia minor vis-à-vis the island of Rhodes. As the only known building on the peninsula, the temple is distinguished by its exceptionally fine architectural ornamentation of marble. In contrast, the interior and substructure were built from limestone. The numerous tiles found during the investigations suggest that the roof was covered in terracotta. With its monumental scale, the early Hellenistic temple not only surpassed the dimensions of its predecessor. It required the natural ridge to be enclosed by a rectangular platform measuring 54 by 33 meters, which fundamentally changed the appearance of the landscape and the sanctuary. Due to its position above the Gulf of Bybassos (today's Hisarönü) and its exposed location on the northern slope of the Eren Dag, the site was visible from afar. Built around 300 BC, it can be assumed that the surfaces were colored in a way that went beyond the natural lithic bichromy, although there is no evidence of painting. In my presentation, I would like to use this example to explore the question of the extent to which the use of materials, their composition and their supposed contrast allow conclusions to be drawn about their functional, aesthetic and semantic use in early Hellenism. Temple and terrace were studied within the Bybassos and Kastabos Project between 2006 and 2015 under the direction of Prof. Dr. W. Held, Philipps-Universität Marburg (Germany) and in cooperation with Ege Üniversitesi Izmir (Turkey).

1007. Stone Scenographies: Material Staging in the Hellenistic Asklepieion of Kos

Authors: Asja Mueller (Kiel University)
Format: Oral

The Asklepieion of Kos in the second century BC is widely known for its scenographic effect, designed for visual impact across the sanctuary. While this monumental ensemble has been the subject of numerous reconstructions, these have largely focused on architectural form and spatial disposition, paying little attention to materiality and surface design. Yet the visual effect of the sanctuary prospect depended not only on built form but also on the deliberate orchestration of materials, textures, and colour contrasts. This paper argues that material and surface choices played a crucial role in shaping the visual presence and perceptual coherence of the Asklepieion. Older buildings, terrace retaining walls, and less representative structures were executed in a coarse, brownish-yellow local travertine, characterized by rough surfaces and low reflectance. The darker, matte terrace walls did not merely serve a structural function but acted as a visual foil, against which the bright and highly reflective temple buildings stood out with increased clarity and prominence. Architecturally dominant buildings employed finely dressed and polished local marble, available in two distinct varieties: white and grey-blue. Especially in the Hellenistic phase, these two marble types appear to have been used in a consciously contrastive manner to articulate architectural hierarchies, structural elements, and visual rhythms within the sanctuary prospect. The interplay between rough and smooth textures and between dark, absorbent and light, reflective surfaces was thus central to the perception of the complex. To assess the perceptual impact of these material strategies, the paper draws on a digital 3D model of the Asklepieion of Kos, created within the project »Dynamic Spaces: The Asklepieion of Kos during Festivals and Healing Rituals« at Freie Universität Berlin. By integrating material properties and surface finishes into the model, the study demonstrates how materiality functioned as an agent of architectural composition and visual meaning.

537. Half-fluted columns, polychromy, and the changing aesthetics of the Doric order in the Hellenistic Period

Authors: Samuel Holzman (Princeton University)
Format: Oral

Starting in the 3rd century BCE, builders of stoas and peristyles in Greece and Asia Minor began crafting half-fluted columns, or to be more precise, columns—mostly Doric—with facets rather than flutes in the lower third of their height. In studies of Greek architecture, a functionalist explanation, first proposed by Leon Battista Alberti, has found broad acceptance: the half-fluted scheme prevented chipping the fragile arrises of flutes, particularly in public buildings with heavy foot traffic. Yet others have argued that aesthetic appreciation and not utility energized the rapid proliferation of the design (Wannagat 1995). There is a likely connection with bichrome columns, known best from Vesuvian sites, in which the lower half of a column is smooth and painted red or yellow, while the upper half is white and fluted (Grawehr and Lipps 2024). Yet, few Hellenistic examples survive with traces of paint to affirm the chromatic dimension to this design feature (reported at Hermapolis Magna ca. 230s BCE by Wace 1959). This paper examines the unusual case of half half-fluted columns (i.e. columns which are fully fluted on one side and half-fluted on the other). This includes a new reconstruction of the half half-fluted Doric columns of the Stoa in the Sanctuary of Great Gods on Samothrace (ca. 275-250 BCE). Unquestionably decorative, these half half-fluted columns illustrate how a broad shift in architectural aesthetics underway in the Hellenistic period impacted the inherited Doric order. The new practice of subdividing columns into horizontal registers of texture and color converges with other trends, including double decker colonnades with parapets, intentional rustication borrowed from unfinished masonry, and elaborate interior wall decoration divided into registers by polychrome dados and string courses.

15 MARGINALITY AND ENVIRONMENTAL SHIFTS: FROM SOCIOECOLOGICAL PERSPECTIVES ON THE ANCIENT MEDITERRANEAN TO PRESENT-DAY RAMIFICATIONS

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Rafael Scopacasa (University of São Paulo | University of Exeter) – Elisa Perego (University College London) – Kevin Lee (University of Texas at Austin)
Keywords: Marginality, Climate change, Socioecological challenges, Human-environment interaction, Urbanization, Climate/environmental justice
Format: Regular session

SESSION ABSTRACT

The study of the late-second and first-millennium BCE Mediterranean has long focused on élite social groups, their funerary rituals, material culture, and socio-political interactions. More recently, growing interest in social marginality in (bio)archaeology and ancient history is profoundly altering this scenario. Yet, the complex interplay between non-élite groups and environmental shifts such as climate change and natural disasters needs sharper focus. Critical is understanding how climatic and environmental challenges were experienced, perceived and tackled by potentially disenfranchised social segments, including some women and children, people with disabilities, and lower-status individuals. This session explores the impact of climatic and environmental shifts on marginalized/underprivileged groups, from the vantage point of the ancient Mediterranean. We invite contributions on: i) Analytical frameworks foregrounding the coping and survival strategies of non-élite and/or marginalized people in phases of climatic and environmental stress; ii) Bioarchaeological contributions to the study of marginality amid socioecological crises such as flooding and drought; iii) Settlement dynamics and urbanization in agriculturally and/or socially marginal environments; iv) Subaltern perceptions and lived experiences of ancient climate and environmental hazards. At the current historical juncture, characterized by both significant socioenvironmental instability and staggering (though somewhat concerning) scientific innovation, we also ask: v) How can archaeological knowledge inform debates on present-day climate justice, potentially fuelling and scaffolding current environmental movements; vi) How might the recent explosion of big-data initiatives in (bio)archaeology both inform and cloud our understanding of past and present climate change; vii) How can technological advances such as AI contribute to exploring marginality and human-environment interactions in the past, while also triggering socioeconomic and socioenvironmental inequalities in the present. Joining ancient Mediterranean experiences of marginality in their socioecological context to current global concerns, this session fosters dialogue across archaeological sub-disciplines with the aim of learning from the past for the future.

CONTRIBUTION ABSTRACTS

809. How Marginal? How Central? The case of Mt. Dikte, East Crete, during the Bronze Age

Authors: George Ntzoufras (Dept. of History and Archaeology, NKUA) – Yiannis Papadatos (Dept of History and Archaeology, NKUA) – Tina Kalantzopoulou (Belgian School at Athens)
Format: Oral

Mountainous landscapes of Bronze Age Crete have often been framed as marginal and socially peripheral, intermittently connected to broader settlement systems. Focusing on the eastern slopes of Mt. Dikte, this paper reevaluates this view by adopting a multi-layered approach that highlights the active role of upland environments in shaping settlement dynamics and territorial organization during the 3rd and 2nd millennia BCE. Rather than seeing mountains as isolated zones, the study treats them as historically embedded landscapes integrated within political and economic networks. The analysis employs a landscape-oriented perspective, emphasizing architecture as a key agent structuring upland space. Architectural remains are interpreted as material expressions of long-term planning and socio-political investment, with construction techniques, monumentality, and spatial articulation indicating sustained occupation and administrative presence. Archaeological datasets are contextualized through ethnoarchaeological perspectives from historical and modern mountain communities. Comparative evidence provides insight into mobility, land use, social organization, and resilience strategies, highlighting long-term continuities but also shifts in practices in highland lifeways. Considering that mountainous areas were neither systematically inhabited nor extensively exploited during earlier phases of Cretan prehistory, this paper seeks to identify the role of centralized polities in driving a decisive shift in upland settlement dynamics. It argues that political and administrative interventions promoted the sustained occupation and systematic exploitation of the demanding mountainous terrain of southeastern Mt. Dikte. In this way, the study emphasizes the "central" position of these otherwise "marginal" mountain settlements, interpreting them as a newly articulated political territory that remained in direct contact with the urban centers of the lowlands.

1360. Eravamo un Popolo Felice: When My Core Becomes Your Periphery at Torre Mordillo

Authors: Mattia D'Acri (Princeton University) – Ilaria Battiloro (Mount Allison University) – Nicholas Cullen (Stanford University) – Parrish Wright (University of South Carolina) – Giuseppe Lucarelli (Università degli Studi della Tuscia)
Format: Oral

The plateau of Torre Mordillo, overlooking the Sibari Plain and the Ionian Sea, has long been a locus of agricultural exploitation and human engagement with the landscape. From Bronze Age macrobotanical remains to early modern plow marks and contemporary practices of caper gathering, this place preserves a longue durée record of productive lifeways rooted in land use and foodways. Far from occupying a marginal position, the Bronze Age communities of Torre Mordillo were embedded within a prosperous and socially complex world, as evidenced by the site's wealthy burials and material culture. Only through historically contingent processes—most notably interaction with Greek-speaking groups—did this landscape become subsumed into what later historiographies have framed as a "periphery." This paper challenges such teleological narratives by approaching Torre Mordillo as a shifting center whose marginalization was neither inevitable nor intrinsic. Drawing on ongoing fieldwork, this paper presents the sampling strategies adopted at Torre Mordillo and discusses preliminary results from the integrated analysis of macrobotanical remains, organic residues from cooking and serving vessels, and samples from living surfaces. These datasets allow for an exploration of continuities and ruptures in diet, agricultural practices, and spatial organization across time. Ultimately, the paper investigates how relationships between people and landscape are transformed when a community ceases to exist within its own center and becomes incorporated into another's periphery, contributing to broader debates on colonial encounters, resilience, and social reconfiguration in contexts of historically contingent connectivity.

49. Water, Marginality and Archaic Dual Structures in the Cults of Mephitis and Marica

Authors: Simona Marchesini (Alteritas)
Format: Oral

This paper examines the cults of Mephitis at Rossano di Vaglio and of Marica at the mouth of the Garigliano as case studies of marginal religious practices embedded in liminal landscapes of ancient Italy. Both sanctuaries occupy environmentally and topographically peripheral settings dominated by water-related features—geothermal emissions, wetlands, and river mouths—approached here through a geosemiotic and phenomenological reading of landscape. The analysis focuses on the epigraphic and cultic evidence associated with two female water-related divinities operating outside canonical pantheons and within linguistically marginal contexts. Both sanctuaries lie in Sabellic-speaking areas (Oscan/Auruncan), allowing linguistic marginality to be treated as a structural component of local cult practice rather than as a secondary or residual feature. The core argument addresses numerical structuring—binary and triadic—as an archaic and marginal mode of organizing divine space. At Rossano di Vaglio, the coexistence of Mephitis and Mamers, materially attested by two statue bases within the sanctuary, has long been interpreted as evidence for a dual cultic configuration. Following Michel Lejeune, and supported by recent reassessments of the epigraphic record, this dualism is best understood as an archaic feature rather than the outcome of later syncretism. At the Garigliano sanctuary, the epigraphic evidence is more elusive. A revised reading of the inscription traditionally associated with Marica (deuom duo, "two of the gods") introduces a numerical articulation that contrasts with the presence of Trivia, whose name implies a triadic framework. Rather than resolving this tension, the paper highlights it as a meaningful structural feature of a marginal cultic context. Without invoking functional or environmental causality, the paper argues that such numerical configurations reflect archaic and peripheral modes of religious organization preserved in marginal sanctuaries and languages outside dominant religious systems.

2772. Cults at Dreadful Natural Environments: Quarry Workers and Religious Coping Strategies on Naxos

Authors: André Corso (National and Kapodistrian University of Athens) – Erica Angliker (University of São Paulo)
Format: Oral

Research on ancient Greek religion has extensively examined responses to uncertainty and risk, yet the religious experiences of non-élite groups working in hazardous environments remain underexplored. This paper investigates cultic practices embedded within quarry landscapes on Naxos, focusing on how quarry workers—operating at both social and environmental margins—negotiated daily exposure to danger through ritual activity. The study centres on the sanctuary of Phelerio, established within an active quarrying area and associated with the worship of local heroes and Nymphs, alongside evidence from the sanctuary of Apollonas. These cultic sites were situated directly in spaces of extraction marked by physical danger, sensory intensity, and environmental instability. Through the analysis of architectural features, votive assemblages, and quarry-related material culture, the paper argues that religious practices functioned as coping and survival strategies in response to uncontrollable natural forces. Particular attention is given to unconventional offerings—including carved stone objects, lithic graffiti, redeposited pottery, and unfinished or damaged statues—whose materiality reflects both precarious working conditions and workers' intimate knowledge of labour, risk, and failure. By foregrounding subaltern religious practices in a harsh environment, this paper contributes to broader debates on marginality, human–environment interaction, and socioecological stress in the ancient Mediterranean.

1040. The Flood of Florence in 1333: Society and Nature before the Anthropocene

Authors: Neri Almeida (Universidade Estadual de Campinas) – Marcelo Candido Da Silva (Universidade de São Paulo)
Format: Oral

The crises arising from global environmental changes are becoming increasingly evident. As they reconfigure social demands, they begin to exert pressure on the very forms through which urban societies represent themselves, revealing nature as a constitutive element of social existence. This experience has been equally significant in indicating the need to reconsider societies of the past, analyzed according to criteria shaped by the radical distancing from nature that characterizes the Anthropocene. Although historical research has not failed to attend to the social consequences of extreme environmental phenomena — such as famines, epidemics, human displacements, and struggles over resources — it has relegated to the background the deeper and more enduring intersection between such phenomena and societies. This intersection can be observed in the recurrence of these events, in their long-term effects, and in the initiatives developed to understand them. So, it is pertinent to ask how accurate our descriptions of the elements of these societies have been. The conflicts that emerge in crisis situations have generally been analyzed in terms of struggles for power and resources. However, from another perspective, might it be possible to identify in the records conflicts that extend beyond these dimensions, involving contestations over the very ideas of society and the future? We will discuss this question in light of the conflict that took place in Florence concerning the flood of 1333. This episode is interesting because it leads us to question the hegemony of social and economic forms associated with the emergence of the so-called "mercantile capitalism." We intend to discuss the extent to which an ecological perspective on crisis and society emerges in documentation shaped, on the one hand, by narrative formulas and specific instruments for describing nature and, on the other, by hegemonic historiographical interpretations that condition the reading of these records.

1775. Marginality and human-climate interactions in Iron Age Veneto, northern Italy

Authors: Rafael Scopacasa (University of São Paulo) – Elisa Perego (University College London)
Format: Oral

In the Iron Age, the marshlands of central Veneto, northern Italy, were characterized by riverine landscapes affected by flooding episodes, which appear to peak in frequency and intensity around 800-600 BC. From a climatic perspective, this period was related to a phase of potential cooling, which might have contributed to increased fluvial instability in the region. From a social perspective, our ongoing research has demonstrated that these environmental challenges were concomitant with changes in ritual, pottery and metal production, trade links, stone procurement, burial practices and cemetery organisation, which foreground evolving social relations and the negotiation of different identities in life and death. Funerary sites, such as those in the flood-prone centre of Padua, reflect the image of a society where social inequality and potential marginality became especially prominent in these phases of environmental downturns and climate change. By analysing a sample of several hundreds of graves from Padua, we show that different burial practices, sometimes concomitant with stratigraphic evidence of flooding, were adopted to single out specific social groups or individuals, such as some neonates and children, people potentially affected by impairments and disabilities, and adults who might have belonged to lower social "classes" or had failed to receive full social inclusion.

1777. Life and death histories of potentially marginalised individuals in Iron Age Veneto, northeast Italy

Authors: Elisa Perego (University College London) – Rafael Scopacasa (University of São Paulo)
Format: Oral

Our research on Iron Age Veneto, northern Italy, c.800-600 BC, has recognized a phase of accelerated socioeconomic change, which was concomitant with climate change and episodes of severe flooding. Ritual violence and "deviant" burial practices were chronologically associated with these broader environmental and social challenges. The use of inhumation instead of the more common cremation rite was one potential marker of incomplete social inclusion, or social difference, especially when associated with unusual features, such as prone burial, disarticulation, and deposition in liminal areas of the burial space. We, therefore, pinpoint the life and death histories of three inhumed individuals who display "abnormal" post-mortem treatments in the flood-prone centre of Padua: an infant, who received a funerary rite reflecting complex nuances of both social recognition and incomplete social inclusion; an adolescent/young adult with osteological evidence of possible disability, who was disposed of in a way that appears to underline social exclusion and the violent erasure of personhood; and an adult male, whose burial treatment embodied somewhat contradictory aspects for his gender and age. From our micro-scale analysis, marginality and social exclusion emerged as complex social constructions that were negotiated through different depositional practices in a phase of growing inequality, against the backdrop of recurrent flooding and climatic oscillations.

2538. Woodworking in Spina, a people's practice? Dendrological evidence for investigating socio-ecological behaviours in the Po Delta

Authors: Léonard Gournay (Université Paris 1 Panthéon-Sorbonne | Università di Bologna | EURArChal | ArScAn)
Format: Oral

The socio-ecological implications of human–environment relationships are difficult to reconstruct due to their limited visibility in the material record. The actors involved in the chaîne opératoire of timber production often remain invisible, and it is still unclear whether woodworking constituted a specialised or a widely shared practice. When considering, as in the case of Spina, wooden structures of large dimensions that likely required a substantial workforce, questions of labour organisation and management inevitably arise. From this perspective, it is essential to consider the social position of workers and the potential hierarchies structuring tasks and functions within woodworking activities. In this context, dendrology makes it possible to extend the scope of inquiry beyond the sole consideration of wood as a construction material and to think its impact on some structural phenomena. This paper thus explores the potential of archeodendrometry for investigating the social position of woodworkers and the organisation of timber production, by presenting a range of methods that help situate woodworking within past societies. Drawing on wooden remains from the perimetral structures of the settlement of Spina and from its necropolises, we investigate woodworking savoir-faire through use-wear analysis of the considered wooden assemblages, and we assess builders' empirical knowledge of the mechanical properties of wood by interpreting tree essences in light of their spatial disposition through GIS analysis. Finally, quantitative estimates of the workforce and timber required for these structures will ground our analyses in a larger social framework.

2651. Altering Aetolia, Shifting Status: Enslaved Labor, Manumission, and Environmental Change in the Hellenistic Mórnos Valley

Authors: Kevin Lee (The University of Texas at Austin)
Format: Oral

In a 2021 study published in "Environment and Planning E", David Brown and his coauthors identify feedback loops between various forms of modern slavery and environmental degradation. This reminds us that marginalized groups not only experience and respond to environmental shifts; willingly or not, they also actively contribute to them. This paper is an exploratory application of the "slavery-environmental nexus" identified by Brown et al. to the ancient Mediterranean. Combining archaeobotanical, sedimentological, and palynological evidence with manumission decrees from eastern Aetolia and western Locris, it explores how enslaved and manumitted individuals helped change the environmental profile of eastern Aetolia's Mórnos River valley during the Hellenistic period (c. 300-150 B.C.). It argues that they did so not only as laborers and consumers, but also as business managers. The paper first correlates evidence for accelerated erosion and expansion of anthropic cultivars with increased Hellenistic-period settlement activity along the Mórnos from Kallipolis to Naupactus. It situates these environmental shifts within a four-legged model of the local mountain economy in which agriculture was complemented by export-oriented pastoralism, forestry, and emigration. It then turns to the region's enslaved and manumitted individuals, both those epigraphically attested at regional sanctuaries and those who remain anonymous behind the archaeobotanical and ceramic assemblages from House IV at Kallipolis. Close readings of these sources strongly suggest the ways enslaved and freed persons changed the valley's environment, from building and cultivating agricultural terraces to managing the pastoral and sylvicultural portfolios of landed estates. Though the ancient evidence does not afford the level of detail available to Brown et al., reading environmental data alongside material and epigraphic evidence nonetheless permits a historically grounded reconstruction of the "slavery-environmental nexus" in an ancient mountain economy, furnishing a comparative point of reference for similar studies in other regions of the ancient Mediterranean.

2099. Resilience in a resource-rich landscape: human-environment interactions at Histria (Romania) across the longue durée

Authors: Adam Rabinowitz (The University of Texas at Austin) – Elijah Fleming (University of Minnesota-Duluth) – Katherine Reinberger (University of Georgia CAIS) – Liviu Iancu (National Museum of History of Romania)
Format: Oral

The Greek settlement of Histria, on the Black Sea coast of Romanian Dobrogea, was continuously occupied for 1300 years, despite a series of violent destructions, the gradual silting of its port, and the shift of economic activity in the Roman period to the nearby center of Tomis (now Constanta). Its residents seem to have adapted to these setbacks across historical moments that climate historians have considered less than ideal for agricultural prosperity, and that saw significant disruptions in this region (for example, the Hellenistic period, which began with a city-wide destruction at Histria, followed by an economic downturn that was acute by the first century BCE, or the third century CE, which saw more violent unrest including sacks by Gothic groups). This paper seeks to explain the city's resilience through its geographic location, which provided it with access to a wide variety of natural resources that allowed the residents of Histria to shift their economic and subsistence activities in response to environmental or historical challenges. These resources seem to have been particularly important to the non-elite populations who were buried in Histria's cemeteries from the second century CE on, at a time when the city was struggling to manage repeated crises. We discuss the results of a preliminary program of analysis of environmental and bioarchaeological remains at the site, and lay out the framework for a broader interdisciplinary, multiscalar research project that will explore the ways in which Histrians managed the resources provided by the varied landscape of Dobrogea to ensure their community's adaptability and persistence.

2424. Dynamic niches along the fringes of the eastern Sahara in antiquity: water stress as a model for adaptive strategies

Authors: Anna-Latharina Rieger (Catholic University Eichstätt-Ingolstadt)
Format: Oral

This paper explores socio-ecological marginality and adaptive economic strategies in the Marmarica, a semi-arid to arid region located along the northern fringes of the eastern Sahara, between the second millennium BCE and the first half of the first millennium CE. Rather than focusing on episodic environmental crises or abrupt climate-driven disruptions, the paper foregrounds permanent environmental stress, especially water scarcity and limited carrying capacities, as defining economic potentials and livelihood in this marginal landscape. Drawing on the geo-archaeological evidence, the paper argues that communities in the Marmarica developed adapted lifestrategies that enabled agricultural production beyond mere subsistence. These strategies can be labelled as exploitation of an ecological niche, where people were flexible in land-use practices, and the combination of pastoral and agricultural activities across micro-environments. These communities were not primarily reacting to sudden disasters or short-term hazards, but operated within long-term constraints that demanded continuous adaptation and resilience. By approaching the Marmarica as a zone of socio-ecological marginality, the paper challenges core–periphery models that frame such regions as economically dependent, fragile, or passive, and at the same time questions the label of marginal for their population. Instead and in line with the session's aims, it draws attention to the model character the adapted life-strategies can have and highlights how marginal environments could foster innovation, sustainability, and forms of economic agency that are often obscured in elite- and urban-centred narratives of the ancient Mediterranean. In dialogue with broader debates on marginality and environmental change, the paper reflects on how archaeological perspectives on populations long accustomed to climatic stress can inform present-day discussions on climate-driven marginalisation, niche exploitation, and coping strategies. It ends with the of over-developping such areas in recent years as touristic destinations, coming along with new challenges for the marginal environments.

34. Ecological Grief and the Safaitic Inscriptions of Ancient North Arabia

Authors: Eris Williams-Reed (Wellcome Collection / University of Warwick)
Format: Oral

To what extent can we recognise experiences of ecological grief in antiquity and how can these experiences inform our own understanding of environmental emotions in the modern world? This paper will explore these two questions via the Safaitic inscriptions of ancient north Arabia. Carved over 2000 years ago in the Harrah desert, these texts offer a rich insight into their authors' ways of life and close relationship with the environment. One key element of this relationship concerned the animals (including sheep, goats, and camels) led by the authors across the desert to known areas of water and pasture. Yet the authors and their animals also experienced drought and ecological instability, with many texts detailing their ensuing enhanced emotional reactions and behavioural changes. By bringing these ancient testimonies into dialogue with contemporary thinking about environmental emotions, this paper will develop a cross-cultural methodology for identifying and analysing expressions of ecological grief in pre-modern communities.

1586. Evolution, persistence, and resilience of the landscapes of Sannio Pentro. A case study from the province of Benevento (Campania, Italy)

Authors: Oriana Cerbone (University of Salerno | Associazione Nazionale Archeologi)
Format: Oral

The case study presented refers to a segment of the ancient Sannio Pentro region in the province of Benevento, characterised by various forms of human occupation, transhumance routes and ancient roads connected to the Via Appia. The landscape analysed here is understood as a multi-layered palimpsest, the sum of the relationships between man and the environment over time. The dynamic process of landscape transformation has therefore involved both anthropic and environmental components, from ancient times to the present day. Some elements of the ancient landscape have survived, blending in with the current landscape. Environmental elements, such as the river and mountains, have strongly influenced the development and evolution of these landscapes. The geographical context chosen is relevant to an area of the Campania region that is the focus of national and European policies as an area at high risk of marginalisation, depopulation and social and economic exclusion. The multi-layered landscape patterns of this territory are highly informative, but their survival is threatened by several factors: their intrinsic fragility - linked to abandonment and depopulation - and the intensive exploitation of the area for the installation of contemporary infrastructure (wind farms, hydroelectric and photovoltaic systems). The scarcity of accessible or recent data creates many problems of interpretation. However, environmental data on a regional and provincial scale can be used to provide a general reference framework. It has therefore been necessary to try to bring together different types of sources (archaeological, cartographic, historiographic, epigraphic, etc.) with data that is not native to archaeological research but which must be considered (such as hydrological instability maps, landslide maps, geomorphological and geolithological maps, etc.) in order to investigate and reconstruct the possible dynamics and interactions between humans and the environment over time.

16 WEAPONS, BODIES AND IDENTITIES: RETHINKING WARRIOR BURIALS IN LATE PREHISTORIC EUROPE

Theme: 1. Widening perspectives in material culture studies
Organisers: Andrea Dolfini (Newcastle University) – Christian Horn (University of Gothenburg) – Maria Katsimicha (University

of Manchester)
Keywords: Warrior burials, Weapon-rich graves, Warrior identities, Osteobiography, Late prehistoric Europe
Format: Regular session
Affiliation: Archaeology and Gender in Europe - AGE

SESSION ABSTRACT

Warrior burials are among the most iconic and enduring forms of funerary evidence in late prehistoric Europe and the Mediterranean. Emerging as early as the 4th millennium BC in regions as distant as the Caucasus and Italy, these burials flourished through 3rd and early 2nd millennium traditions as diverse as Bell Beakers, Corded Ware, and El Argar, and continued into later Bronze Age and early Iron Age contexts, including southern Scandinavia and Mycenaean Greece. Their distinctive assemblages of weapons and personal gear have long fuelled debates on identity, gender, personhood, mobility, migration, social turmoil, and conflict. However, these debates often remain confined within narrow regional or chronological frameworks, limiting cross-cultural comparison and the development of broader interpretative models. This session seeks to bridge these divides by inviting innovative approaches to weapon-rich burials and related evidence from the Late Neolithic to the Iron Age, across Europe from the Caucasus to Ireland and from Scandinavia to the northern Mediterranean. We encourage papers and posters that combine archaeological and bioarchaeological perspectives, and that explore both the material assemblages and the buried individuals themselves – or ideally, the interaction between the two. Contributions may address the life and death of these individuals alongside the social lives of their artefacts, from production and use to deposition and commemoration. Particularly welcome are interdisciplinary studies examining the interplay between weapon assemblages and osteological evidence for conflict, osteobiographical reconstructions integrating archaeological and bioarchaeological data, contextual analyses of weapon and non-weapon burials, and comparative approaches that cut across regional and temporal boundaries. By foregrounding both the materiality and biographies of weapons, and the identity and lived experiences of the buried, this session aims to widen our perspectives on how warrior burials illuminate social identities, gender roles, power dynamics, and ideologies of violence in late prehistoric Europe.

CONTRIBUTION ABSTRACTS

324. Warrior burials in Chalcolithic Italy: a new interpretation

Authors: Andrea Dolfini (Newcastle University)
Format: Oral

This paper proposes a new interpretation of so-called 'warrior graves' and other richly furnished individual burials of Chalcolithic and Early Bronze Age Europe, focusing on the Rinaldone funerary tradition of central Italy (4th–3rd millennia BC). Across large swathes of Europe, a new funerary language emerged during this period, characterised by individual inhumation in anatomical connection and by the use of grave goods—metal and non-metal alike—to mark gender and, according to prevailing interpretations, elevated social status. Warrior graves have become the most visible and intensively studied expression of this phenomenon and are frequently understood as material indicators of emerging sociopolitical hierarchies grounded in metal wealth. The paper critically reassesses three key assumptions underpinning this reading. First, the taphonomy of Rinaldone cemeteries suggests that burials with grave goods were originally more numerous than the surviving archaeological record implies. Second, it questions the presumed rarity and exceptional value of copper in early Italy. Third, it challenges the tendency to interpret prehistoric individual burials through modern, Western concepts of personhood, identity, and status. Instead, the paper argues that warrior graves are better understood through culturally specific notions of gender, age, and the life course, and through the ways these categories were reconfigured during funerals. Unusual life and death circumstances—including episodes of violence, both inflicted and suffered—may have motivated the deposition of selected individuals with conspicuous weapon assemblages, without any subsequent reopening of the grave to disarticulate the skeleton and recirculate its grave goods. From this perspective, warrior graves reflect not an established social hierarchy, but a new system of meanings centred on memory, social transformation, and the ritualization of death.

2251. Aegean Late Bronze "Warrior Graves" Before, During and After the Palatial Period: Similarities and Differences

Authors: Ioannis Georganas (Canadian Institute in Greece)
Format: Oral

Burials with weapons are one of the most striking features of Aegean Bronze and Early Iron Age archaeology. Such burials appear as early as the Early Bronze Age and continue well into the Early Iron Age. Although the type of graves used and the nature of the artefact assemblages vary temporally and spatially, all of the burials are usually males accompanied by weapons; in some cases these are not only numerous but also spectacular. Well known examples come from Grave Circles A and B at Mycenae and the Late Minoan cemeteries around Knossos, as well as numerous postpalatial graves from mainland Greece. The purpose of this paper is to examine the similarities and differences between the Palatial and Postpalatial "warrior graves", both in terms of material culture and ideas about identity and status. Special attention is going to be given to the graves dating to the Late Helladic IIIC period.

1591. Again...are all warriors male? Investigating gender and warrior identities in the European Iron Age, ca. 650 – 400 BCE

Authors: Kathryn Mccarty (University of Wyoming)
Format: Oral

There are two lingering misconceptions about a deceased individual buried with weapons during the European Iron Age. First is that the individual is male, and second, that they are a warrior. However, given that certain evidence has come to light, we now know that this is not necessarily the case. Archaeologists have gotten better about exploring other possibilities in terms of identity, personhood, and gender, but there is still much more to uncover. Because aDNA and osteological identification of an individual's sex are not always done, what is still usually analyzed in terms of identifying gender are differences in the composition of grave good assemblages between males and females. In this paper, I hypothesize that gender-based warrior identities will show marked differentiation in terms of frequencies of certain categories of grave goods and that the cultural identity and identification of female warriors changed over time as gendered ideologies evolved within the context of the encounters between the Classical Mediterranean world and temperate Europe. To more fully explore this, I analyzed data from numerous early Iron Age burial sites in Europe, identifying key differences in grave good assemblages and compositional frequencies. The results of my research indicate significantly more work challenging modern gender-based ideologies and their application to the pre-modern world may be in order.

584. Does the Weapon Make the Man? Weapon burials, and expressions of masculine identity in Cisalpine Gaul, c. 400–180 BCE

Authors: Alastair Lumsden (University of St Andrews)
Format: Oral

In pre–Roman Cisalpine Gaul, mortuary assemblages constitute the principal evidence for interpreting identity, yet assessing status and position within an aristocratic hierarchy is precarious, particularly when measured through weapons alone. This paper presents an interdisciplinary model that tests whether patterns in the deposition of military items track social differentiation or whether non-military items more reliably reflect the deceased's age, authority, status, or wealth. It collates and analyses over 100 weapon burials from major necropoleis across the four dominant Cisalpine Gallic polities (Boii, Cenomani, Insubres, Senones), presenting their assemblages in cemetery-specific itemised databases. This detail and scope enable both intra-regional and inter-regional comparisons, revealing patterns and anomalies in burial assemblages that infer an individual's relative positioning within an aristocratic hierarchy and trace how expressions of masculine identity were renegotiated as differing cultural ideologies responded to broader sociopolitical and military developments. Observations are then subject to formal statistical testing (Chi-square test, Fisher's Exact test) to evaluate whether deposition rates of specific pieces of military equipment and domestic goods remained proportionally similar between necropoleis and amongst Cisalpine Gallic polities over the longue durée. These conclusions are integrated with modern anthropological theories (Hegemonic masculinity, Cost-signalling theory) to contextualise potential ideological motivations behind the deposition of specific items and their association with the deceased's identity. Where permissible, this analysis also integrates osteological evidence to illustrate that age or martial trauma alone do not reliably indicate hierarchy or martial participation. These findings are supported by comparison with burial practices and expressions of masculine identity among contemporary pre-state groups (Celtiberians, Iberians, and Samnites), demonstrating the transferability of this model across cultural and temporal boundaries.

1603. Swords and Saddles? An Interrogation of Warrior Identity, Status, and Mobility in the Eurasian Iron Age

Authors: James Johnson (University of Wyoming)
Format: Oral

Research into the social lives (and deaths) of warriors in the broader Eurasian Iron Age, ca. 900 – 200 BCE, focuses conventionally on presence/absence of certain types of grave goods like swords and spears. Based largely on this premise, archaeologists have identified deceased individuals during the 'Scythian' period, ca. 600 – 300 BCE, as not only warriors but homogeneously define the Scythians as a warrior-based society. This is probably because as pastoralists, Scythian populations left relatively ephemeral traces in the archaeological record besides their mortuary practices that centered on the use of different size burial mounds. Within those burial mounds the statuses and social roles associated with warriors seem to take center stage in Scythian burial rites. Yet it remains unclear as to whether this predominant focus on the warrior: 1) is deserved; 2) can be identified in terms of regionally specific material correlates of Scythian period 'warriors'; and, if so, 3) can such materials be linked to other social positions and/or roles. Utilizing data from Renate Rolle's (1979) compendium of Scythian period burials in the lower Dnipro region of present-day Ukraine and data collected from the ongoing Comparative Iron Age Burial Mound Project at the University of Wyoming, I interrogate the degree to which Scythian warrior identities were homogeneous and subsequently singularly constructed and expressed. I investigate if such identities were linked to other social and material factors such as mound construction, the deposition of grave goods other than just weapons, such as horses and riding accoutrements, and various other symbolic expressions of status. This study suggests a more complex social structuring of Scythian society was at play from 600 – 300 BCE, and perhaps even earlier.

2247. Graves with weapons in the Latène biritual cemetery from Trestieni (Prahova county, Romania)

Authors: Vlad Carabisi – Meda Toderas – Andrei Magureanu ("Vasile Pârvan" Institute of Archaeology, Bucharest) – Marta Petruneac ("Horia Hulubei" National Institute for R&D in Physics and Nuclear Engineering)
Format: Oral

During the archaeological investigations preceding the construction of the A7 motorway (Ploiești – Buzău) in 2022 and 2023, a biritual cemetery was excavated, dated in the 5th-4th c. BC. The grave goods in both cremations and inhumations consist largely of the same categories, namely weapons, arrowheads, numerous pieces of attire, and pottery. Weapons were found in cremation and inhumation graves and consist of two akinakai, a double axe, and numerous bronze arrowheads. The grave goods also contained iron knives, however, their function as weapons is uncertain. Computer Tomography was used in the analysis of certain grave goods. Both graves with akinakai share similarities in the ritual, i.e. in both cases the akinakes was placed on a concentration of cremated bones along with bronze arrowheads. Notably, neither the akinakai, nor the arrowheads displayed traces of burning. This suggests the body was burnt elsewhere and the remains were subsequently deposited in the rectangular pit alongside the grave goods. Arrowheads occur frequently in both cremation and inhumation graves and are associated with both weapons and pieces of attire. The purpose of this contribution is to identify patterns and variations in the funerary behaviour regarding the treatment and deposition of weapons, compared to other types of grave assemblages in the same cemetery. Finally, the grave assemblages from Trestieni are compared to other contemporary cemeteries from the Lower Danube, to place the cemetery in a broader context.

1108. Warrior or warlord – Hallstatt period sword grave from Brzoza in Poland

Authors: Tomasz Gralak (University of Wrocław)
Format: Oral

Inside the barrow from Brzoza, not only weapons were discovered, but also a very large set of objects not related to the military sphere. The buried man was therefore equipped with a sword, a dagger, a spear, and horse tack. Metal (including gold) and glass elements of the costume were also found. The basic part of the equipment consisted of several dozen different types of ceramic vessels. In addition, a crescent-shaped idol and bones constituting the remains of a cattle carcass were also discovered. Assuming that all of them constitute a source of information about the buried person, violence was only one element of his activity. Pottery is directly associated with consumption, and its number suggests it was collective. It can therefore be assumed that this was a way of showing control over food and other goods. In this sense, weapons and violence were merely a means used to achieve other goals. Two other barrows located in the immediate vicinity were characterized by less extensive equipment and female ornaments. Domination, therefore, also concerned the gender sphere. Moreover, flat graves (cinerary urns) without any equipment were recorded around the barrows. The entire cemetery was therefore a visualization of the social pyramid – at its top stood an armed man.

2590. Warriors and Princes in the Eastern Hallstatt Circle – class, role, status, or something else?

Authors: Hrvoje Potrebica (University of Zagreb, Faculty of Humanities and Social Sciences)
Format: Oral

The Hallstatt Culture was used as a synonym for the Early Iron Age of the Central Europe. This paper will cover its eastern part (eastern Alps and southern edge of the Carpathian Basin), specifically Hallstatt sites in the Požega Valley. Several cultural groups existed in this area in period from 8th to the 6th century BC that shared some common traits believed to be inherent to all Hallstatt societies. One of them was that ruling elite of these communities consisted of warrior aristocracy. This was reinforced with category of princely graves with lavish inventories dominated in many cases by sets of weapons and horse equipment. This definition was at least oversimplified as well as somewhat circular argument. Unfortunately, the dominant burial ritual was cremation with little or no anthropological remains to be studied in relation to weapons from particular graves. However, the study of chronological or provenance background of individual weapons from these graves provides different insight in warrior identity of those communities. It seems that 'warrior' was not class but status intertwined with social role of these individuals. Feasting sets present in these graves also suggest much more complex identity and multiple social roles of individuals buried with weapons. We have to ask were warriors ruling class of Hallstatt societies or elite that ruled these communities adopted warrior paraphernalia as part of their special identity markers. The carefully compiled sets of weapons do note reflect just warrior character of person buried with it but also continuity and legitimacy of their rule as well as exclusive control of communication network between neighbouring and distant communities and/or local resources.

803. Resonant Power: Weapons, Horse, and Identity in an Early Iron Age Princely Burial at Jalžabet

Authors: Sasa Kovacevic (Institute of Archaeology, Zagreb)
Format: Oral

The princely burial mounds in Jalžabet, northwest Croatia, provide a rare insight into Early Iron Age mortuary practices within the East Hallstatt cultural sphere. Excavations conducted by the Varaždin City Museum and the Institute of Archaeology over the past three decades have revealed substantial quantities of cremated remains; however, the highly fragmented condition of the bones

presents a significant challenge for the reconstruction of the burial rite. Owing to extensive fragmentation, mixing, and post-depositional disturbance, the scientific identification of unequivocal human remains is problematic. This situation raises important methodological and interpretative questions concerning the treatment of the body and the construction of identity in elite Hallstatt funerary practice. The associated assemblage includes weapons (fragments of scale armour, spearheads, and arrowheads), elements of horse gear, and items of gold and amber jewellery. This combination suggests the deliberate construction of a princely identity in which martial equipment, equestrian symbolism, and prestige goods collectively articulated power, mobility, and social status. The prominence of horse gear points to the significance of mounted warfare or elite mobility, while the coexistence of weapons and ornaments challenges narrowly defined interpretations of "warrior burials". This lecture argues that the Jalžabet burial assemblage reflects a complex and layered expression of identity that cannot be understood through a single disciplinary perspective. It therefore calls for closer interdisciplinary collaboration between osteology, archaeology, the archaeology of ritual, and related fields in order to address the methodological and interpretative challenges posed by elite cremation burials of the Early Iron Age.

599. Women, Warriors, and Victims - Tracking Gendered Cultures of Violence in Danish Early Iron Age Bog Burials

Authors: Cecilie Wilsborg (Aarhus University)
Format: Oral

This paper presents preliminary results from the PhD project Women, Warriors, and Victims – Tracking Gendered Cultures of Violence in Danish Early Iron Age Bog Bodies, which investigates multiple-burial deposits in wetland contexts as a complementary and rather underexplored body of evidence for warrior identities, conflict, and funerary ideology in southern Scandinavia. These contexts are defined as abnormal burials in which two or more individuals were deposited during the same event, including apparent mass graves in bog environments. The dataset comprises 453, mostly skeletonised, individuals from 98 localities across Denmark, enabling large-scale quantitative and comparative analyses. Moving beyond traditional burial evidence, the project foregrounds the embodied biographies these individuals through an multidisciplinary methodology combining osteological assessment of the skeletal remains, analysis of associated material culture and combat equipment, emerging genetic data, and exploratory statistical modelling, integrated with gender and bioarchaeological theory. Patterns of ante- and perimortem trauma, sex-based selection, and the presence of weaponry in some contexts suggest links to organised warfare and militarised identities. Other deposits appear to reflect massacres of small groups, with both adults and children displaying lethal injuries, pointing to different modes of conflict and victimhood. Across the multiple-burial contexts, female individuals are consistently underrepresented, raising critical questions about gendered participation in warfare, violence, and the selection of victims. These patterns are explored through the development and statistical testing of a new theoretical framework, the Gendered Cultures of Violence Model. The hypothesis is that these bog body deposits represent long-term, socially structured practices of violence that actively shaped the construction and negotiation of gender, power, and martial identities in the Early Iron Age.

1373. Weapons and warriors from the cemetery of Store Frigård (Bornholm): mobility vs. local patterns

Authors: Piotr Łuczkiewicz (Maria Curie-Sklodowska Univeristy of Lublin) – Tine Trolle (Aarhus University, Bornholm Museum) – Aneta Kuzioła (Adam Mickiewicz University of Poznan) – Michał Grygiel (Nicolaus Copernicus University in Torun)
Format: Poster

The "Bornholm – the island in the middle" project currently underway aims to shed light on societies, contacts and alliance systems in the Baltic Sea region in the Early Iron Age (500 BC – 400 AD). It-is based on material from Bornholm's largest cemetery, Store Frigård with 1250 cremation graves. With its central geographical location in the middle of the Baltic Sea, the island of Bornholm has always been an obvious link and a treasured "stepping stone" between the Continent and Scandinavia. Weapons were found in 40 graves and are among the most significant finds at the site (although the original number of weapon graves was certainly greater). Particularly interesting is a high percentage of swords in the burials, which is very rare in Northern Europe. Weapons, as well as the presence/absence of other grave goods, provide a wealth of information about self-identification of local communities, personal mobility, social status, power dynamics and ideologies of violence. The social life of the weapon artifacts, from production and use to deposition, is examined together with the life and death of the buried individuals. The cremation burial rite and the generally small number of bones in most weapon graves limit the perspectives for bioarchaeological analyses. However, combining the archaeological perspective (morphology, typology, chronology, contextual analyses of weapon and non-weapon burials) with natural science methods – provenance analyses of iron, glass, ceramics and the buried individuals themselves – reveals a complex network of local and cross-regional interactions. This reflects - in a unique 900-year perspective - mobility on various scales, possible political and military alliances in smaller or larger geographical areas, but also local patterns/habits and the power of tradition.

1557. Symbolism of the Graves with Weapons from the Late Eneolithic and Early Bronze Age in Bohemia

Authors: Katarina Petriscakova (Museum of Prague)
Format: Poster

The aim of this study is to describe the changes at the end of the Eneolithic period and at the beginning of the Bronze Age, on the basis of the analysis of graves with weapons and the possibilities (limits) of identifying the warrior burials in Bohemia. The end of

the Eneolithic is characterised by two cultural complexes, the Corded Ware Culture and the Bell Beaker Culture, on which the Early Bronze civilization evolved, characterised by the Únětice Culture in our context. It is in this transitional period, that graves with specific goods appear increasingly, and we can finally call these as true weapons. Weapons are associated with warfare attributes that, according to the latest theories, played an active role in prehistoric society. However, weapons could also represent attributes of certain symbols associated with socially significant individuals. More than 500 graves that contained weapons – warrior's burials – from Bohemia dating to the Late Eneolithic and Early Bronze Age as part of this study were analysed. A fundamental concept is based on spatial analysis of specific grave assemblages and traceological analysis of selected types of weapons. Current analyses and re-analyses of human skeletal remains with evidence of conflict were also mentioned.

1735. A Warrior Burial by the Fjord – Networks, Rituals and Identity in the Early Bronze Age

Authors: Marie Rasmussen (Museum Horsens)
Format: Poster

This poster presents a unique Early Bronze Age warrior burial excavated in 2022 near Horsens Fjord in eastern Jutland, Denmark. The grave is dated to Period 1b (1600–1500 BC) and is characterized by a long stone setting shaped like a boat, with a raised prow and a straight-cut stern. Although the organic material was not preserved, the dimensions and morphology of the grave, combined with the boat-shaped stone setting, indicate that the deceased was originally placed in a log boat coffin. The narrow coffin trace further suggests the burial of a single individual. The grave contained three prominent artefacts: a flint dagger, a sandstone battle axe imitating a Fårdrup-type copper axe, and a bronze dagger of the Sögel type. No close parallels to this combination of grave goods are currently known from Denmark, and the overall burial form likewise lacks direct local comparison. The poster explores how this unusual assemblage and burial architecture can be interpreted within broader Early Bronze Age warrior traditions and mortuary practices. Archaeological interpretation is combined with archeometallurgical analyses of the bronze dagger, which indicate participation in long-distance exchange networks linking eastern Jutland with northern Germany and Central Europe. The burial is discussed as a locally distinctive and socially meaningful expression of warrior identity, ritual practice, and connectivity in the Early Bronze Age.

2300. Arrowheads as Markers of Male Identity in Early Bronze Age Funerary Contexts North and South of the Carpathians

Authors: Pawel Jarosz (Institute of Archaeology an Ethnology Polish Academy of Sciences) – Eva Horváthová (Archeologický ústav SAV) – Anita Szczepanek (Institute of Archaeology an Ethnology Polish Academy of Sciences | Department of Anatomy Collegium Medicum Jagiellonian University) – Piotr Mączyński (Institute of Archaeology, Maria Curie-Skłodowska University)
Format: Poster

Arrowheads constitute one of the most recurrent categories of grave goods found in male burials dating to the Early Bronze Age. This paper examines the role, typology, and contextual significance of arrowheads deposited in funerary contexts north and south of the Carpathians, with particular emphasis on their association with adult male individuals. Based on a comparative analysis of burial assemblages, the study explores morphometrical variability, raw material selection, and technological features of arrowheads, as well as their placement within graves. The primary source base consists of richly furnished warrior burials from the Mierzanowice culture cemetery at Krzyżanowice Dolne, site 81 (south-eastern Poland), and funerary complexes of the Košťany culture from Michalany and Hatalov (eastern Slovakia). These assemblages originate from distinct raw material provinces, characterized respectively by the use of flint and obsidian. The presence of flint arrowheads is interpreted as a marker of social identity, potentially reflecting gendered roles associated with hunting, warfare, or symbolic representations of masculinity. The analyses contribute to a broader discussion on social differentiation, the construction of identity, and cultural interactions within Early Bronze Age communities of the Carpathian zone. This research was funded by the National Science Centre Poland, grant number NCN 2020/37/B/HS3/03816 and 2020/39/B/HS3/00454.

17 BRINGING TOGETHER ZOOARCHAEOLOGY, ARCHAEOGENOMICS AND MORPHOMETRY: SHAPING THE FUTURE OF INTERPRETATION

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Konstantina Saliari (Natural History Museum Vienna) – Vlatka Čubrić Čurik (University of Zagreb/ Faculty of Agriculture) – Preston Miracle (University of Cambridge) – Ino Čurik (University of Zagreb/ Faculty of Agriculture) – Katerina Trantalidou (Hellenic Ministry of Culture)
Keywords: aDNA, Morphometrics, Zooarchaeology, Migration, Subsistence strategies, Biodiversity
Format: Regular session

SESSION ABSTRACT

Zooarchaeological material is recovered from numerous archaeological sites. Although the amount of faunal remains may vary, they constitute one of the most significant categories of biological/ archaeological finds. In recent years applications of ancient DNA and morphometrics have been transforming the field of zooarchaeology. Novel knowledge has been produced concerning a large variety of topics, including the process of animal domestication, livestock management, taxonomic identification, mobility, trade and networks as well as palaeovirology. The new genetic and osteometric data provide a crucial historical database, contribute significantly to the interpretation of archaeological sites, help us understand mechanisms of human choices and decisions, are of vital importance to reconstruct evolution and past relationships and can be used to help preserve biodiversity. This interdisciplinary session aims to bring together researchers with wide-ranging theoretical, geographical and chronological interests to apply ancient DNA and morphometrics to make the most out of archaeological faunal remains for both our past and future.

CONTRIBUTION ABSTRACTS

1082. Uncovering history using ancient parasite DNA: A metagenomical screening approach

Authors: Kristýna Kuklová (Department of Botany and Zoology, Masaryk University | Department of Archaeology and Museology, Masaryk University | Institute of Vertebrate Biology, Czech Academy of Sciences)
Format: Oral

The study of helminths in archaeological context provides indicators of diet, hygiene, mobility, and human–animal interactions, and also offers a means to understand pathogen evolution, shifts in virulence, and historical epidemics. However, classical diagnostic methods used to detect parasitic infections in archaeological materials are often limited by insufficient specificity and sensitivity. In molecular analyses, this problem is compounded by extensive DNA fragmentation, limiting recovery and reconstruction of long genomic sequence. Targeted metagenomic screening using molecular probes to enriched sequencing library for specific taxa enables precise identification of parasitic DNA even in samples previously assessed as negative for helminths using traditional microscopic and PCR methods. One of the main advantages of molecular probe-based analyses is the ability to reconstruct complete genomes of ancient organisms that may be thousands of years old. Using environmental samples from the Czech Republic, archaeologically dated to the 11th to 13th centuries, we conducted a pilot study employing a targeted sequencing using probe panel focused on complete mitochondrial genomes of parasitic helminths. This analysis complements classical microscopic examination and standard approaches that have already been performed. We show that integrating metagenomic parasite screening into zooarchaeological and archaeogenomic research enhances the interpretative potential of environmental remains, contributing to reconstructions of past parasitic infections, health, subsistence strategies, and human–animal interactions. This interdisciplinary framework integrating genetics and archaeology highlights the relevance of ancient parasite DNA for shaping future bioarchaeological interpretations.

369. Paleogenomic characterization of animal populations used in funerary LBK contexts in the Paris Basin

Authors: Thierry Grange – Eva-Maria Geigl (Université Paris Cité, CNRS, Insitut Jacques Monod) – Lamys Hachem (INRAP - UMR 8215 Trajectoires)
Format: Oral

The nature and placement of whole animals or animal body parts as grave goods suggest distinct meanings and may offer valuable insights into the symbolism of early sedentary life. They not only reveal the roles animals played in funerary rituals but also contribute to the understanding of animal-human-environment interactions within specific ecological contexts. Indeed, animals placed as grave goods reflect their source wild or domestic animal populations. Paleogenomic (ancient DNA) analyses are instrumental in identifying the exact animal species of the faunal remains, their domestication status, hybridization between domesticates and wild counterparts, and other biological characteristics. Moreover, the analysis of the genomes of contemporary faunal remains in the villages and the surrounding environment refine the genetic characterization of the source populations of the faunal grave goods. In this study, we explore such a situation in the LBK of the Paris Basin, northern France, and place these animal genomes in the overall supraregional context through time.

2421. First genomic insights into the evolutionary history of the Greek dogs from antiquity to the present

Authors: Eleftheria Tosiou (School of Biology, Aristotle University of Thessaloniki | GENeTres, Center for Interdisciplinary Research and Innovation, Balkan Center) – Evangelos Antonios Dimopoulos (Department of Veterinary Medicine, University of Cambridge | Ineos Oxford Institute for Antimicrobial Research, University of Oxford) – Nikoleta Karaiskou (School of Biology, Aristotle University of Thessaloniki | GENeTres, Center for Interdisciplinary Research and Innovation, Balkan Center) – Katerina Trantalidou (Hellenic Ministry of Culture) – Dimitrios Kiousis (4th Hunting Federation of Sterea Hellas) – Angelos Hadjikoumis (The Cyprus Institute) – Elaine A. Ostrander (National Human Genome Research Institute, National Institutes of Health) – Laurent A.F. Frantz (Institute of Animal Systems Genomics, Ludwig-Maximilians-Universität München | School of Biological and Behavioural Sciences, Queen Mary University of London) – Larson Greger (Palaeogenomics and Bio-Archaeology Research Network, University of Oxford) – Alexandros Triantafyllidis (School of Biology, Aristotle University of Thessaloniki |

GENeTres, Center for Interdisciplinary Research and Innovation, Balkan Center)

Format: Oral

Dog is the first domesticated animal, originating from the grey wolf in the Old World, and has a complex evolutionary history. In Europe, the ancient dogs exhibited extensive genetic diversity, resulting from admixture between Near Eastern and Arctic dog lineages at least 10.9 thousand years ago along with multiple population expansions. Previous studies suggested that a transformation in dog ancestry coincided with the dispersal of Neolithic farmers from the Near East into Europe. These human populations followed two main routes: one along the Mediterranean coast and an inland route crossing the Balkans and central Europe. Subsequently, a distinct ancient dog population expanded within Europe replacing the earlier populations and erasing the genetic diversity of modern European dogs. There is a knowledge gap regarding how the Greek dogs have been influenced by these expansions and replacements across time and space, as well as by the sustained maritime trade and communication between human civilizations of the ancient Mediterranean world. In this study, whole genome sequencing data were generated from ancient dog bones, found in Greece and Cyprus and dated from 7,000 BP to Middle Ages, as well as for three Greek and six Balkan modern hunting dog breeds. These genomes were collectively analysed and compared with available genomic data of ancient and modern dog samples from the Balkans, Europe, Africa and Asia to investigate the genetic ancestry, diversity and population structure of Greek dogs from antiquity to present day. Our study provides the first comprehensive genomic evidence on the evolutionary history of ancient and modern Greek dogs and contributes to a broader understanding of dog population dynamics in the Mediterranean region. The preliminary results suggest that the native Greek hunting dog breeds are characterized by distinct genetic profiles. The incorporation of ancient genomic data will further elucidate their genetic history.

2428. Inheritance of coat color in Balkan cattle: contributions of modern and aDNA

Authors: Ivana Keršić – Zvonimir Mijadzikovic (University of Zagreb, Faculty of Agriculture) – Aurélien Capitan (INRA, GABI, AgroParisTech, Université Paris-Saclay) – Maja Ferenčaković (University of Zagreb, Faculty of Agriculture) – Ino Curik (University of Zagreb, Faculty of Agriculture | Hungarian University of Agriculture & Life Sciences, MATE) – Preston Miracle (University of Cambridge, McDonald Institute for Archaeological Research) – Vlatka Cubric-Curik (University of Zagreb, Faculty of Agriculture)

Format: Oral

In cattle, coat color is a key phenotypic trait, representing a complex polygenic trait with potential pleiotropic effects and serving as an indicator for breed identification, selective breeding, and adaptation to environmental conditions. Contemporary cattle breeds show a marvelous variety of coat colors and patterning as a result of intense selection by humans. Today's coat color spectrum is based upon the past genetic diversity of cattle and aurochs populations, of which we have limited information on coat color through ancient and historical art and texts. With ancient DNA analysis, our knowledge of this foundational genetic diversity in cattle can be greatly expanded, provided the gene region of interest is present within the typically damaged, lower-coverage ancient sequence. Analysis of genetic polymorphisms underlying coat color provides valuable insight into within- and between-population genetic diversity necessary for conservation strategies of endangered breeds, and the addition of a temporal dimension through ancient DNA analysis allows us to trace the evolutionary past of cattle coat color inheritance. In this study, whole genome sequences of individuals representing modern cattle breeds, along with low-coverage sequences representing ancient cattle and aurochs and published ancient sequences from areas relevant to the neolithization process in the Balkans were analysed for coat color. Variant discovery and annotation were conducted using a custom bash pipeline, focusing on two key coat color-determining genes, MC1R and ASIP. Identified variants were classified by genomic location and mutation type. Functional annotation was used to assess their potential impact on gene expression and protein function. These results contribute to the understanding of coat color inheritance in cattle and show the importance of incorporating ancient DNA into these kinds of analyses.

1247. Paw Prints of Progress: Animal Influence on Copper Age Technological Diffusion in Hungary

Authors: Linoy Namdar (MTA-ELTE Lendület "Momentum" Innovation Research Group | Institute of Archaeological Sciences, ELTE Eötvös Loránd University) – Péter Csippán (ELTE Eötvös Loránd University, Institute of Archaeological Sciences | Hungarian National Museum) – Zsuzsanna Siklósi (MTA-ELTE Lendület "Momentum" Innovation Research Group | Institute of Archaeological Sciences, ELTE Eötvös Loránd University)

Format: Oral

The Early and Middle Copper Age (4500-3650 cal BCE) in the Carpathian Basin was characterized by a network of small, farm-like settlements and the emergence of formal cemeteries. There has long been a hypothesis that this era saw a greater reliance on animal husbandry and animal products, which may have facilitated access to prestigious long-distance raw materials and artefacts and maintained contact between communities. This study investigates animals' role as products in shaping long-distance interactions between Copper Age communities in the Carpathian Basin, comparing archaeological sites from three regions (Great Hungarian Plain, Central Hungary, and Transdanubia) and exploring the potential change in animal husbandry practices between periods. To do so, two research objectives will be examined: (1) identify evidence for specialization in hunting and livestock production, through detailed zooarchaeological analysis of animal bone assemblages, focusing on species abundance, age and sex profiles, and rare cases of paleopathologies and butchery patterns (cut marks); (2) explore the potential of livestock mobility and inter-community contact between settlements. This will be made by analysing 2D and 3D geometric morphometric (using a MicroScribe) variation of cattle astragali and metacarpals to differentiate between different breeds.

2227. ZooMS-based Identification of Faunal Materials from The Necropolis of Antandros

Authors: Seher Mekik (Istanbul University, Institute of Graduate Studies in Sciences | Istanbul University-Cerrahpasa, Institute of Nanotechnology and Biotechnology) – Nur Bayram – Eren Erişçi (Istanbul University, Faculty of Science, Dept. of Molecular Biology and Genetics) – Begüm Sekmen (Istanbul University, Institute of Graduate Studies in Sciences) – Gürcan Polat (Ege University, Faculty of Letters, Dept. of Archaeology) – Ercan Arıcan (Istanbul University, Faculty of Science, Dept. of Molecular Biology and Genetics)

Format: Oral

Faunal materials recovered from funerary contexts provide important insights into ritual practices, resource selection, and human-animal interactions in the past societies. Bone remains associated with grave goods, offerings, and symbolic objects are particularly informative, yet their taxonomic identification is often limited by fragmentation, surface modification, and the absence of diagnostic morphological features. Biomolecular approaches offer an effective means of overcoming these limitations. In this study, faunal remains unearthed from the necropolis of Antandros, which is an important settlement in western Anatolia with long-term occupation from the Classical through Byzantine periods, were analyzed using Zooarchaeology by Mass Spectrometry (ZooMS). Collagen peptide mass fingerprinting was employed to identify animal taxa represented among highly fragmented bones associated with funerary contexts. The ZooMS analyses reveal the presence of multiple animal taxa within the necropolis assemblage, indicating a diverse use of faunal materials in funerary practices. Identified remains include domesticated species commonly linked to subsistence and ritual activities, as well as taxa less frequently recognized through conventional zooarchaeological methods. In particular, the biomolecular identification of compact and morphologically similar skeletal elements, such as astragali, provides new perspectives on species selection in symbolic and burial practices and contributes to discussions of dietary choices. By integrating ZooMS-based taxonomic identification with archaeological context, this study offers new perspectives of funerary behavior at Antandros and demonstrates the value of biomolecular approaches for reconstructing human-animal relationships in ancient necropoleis.

2450. Birds of a Feather: Use of ZooMS to distinguish between domestic pigeon and stock dove in Hauskirchen Lombard graves (Austria)

Authors: Manasij Pal Chowdhury (Department of Evolutionary Anthropology, University of Vienna) – Konstantina Saliari (Naturhistorisches Museum Wien) – Elisabeth Nowotny (Universität für Weiterbildung Krems) – Swen Renner – Hans-Martin Berg (Naturhistorisches Museum Wien) – Katerina Douka (Department of Evolutionary Anthropology, University of Vienna)

Format: Oral

Domestic pigeons (Columba livia f. domestica) have been of great historical importance to humans, playing an important role as food, messengers, and pets. Rock dove, the wild progenitor of domestic pigeon, was among the first birds to be ever domesticated, with the human use of pigeons documented as early as the Pleistocene era (circa 10,000 years ago), with evidence for their possible domestication documented in Mesopotamian records as early as 5000 years ago. However, despite their significance in archaeology, identifying domesticated pigeons in archaeozoological records can be onerous – they share important morphological characteristics with stock dove (Columba oenas), complicating secure identification. Here, we apply Zooarchaeology by Mass Spectrometry (ZooMS) to distinguish between stock dove and domestic pigeon remains using collagen fingerprinting. Known reference specimens belonging to both stock dove and domestic pigeon were obtained from Naturhistorisches Museum Wien, and ZooMS was applied on them to create a reference spectral library. Following the identification of certain biomarker peaks allowing us to distinguish between stock dove and domestic pigeon, avian faunal remains from Hauskirchen, one of the most well-preserved and important Lombard period cemeteries in Central Europe, were then analysed using ZooMS. The presence of previously identified biomarkers, applied in conjunction with comparison with the reference spectra, enabled their taxonomic identification, resulting in the first secure identification of domestic pigeon in Austrian archaeological records.

734. Paleogenomic analysis of the demographic history of ancient goats from the Canary Islands, a North African isolate

Authors: Clara Díaz Pérez (Universidad de La Laguna, Evolution, Paleogenomics and Population Genetics Group) – Kevin Daly (UCD School of Agriculture and Food Science, University College Dublin | UCD Conway Institute of Biomolecular and Biomedical Research) – Aitor Brito-Mayor – Alejandra C. Ordóñez (Universidad de Las Palmas de Gran Canaria | University of Las Palmas de Gran Canaria, TARHA Group) – Javier G. Serrano (University of Copenhagen Lundbeck Foundation GeoGenetics Centre, Globe Institute) – Jonathan Santana (Universidad de Las Palmas de Gran Canaria | University of Las Palmas de Gran Canaria, TARHA Group) – Rosa Fregel (Universidad de La Laguna, Evolution, Paleogenomics and Population Genetics Group)

Format: Poster

Archaeological, linguistic and genetic evidence supports a North African origin for the indigenous people of the Canary Islands. Radiocarbon dating indicates that, apart from a temporary Roman purple dye workshop established in the first century BCE, the indigenous human occupation of the islands began in the first centuries CE and persisted until the European conquest in the 15th century. The most abundant domesticate found in Canarian indigenous sites are goats, offering a proxy for investigating the origin

and the temporal evolution of indigenous herds. Also, they represent an opportunity to characterize the North African populations at the time of the islands' colonization, providing paleogenomic data on this understudied region. We obtain a total of 36 low-coverage genomes, including individuals from the Roman, indigenous and post-conquest periods. Ancestry inference analyses support an African ancestry for both the Roman and indigenous goats, placing the most probable origin in the northwestern region. We detect a temporal continuity from the Roman and indigenous times until modern-day goats. However, historical goats show a minor European input due to the introduction of goats after the conquest. Finally, we identify signatures of isolation such as high inbreeding and low heterozygosity values.

1223. Inter mare et terram: animal resource management at the Late Antique villa of Almenara-Puras (Valladolid, Spain) during the 5th century

Authors: Rocío Pazos García – Alberto Marchán-Fernández (Universidad de Salamanca. GIR PREHUSAL) – Rosana Cerezo-Fernández (Universidad de Salamanca. GIR PREHUSAL | Université Toulouse Jean Jaurès. CNRS. Laboratoire TRACES-UMR 5608) – Esteban Álvarez-Fernández (Universidad de Salamanca. GIR PREHUSAL) – Margarita Sánchez Simón (Universidad de Burgos)
Format: Poster

This poster presents the integrated results of the archaeozoological, archaeomalacological and bone industry study from the late antique levels (5th century AD) of the Roman villa of Almenara de Adaja-Puras (Valladolid, Spain). The site corresponds to an agricultural settlement with a sequence of occupations beginning in the Neolithic period, in which Roman activity is documented from the 1st century AD. In the middle of the 5th century AD, the villa was abandoned and destroyed, the chronological context with which the analysed archaeozoological assemblage is associated. The aim of this work is to demonstrate how the integration of data from different categories of archaeological materials allows us to review and refine the interpretation of production and consumption practices in Romanised rural areas. Faunal analysis reveals patterns of livestock farming characterised by diversified management of bovids, ovicaprids and suids, together with a significant presence of small hunted species. Likewise, the malacological assemblage, composed exclusively of marine oysters, provides complementary information on resource procurement strategies and coastal-inland exchange networks. For its part, the study of the bone industry reveals the existence of secondary use strategies, as well as specialised domestic workshops. The integration of these assemblages, evaluated from different analytical perspectives (taxonomic, taphonomic, biometric, and technological, among others), allows us to address key issues such as animal mobility, specific selection, the standardisation of craft techniques, and economic resilience in a period of socio-political transformation.

1265. Ancient Genomes Inform Social Complexity and Kinship Transformation in Neolithic China

Authors: Yuntao Sun – Quanchao Zhang (Jilin University) – Chao Ning – Rui Qiao (Peking University) – Lobsang Dargye (Jilin University)
Format: Poster

Ancient genomes offer new leverage on prehistoric social organization, yet diachronic, community-scale reconstructions remain scarce in East Asia. We analyze genome-wide data from 29 newly generated middle-phase Dawenkou individuals and assemble a time series of Dawenkou-related samples spanning the early, middle, and late cultural phases. After quality control and reanalysis of previously published datasets, 77 individuals with more than 400,000 SNPs on the 1240k panel were retained. Population genetic results place Dawenkou-related groups on the cline of Yellow River millet farmers while retaining variable ancestry related to ancient southern East Asians. Using genome-wide relatedness, uniparental markers, and mortuary provenience, we reconstruct pedigrees across the sequence and identify a progressive transformation in social organization. Early contexts show flexible, overlapping kin networks that traverse burial features. The middle phase exhibits matrilineal tendencies, including a three-generation maternal lineage and household-level spatial clustering by maternal lines. Previously reported matriliny in the late phase provides an endpoint for comparison and contextualizes this transition. Patterns of genomic homozygosity and segment sharing indicate strengthening endogamy through time, with a marked contraction in effective population size in the late phase. Rather than conforming to a uniform model, these findings highlight how descent, mobility, and ritual interacted in distinct ways across communities, shaping diverse pathways in the formation of Neolithic social complexity.

18 WEALTH AND (IN)EQUALITY IN PREHISTORY: IMPACTS, EXTENTS, AND MECHANISMS

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Mikael Fauvelle (Lund University) – Mikkel Nørtoft (Saxo Institute, University of Copenhagen) – Lasse Sørensen (National Museum of Denmark, Department of Prehistory)
Keywords: Economic anthropology, Political economy, Social inequality, Quantitative methods
Format: Regular session

SESSION ABSTRACT

Wealth inequality shapes many aspects of modern life. Despite this, it is only relatively recently in our history that some human societies started to be characterized by stark and persistent disparities in access to different forms of wealth. It is therefore critical that we understand the mechanisms, impacts, and extents of wealth inequality in early societies, and why potential levelling mechanisms were successful or failed. This session invites papers that explore different ways of both quantifying and theorizing wealth (in)equalities in prehistory. Papers will explore different intersecting aspects of wealth including forms of material, relational, and embodied wealth. Topics will include studies of wealth indices related to burial wealth display, early weight and monetary systems used to measure wealth and value, as well as case studies documenting the sociopolitical impacts of changes in degrees of wealth inequality. We are especially interested in papers from case studies of small-scale and transegalitarian societies where systems of wealth (in)equality were emergent and potentially in flux. Our discussion will advance our understanding of processes that have led to the emergence of persistent social (in)equality in the past and shape our society today.

CONTRIBUTION ABSTRACTS

1953. QuantWealth.eu – A multivariate browser app for easy wealth and inequality calculation and visualization

Authors: Mikkel Nørtoft (University of Copenhagen)
Format: Oral

Wealth expression can change over time, between, and within, cultural traditions. Quantifying wealth and (in)equality from one proxy over the longue durée, yields periods where data becomes less prominent or absent. QuantWealth.eu addresses this head-on. For grave goods (or any count data), QuantWealth calculates "exclusivity values" based on Total Object Types (TOT) per grave (presence only), and per grave good type, with confidence intervals based on sample size and grave occurrence. This gives more nuance than uniform values of 1. To account for large quantities of some types, QuantWealth adds squareroot-transformed counts to the total wealth per grave. When calculated separately for specific time slices, this exclusivity approach can let exclusivity values change with developing exchange networks, technologies, and symbolisms. QuantWealth addresses problems with high Gini coefficients (henceforth Ginis) for zero-inflated count data (graves without grave goods), and problems with comparing Ginis over time with very different wealth amounts by focusing on the Absolute Gini (Gini × Mean wealth). Because researchers categorize grave goods (or construction features, animal species, etc.) differently, QuantWealth simulates Ginis with categories merged or split. If results are added to the time-atlas, the plots and data can be stored so every resulting map point can be interrogated or downloaded for further analysis while the app data accumulates with new contributions. Beyond calculating wealth proxies and (in)equality, and producing interactive and downloadable plots, QuantWealth leverages the multitude of wealth proxies: house and storage sizes, burial mound sizes, grave pit depth, and various count data. It combines these by summarizing Ginis from different proxies in the Composite Archaeological Inequality index (CAI, Oka et al. 2018) in an interactive "Trendplot" from a user-drawn area and timeframe. This helps to close our data gaps and embrace the pluralism of past wealth expressions. See more: https://QuantWealth.eu Nørtoft 2026, https://doi.org/10.31235/osf.io/wzcqy_v2)

566. Measuring wealth, constructing (in)equality: the use of measurements and quantitative systems in Late Prehistoric Western Europe

Authors: Thibaud Poigt (Ausonius, Bordeaux)
Format: Oral

Traditionally associated with trade and monetary processes, measuring tools can offer a broader scope of observation and interpretation of ancient societies. These cognitive devices facilitate the assessment of quantities and values, as well as processes that result in material traces of quantitative thought and organisation. This mode of thought and the structuring of the environment are frequently observed in instances of endeavour to establish egalitarianism or inequity among individuals, social groups or communities. The purpose of this paper is to provide a comprehensive overview of the evidence for the use of measurements and quantitative processes in societies from the Bronze and Iron Ages in Western Europe. This presentation, which is non-exhaustive in nature, is based on several studies that have been conducted in recent years. It will include the following topics: the use of length/surface measurements to organise and hierarchise urban and rural settlements or their environment; the application of common to standardised capacities in some potter productions; and a reflection on the way ancient societies could calculate their agricultural production and store it. It will also include a comparison of the diffusion of weights and scales in Europe with the evidence for weighing practices, in particular those based on metal production and hoarding. The purpose of this presentation is to propose a novel approach to the utilisation of metrology in order to stimulate reflection and debate on inequality in Late Prehistoric Europe. This approach will explore the tools that may have been developed by people to reinforce inequality or, conversely, to avoid or combat it.

635. Premise-driven approaches to inform Concepts of Inequality in Prehistoric Burial Communities

Authors: Sven Brummack (Marie-Curie University Lublin)
Format: Oral

I propose an analytical framework based on premises for investigating social inequality in prehistoric burial communities. Inequality is approached not as a question of reconstructed meanings or individual identities, but fundamentally as a structured phenomenon of distribution. This approach is explicitly grounded in a set of self-defined premises that aim to clarify the epistemic conditions under which inequality can be identified in archaeological burial data. Firstly, social complexity is conceptualised as a scale of interaction potential, rather than as a proxy for hierarchy or social geometry. Complexity and equality are treated as analytically independent dimensions, allowing for multiple organisational forms. Secondly, the framework rejects assumptions of homogeneity or social equilibrium in prehistoric communities, instead arguing for heterogeneous social spaces characterised by varying degrees of inequality. Thirdly, burial practices are defined as a distinct social field in Bourdieusian terms. They are understood as the outcome of collectively executed, rule-aware actions, which are structured by shared dispositions and classification frames instead of viewing them as direct reflections of individual identities. Fourthly, the symbolic order of things in burial assemblages is considered intentional, though not necessarily truthful with regard to lived social realities. Representation and identity are therefore analytically decoupled. Further premises emphasise the collective authorship of burial practices, the coexistence of intentional and unconscious dispositions in ritual action and acknowledging the limited archaeological accessibility of 'identity' as such. On this basis, inequality is most productively examined at the collective rather than the individual level. Recurrent patterns of selection, exclusion and spatial organisation are interpreted as manifestations of constraints on collective action. Methodologically, the focus is on quantifying variance, diversity and exclusivity within and between groups in order to assess distributional inequality. By foregrounding explicit premises, the aim is to provide a transparent and transferable framework for researching inequality in prehistoric burial archaeology.

210. Wealth as an infrastructure for relations

Authors: Knut Rio (University of Bergen)
Format: Oral

When addressing the concept of wealth in pre-capitalist/pre-historic society we must leave behind our own era's orthodoxy of economy and production, exchange and consumption. We should instead draw on approaches akin to Marcel Mauss' idea of wealth as a total social phenomenon and recognize in wealth its capacities for reproduction, materialization of crucial relations and animation of spiritual capacities. Drawing on lessons from anthropology, I propose to look at wealth primarily as a concept of infrastructure - a technology for making and upholding relational forces. My starting point will be the spectacular megalithic structures of Neolithic Europe, but understood through the comparative specter of displayed wealth in ethnographic descriptions – with particular attention to megalithic cultures of the Austronesian world. Explicit comparison will be drawn from the relational capacities of polished stone blades in the islands of Papua New Guinea as well as the ritual hierarchies of male grade-taking ceremonies in Vanuatu.

1093. The Emergence and Reproduction of Social Inequality in Prehistoric and Protohistoric Societies: Combining Behavioral Genetics and Archaeological Approaches

Authors: Ralph Großmann (Institute of Pre- and Protohistoric Archaeology, Kiel University) – Christoph Spörlein (Department of Social Sciences, Düsseldorf University)
Format: Oral

This project integrates recent developments in sociology and archaeology to advance an interdisciplinary understanding of the origins and reproduction of social inequality. Both disciplines increasingly employ genetically informed approaches, albeit with distinct conceptual and methodological orientations. The project aims to synthesize these perspectives to generate new insights into the structure and dynamics of prehistoric societies. In sociology, the measurement of genetic potentials has become an important tool for describing the magnitude and transformation of social inequality. The extent to which genetic variation contributes to individual social positioning provides indirect evidence for the rigidity of social structures: stronger genetic effects imply weaker constraints imposed by ascriptive traits such as social origin or gender. Spatial and temporal variation in these effects thus reflects the institutional and normative foundations of inequality. In archaeology, analyses of ancient DNA (aDNA) have predominantly focused on migration and population history. However, these data also permit the construction of genetic potential measures that, when combined with detailed archaeological records of burial contexts, can serve as indicators of social status. By linking sociological theory with archaeological and genetic evidence, the project seeks to reconstruct patterns of inequality from the Neolithic Age onward, thereby illuminating the institutional roots of stratification in human prehistory.

477. Comparing Wealth Inequality in Complex Fisher-Forager Societies: A Quantitative Approach

Authors: Mikael Fauvelle (Lund University) – Mikkel Nørtoft (University of Copenhagen) – Alicja Björk (Lund University)
Format: Oral

Fisher-forager societies have long attracted the attention of archaeologists and anthropologists due to their propensity towards sedentary lifeways and high degrees of economic complexity. Yet how unequal were fisher-forager societies? Furthermore, how much variation in inequality do we see between fisher-foragers in different world regions? This paper employs the QuantWealth application to quantify differences in burial wealth display between different fisher-forager societies in North America and Scandinavia. Specifically, we compare the Middle Neolithic Pitted Ware Culture from Gotland with Late Holocene fisher-foragers from southern California and the Pacific Northwest Coast. All of the case studies chosen for comparison were sedentary fisher-foragers, yet

considerable differences exist in population sizes and settlement organization. We explore connections between wealth display in burial contexts and the ethnographically documented political-economic organization in the two North American Cases. We then use the insights gained from such comparisons to propose possible models for understanding the social organization of the Pitted Ware Culture.

1369. Quantifying Wealth Inequality in Bronze Age Transylvanian Mortuary Practices

Authors: Sophie Chorek – Colin Quinn (University at Buffalo)
Format: Oral

Archaeologists have long considered variability in mortuary practices to be an important line of evidence in the presence of social difference and inequality in the past. The introduction and spread of cremation in late prehistoric Europe is part of a complex process in which status, identity, and the body are transformed. In Middle Bronze Age Transylvania (2000-1500 BCE), there were numerous pathways of the body from death to burial, including both cremation and inhumation. In this paper, we present a comprehensive analysis of quantifying wealth and intracultural comparison in mortuary practices across Transylvania. We quantify wealth based on Nørtoft's (2022) QuantWealth framework, calculating the total object types present among graves, the prestige of grave goods, and scarcity. We compare these results between both inhumations and cremations in the region to verify if different treatments of the body extended into wealth. Grave good categories in these analyses include decorated and undecorated ceramics, metal and nonmetal adornment pieces, tools, stone objects, and faunal remains. Our broader framework for exploring inequality and equality is mediated through treatment of the dead has applicability in other global contexts.

516. Inheritance of wealth and socioeconomic inequality in the Early Bronze Age: Evidence from the Mokrin necropolis (2100–1800 BCE)

Authors: Marko Porcic – Marija Krečković Gavrilović – Mina Amzirkov – Sofija Stefanović (Faculty of Philosophy, University of Belgrade)
Format: Oral

The social structure of Bronze Age societies in Europe, particularly the extent and nature of socio-economic inequality, remains a subject of debate. At the heart of this discussion is the question of whether the Bronze Age witnessed a substantial increase in social and economic inequalities, or whether observed changes represent a continuation of patterns already present during the Neolithic and Eneolithic periods. Central to this debate is the issue of inheritance, since socio-economic inequalities are both expressed and reproduced through the intergenerational transmission of material wealth within kin groups. This paper contributes to ongoing discussions of inequality and inheritance in the European Bronze Age by quantitatively assessing socio-economic inequality and by examining evidence for the intergenerational transmission of material wealth at the Mokrin necropolis (2100–1800 BCE), one of the most important Bronze Age cemetery sites in Southeast Europe. Our aims are twofold: 1) to measure inequality, and 2) to look for evidence of wealth inheritance. Given the economic importance of metal in the Bronze Age, it is reasonable to assume that the quantity of metal reflected material wealth to at least some extent. On this basis, we use the mass of metal grave goods (predominantly bronze) as a proxy for material wealth and calculate the Gini index to quantify inequality. To address questions of inheritance, we examine 1) the distribution of metal quantities across age categories and 2) the potential spatial correlation between adults and children buried with metal objects, which may indicate intergenerational wealth transmission within family groups.

1599. Bronze, Beads, and Beasts: Inequality in the Carpathian Basin Bronze Age (Maros Culture)

Authors: Amy Nicodemus (University of Wisconsin-La Crosse) – John O'Shea (University of Michigan)
Format: Oral

The second millennium BC in the Eastern Carpathian Basin is a time of dramatic social and cultural transformation. As in many other European regions, unprecedented levels of wealth inequality emerge among some of these transegalitarian societies. Here we consider this trajectory of change within one such regional polity, the Maros Group, situated in southeast Hungary, western Romania and northern Serbia. The Maros are among the best studied Bronze Age groups in the region, with research traditionally centered on their extensive inhumation cemeteries. There are striking differences in the quantity and quality of grave goods between individuals, supporting the development and embodiment of significant wealth inequality at this time. However, less attention has been paid to how this inequality manifests within the structure and daily practices of living communities. This paper integrates results from extensive new excavations of Maros settlements. We examine wealth through several economic lenses, including subsistence, craft production, and trade. A proliferation of high-precision C14 dates allows for a detailed comparison of settlements across space and time. Maros communities demonstrate considerable variation in economic organization, with heightened differentiation over time. The largest tells, such as Pecica Şanţul Mare (Romania), become major economic centers for the production and distribution of high value goods, like horses, composite ornaments, and metals, and serve as key nodes in an emergent macro-regional system of interaction and trade. Further, they integrate more strongly within extra-regional exchange networks, providing its inhabitants with a greater range of exotic materials. The Maros serve as an ideal case study for differential economic development within complex non-state level societies.

1904. Quantifying Wealth and Inequality in Middle Danube Germanic Chiefdoms: An Analysis of

Roman-Period Burial Context

Authors: Marek Vlach – Balázs Komoróczy – Petra Dragonidesová (Institute of Archaeology of the Czech Academy of Sciences, Brno) – Katarína Hladíková (Slovak National Museum - Archaeological Museum)
Format: Oral

Germanic communities, referred to as the Marcomanni and Quadii, beyond the Roman frontier in the Middle Danube region during the first four centuries CE, provide a case study for examining wealth disparities and their societal implications. These groups – traditionally termed "tribal" but showing features of chiefdom organisation – coexisted with the Roman Empire, and the resulting interactions are reflected in various sources, primarily burial contexts that exhibit both distinctive variability and regularities in grave-goods composition. To address these questions, we apply a data-driven framework to a large burial dataset (more than 5500 graves) from the Middle Danube Suebian populations across three distinct regions of Czechia, Austria, and Slovakia. This study aims to address wealth distribution and the potential reflection of social stratification through the analysis of burial contexts and grave-goods assemblages, acknowledging that such material expressions may not directly mirror lifetime status. A suite of computational techniques, such as unsupervised clustering, predictive classification to detect patterns in assemblage composition, convolutional neural networks for automated urn typology classification, aoristic temporal modelling, and random forest classifiers to accommodate uncertain dates and to infer age and sex for poorly documented burials, enables the identification of patterns of wealth distribution across regions and over time. It is apparent that external economic stimuli from the Roman Empire contributed to internal social differentiation, enabling certain individuals or families to accumulate exceptional wealth. By integrating advanced analytical methods with robust archaeological data, this study provides a quantitative assessment of inequality in a distinctive part of the ancient Germanic world.

2138. Pomp Funebre Competition in Mycenae

Authors: Tim Kerig (Museum Alzey) – Jutta Lechterbeck (Museum of Archaeology, University of Stavanger)
Format: Oral

The shaft graves of Mycenae can undoubtedly be related to an elite. In Antiquity already Pausanias interpreted them as royal tombs. This contribution aims to identify and interpret the grave's differences in effort in tomb construction and in richness of grave goods. To this end, a seriation of the burials from grave circles A and B is performed and the diversity of grave goods is measured (method: detrended correspondence analysis). Based on this new chronological model, Gini coefficients for expenditures and grave goods are calculated. This reveals unexpected effects that linked to a particularly historical situation of competition for rank and/or conspicuous consumption. Fundamental considerations regarding the Gini index will be discussed. Over time, funerals became more elaborate and lavish, while the Gini indices show a convergence of these funerals. Evidently, a point was reached where the less affluent withdrew from the competition for social positions, while the more affluent continued to display lavish funeral pomp.

273. Textile Colours of the Viking Age: A matter of wealth?

Authors: Charlotte Rimstad – Ulla Mannering (National Museum of Denmark)
Format: Oral

Our present understanding of colours in the Viking Age is largely limited to small-scale studies of paints, beads and Old Norse colour terms written in Icelandic texts after the Viking Age. Nonetheless, hundreds of textile fragments that contain dyestuff traces are preserved from the Viking Age and these traces offer an opportunity to discern not only which colours were used but also how they were used. In the Textile Colours of the Viking Age (TeCoVa) project, textile samples are selected from a range of Danish male and female graves dated to the Viking Age, supplemented by textile samples from other comparable contexts. By using the HPLC dye analysis method, the textile colours are identified and compared to the colours of beads and other jewelry. The project seeks to answer: Which textiles colours were available in the Viking Age? How and where were they produced and used – and by whom? Did certain colours represent more value than others? How do these new results change our perception of the visual appearance of Viking Age people? Especially the identification of the societal and status markings, hidden in the still understudied colour schemes of clothing and dress of the period, is a challenge. This study thus targets problems of colour production, perception, conception, value, use and change. Several case studies will be presented that challenge our understanding of the Viking Age, not least in how we visualize this period of the past.

288. When the farmers met the locals – wealth and sharing in Early Neolithic Norway

Authors: Håkon Glorstad (Community of Archaeological Legislation and Organisation)
Format: Oral

When the farmers met the locals – wealth and sharing in Early Neolithic Norway Recent aDNA analyses of Late Mesolithic and Early Mesolithic skeletons indicate that agriculture was introduced to South Scandinavia by immigrant farmers. Some evidence suggests that such immigrants also reached Southeastern Norway. Here, they met the local hunters and gatherers as part of a wider acculturation process. The archaeological evidence from the region also indicates that this was an encounter between two different ways to understand and handle wealth. This paper presents some of the evidence and discuss those based on anthropological observations on perceptions of wealth in agrarian segmentary lineage societies and among hunters and gatherers. The hunter-gatherer imperative of unconditional sharing may have stood in rather sharp contrast to the agrarian worldview of depts and accumulation. Such differences may explain significant patterns in the archaeological record in Norway. Historical differences between different groups of hunters and gatherers may also have shaped the encounters between the agriculturalists and the indigenous populations.

2153. Farms, fields and inequality: House Size, Land Use, and Landesque Capital in Prehistoric Rogaland, Southwestern Norway

Authors: Jutta Lechterbeck – Barbro Dahl – Hilde Skjerping Dahl (Museum of Archaeology, University of Stavanger)
Format: Oral

This paper explores the relationship between agricultural investment, landesque capital, and social inequality in prehistoric Rogaland, south-west Norway. Using house size as a proxy for household wealth, we examine how settlement structure and agricultural intensification shaped social differentiation from the Late Neolithic to the Viking Age. Our dataset comprises 236 houses with associated radiocarbon dates, including the uniquely extensive Forsandmoen settlement. Summed probability distributions (SPDs) of radiocarbon dates, combined with size-based house classes, reveal long-term stability in household size from the Late Neolithic through the Pre-Roman Iron Age. A marked change occurs in the Roman Iron Age, when both the average house size and the variability between houses increase, signalling the emergence of significant social stratification. Parallel analysis of deep anthropogenic soils (DAS), themselves a form of landesque capital, demonstrates sustained agricultural investment across the region. Together, these findings highlight the interplay between farming practices, the creation of enduring agrarian landscapes, and the rise of inequality. Rogaland thus provides a key case study for understanding how long-term agricultural labour and land modification underpinned the development of increasingly hierarchical societies in northern Europe.

1871. Quantitative Approaches to Iron Age Hillforts in North-Western Iberia from Intra- and Inter-site Spatial Analysis: Domestic Units, Community and Territory

Authors: Santiago Tunas-Corzon – Alicia Hernández-Tórtoles – Brais Currás-Refojos – Inés Sastre-Prats (Spanish National Research Council, IH-CSIC)
Format: Oral

In 1998, María Dolores Fernández Posse and Javier Sánchez Palencia published a paper that laid the foundations for interpreting Iron Age hillforts (castros) in northwestern Spain as egalitarian agrarian settlements with a segmentary landscape structure. According to this theory, castros followed a model of self-sufficient peasant villages with no clear signs of social hierarchy. This conclusion was based on the intra-site spatial analysis of several castros in the province of León and on their territorial organisation, defined by a social landscape oriented towards agriculture, as well as isolation and equidistance between sites. Today, it is increasingly common to interpret prehistoric societies, particularly protohistoric ones, using analytical categories such as heterarchy or egalitarianism. It is therefore important to recognise that similar perspectives had already been proposed for the Iron Age in NW Iberia four decades ago, when such views were still highly controversial and unpopular. At the time, this approach challenged the traditional view of the European Iron Age as dominated by highly hierarchical societies and heroic warrior elites. Since then, the segmentary model has evolved theoretically and has been applied to various regional case studies. Testing its strengths and inconsistencies across the Iberian northwest is the main goal of an ongoing PhD thesis from which this paper derives. This is being approached through the application of quantitative and computational methods by conducting an extensive spatial analysis of Iron Age castros across the entire region. Adopting the multi-scalar approach of the original article by Fernández-Posse and Sánchez-Palencia, this study examines socio-economic relationships at three analytical levels: material dispersion within households, relationships between domestic units within settlements, and territorial landscape structure in terms of settlement hierarchy. Spatial and multivariate statistics, together with GIS analysis, are employed at intra- and inter-site scales, supported by social theory on rationality and peasant ways of life.

1995. From Stone to Bronze in Scandinavia – Tradition and Transformation

Authors: Casper Sørensen (Aarhus University, Department of Archaeology and Heritage Studies | Viborg Museum) – Heide Nørgaard (Moesgaard) – Helle Vandkilde (Aarhus University, Department of Archaeology and Heritage Studies)
Format: Oral

The transition from second part of the Late Neolithic (c. 2100-1700 BCE) towards a booming metal-based Middle Bronze Age society (c. 1500-1200 BCE) in Southern Scandinavia included vast transformations in wealth display, often correlated with increasing social inequality. In this paper we examine these changes within a framework where the display of wealth shifts from traditions of collectivity towards individuality. To begin with, a strong collective tradition was challenged by the new opportunities for individual enrichment mirrored in a global bronze-led metal-for-amber network. This transition follows a dramatic increase in metal quantities from few objects in collective votive offerings in the Late Neolithic to a massive display of wealth in individual graves in the Middle Bronze Age, a development reinforced by the Europe-wide disruption c. 1700 to 1600 BCE. These changes are concurrently reflected in other parts of the archaeological record, particularly in settlements and monumental burial mounds. The display of wealth is evident not only in the substantial accumulation of metal objects but also manifests in monumental architecture and changed settlement patterns. As the amount of bronze increased and the focus shifted from the collective to the individual, the

perceived value of bronze as a marker of wealth in society may also have changed. By tracking these transformations across the material record, we can theorize how this development evolved and begin to question how we approach potential shifts in prehistoric perceptions of wealth.

1109. Displaying wealth in the Danish Viking Age through the use of fur in clothing

Authors: Luise Ørsted Brandt (The Globe Institute, University of Copenhagen) – Asta Berenth Schunck (The National Museum of Denmark) – Laura Viñas Caron – Helene Skou De Neergaard (The Globe Institute, University of Copenhagen)
Format: Oral

Fur is considered as one of the major commercial products of the Viking Age (~800-1050 CE). The records describe how fur from wild animals hunted in current day Northern Scandinavia and Russia like fox, beaver, marten, ermine, and sable were amongst the pivotal commodities brought by the eastern Vikings (Rus) via the Russian rivers to the growing Arab fur market. An example of the economic value and signalling effect of fur traded by the Rus is given by the Arab al-Mas´ūdī who in 943 wrote: "The black furs are worn by Arab and non-Arab kings… ...There is no king who does not possess a fur coat or a caftan lined with the black fox fur of the Burtās". In the VAFur (Viking Age Fur) project, we aim to understand if fur was also purchased and worn as a visual marker of wealth in the Danish Viking Age. So far, in Viking Age Denmark, fur has mainly been acknowledged in elite burials. We question whether this is a sign of wealth or if the current representation of fur is biased by the better preservation of organic materials in elite graves. These are often deep and have chambers and or mounds compared to shallow ordinary graves. Moreover we hypothesize that fur is more abundant than previously assumed as focus has laid on e.g. the often more well-preserved and dashing metal objects. We systematically survey Viking Age graves for fur and in our database quantify the grave's objects, register burial style and other parameters, which in Viking Age are related to wealth. In cases where fur is preserved, we identify the animal species using proteomics and isotopically characterise them as imported or local. We present preliminary data as a first step to understand fur´s value and meaning as status markers.

2480. What the wealth!? Current narratives for the Bronze Age versus a posthuman view on a transalpine Gateway-Community

Authors: Raphael Berger (University of Bern, Institute of Archaeological Sciences)
Format: Oral

Common narratives about the Bronze Age tell that the alloy bronze brought the possibility for wealth accumulation, which increased or created wealth inequalities. Such stories about a group of 'rich' burials from the Early Bronze Age (2200-1600 BC) in the lower Lake Thun region in Switzerland are also echoed in specialist and popular scientific literature. The most popular explanation for the large amount of 'precious' metal objects recovered in this region is that certain communities controlled access to important passes through the Alps that connected the densely settled alpine foreland with ore-deposits in the mountains. This Gateway-position within 'trade' networks brought wealth to the region and allowed a local elite – reflected in the graves – to gain power. These narratives about the ancient world are based on contemporary capitalist thinking; they assume bronze had proto-monetary characteristics and link metals, wealth, and power in a typically modern way of structuring the world. In this talk, I argue that posthuman theory combined with formal network analysis offers an alternative and more productive research framework for explaining the regions 'wealth'. Newly discovered settlements expand the archaeological record for the early Bronze Age in that region and enable further investigation of how the burials fit into socio-material networks. Based on the key study of the lower Lake Thun basin it is proposed to rethink 'wealth' and '(in)equalities' from a posthuman perspective based on Actor-Network Theory (ANT).

1173. A wealth of stories about the past: Grand narratives and inequality

Authors: Jess Beck (University College Dublin)
Format: Oral

The disciplinary focus on materiality and deep time provide archaeology a unique access to millennia of human social organization. Ironically, however, the most popular books about past societies are no longer written by archaeologists. Instead, today's best-selling histories of the human condition are authored by historians, geographers, and evolutionary biologists, few of whom have been trained in interpreting the material traces of the human past. In this paper, I explore how archaeological research has been leveraged by a cohort of public intellectuals to make specific arguments about the nature and direction of inequality in human social evolution. I explore common themes that pervade this body of literature and examine what lines of archaeological evidence, and what forms of archaeological research, are drawn upon by such books. I conclude by discussing the implications of the "grand narratives" phenomenon for popular understandings of the human past and articulate a need for a greater range of research dissemination strategies in archaeology.

19 ARCHAEOLOGY SUPPORTING MENTAL HEALTH AND WELLBEING – HOW COULD A EUROPE-WIDE CONNECTED APPROACH BETTER IMPROVE PEOPLE'S LIVES?

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Andres Dobat (Aarhus University) – Carenza Lewis (University of Lincoln) – Linda Monckton (Historic England) – Francesco Ripanti – Faye Sayer (University of Birmingham)
Speakers: Anne-Sofia Hjemdahl (Oslo University) – Arkadiusz Marciniak – Patrycja Filipowicz (Adam Mickiewicz University in Poznań) – Heleen van Londen (University of Amsterdam) – Monique van den Dries – Roberto Arciero (Leiden University) – Tibor Ákos Rác (Pázmány Péter Catholic University)
Keywords: Archaeology and Wellbeing, Mental Health, Heritage Therapy, Public Archaeology, Social Impact, European Collaboration
Format: Workshop
Affiliation: Public Archaeology Community

SESSION ABSTRACT

Poor mental health and wellbeing is a serious and rising problem across Europe: 46% of EU citizens report emotional or psychosocial issues (www.socialeurope.eu/from-crisis-to-pandemic-mental-health-in-europe) and poor mental health affects >84 million EU residents (www.europarl.europa.eu/RegData/etudes/BRIE/2023/751416/EPRS_BRI%282023%29751416_EN.pdf). Studies across Europe including in the Czech Republic, Cyprus, Denmark, England, Germany, Italy, Netherlands, Poland, Spain and elsewhere have shown that participation in archaeological activities can support wellbeing and improve poor mental health. The ways in which it achieves this include by reducing loneliness, anxiety and symptoms of depression, by increasing physical activity, self-esteem, community trust and place attachment, and by enabling people to learn, enjoy themselves, develop and fulfil aspirations and make a contribution to society, among many other mechanisms. But these benefits are considerably less widely felt than they could be because research has to date not reached most parts of Europe, leaving many people unaware of the health benefits of archaeology, and practitioners and policymakers unable to recommend or fund activities that deliver these benefits. This workshop, run in collaboration with the EAA Public Benefits of Archaeology Advisory Committee, will bring together discussants from states where activities and/or research has already provided compelling evidence for the health benefits of archaeological participation, and discussants from states where knowledge, understanding and awareness is much more limited. The aim will be to share experience and explore whether, and if so how, a coordinated, pan-European programme of research, delivery and dissemination might potentially enable archaeology to support good mental health and wellbeing more effectively and more widely in the future.

20 THE SOCIAL LIFE OF FUNERARY MEGALITHS: THE CONSTRUCTION OF IDENTITY THROUGH STONES

Theme: 1. Widening perspectives in material culture studies
Organisers: Laura Waldvogel – Méryl Defours Rivoira (Laboratoire d'archéologie préhistorique et anthropologie, University of Geneva) – Noisette Bec Drelon (Membre associé au laboratoire Archéorient - UMR 5133 / Paléotime)
Keywords: megalithism, Social structures, Ethnoarchaeology, Funerary practices
Format: Discussion session

SESSION ABSTRACT

Megalithism is a complex and multifaceted phenomenon which developed in several regions of the world within differing chronologies. It involves monuments with funerary purposes (dolmens, tumuli, etc.) or not (menhirs, stelae, alignments of standing stones, etc.), whose characteristics raise questions about their meaning and the social structure of the populations that erected them. In this context, data from recent and contemporary megalith-building societies provide an essential source for understanding this phenomenon. They help eliminate certain interpretations, broaden the scope of possibilities, and develop new models for interpreting past megalithism. This session aims to bring together researchers studying funerary or related megalithism, without geographical or chronological limitations, with the goal of addressing the issue of its social context. Among other things, we will examine themes such as memory, territories, social structures and hierarchies. Presentations and posters may take the form of national or regional syntheses, as well as case studies. They may focus on the following points: • Architectural variations of the constructions and their spatial distribution. • The sourcing of materials used in construction. • The "biography" of the monuments (removals, additions, reuses, etc.) and their evolution. • The decorative repertoire of megalithic slabs and their interpretations. • The relationship with other types of contemporary burials. • Funerary recruitment (types of human deposits, biological and kinship links, geographical origin, age at death, biological sex, health status, etc.).

CONTRIBUTION ABSTRACTS

1271. Megalithic tombs: architectural variations and spatial distribution in Alentejo (Portugal)

Authors: Leonor Maria Pereira Rocha (Évora University, CHAIA)
Format: Oral

Southern Portugal has the highest concentration of Megalithic tombs in the Iberian Peninsula. A brief review of the research carried out shows that the first references to megalithic monuments in the region date back to at least the 15th century, in documents published by G. Pereira (Pereira, 1887: 35), and that at the end of the 19th century and beginning of the 20th century, more than 700 megalithic funerary monuments were excavated. Despite the difficulties encountered with the older excavations (recording and interpretation of data), the architecture was recorded in a very systematic manner. Archaeological work carried out in recent decades has provided extremely interesting data on megalithic monuments and, in particular, on the raw materials used in their construction and types of architecture. The megalithic constructions of the Late Neolithic/Chalcolithic societies of southern Portugal demonstrate the existence of population groups that, despite proven contact with each other and the exchange of materials and raw materials, opted for different construction techniques to bury their dead... for different types of monuments. In this paper, we present a brief summary of the diversity of architectures and typologies existing in this region.

1558. Peribolos tombs from the necropolis of Apollonia Pontica, Sozopol, Bulgaria

Authors: Teodora Bogdanova (National Archaeological Institute with Museum Bulgarian Academy of Science) – Dimitar Nedev (Municipal Cultural Institute „Museum Center-Sozopol“, Bulgaria) – Alexandre Baralis (Ecole française d'Athènes)
Format: Oral

The aim of this report is to give an overview of the funerary structures known as "peribolos tombs," found in the necropolis of Apollonia Pontica, in the context of the new social elite of the polis. Despite the fact that more than 3000 graves were excavated at the necropolis, peribolos tombs are relatively rare, and only 7 such structures have been discovered so far. They can be dated to the period between the second half of the 5th and the beginning of the 3rd century BC. These structures are massive stone enclosures erected under tumuli, containing between one and seven burials. Although the predominant burial ritual is inhumation, in one case cremation is also recorded, which is the earliest in the necropolis of the polis. The construction of such structures, even the most modest ones, was an extremely expensive undertaking, unaffordable for the majority of society. The main focus of the report will be the architecture of these monuments and the burials they enclose (cist graves, sarcophagi, etc.). Their location in the necropolis, as well as the funerary and post-funerary rites, will also be mentioned. In a few cases, rituals related to the construction of the tomb or the raising of the tumuli are also attested. Data from the anthropological analysis of the buried individuals will be presented: age at death, biological sex, and health status. Based on the archaeological and historical context of their appearance, the social status of the individuals buried in them will be analyzed and interpreted.

265. Monumentality on the forest edge: New Research on the Tazunu of the Central Africa Republic

Authors: Peter Coutros (Ghent University) – Nicolette Edwards (Southern Methodist University) – Henri Zana – Lucien Nguerede (Ghent University | University of Bangui) – Sara Pacchiarotti (Ghent University)
Format: Oral

Along the northern edge of the Congo rain forest, on the boarder between the Congo and Chad basins, exists a substantial, yet understudied, megalithic tradition. These monuments, locally known as Tazunu, comprise a Megalithic Zone with more than 100 currently known structures between Bouar and the Cameroonian boarder. Sporadic research in this region between the 1960-80s revealed that this tradition was relatively long-lived, with Tazunu construction beginning around 1200 BC and lasting until approximately AD 1000. The Tazunu of Bouar show variation in both form and function, Including both tumuli with rectangular or U-shaped burial chambers and non-burial monuments with up to 30 standing stones. Significantly, the various megalithic monuments are part of a broader archaeological landscape intermixed with contemporary village and iron production sites earthen tombs, and cremations features. The coeval emergence of megalithism and iron production, as well as the apparent differentiation in burial practices, suggests that this phenomenon is likely tied to the emergence of new social forms and technologies (e.g., iron production). Furthermore, the Tazunu are almost uniformly constructed along the edges of the plateaus, between 1000 and 900 masl, suggesting their secondary purpose as possible landscape markers. This paper presents the newest research on the Bouar Megaliths, based on large-scale survey and excavations conducted by the CongUbangi project during January, 2026. Excavations targeted both Tazunu and the associated village and special activity sites. This new archaeological data will be complimented by ethnographic and linguistic information collected over the past two years of research across the region. The focus of this interdisciplinary research is to explore the social context in which the Tazunu were constructed, how this shifted over time, and how they relate to the landscape and contemporary burial, iron production, and village sites.

2140. A story of rock'n roll. The « biography » of a megalithic tomb from Gollu Kadelu (West Sumba, Indonesia)

Authors: Laura Waldvogel – Élisa Eschenlauer – Méryl Defours Rivoira – Marie Besse (University of Geneva, LAP)
Format: Oral

In the absence of written sources, graves offer one of the main windows into the social identities of past individuals. Reconstructing these identities, particularly through the study of funerary megaliths, is a delicate task in archaeology, as the archaeological record provides only a partial and indirect image of social structures. In this context, ethnoarchaeology emerges as a key methodological tool for better understanding these structures. This paper presents data from a one-month ethnoarchaeological fieldwork conducted in 2025 among societies in the western part of Sumba Island (Indonesia), where megalithic practices remain a vivid tradition. The study provides valuable insights not only into the social dynamics involved in the construction of these monuments, but also into the events that may lead to changes in their architectural forms. To illustrate these dynamics, we will focus on a megalith constructed in the garden house of the 'ancestral house' of the Weebole clan, near the village of Gollu Kadelu ('ancestral village'). The 'biography' of this monument reveals a complex history, intricately linked to ritual and memorial concerns, as well as to social competition between 'noble' and 'commoner' lineages within a 'segmentary' society structure.

1091. Social structures reflected in megalithic grave studies of the Funnel Beaker Culture in northern Germany

Authors: Anja Behrens (Lower Saxony Inst. of Historical Coastal Research, Wilhelmshaven)
Format: Poster

The megalithic graves in northern Germany play a key role in understanding Funnel Beaker societies of the Neolithic. Over the past years excavations and studies in this field were carried out to tackle questions on communication and social structures. Hereby, two areas have been investigated in detail – the island of Rügen and the Elbe-Weser Triangle – two macro regions associated to different Funnel Beaker groups. Within a phd-thesis over 400 megalithic graves could be recorded and analyses for Rügen. Comparative studies on the architecture and pottery finds revealed regional traditions that point to tight community areas. Further, single exceptional monuments could be exposed and might reflect hierarchical structures. For the Elbe-Weser Triangle records of about 430 megaliths are the base of a recently running project on Funnel Beaker societies in that area. First analyses of the architecture reveal a similar pattern of the traditional habits as on Rügen. In both areas excavations at well preserved sites were carried out and uncovered complex biographies. Here insights are given on the different construction periods as well as on the activities connected to the monument. The poster presents an overview of all the results to open the discussion on megalithic tradition and social interpretation.

21 VISUALIZING ARCHAEOLOGY: CONSTRAINTS AND SOURCES OF INNOVATION IN RESEARCH

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Jean-Olivier Gransard-Desmond (ArkeoTopia) – Dominik Lengyel (BTU Brandenburg University of Technology Cottbus-Senftenberg | Lengyel Toulouse Architects Berlin) – Harold Mytum (University of Liverpool) – Matthew Walsh (National Museum of Denmark, Modern History & World Cultures)
Keywords: illustration of archaeological data, Outreach activities, Innovation in archaeology, Methodological bias, Public engagement, Case studies
Format: Regular session
Affiliation: Community on Storytelling and Archaeology

SESSION ABSTRACT

The visualization of archaeological research results has both tremendous potential as well as the risk of terrible pitfalls. Illustrations and visualizations concomitantly illuminate and obscure certain aspects of the original data for both professionals and the general public. Sharing research findings with a general audience may result in oversimplification, while visualizing 3D models or other visual aids can lead to misunderstandings among experts. The limitations of visualization, such as colour coding, omission of details, and inadequate information leading to overanalysis, can obscure uncertainty or skew tentative conclusions. The constraints of visualization, ironically, provide a rich terrain for invention. By revealing the whole from a single component, it can spark fresh inquiries, crowd-sourced insights, or local wisdom that uncovers overlooked research avenues. The process of re-explaining or re-framing hypotheses for a broader audience in the realm of popularization acts as a kind of self-reflective mirror for archaeologists and heritage professionals. It prompts them to examine their own blind spots and methodological biases. Furthermore, the use of cutting-edge media, such as virtual reconstructions and participatory mapping in dissemination can significantly enhance research pipelines, generate fresh data, foster new hypotheses, and/or refine visualization techniques. The same is true for the interaction between graphic designers, architects, and archaeologists, and not least any creative or artistic discipline. As a result, visualizing archaeological research data is no longer just a final product of communication. Instead, it becomes a dynamic tool that can reveal research gaps, spark innovation in methodology, and generate new data. Speakers are invited to discuss real-world

examples where the visualization of archaeological data –whether for public or academic audiences– has encountered constraints, but has also uncovered fresh paths for exploration.

CONTRIBUTION ABSTRACTS

412. Finding the archaeological angle: Tips, tricks and case studies for public outreach/ archaeological science communication today

Authors: Samantha Reiter (National Museum of Denmark | The European Archaeologist)
Format: Oral

So you want to do public outreach, but don't know how or where to start? Think it's a simple case of "dumbing down" or "simplifying"? Think again! Public outreach is all about SALES. This presentation gives tips and tricks on how to 'sell' yourself (and your research!) and gives practical advice you can ACTUALLY USE. This presentation will help you 'find your angle' (and will tell you a bit about what that actually means, too…) We'll talk about strategies for catching attention—and keeping it!!!—and we'll explore several examples of where this has been successfully from various fora, including exhibition design, live action events, YouTube video and via the written word. The format we will follow will examine 1) why you should invest in creating a narrative, 2) how to build a story and 3) strategies for building rapport with the audience. The presentation will round off with an open discussion of three case studies from the author's own work, where we will (with the new tools from the talk) determine which were successes and which failures. This presentation represents the extracted knowledge from involvement with the Danish Royal Academy of Sciences and Letters' Science Communication Academy, the EAA's StoryArch Community, ArcheoSnack, five years' editorship of The European Archaeologist (TEA), and a lifetime as the daughter of an excellent saleswoman.

368. From Outreach to Innovation: What Educational Illustration Adds to Archaeological Research

Authors: Jean-Olivier Gransard-Desmond (ArkéoTopia)
Format: Oral

In archaeology, educational illustration is often used as an outreach tool. It translates complex data sets into accessible images for schools, museums, and the general public. This article proposes that such "popular" visualizations should be recognized as research instruments in their own right. Creating visual representations from firsthand archaeological findings, such as stratigraphic records, artifact analyses, architectural remains, wear patterns, or spatial models, does more than just convey results. It also serves as a way to validate them through the act of drawing. Illustration can force implicit assumptions to become explicit (missing joins, uncertain scales, reconstructed gestures, lighting, visibility, sequences of actions). This allows for the generation of new research questions, the exposure of cognitive biases embedded in interpretive routines, and the exposure of errors that remain hidden in texts, tables, or even standard diagrams. Outreach activities based on research-derived illustrations, such as guided drawing sessions, participatory reconstructions, museum mediation using sequential visual narratives, or comics with scientific value, can therefore serve as controlled "stress tests" of archaeological interpretation. Audience feedback, misunderstandings, and narrative friction points become diagnostic indicators, revealing where reconstructions lack sufficient argumentation, are overly linear, or reflect modern expectations. The proposed communication outlines a framework for treating educational visualization as an iterative research cycle: evidence, visual reconstruction, critical review and revised hypotheses. At the heart of this approach is the collaboration between the archaeologist and illustrator. Rather than a mere division of labor (one providing data, while the other creates art), they form a symbiotic pair, combining visual proficiency, material understanding, and logical storytelling to generate insight and innovation. Drawing is recast as a tool for epistemic exploration, capable of broadening the scope of inquiry, enhancing clarity, and bolstering the validity of archaeological assertions.

2015. Between Evidence and Imagination: How Far Can Youth Archaeological Fiction Go Without Betraying the Data?

Authors: Christiane Angibous-Esnault (ArkéoTopia)
Format: Oral

Archaeology depends on evidence, yet the moment we communicate that evidence—through words or images—we inevitably shape it. This paper explores a central tension in youth archaeological fiction: how far can imagination go without betraying the data? I argue that this boundary is not only an ethical or pedagogical concern, but also a powerful lever for research innovation when addressed through a deliberate collaboration between an archaeologist, a youth novelist, and an illustrator. Building stories and illustrations from excavation records, specialist studies, and interpretive hypotheses requires constant decisions about selection, emphasis, and visualization. These choices expose what academic writing often leaves implicit: degrees of uncertainty, competing explanations, and the narrative "gravity" that pulls interpretations toward familiar plots and iconic imagery. In practice, the novelist's need for coherence and the illustrator's need for visual clarity repeatedly provoke the same revealing questions: What is actually supported by the data? What is plausible but unproven? What is pure invention—and how can it be signposted? I show how this triadic workflow turns popularization into a methodological probe. By documenting where storytelling demands exceed what the dataset can justify, the team can detect cognitive biases, identify fragile inferential steps, and surface potential errors. Rather than rejecting imagination, the paper proposes a framework for controlled, transparent creativity: fictional expansions are permitted,

but explicitly framed in relation to evidence and uncertainty. Ultimately, youth fiction that respects archaeological data can do more than educate. By negotiating the evidence–imagination boundary in a structured way, the archaeologist–writer–illustrator trio can generate new research questions, refine interpretive claims, and develop more honest, uncertainty-aware forms of archaeological visualization.

2476. Standing solitary: the Araca church revisited through gaming engine

Authors: Jugoslav Pendic (Institute BioSense) – Milica Tomic (Arhneo) – Dejan Vukelic (Mathematical Institute of the Serbian Academy of Sciences and Arts)
Format: Oral

Monumental remains of Araca, a romanic basilica constructed first during 13th century, are found between Novi Bečej and Novo Miloševo, Serbia. The towering ruin of the church has drawn attention of both local residents and traveling writers for centuries. A cultural heritage site, declared as one of exceptional importance to the Republic of Serbia, it rises above the surrounding (unpopulated) plains, a sight of awe, impossible to ignore even from kilometers away. Below the structure: another monument, a sprawling medieval settlement anchored to the church grounds, largely unexplored - but thoroughly mapped by detailed geophysical prospection. Yet despite its great heritage value, the site remains isolated, with little to offer in the access roads or management and presentation facilities on the ground. This paper presents an attempt to build up on a powerful storytelling image of this monument to bring it back from isolation and cut the distance between the material remains and general public. The authors have relied on usage of now well established workflows for digitalization of structures via 3D scanning methodologies, in order to create a digital twin of the church's remains. From that starting point, we have opted to explore versions of the digital reconstruction, using an Unreal Engine workspace. In this presentation we showcase our results and discuss our decision making process to the final product, and its intended impact.

713. Most Likely: Object-Based, Interdisciplinary Learning in an Archaeology–Design Exhibition

Authors: Nurith Goshen (Israel Museum, Jerusalem) – Oded Friedland (Bezalel academy of art and design, Jerusalem | Monkey Buisness)
Format: Oral

Most Likely: Designers, Archaeologists, and Mysterious Objects is an exhibition at the Israel Museum, Jerusalem, that uses archaeological "mystery objects" as a laboratory for object-based learning, design thinking, and public engagement. Ten undeciphered artifacts, from the Neolithic to the early Islamic period, are re investigated through collaborative work between archaeologists and designers. Each case study makes explicit archaeological reasoning while applying design methods. The project invites visitors into this dialogue by presenting competing interpretations and foregrounding uncertainty and inference rather than authoritative answers. Interactive trilingual materials (Hebrew–Arabic–English) extend learning in and beyond the gallery, encouraging participants to propose their own "most likely" functions for the objects. In doing so, the exhibition models archaeology as an open, evolving inquiry that links primary evidence with secondary narratives and contemporary creative practice and offers low threshold entry points for non specialist audiences. In the present socio-political climate, this shared practice of questioning objects and interpretations functions as an intellectual resource: visitors learn to formulate more precise questions, to scrutinize unsupported claims, and to cultivate evidence based critical thinking, acquiring not only archaeological and design skills but also tools for engaging with an information rich world. Finally, the aftermath of the exhibition is a university course that exemplifies a grassroots approach to education, in which knowledge, questions, and experience flow from the general public into academic institutions rather than only in the opposite direction. In this paper, we will present the ideas behind the exhibition, how it operated and was received, and reflect on future directions, including aspects that proved successful and those that call for improvement.

1327. Architecture as method of reflection and generation of archaeological knowledge

Authors: Dominik Lengyel (BTU University) – Catherine Toulouse (Independent Researcher)
Format: Oral

As a long-established discipline steeped in tradition, architecture possesses an extensive repertoire of methods for analysing and generating space. This makes architecture a particularly versatile and competent partner for analysing spatial archaeology and generating appropriate spatial hypotheses. Precisely because the tools of architecture serve entirely different purposes than those of archaeology, their transfer to archaeology is a genuinely complementary enrichment. The methods include both the generation of new forms, a process that in architecture takes place in dialogue between the client and the architect, and the meaningful visual representation of spatial ideas in all phases of the development of new buildings, from the rough volumetric sketch to the development of construction details. The tension between vague intentions and the need for constant exchange in every phase of development can be directly transferred to the relationship between historical truth and archaeological research. In both architecture and archaeology, knowledge about planning on the one hand and historical truth on the other is constantly evolving. The difference lies in achieving certainty. While architecture usually culminates in a final realised building, archaeology usually has to content itself with a stage of incomplete certainty. Achieving historical truth is an almost endless asymptotic process. But apart from this final moment of achieving the realised building, the requirements of the two disciplines are very similar. Both cases deal with the negotiation of intention and interpretation. This paper aims to show the added value that the discipline of architecture has

brought to archaeological discourse and how the dialectical relationship leads to further results. Numerous projects by the authors, most of which have been published and some of which have been exhibited in museums, are demonstrated. All of these projects were developed in close collaboration with various cultural and research institutions.

394. "L'image pertinente" as a guideline: a walk through Rome balancing accuracy and intelligibility for 3D reconstruction

Authors: Orline Poulat (UR 4254 ERLIS – CIREVE, Université de Caen Normandie)
Format: Oral

This paper stems from the researches carried out by the Plan de Rome project (Université de Caen Normandie, France) that reconstructs 4th century AD Rome in 3D. If 3D reconstruction has become quite common, it is often limited to the study of isolated monuments. Therefore, being able to visualize entire urban districts constitutes a scientific tool that radically questions hypotheses' feasibility and prompts researchers to a detailed reexamination of the available sources. Measurements, luminosity and mobility, otherwise often overlooked, stand out as important matters to consider when recreating buildings destined to be seen and "experienced". The spectator is no more such: one becomes an actor through interaction, enhancing a better understanding through active participation. Besides, experimental archaeology and 3D reconstruction complete each other, with 3D's ability to "low-costly" produce several hypotheses for a mechanism such as roman theatre's uela. Through successive models, a building's evolution can be made visible: architectural choices, function changes, or even the perception of the building itself can be highlighted. Nonetheless, incomplete data often leads to "too polished" reconstructions thus distorting spectators' vision: research over the colors on art and buildings is an interesting example that enhance the "marble-white" models' fragility often offered when archaeological data is unavailable. As highlighted by Jean Claude Golvin (2003), creating an "image pertinente" (relevant image) needs to both ensure scientific accuracy and public accessibility. In the Plan de Rome project we decide to reconstruct elements even if details aren't precisely discovered, knowing the non-representation of such elements would have been equally, if not more, scientifically wrong. Through critical feedback, this paper will debate these elements and highlights both the interdisciplinarity's challenges and benefits between graphic designers and researchers, and knowledge-sharing with a broader non-specialized audience.

464. Reading Reconstructions: uncovering unconscious decisions in all modes of image creation

Authors: Harold Mytum (University of Liverpool)
Format: Oral

Archaeologists often use reconstruction images, scale models and full-scale recreations to convey impressions of the past. Whether constructed by computer, a graphic artist or construction craftsmen, all rely on many decisions made on many aspects of production that affect how the public (and indeed other professional archaeologists) view – read – the output and formulate their interpretations. This paper concentrates on two issues out of many that comprise the challenges of using reconstruction images to convey what the archaeologist intends. The first is the matter of presence vs. absence, which comes in many forms. 1) Reconstruction concentrates on, for example, construction methods or overall appearance of a structure in isolation. The focus is not on placing the structure in its environmental, cultural, peopled, context and so its functions and meanings are not revealed let alone explored. 2) The static reconstruction vs the dynamic context in which the structure operated. Physical reconstructions and computer modelled visualisations may allow movement around a structure provide some of this dynamism, but rarely show changes through time – the day, the season, the life cycle of the structure, or different past experiences within that structure. They do not convey change through time or varied past experiences of a space that are often central to archaeological interpretation. The paper discusses how these issues can be addressed to support those 'reading' the reconstruction.

1607. 3D representations of archaeological textile finds: From fabric properties to visualizing "real" garments

Authors: Karolina Pallin (The Society for Textile Archaeology and Culture Studies, TexArk)
Format: Oral

In archaeology, textiles are often numbers in a form and 2D photos and drawings. Even clothing is often presented in this numerical and flat manner, for good reasons in many aspects but not super helpful in others. Using the more common 3D techniques is another way for representing textiles, and especially garments, but this format is not perfect either. Textile is a flowing, draping material and cannot really be understood in a "frozen" format, which an image and even most 3D models must be classified as. The fashion industry has for a long time been developing softwares for both constructing and visualising textile, both for clothing and interior. There are also softwares where you can make your own fabrics to be used in your own 3D projects. I have made several studies on how these softwares can be used for textile research and visualization of foremost archaeological textile finds. I have presented this for colleagues in the textile archaeological field with enthusiastic response and many ideas on how to take this further. By creating 3D garments from already published pattern analyses, I've faced construction issues with the pattern and gained insight into different interpretations, sewing methods and also the wearers body size and posture, as an example. Now I believe it is time for a broader audience. Might this approach to visualising textile discoveries and interpretations serve as one of several methods within the 3D toolkit?

854. Interpreting fluvial dynamics through historical maps: opportunities, biases, and reinterpretations

Authors: Anna Kharlanova – Claude Vella (Aix-Marseille Univ, CNRS, IRD, INRAE, Coll de France, CEREGE, Aix-en-Provence) – Véronique Rinalducci (ciham, umr5648) – Philippe Rigaud (LA3M, umr7298) – Jules Fleury – Doriane Delanghe – Olivier Bellier (Aix-Marseille Univ, CNRS, IRD, INRAE, Coll de France, CEREGE, Aix-en-Provence)
Format: Poster

Historical maps provide a visual archive of past landscapes that can be reinterpreted from a geomorphological perspective. They allow the identification of palaeochannels, meander migration, avulsion patterns and shoreline changes. The Rhône Delta during the Little Ice Age (LIA) serves as a reference case, a period marked by enhanced fluvial activity and hydroclimatic variability (Arnaud-Fassetta, 1998; Bond et al., 2001; Mann et al., 2009; Miller et al., 2012; Pichard et al., 2014; Kharlanova et al., 2025;). Georeferencing and comparison with present-day topography reveal traces of fluvial dynamics that are no longer visible today. Although these maps were produced for non-geomorphological purposes, they can be used as geomorphological archives, provided that scale, graphic conventions, spatial uncertainty and cartographic bias are considered (Rinalducci et al., in press; Kharlanova et al., in prep). Beyond geomorphology, such analyses can foster archaeological and historical reinterpretations of existing studies (Rossiaud, 1994; Deye, 2024) by reframing settlement patterns, land use and infrastructures in relation to river mobility. They also help to provide geomorphological explanations for shifts in activities, such as the abandonment of the Vernède saltworks driven by documented fluvial dynamics. The case of Mas de la Bélugue, an agricultural estate in the Rhône delta plain, illustrates both the heuristic potential and the limits of cartographic visualisation. Variations in the position of the toponym on historical maps suggest a possible relocation of the estate linked to fluvial dynamics (Kharlanova, in prep.). However, the present-day building does not spatially correspond to the location depicted on early maps, despite archaeological evidence dating occupation to the same period (Deye, 2024), raising the possibility of an earlier, unrecorded structure not represented cartographically. This exploratory approach can be extended to other Mediterranean deltas to assess how cartographic visualisation shapes the visibility of LIA fluvial dynamics across different deltaic systems.

22 COLLABORATIVE SYNTHESIS TO ADDRESS MAJOR RESEARCH QUESTIONS WITH BROAD RELEVANCE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Sarah Klassen – Scott Ortman (CU Boulder) – Martin Furholt (Kiel University)
Keywords: synthesis, cross-disciplinary, collaborative
Format: Session with presentation of 6 slides in 6 minutes

SESSION ABSTRACT

This session will create a dynamic forum to examine how collaborative, cross-disciplinary, and international synthesis can address one of archaeology's most pressing challenges: integrating heterogeneous datasets and methodological approaches to answer large-scale questions about long-term human and environmental dynamics. Presenters, including members of the Coalition for Archaeological Synthesis (CfAS) and affiliated initiatives, will demonstrate how synthesis-driven research can overcome fragmentation in archaeological data and practice by combining diverse evidence, comparative frameworks, and multiscalar analyses. The session will highlight concrete case studies in which synthesis has produced new insights into major thematic problems such as urban resilience, socio-environmental change, religious transformation, and inequality. Speakers will introduce methodological strategies for integrating datasets, from textual and material archives to remote sensing, computational modeling, and community-based knowledge. They will also share lessons learned in building and sustaining long-term collaborative research networks, including best practices in data interoperability, ethical engagement, and knowledge translation. Participants are warmly invited to reflect on their own experiences with collaborative research and to contribute ideas for future synthetic efforts. Through focused discussion on the problem of archaeological fragmentation and the methodological innovations needed to overcome it, this session aims to chart a clear and actionable vision for the next generation of archaeological synthesis.

CONTRIBUTION ABSTRACTS

238. What made the Global Dynamics of Inequality Project successful?

Authors: Scott Ortman (University of Colorado Boulder)
Format: Oral

The Global Dynamics of Inequality Project, sponsored by the Coalition for Archaeological Synthesis through NSF, has by all measures been very successful, in terms of publications, awards, and on-going collaborations. What was it about this working group that made it successful? In this presentation, I go beyond the research itself to consider some of the social, logistical, and practical aspects of the project that made it work so well. One important aspect was the process through which the working group came together, which ensured a combination of existing collaborators and individuals who had not worked together previously became

part of the team. A second was the mix of periodic in-person meetings and regular remote meetings, which kept everyone engaged. A third was the structure of the working group, which included core and extended members, ensuring there was always a quorum available for project activities. A final ingredient was the character of project leadership, which included effective communication, reasonable workplans, and data integration support. All of these and more were necessary for the project to be successful.

3. The Network Structure of the Urban Revolution

Authors: Giacomo Benati – Sergi Lozano (University of Barcelona)
Format: Oral

Long-distance interaction predates cities, but the scale, intensity, and organizational complexity of exchange during the Urban Revolution were unprecedented. How did early urban societies sustain transcontinental trade without modern transport technologies, financial instruments, or formal institutional infrastructure? We address this question through a formal network analysis of the Uruk Expansion in Chalcolithic Mesopotamia (ca. 4000–3000 BCE), widely regarded as the earliest episode of globalization. Drawing on a newly assembled dataset of more than 1,700 settlements and documented interaction routes, we reconstruct evolving patterns of connectivity across Mesopotamia and its peripheries. Our results show that exchange networks initially structured around riverine corridors gradually transformed through processes of diaspora settlement and intermediary bridging. These dynamics generated increasingly dense clusters and, over time, small-world network properties that balanced strong local integration with efficient long-distance connectivity. This transition from sparse, branching systems to grid-like integrated networks challenges core–periphery and dependency-based interpretations, instead highlighting an emergent process of market formation and self-organized coordination in early urban economies.

1951. From Fragmentation to Integration: Big Interdisciplinary Archaeological Database (BIAD)

Authors: Natalia Ryabogina (University of Gothenburg) – Adrian Timpson – Simon Carrignon (University College London) – Jelena Bulatović (University of Gothenburg) – Robert Staniuk (Adam Mickiewicz University in Poznań) – Jan Kolář (Institute of Archaeology of the Czech Academy of Sciences) – Samantha Reiter (National Museum of Denmark) – Stephen Shennan – Mark Thomas (University College London) – Kristian Kristiansen (University of Gothenburg)
Format: Oral

In this paper, we present how the COREX ERC project has developed the Big Interdisciplinary Archaeological Database (BIAD) for the exploration of complex relationships in response to multifaceted research questions. BIAD is an initiative aimed at integrating and harmonising large, heterogeneous archaeological datasets within the current scientific move towards Big Data. At present, BIAD integrates detailed information of archaeological sites, including material culture, human data (burials, individual characteristics, palaeopathology, and links to ancient DNA), ^{14}C, isotope and strontium data, metallurgy, faunal and botanical datasets. Critically, all datasets are internally linked and traceable to verified source citations. We outline the core principles of the BIAD architecture, together with its conceptual differences from existing archaeological repositories and databases. Key project outcomes and methodological challenges related to the integration of non-standardised datasets from diverse European research traditions are addressed, with particular emphasis on strategies, data structures, and vocabularies developed to improve cross-dataset comparability and data quality. Although BIAD entries now focus primarily on Europe, the database is designed to be scalable and flexible, allowing for the integration of data from any region. BIAD is conceived as a fully relational system built for long-term growth and potential globally. Beyond data aggregation and linkage, BIAD is conceived as an integrated analytical environment that tightly articulates complex data queries with statistical analysis. This has been made possible by the development of BIADConnect, a versatile R interface that enables direct interaction with the database and supports a range of analytical workflows. This interface also facilitates the development of complementary applications, such as BIAD TaxaExplorer, a web-based tool for visualising data distributions and summary statistics for archaeobotany and zooarchaeology. TaxaExplorer allows exploration within user-defined spatial polygons and time slices, enabling rapid visual assessment of sample distributions and dimensionality reduction using correspondence analysis.

936. A synthetic and integrative approach to the exploration of the deep ROOTS of Socio-Environmental Connectivities

Authors: Martin Furholt (Kiel University)
Format: Oral

The Excellence Cluster Roots explores the long-term trajectories of current socio-environmental challenges related to conflict, inequality, diet and disease, settlement concentrations and urbanity, knowledge transmission, and the impact of environmental hazards. We aim to mobilise and integrate a set of usually diverging disciplines from the humanites, social and naturals sciences in order to empirically assess the deep histories of those phenomena, as well as their interrelations. We use this work to critically reflect the impact of these historical trajectories on our current societies and on our current worldviews including our current academic approaches to the past. In this contribution, I will address inherent challenges of interdisciplinary integration, data and proxy development and their interpretations as well as the impact of historically contingent academic traditions that play an important part in our integrative approach to the past. The integration into an international research network like CfAS is a central pillar of our strategy.

415. Pizza, not Pantry: Turning fragmented archaeological data into digestible evidence

Authors: Martin Hinz – Sophie Schmidt (Kiel University)
Format: Oral

Archaeological datasets are increasingly visible, digital, and openly shared, yet they remain difficult to use in large-scale analysis within and beyond archaeology. This matters because other research communities, especially in the climate and Earth system sciences, are seeking long-term human-impact baselines: signals of land use, settlement dynamics, and socio-ecological change that can complement palaeoenvironmental archives. In practice, much archaeological data does not find its way to these research communities. It is encoded in discipline-specific categories, unevenly documented, spatially and temporally heterogeneous, and accompanied by uncertainty that is hard to carry into downstream analyses. Archaeology therefore risks being simultaneously highly relevant and operationally unusable for interdisciplinary synthesis. Large-scale questions with broad relevance require something different: not just ingredients, but a meal that is ready to be served and eaten. This paper argues that bridging the gap is not primarily a matter of more data, but of archaeological synthesis understood as translation across communities of practice. We must deliver the pizza, not the pantry. Making archaeological evidence reusable requires treating interoperability, uncertainty, and bias as first-class research products. Concretely, this means a three step workflow: 1. curate data with provenance and machine-readable metadata so others can assess fitness for use, 2. formalise preservation loss, sampling intensity, and infrastructural inequalities that shape what becomes visible, and 3. produce harmonised outputs with credible intervals and documented assumptions that can be integrated into interdisciplinary workflows. Also within the field such practices will facilitate large scale meta-analyses. We illustrate these points with an ongoing demographic synthesis effort that consolidates multiple archaeological proxies within a transparent Bayesian framework and produces reusable estimates plus diagnostics, a nutrition label that collaborative networks can rely on. The take-home message: interdisciplinary relevance depends on whether we deliver results in forms that other communities can immediately use, test, and build upon.

1285. The "Myth of Barter" Reconsidered: Comparative Commercial Development on Europe's Periphery in the Late Iron Age

Authors: Thomas Hall (Christopher Newport University)
Format: Oral

The origins of money, and their relationship with the broader development of exchange, commerce (standardization), and finance, have received new attention by scholars spanning economic and commercial history, archaeology, and anthropology in recent years. In this paper, we identify testable hypotheses derived from four broad theoretical traditions: orthodox, Chartalist, trade, and new institutional economics. To compare the theories, we derive findings from archeological, numismatic, and inscribed evidence from peripheral Europe during the first eras in which archaeology can be supplemented with relevant historical and archival research: the late Iron Age. More specifically, we analyze the comparative development of commerce, standardization, and financial sophistication, using three sets of data analyzed in this way for the first time here. Our first empirical exercise is a qualitative analysis of long-term monetary, commercial, and financial developments in the under-studied periphery of Europe. Second, we test hypotheses related to standardization of earthenware containers for commercially-traded goods. Our third inquiry develops a period-appropriate approach to industry analysis (also known as asset allocation at the industry level), and proposes a capital market line diagram for Macedonian Dynasty-era Byzantium. We conclude with suggestions for comparing the four theories using archaeological, historical, and anthropological data from other times and places, with appropriate concomitant dissemination of the actual, historical roots of money in broader perspective.

1473. Beyond the Species List: Marine Exploitation and Human–Coastal Dynamics on the Eastern Adriatic, Hellenistic to Early Modern

Authors: Antonela Barbir (Institute of Archaeology - Zagreb) – Melita Peharda (Institute of Oceanography and Fisheries - Split)
Format: Oral

Despite the long-standing maritime orientation of Eastern Adriatic communities, marine animals, a key yet underutilised proxy for past human-coastal interactions, remain significantly understudied in the region's archaeological record. This study presents the first comprehensive synthesis of marine resource use from the Hellenistic period to the Early Modern Era, drawing on published evidence from multiple archaeological contexts that vary in function, chronology, and analytical resolution. By jointly considering molluscs and fish, the study moves beyond taxonomic inventories to provide a nuanced evaluation of human engagement with coastal ecosystems. The review critically examines methodological diversity, ranging from systematic quantitative studies to brief species listings, and considers how these differences shape current interpretative frameworks. Structural imbalances in research visibility emerge: Roman-period assemblages constitute the most analytically developed body of evidence, whereas the Medieval and Early Modern periods remain comparatively underrepresented. Hellenistic material, although increasingly documented, is still seldom explored in depth. Evidence for fish is generally scarce, limiting integrated reconstructions of marine economies. Rather than framing these disparities solely as limitations, the study situates them within broader research traditions and disciplinary trajectories that have guided archaeozoological practice in the region. Recurring taxa nonetheless indicate persistent and adaptable

strategies of coastal exploitation across different site types and historical periods. By establishing a regional interpretative baseline and highlighting critical gaps, this study underscores the potential of marine faunal remains to illuminate long-term human–coastal interactions. It further advocates for consistent recovery and analytical approaches, including application of sclerochronological methods, to support robust diachronic and interregional comparison, providing a framework for future research that extends well beyond existing site-specific datasets and enables meaningful comparative analyses across the broader Mediterranean region.

1501. From Close Kinship to Population Interactions: Integrating Biological and Cultural Indicators of Past Social Identities in a Multiscalar Framework

Authors: Niels Johannsen (Department of Archaeology and Heritage Studies, Aarhus University) – Kent Johnson (Sociology/Anthropology Department, SUNY Cortland)
Format: Oral

In this presentation we will report on an ongoing initiative to chart a novel roadmap for next-generation archaeogenetic approaches to social organization and identity in the deep past. In March 2026, a diverse group of researchers in archaeology, archaeogenetics, other biomolecular archaeologies, and data modelling met at the Sankelmark Academy in northern Germany for a workshop sponsored by the CfAS and the Kiel Center for Collaborative Synthesis in Archaeology (CCSA). The purpose of this meeting was twofold; first, to discuss potential designs of future research collaborations that use genetic and cultural data to generate more nuanced interpretations of social networks and cultural identities across multiple scales, ranging from kinship to supra-regional cultural affiliation networks; and second, to initiate collaborative outline of one or more proposals seeking funding to implement such a longer-term research effort. We reflect on the process so far as well as the wider, strategic challenge of identifying and integrating existing archaeogenetic and cultural datasets and developing the theoretical approaches and methodological techniques needed to advance archaeogenetic research in archaeology.

2125. Ancient DNA implicates Salmonella Paratyphi C as a candidate pathogen in a thirteenth-century East Asian epidemic

Authors: Jiayu He – Li Yu (China Academy of Chinese Medical Sciences) – Fan Zhang (School of Archaeology and Museology, Sichuan University) – Ge Song (China Academy of Chinese Medical Sciences)
Format: Oral

By synthesizing palaeogenomic, archaeological, and historical records, this study investigates disease dynamics in 13th-century North China. We screened ancient metagenomic data from 15 individuals from a 13th-century mortuary context at the Xiyang site (Shanxi, North China). Authentic Salmonella enterica subsp. enterica serovar Paratyphi C (SPC) reads were detected in 5/15 individuals, of which three met criteria for downstream analyses. Ancient authenticity was supported by deamination signatures, short fragment lengths, mapping stringency, and negative controls. Human genomic profiles show affinities consistent with contemporaneous North China agricultural populations. Archaeological context reveals these 15 individuals derived from six multi-individual burials with no biological kinship ties across burials, indicating multi-household exposure rather than a single-family cluster. Pathogen detections represent a conservative lower bound; the true number of infections likely exceeded five. Historical records from 1213–1232 CE document a severe epidemic with fever, headache, diarrhea, and bloody stool—symptoms consistent with SPC. Wartime environmental degradation likely facilitated faecal-oral pathogen spread. SPC detection aligns temporally with this epidemic. Together, archaeological, palaeogenomic, and textual evidence support the hypothesis that SPC contributed to outbreaks, while acknowledging it was not necessarily the sole agent. Limitations include modest sample size (n=15; positives=5), uncertain within-tomb simultaneity, and incomplete chronological precision. These findings extend SPC's range to 13th-century North China and motivate targeted capture, direct dating, and broader screening to evaluate scale, timing, and aetiological heterogeneity.

1186. The BIAD Standards: Data protocol recommendations from the COREX Project

Authors: Samantha Reiter (National Museum of Denmark) – Robert Staniuk (Adam Mickiewicz University in Poznań) – Jan Kolář (Institute of Archaeology, Czech Academy of Sciences) – Jelena Bulatović – Helene Rose – Natalia Ryabogina (University of Gothenburg) – Stephen Shennan (University College London) – Kristian Kristiansen (University of Gothenburg) – Mark Thomas – Adrian Timpson (University College London)
Format: Poster

The Big Interdisciplinary Archaeological Database (BIAD) has been under construction by members of the COREX Project and many other collaborating projects since 2021. Currently BIAD predominantly covers Europe c. 6000 to 500 BCE, but continues to expand in scope with ambitions to incorporate all types of archaeological data from around the world. Datasets are properly integrated within a relational structure, currently including archaeobotany, radiocarbon dates, zooarchaeology, grave constructions, demography, health, stable isotopes, material culture, metallurgy, funeral rites and monument formation processes. This poster gives a brief introduction of the project and then provides a series of guidelines for the publication of archaeological data for the facilitation of big data projects. The guidelines are based on five years collecting, harmonising and relating published data into BIAD and represent the collected suggestions of a team of c. 20 topical specialists working with the data types listed above. Advantages to publishing in a big-data friendly manner support FAIR principles, increasing the usefulness, impact and reach of data, whilst also increasing the frequency of citations for data contributors.

23 SCALING UP THE SMALL: ASSESSING MICROARCHAEOLOGICAL ASSEMBLAGES AND METHODOLOGICAL FRAMEWORKS IN SOUTHEAST EUROPE AND EASTERN MEDITERRANEAN

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Evanthia-Stefania Kourti (Université Paris 1 Panthéon-Sorbonne | UMR 7041 ArScAn | EUR ArChal) – Yoanna Katreva (Institute of Biodiversity and Ecosystem Research, Bulgarian Academy of Sciences)
Keywords: microarchaeology, multi-proxy analysis, human–environment interactions, subsistence strategies, archeobotany, Southeast Europe
Format: Regular session

SESSION ABSTRACT

The regions of Southeast Europe and Eastern Mediterranean form an area whose subsistence patterns and environmental conditions during prehistory have been widely researched through diverse datasets. Over recent decades, archaeological studies have largely focused on macroarchaeological evidence – plant macrofossils, pottery, lithics, shells, and other material culture – providing a robust framework for understanding subsistence strategies and socio-economic activities. In the past few decades, however, there has been a significant rise in pluridisciplinary studies with a strong focus on microarchaeological remains that aim to better capture past anthropogenic and natural landscapes and to unravel the complex interplay between humans and their environments. This session is inspired by the conviction that to address the complexity of human–environment interactions, we must turn to multi-proxy and interdisciplinary approaches. Combined microarchaeological assemblages have the potential to reveal broader patterns of human–landscape interaction where people did not only exploit, adapt to, or intentionally transform their environments, but also left behind traces of unplanned, indirect, and often subtle relations with their surroundings. In particular, we aim to emphasize the methodological potential of combining micro-proxies as pollen, microcharcoal, diatoms, non-pollen palynomorphs, phytoliths, and starch grains with geoarchaeological, isotopic, GIS-based, and other environmental datasets. Special attention will be given to the methodological challenges posed by preservation in different archaeological contexts and the interpretive difficulties of taphonomic processes. In addition, we aim to put emphasis on the methodological potential and limitations of archaeological archives and past excavation materials of relevance for microarchaeological approaches. Finally, this session is viewed as a special opportunity for comparing data, refining methodological approaches, and fostering collaboration to shape future research directions for this pivotal region.

CONTRIBUTION ABSTRACTS

1452. Microremains and macroquestions: plant processing and subsistence strategies in two Late Neolithic sites in Eastern Bulgaria

Authors: Nataliya Ivanova – Teodora Bogdanova (National Institute of Archaeology and Museum, Bulgarian Academy of Sciences) – Rositsa Hristova (History Museum Atanas Karaivanov – Karnobat)
Format: Oral

The study of microbotanical remains, particularly phytoliths and starch grains, within the interdisciplinary research of Bulgarian archaeology is still in its initial stage. However, large-scale rescue excavations over the last few decades provide a good opportunity for studying "fresh" material, allowing the accumulation of data and attesting the potential of microbotanical remains for addressing both specific and broad research questions. Such is the case with two Late Neolithic sites located in Eastern Bulgaria, near the modern town of Burgas. Both sites have revealed structures with different interpretations – pits and dwellings with possible storage areas, where complete or fragmented grinding stones have been discovered. By examining microremains recovered from the active surface of grinding stones, this study aims to shed light on the subsistence strategies of the people inhabiting the area during the second half of the 6th and beginning of the 5th millennium BC through combined phytolith and starch grain analyses. The results reveal the use of the sampled tools in plant processing and add to our knowledge about plant-human interaction.

1924. Out of the Pit : First phytolith results from the upper levels of a Neolithic site in Northern Greece.

Authors: Evanthia-Stefania Kourti (Université Paris 1 Panthéon-Sorbonne)
Format: Oral

The Late Neolithic site of Promachon-Topolnitsa (5150-4800 BC), located on the lower part of the Struma/Strymon valley and divided by the Greek-Bulgarian border, is a unique example of spatial use; the Greek sector of the site is dominated by a large subterranean structure, used throughout the first two habitation phases of the settlement. The first phase of this structure (Promachon 1a) presented successive destruction layers, containing significant amounts of ritually coded objects, animal bones and food-preparation tools, has been the most studied one. Although multiple interpretations have been proposed, the most used one was that of a large depository of possibly ritualistic nature. A recent phytolith analysis conducted on the active surfaces of some of the numerous grinding tools found inside these layers revealed the presence of wheat and barley, as well as some species of the Chloridoideae, the Panicoideae and the Cyperaceae families. Furthermore, this analysis hinted at a differentiation between the interior and the exterior

of the structure: a phytolith presence was noted inside of the structure, but not in the sample coming from outside of it. This study, stemming from the previous analysis' results, wishes to further examine this area and the rest of the Greek sector, used during the subsequent phases of the settlement. It is a comparison of the three consecutive phases of the Promachon settlement (1a, 1b and 2), using phytolith records from grinding stones found in different areas of the settlement. Finally, this study aims to start a discussion on the methodology that can be used in post-excavational analytical practices that rely heavily on spatial data.

2574. Micro-archaeobotanical remains and taphonomic processes in fumier deposits: evidence from El Mirador cave

Authors: Aitor Burguet-Coca – Isabel Expósito – Nit Cano-Cano – Josep Maria Vergès – Ethel Allué (IPHES-CERCA, Institut Català de Paleoecologia Humana i Evolució Social | URV, Universitat Rovira i Virgili, Departament d'Història i Història de l'Art)
Format: Oral

Microarcheobotanical interpretations are strongly influenced by preservation pathways due to anthropogenic or natural post-depositional processes. This study presents a case study from the Neolithic–Bronze Age sequence of El Mirador (Atapuerca, Burgos), focusing on the taphonomy of phytolith, spherulite and pollen assemblages within fumier deposits formed through repeated cycles of livestock stabling, burning, and post-depositional alteration in a cave context. The study integrates quantitative, morphological, taxonomical and taphonomic data from phytoliths, spherulites and pollen with FTIR-based sediment mineralogical analyses from Sector 100. MIR104 represents an in situ, high-temperature burnt fumier, where fire emerges as the dominant taphonomic agent. Phytolith and spherulite concentrations are unexpectedly low despite the abundance of burnt dung, while alteration indices indicate intense thermal impact. In contrast, pollen assemblages in the most intensely burnt facies are strongly degraded, indicating a near-complete loss of taxonomic information. MIR105 records a different preservation trajectory, characterised by lower fire impact and a stronger influence of post-depositional processes linked to sediment reworking and alternating humid–dry conditions. In this unit, phytolith alteration is dominated by physicochemical weathering related to water percolation and reactions with calcite, and both phytolith and spherulite concentrations vary along the sequence. Pollen assemblages show higher richness but clear evidence of fragmentation and mixing, indicatinf pointing to complex depositional and diagenetic histories. By comparing phytolith, spherulite and pollen assemblages formed under contrasting fire regimes and water-related post-depositional processes within the same archaeological context, this study demonstrates how preservation biases differentially affect archaeobotanical proxies in fumier deposits. The results highlight the need for an integrated microbotanical approach to unravelling formation processes and improving interpretations of plant use, environments, and subsistence in highly anthropogenic contexts.

52. Agriculture in southern Attika during Historical times. The phytolith evidence

Authors: Georgia Tsartsidou (Ephorate of Palaeoanthropology-Speleology, HMC | Wiener Laboratory for Archaeological Science, ASCSA) – Liana Psarri (Ephorate of Antiquities of Piraeus and Islands, HMC)
Format: Oral

This study presents the first integrated phytolith analysis from seven rescue excavation plots in the region of Alimos, southern Attika, offering a microarchaeological perspective on agricultural practices during Historical times. Phytoliths were extracted through a standardized protocol involving acid digestion, heavy liquid separation, and high magnification petrographic microscopy, enabling the identification of morphotypes linked to major plant families and cultivated taxa. Despite the challenges posed by the region's calcareous sediments—an alkaline sedimentary environment that promotes dissolution of silica bodies—the assemblages preserve diagnostic signatures of past land use. Across the plots, phytolith concentrations vary considerably, yet several samples exhibit exceptionally high densities, reaching tens of thousands of phytoliths per gram. These peaks, dominated by morphotypes of the Pooideae subfamily, indicate intensive cultivation of C3 cereals such as wheat. The presence of articulated silica skeletons from seed glumes further supports the interpretation of in situ crop processing or repeated agricultural activity. Low frequencies of dicot phytoliths, combined with the scarcity of taxa typical of orchards or shrubland, suggest that the investigated fields were primarily dedicated to cereal agriculture rather than arboriculture. Only in one plot grapevine remains were recovered in later pits dug in the furrows. The Alimos dataset demonstrates how microbotanical residues can illuminate agricultural regimes even in taphonomically adverse contexts. When scaled up across multiple small excavation plots, the phytolith evidence reveals a coherent agricultural landscape characterized by sustained cereal cultivation and soil management practices consistent with long term field use. This study highlights the value of microarchaeological approaches for reconstructing land use histories in densely occupied Mediterranean environments.

2530. Wild versus Domestic: Using AI to Refine Wheat Husk Phytolith Identification at the Pre-Pottery Neolithic Mega-site of Beisamoun

Authors: Lachlan Kyle-Robinson – Melanie Pugliese – Keevan Buch – Zehao Fan – Nicolas Iovu – Monica Ramsey (University of Toronto)
Format: Oral

Beisamoun is a large Pre-Pottery Neolithic (PPN) B–C mega-site in the Hula Valley of northern Israel. Occupied during the advent of the first morphological cereal domestics in the region (Triticum dicoccum (emmer), poor macro botanical preservation means that it is still unclear if the wheat exploited at Beisamoun represents wild gathering, domesticated production, or both. This unanswered question directly affects interpretations of cultivation intensity, subsistence strategy, and the tempo of early agricultural development. Phytoliths, inorganic silica casts of plant cells, provide a solution. Applying our lab's latest artificial intelligence (AI) model, we have refined our identification of Triticum to the species level, surpassing the precision of manual methods. In this paper we apply these AI models to archaeological materials for the first time, separating wild from domestic Triticum (dicoccoides vs. dicoccum) This study applies a supervised deep-learning (DL) classification model to archaeological multi-cell husk phytoliths from a triumvirate of sites in the Southern Levant, including a Natufian site (prior to morphological domestication), Beisamoun (PPNB-C), and a post-PPN site (after morphological domestication). Multi-cell cereal husk phytoliths from Final Natufian deposits provide a baseline for wild cereal exploitation, while samples from a post-PPN fully agricultural site provides a comparative baseline for domesticated cereal processing. The model is then applied to phytolith assemblages from Beisamoun to evaluate whether the Triticum husk phytoliths, align more closely with wild-type (dicoccoides) or domesticated-type (dicoccum). The development and now application of DL models marks a turning point in archaeobotany, enabling domestication status to be evaluated through microbotanical analysis rather than relying solely on macro botanical preservation. This improved discrimination between wild and domesticated Emmer wheat directly strengthens reconstructions of PPN plant economies, contributing to a stronger understanding of how Beisamoun maintained a stable occupation during a period of broader regional social reorganization.

2119. Evaluating an Expanded and Interpretable Deep Learning Framework for Automated Phytolith Identification

Authors: Melanie Pugliese – Lachlan Kyle-Robinson – Kevaan Buch – Zehao Fan – Nicolas Iovu – Monica Ramsey – Takia Talha – Mahdi Alani (University of Toronto)
Format: Oral

Recent deep learning applications to phytolith identification have demonstrated high accuracy under controlled conditions, yet most remain limited by narrow class structures and highly curated image datasets. This presentation reports the results of an expanded phytolith classification algorithm designed to operate across a broader range of morphologies and image conditions representative of archaeobotanical microscope slides from the Southern Levant. The study integrates three key components: best practices in training dataset construction, image segmentation strategies that distinguish single-cell and multi-cell phytoliths, and a modeling framework that improves robustness as class diversity increases. Particular attention is given to how training data quality, class balance, and background management influence model learning. These design choices are evaluated for their impact on algorithm performance when applied to complex archaeological slides rather than idealized reference material. This presentation reports the performance metrics of an expanded algorithm, including class-specific accuracy, error structure, and model behavior as classification complexity increases. Interpretability tools such as Grad-CAM, are used to examine which visual features of phytolith morphology the model relies upon, allowing assessment of whether algorithmic decision making aligns with established human identification criteria. These analyses also highlight cases in which the model consistently differentiated similar phytolith morphologies that are difficult to separate through traditional visual analysis. To test archaeological applicability, the model will be applied to phytolith assemblages from Southern Levantine archaeological sites including Ohalo II, Kharaneh IV and Beisamoun. These sites span a broad chronological range from the Epipalaeolithic through the Neolithic, allowing evaluation of the algorithm across diverse archaeological contexts. The pilot focuses on common Levantine grass phytolith morphotypes such as dendritic long cells, psilate long cells, rondels and other short cell morphotypes. By automating the identification of single cell grass phytoliths the workflow substantially accelerates analyses and enables large-scale comparison of plant exploitation patterns across time.

2257. Resinous Adhesive Materials as Multi-Proxy Archives of Environmental and Technological Practices for the LBA. A Case Study from Plovdiv, Bulgaria

Authors: Yoanna Katreva (Institute of Biodiversity and Ecosystem Research, BAS) – Elena Marinova (Archaeobotany Lab at State Office for Cultural Heritage Baden-Württemberg) – Elena Bozhinova (Regional Archaeological Museum - Plovdiv)
Format: Oral

Plant exudates had a wide range of uses in the past; however, they are rarely preserved in the archaeological records and are still not well studied in Bulgaria. This paper presents a microbotanical case study of resinous substances preserved on pottery vessels from a Late Bronze Age well in Plovdiv, Bulgaria, excavated over sixty years ago and now housed in a museum collection. By combining chemical and microbotanical analyses, the study questions the origin and technological use of plant exudates as adhesives and evaluates the potential of such materials to preserve ecological, environmental, and cultural information. Preliminary results suggest the utilization of both local and potentially non-local plant resources in the production of the adhesive substances. A comparison with regional palynological, antracological, and biomolecular analyses from the North Aegean and the Balkans will test hypotheses concerning the availability of woodland resources, patterns of exploitation, and technological choices involved in the manufacture and use of adhesives during a period of intensified human mobility and increasing anthropogenic pressure on forested landscapes. Also, the paper addresses a methodological question: how reliably can resinous substances preserved on pottery vessels be used to reconstruct past craft practices and local environments (especially when working with museum collections)?

819. Medieval and Modern Environmental Change in Southern Herzegovina: A Palaeoecological

Perspective

Authors: Nina Caf – Maja Andrič (ZRC SAZU, Institute of Archaeology) – Saša Čaval (ZRC SAZU, Institute of Anthropological and Spatial Studies | University of Primorska, Institute for Archaeology and Heritage)
Format: Oral

Humans have inhabited Southern Herzegovina since prehistoric times; however, palaeoecological analyses of human impact on the environment remain rare. We present a palaeoecological study from the Dabarsko polje area, using pollen, NPPs, microcharcoal, LOI, and XRF, with a focus on the Medieval and Modern periods. Methodologically, this research addresses the challenges of working in a karst polje, with its complex hydrological regime and relatively rapid changes. Moreover, disentangling climatic and anthropogenic drivers of landscape change in a karst setting is often challenging; therefore, a multi-proxy analysis was necessary. Palynological results indicate an open landscape dominated by grasslands over the last 1,000 years. Low percentages of tree taxa are presumably due to a combination of continuous human impact, Mediterranean climate, and karst geomorphology, which limited (thermophilous) forest development. Anthropogenic indicators and NPPs suggest that grazing was the primary activity during the studied period. Pollen grains of the Cerealia type were present in only one sample; however, historical data indicate continuous agriculture in the area. This discrepancy is probably due to poor pollen dispersal of Cerealia type and seasonally flooded valley floors, which limited crop production and restricted arable cultivation to higher, better-drained terraces. Palaeoecological data show gradually drying conditions in the area over the last 200 years, with increased fire activity, the appearance of more aridity-tolerant taxa, and more oxidative conditions within the seasonally flooded valley floors. Overall, the results suggest that climatic variability strongly influenced land-use opportunities and economic practices in the karst environment.

1114. Using teeth as tools: dental wear and calculus micro-remains evidence for textile crafts in 15th–19th century skeletons from Romania

Authors: Paul Donciu – Ozana Ciorpac-Petraru – Mihaela Danu ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași) – Ana Drob (Arheoinvest Center, Department of Natural and Exact Sciences, Iași) – Aurel Stănică ("Gavrilă Simion" Eco-Museum Research Institute,Tulcea) – Luminița Bejenaru ("Alexandru Ioan Cuza" University of Iași, Faculty of Biology, Iași | "Olga Necrasov" Center of Anthropological and Biomedical Research, Iași)
Format: Oral

Dental wear can offer valuable insights into non-dietary activities and the behaviours (e.g., everyday craft practices), in which the teeth were used as tools. Although there are many studies addressing activity-induced dental modifications (AIDMs) in past human populations, knowledge on this topic remains limited in Romania. This study focuses on the analysis of activity-induced dental modifications and dental calculus micro-remains in two human skeletons recovered from a necropolis of 15th–19th centuries associated with the "St. Athanasius" Church in Niculițel (Tulcea County, Romania). Dental surfaces were examined through low- and high-magnification optical microscopy and scanning electron microscopy. The anthropological study revealed that the two skeletons belonged to young adult females. Distinct grooves with smooth walls and parallel microstriations were recorded on the second incisors, suggesting repeated non-masticatory use of the anterior dentition. The morphology and orientation of these features are consistent with the manipulation of flexible materials, most plausibly fibres involved in textile-related activities. Also, multiple chipping features on anterior teeth probably resulted from task-related behaviours. Microscopic analysis of dental calculus revealed preserved textile fibres of plant and animal origin, including hemp, flax, cotton, and wool, providing direct evidence of contact with textile materials. These findings suggest a possible association between fibre preparation activities and female individuals. This study is the first in Romania correlating AIDMs with micro-remains found in human dental calculus. Activity-induced dental modifications associated with fibre manipulation have been documented in several archaeological populations across Europe, including Bronze Age communities in Iberia and Portugal and prehistoric populations in Italy; however, evidence from southeastern Europe remains limited. The results support the potential of dental evidence for exploring non-dietary behaviours in archaeological contexts; specifically, the dental wear, and calculus micro-remains allowed the reconstruction of everyday textile-related practices during the Ottoman and early modern periods in southeastern Romania.

24 TOUCHING THE PAST: EXPLORING THE COGNITIVE, EMOTIONAL, AND SOCIAL VALUE OF ARCHAEOLOGICAL HERITAGE IN CONTEMPORARY SOCIETY

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Laura Sarli (GAE Engineering) – Marianna Negro (University of Cambridge) – Aura Piccioni (Universität Trier)
Keywords: Archaeological heritage, Museums, Well-being, Engagement, Cognitive stimulation, Emotional stimulation
Format: Regular session

SESSION ABSTRACT

This session invites contributions that explore and critically reflect on the multifaceted value of cultural and archaeological heritage in contemporary society, with a particular focus on its impact on individual and community well-being. Beyond their historical and aesthetic significance, archaeological finds can be powerful tools for engagement, inquiry, and learning. They can stimulate cognitive processes, foster curiosity, encourage social interaction, and contribute to improving physical and mental well-being. The material properties of archaeological objects imbue them with intrinsic value that inspires active thinking, imagination, and memory construction (Dodd – Jones 2014; Cobb – Croucher 2022). At the same time, heritage is inherently affective: it operates through emotions that shape both individual and collective identities, influencing how people connect with and interpret the past. Emotional engagement, rather than being secondary to cognition, often makes encounters with heritage meaningful and transformative. Yet affect is not neutral, it can foster empathy and inclusion but also perpetuate exclusion or legitimise specific narratives, raising ethical questions about how emotions are curated and experienced. Recent studies show that heritage- and arts-based activities in museums, hospitals, and care homes provide valuable cognitive and emotional stimulation, offering people meaningful occupations, learning, and promoting well-being (Sweetman – Hadfield 2018; Sweetman et al. 2020; Paddon et al. 2014; Ander et al. 2012). Museums such as the Egyptian Museum in Turin (Liberi di imparare project) and the Etruscan Museum of Villa Giulia in Rome (ParkinZone project) exemplify this potential through inclusive outreach programmes for hospitals, prisons, and marginalised communities. This session therefore seeks to address questions such as how do the physical and affective properties of heritage evoke empathy, curiosity, or healing? How can emotional engagement complement cognitive understanding? And how might heritage professionals navigate the ethical dimensions of affective interpretation to promote care, inclusion, and social connection?

CONTRIBUTION ABSTRACTS

104. Archaeological Heritage and Well-Being: Multisensory and Participatory Museum Practices

Authors: Laura Sarli (GAE Engineering)
Format: Oral

This paper offers a critical reflection on the evolving function of museums, according to the ICOM definition (2022), emphasising the role of cultural heritage in fostering individual and collective well-being. Drawing on the etymology of the term museum from the Greek Mouseion, the study highlights the museum's vocation as a space for inspiration, memory, and intellectual growth. The paper explores how participatory and multisensory engagement with heritage can enhance emotional, cognitive, and physical well-being by promoting memory retention, self-expression, and emotional responses. By actively engaging individuals in practices connected to heritage, museums can facilitate meaningful experiences that strengthen emotional connections to the past and present (Everill – Burnell 2022; Marinetti 2014). An increasing body of research highlights a positive correlation between engaging with cultural and archaeological heritage and improved mental and physical health. Engaging with heritage has been shown to reduce stress, improve mood, and foster a sense of purpose, with beneficial effects on overall health outcomes. (See, for example, the project L'arte cura, developed in collaboration with the Museo Egizio di Torino; the programme for visitors with dementia hosted by the Benaki Museum in Athens; the project Dance Well. Ricerca e movimento per il Parkinson, hosted by the Museo Etrusco di Villa Giulia in Rome). Finally, as part of the CARMEN project on Carmina Latina Epigraphica, the paper proposes a reflection on innovative strategies for presenting Latin verse inscriptions through interactive and participatory approaches. These methods would aim to communicate the epigraphic heritage while improving visitor understanding and accessibility to the Latin language and culture. They also take into account the potential of poetry to generate psychological and physical well-being and improve memory. Ultimately, the study conceptualises archaeological heritage as a dynamic and living process, through which ancient artistic and life expressions continue to inspire and enrich contemporary life.

1641. Sensing the Past: New Directions for Archaeology in Dementia Care

Authors: Alison Hadfield (Independent scholar | St Leonard's Associate, University of St Andrews)
Format: Oral

A broad range of geriatric and museological research indicates that artefact handling plays an important role in dementia care, offering multisensory stimulation, peer support, intellectual challenge and personally meaningful activity (D'Andrea et al, 2022; Camic et al, 2017). Until now, however, archaeological collections, have rarely been used as a stimulus, providing an impetus for my doctoral research, 'In Touch with the Past: A Sensory Approach to Objects, Memory and Wellbeing' (Hadfield, 2025). This asked whether archaeology might perform a unique therapeutic role, through its age, aura and unfamiliarity, when compared to the 20th century material which many museums rely upon for reminiscence. Drawing upon museum visitor studies and experimental psychology, it also sought to identify the advantages and disadvantages of physical and digital representations of the past from the perspective of people living with dementia and their carers. In this paper, I will present the findings of my experiments, conducted with 91 participants in Scottish memory groups and reflect upon the role of archaeology to connect their lives to much longer narratives of time and place. I will also discuss the practical challenges of interdisciplinary research, including the need to balance scientific rigour and ethical procedures with the delivery of engaging, person-centred activities. Finally, I will share insights gained by piloting my new observational tool which is aligned with the New Economic Foundation's Five Ways to Wellbeing Framework, offering an inobtrusive approach to evaluation.

1713. Spectacle, Affect, and Well-Being: Performing the Past at Archaeological Festivals in Poland

Authors: Michal Pawleta (Faculty of Archaeology, Adam Mickiewicz University in Poznań)
Format: Oral

Archaeological festivals - widespread in Poland and increasingly popular across Europe - constitute a distinctive form of heritage engagement and storytelling, in which the past is experienced through archaeology in ways that extend beyond traditional cognitive and discursive modes of interpretation. These events create immersive narrative environments structured around scenarios of past events, blending elements of fact and fiction, and presenting material culture through embodied, sensory, and affective experiences. Archaeological festivals rely heavily on visual imagery, performance, reenactment, staged demonstrations, and multisensory participation. In doing so, they activate emotional and affective responses - such as curiosity, excitement, empathy, and a sense of connection - that play a crucial role in how audiences engage with, interpret, and remember the past. Drawing on both existing literature and ethnographic research conducted during archaeological festivals in Biskupin and in Szwajcaria near Suwałki - including participant observation, in-depth interviews, and quantitative surveys with visitors and historical reenactors - this presentation explores how spectacle and performance function as powerful tools for public engagement with heritage. It is argued that archaeological festivals operate as performative spectacles, employing theatrical elements such as staging, actors, scenography, and props to construct emotionally resonant narratives of the past. These affective and embodied encounters foster social interaction, shared experiences, and a multisensory form of learning that can contribute to participants' sense of well-being and meaningful engagement with heritage. At the same time, the paper critically reflects on the ethical dimensions of such affective interpretations, examining how spectacle may privilege certain narratives of the past while marginalising others. By situating archaeological festivals within broader discussions on affect, emotion, and well-being in heritage practice, this contribution highlights both the potential and the challenges of using performative and affective strategies to promote inclusive, engaging, and socially meaningful connections with the past.

1211. "Sometimes, all you find is yourself" – Insights from the Danish Veterans in Archaeology Program

Authors: Thomas Mikkelsen – Christina Seehusen – Andres Dobat (Aarhus University)
Format: Oral

"Veterans in Archaeology" is a Danish community archaeology program that introduces military veterans suffering from psychological and moral injuries to amateur metal detecting, as a means of supporting mental- and physical wellbeing, personal empowerment, and social connectedness. The program consists of two tracks: 1) an intervention track focused on connecting participating veterans with a nationwide network of experienced volunteer "mentors" and 2) a research track that investigates the lived experiences of the veterans using qualitative ethnographic methods. The positive mental health benefits of intervention archaeology in general and avocational metal detecting specifically, are multifaceted and entangled, containing many elements that taken together contribute to increased mental wellbeing among the participating veterans. Metal detecting becomes an arena for flexible sociality with non-veterans, a concrete mindful practice that alleviates anxiety, stress and to a lesser extent the hyper-vigilance commonly associated with PTSD. While metal detecting does not cure PTSD, it becomes a strategy to manage symptoms and to regenerate. In the words of a participating veteran: "When I feel the pressure building up, my thoughts turning dark, I know I have to go detecting". Likewise, the veterans imbue the artifacts they find with multiple meanings and qualities. Some veterans feel shame and guilt because of what they did (or didn't) do as soldiers, others of their inability to participate in society, work and pay taxes. For some of those, found objects enter a moral economy, where finding, registering and handing them over to the local museums becomes almost a way of atonement, "paying back by contributing to our common history. I cannot do much, but I can do this". In short, psychologically injured veterans sometimes find more than just a stray object, or a site previously undescribed. They find a way to live with their injuries through the cocreation of shared heritage.

2589. Democratising Harm? Sexual Violence, Wellbeing, and the Digital Collection of the Rijksmuseum

Authors: Miyuki Kerkhof (Leiden University)
Format: Oral

Engagement with cultural heritage is often presented as beneficial for mental and physical wellbeing, and museums increasingly promote themselves as inclusive institutions. Yet digital heritage practices can unintentionally perpetuate inequalities and reproduce harm when sensitive subjects such as sexual violence are euphemised or recontextualised without care. This paper examines how the Dutch Rijksmuseum's digital collection mediates sexual violence through its cataloguing language, multilingual search functions, and visitor-generated content. Quantitative mapping of search results in Dutch and English was combined with qualitative interpretation of metadata descriptions, institutional tags, and interface pathways to analyse how depictions of sexual violence become visible or obscured. The results reveal systematic patterns, including euphemistic and sanitising language, inconsistent terminology across languages, and unmoderated visitor features that can expose users to triggering content. These patterns demonstrate how well-intentioned efforts to democratise digital heritage risk undermining inclusivity. This article proposes feminist ethics of care and trauma-informed approaches to digital heritage practices, prioritising non-euphemistic metadata, critical contextualisation of patriarchal structures, content warnings and points of pause, and community-based moderation of visitor features. Centring survivor wellbeing reframes digital heritage not as a neutral repository but as a care infrastructure, positioning museums as accountable to users and survivor communities.

1670. Playful Heritage: Engagement and Wellbeing through Minecraft Education

Authors: Francesco Ripanti (University of Birmingham)
Format: Oral

Archaeogaming enables diverse audiences to experience archaeological sites and artefacts in immersive and interactive ways, creating innovative opportunities to combine heritage interpretation with educational practice. Recent studies have shown that videogames function not only as digital playgrounds but also extend the possibilities of object-based learning and thematic storytelling. Examples such as the Discovery Tours part of the Assassins' Creed franchise and the RoMeinCraft project demonstrate the breadth of opportunities offered by videogames to foster collaborative participation and sustain public interest in archaeology. Building on these developments, this paper extends current discussions by exploring an emerging dimension of archaeogaming: its capacity to support wellbeing through playful, inclusive environments focusing on two cultural heritage landmarks. The Tower of Alaminos (Xeros River Valley, Cyprus) and the Vignale Castle (Tuscany, Italy), were recreated as independent worlds within Minecraft Education as accessible spaces for exploration, learning, and simple task-based interaction. In autumn 2024, the environments were embedded in a programme of activities tailored for diverse audiences, including primary schools, gaming sessions with university students and families, and workshops with members of a mental health service unit. Initial findings suggest that these Minecraft experiences not only enhanced outreach, but also contributed positively to participants' wellbeing, indicating a promising avenue for future research at the intersection of archaeology, digital heritage, and wellbeing. This work forms part of the Linking Community Archaeology and Wellbeing in the Mediterranean (LOGGIA) project, funded through a Marie Skłodowska-Curie Postdoctoral Fellowship by the European Union.

2218. Beyond the artefact: Relational archaeological heritage in contemporary museums

Authors: Alexandra Staniewska (Adam Mickiewicz University)
Format: Oral

Drawing on qualitative research conducted in Polish archaeological museums, I challenge object-centred understandings of archaeological heritage by foregrounding its processual, relational, and affective character. I examine how archaeological heritage should not be understood as artefacts carrying intrinsic meaning, but as something socially produced and sustained through narratives, interpersonal relations, and embodied experiences in everyday museum practice. I situate these considerations within broader challenges currently faced by museums, including declining visitor numbers and persistent difficulties in engaging new audiences. While many institutions respond to these challenges by adopting more narrative-driven or digitally mediated displays, this shift alone often proves insufficient. Based on interviews with museum professionals, I explore alternative strategies through which museums seek to sustain the social relevance of archaeological heritage, highlighting the role of emotional connection, embodied forms of engagement, and relational care in fostering long-term relationships between visitors and institutions. I argue that these practices are crucial for enabling the past to remain meaningful in the present.

1450. Experiencing the Past: Archaeological Imaginaries and Deliberative Heritage Making Today

Authors: Anja Mlakar (University of Maribor, Faculty of Tourism)
Format: Oral

This paper will explore contemporary processes of heritage making at archaeological and allegedly archaeological sites that are interpreted through spiritual and experiential terms. Focusing on archaeological imaginaries rather than empirical verification, the contribution will examine how certain places—ranging from archaeologically confirmed sites to perceived megalithic and so-called "energetic" locations—are experienced and described as sources of meaning, well-being, and healing in the present. Instead of approaching such interpretations as epistemic alternatives to archaeology, the paper will understand them within broader and inherently deliberative heritage-making processes, in which material remains, landscapes, bodily sensations, expert knowledge, and vernacular imaginaries all contribute to contemporary understandings of the past. Particular attention will be paid to how different actors negotiate and attribute heritage values to archaeological places. Empirically, the paper will be based on ongoing and exploratory research in Slovenia, especially in the Kozjansko region, where sites such as Rifnik combine archaeologically attested remains, contemporary religious practices, and vernacular spiritual interpretations, including narratives about megaliths and healing landscapes. Preliminary observations suggest that such practices respond to contemporary needs for stability, meaning, and well-being. At the same time, they reveal ongoing processes through which different understandings of the past are articulated, negotiated, and sometimes contested among heritage professionals, local communities, religious actors, and visitors. The paper will thus be based on an analytical distinction between epistemic validation and interpretive recognition. While archaeology retains authority over empirical claims about the past, other disciplines such as anthropology and heritage studies have a responsibility to analyse why and how alternative interpretations emerge, what social needs they address, and how they participate in broader deliberations over heritage values and meanings.

2746. Petroglyphs as Worldview: Prehistoric Visual Scenes and Alternative Ways of Knowing

Authors: Mariam Shakhmuradyan (Institute of Archaeology and Ethnography, Armenian Academy of Sciences)
Format: Oral

This paper draws on research into the Itsagir petroglyph corpus (Armenia) to examine how prehistoric petroglyphs articulate a coherent worldview grounded in direct engagement with landscape, animals, movement, and collective action. Rather than treating petroglyphs as art objects in a modern sense, the study approaches them as structured visual scenes and relational models through which past communities expressed how reality was understood, organised, and made meaningful. The paper contrasts these prehistoric visual worldviews with contemporary modes of perception shaped by mass media, digital circulation, and fragmented narratives. While modern images often mediate experience at a distance, the Itsagir petroglyphs emerge from embodied practice and shared communal knowledge. Through repeated scenes, conventionalised actions, and patterned compositions, they communicate values and priorities rooted in lived interaction rather than abstraction. Engaging with such petroglyphs today activates both cognitive and emotional processes, inviting slow observation, interpretation, and imaginative participation. This encounter offers not only historical insight but also an alternative way of relating to the world, with clear relevance for learning, reflection, and well-being. The paper also addresses the ethical responsibility of mediating these worldviews carefully, avoiding romanticisation while recognising their potential to challenge contemporary assumptions and foster deeper, more meaningful engagement with the past.

387. The Museum as a Medium for Facilitating Science Communication: From aDNA to Puppy Yoga

Authors: Povilas Blaževičius – Sigita Mikšaitė (National Museum of Lithuania) – Giedrė Piličiauskienė (Vilnius University)
Format: Oral

In contemporary society, the funding of scientific research—particularly in the humanities—is often met with skepticism, with its practical value frequently questioned. Archaeology, however, has moved beyond the traditional boundaries of the humanities and now operates as an inherently interdisciplinary field, integrating bioarchaeological, chemical, and genetic methods. As a result, archaeological research outcomes have the potential to engage diverse audiences beyond academic circles. Despite this shift, science communication in the museum context remains a significant challenge. How can complex research methods—such as stable isotope analysis, radiocarbon (^{14}C) dating, and ancient DNA (aDNA) studies—be presented in ways that are both scientifically accurate and accessible to non-specialist audiences? How can museums foster curiosity rather than alienation when addressing sensitive materials, such as human and animal remains? This presentation examines a case study from the Lithuanian National Museum exhibition dedicated to the history of dogs, focusing on the museum as an active mediator of science communication. It analyzes strategies for presenting archaeological materials and research results through a three-tiered communication model, tailored to different visitor groups according to their informational needs and levels of prior knowledge. The paper argues that structured, audience-oriented science communication within museum exhibitions enhances public engagement with scientific research and contributes to greater trust in its societal value.

422. Archaeological Heritage as a Tool for Social Integration: The Case of the Belginum Archaeological Park

Authors: Aura Piccioni (Universität Trier) – Laura Sarli (GAE Engineering)
Format: Oral

In recent decades, museums have increasingly engaged in critical self-reflection, adapting their roles and practices to the profound cultural, economic, demographic, and communicative transformations of contemporary society. This shift is reflected in the new definition of the museum adopted by the International Council of Museums (ICOM) in 2022, which recognises museums not only as institutions dedicated to research and heritage conservation, but also as participatory, ethical, inclusive, sustainable, and community-oriented spaces. Within this evolving framework, museums are called upon to actively contribute to social well-being and community development. This paper explores the Archaeological Park Belginum in Germany as a case study exemplifying the social, economic, and integrative potential of contemporary museums. Particular attention is given to a project focused on social integration and the generation of both economic and personal well-being for the local community. The analysis focuses on the temporary exhibition Soziale Arbeitsmarktpolitik im Dienste von Tourismusförderung und Archäologie, held in 2006, which foregrounded the social significance of the Belginum Archaeological Park and made visible its broader impact beyond cultural heritage preservation. Since 1999, the project Vicus Belginum – Development of Archaeological Excavations for Touristic Purposes, organised by the municipality of Morbach in collaboration with the Citizens' Service of Trier, has provided employment and professional training opportunities, particularly targeting individuals facing long-term unemployment and multiple barriers to labour market integration. By creating synergies between archaeological research, tourism development, and social labour market policies, the project demonstrates how heritage initiatives can function as tools for social inclusion. The exhibition and the project as a whole highlight the expanded role of museums and archaeological parks as active agents in fostering economic development, social cohesion, and improved quality of life, reinforcing their relevance within contemporary society.

1885. Places in the making: participatory approaches to cultural heritage-led sustainable development of rural places

Authors: Ulrika Soderstrom – Anna-Karin Karlsson (Kalmar County Museum)
Format: Oral

In Sweden, there are several communities and places in the countryside that are experiencing an ongoing decline in development due to manual industries and local businesses gradually being decreased or completely discontinued. When struggling to counteract problems connected to, among others, declining population and growth, municipalities have discovered the potential of using heritage and archaeology in place making processes. But, as development with heritage and archaeology as a resource places great demands on processes being adaptive and responsive to the varying needs of local communities, there is also a need to develop heritage practices and methods that promote carefully designed living environments, accessibility, attractiveness, long-term sustainability, and well-being for local communities. This presentation focuses on the project "Places in the making" (2023-2026) in which Kalmar County Museum have been exploring new methods to working with cultural heritage and archaeology as a resource to promote sustainable rural development and community well-being in Bergkvara, a small coastal area in south-east Sweden. The project is based on cross-sectoral collaboration between actors with different roles and mandates in development processes to promote rural development, placing local cultural heritage and community engagement, participation and well-being at the forefront. Here, we draw on the various practices explored and discuss the results and lessons learned along the way.

646. What happens when you can't take your archaeology with you? The complex issue of migrant immovable cultural heritage

Authors: Heather Gill-Frerking (Carleton University, Department of Law & Legal Studies)
Format: Oral

Conservative calculations suggest that fifty million people will face internal displacement related to climate causes by the year 2050 (Durrani 2025, 2), with some estimates reaching 500 million total climate migrants by 2050 (Clements 2024, 10287). Many of those migrants move to, or hope to settle in, Europe. Each of those migrants faces a significant loss of personal, family, and community cultural heritage due to migration. As part of this, imagine losing archaeological past – your burial places, your archaeological sites, your dreaming sites, and many other connections to your past. This paper explores the practical and legal aspects of the archaeological heritage of climate migrants. It will address whether migrants have any legal rights to the archaeological heritage that they are forced to leave behind. Furthermore, the paper will examine whether there are any practical ways for a community to transfer its archaeological heritage to new locations, particularly in a new country, or even on a new continent. References Clements, Paul. 2024. International Climate Migrant Policy and Estimates of Climate Migration. Sustainability 16:10287. Durrani, Sardar Usman. 2025. The Great Climate Migration: 50 Million Projected by 2050. Available at SSRN 5370117.

417. 2500 Years Later: Archaeology and the Making of National Identity in Greece and Persia. Part I: Introduction and Greece

Authors: Nicolas Nicolaides (Centre for Asia Minor Studies) – Ehsan Behbahani-Nia (University of Wisconsin–Madison)
Format: Oral

Greece and Persia are two civilizations that co-existed for many years and dominated the narratives of the mid–first millennium BC. Their conflicts and interactions have long been told by historians and studied through their material culture. This paper shifts the focus to the modern nations of Greece and Iran. It examines how, 2500 years later, archaeological heritage functions not as a passive remnant of the past but as an active tool in the making of national identity in both countries. Adopting a comparative framework, the joint project focuses on two key archaeological sites: the Athenian Agora in Greece and Pasargadae in Iran. It explores how today Greeks and Iranians have developed selective engagements with their material remains, contributing to collective identity and national narratives. In both cases, the paper examines two interrelated factors: (1) the attribution of value to particular archaeological layers while others are ignored, removed, or destroyed to privilege an idealized "golden age"; and (2) the use of archaeological landscapes as stages for political legitimacy. The Athenian Agora, where democracy was born in the 6 th century BC, was continuously inhabited from antiquity through the modern period. However, it acquired a new and highly curated meaning in the 1930s through excavations led by the American School of Classical Studies at Athens. These interventions privileged the Classical period as a democratic "golden age," marginalizing or removing Byzantine, Ottoman, and modern layers, thereby creating a narrative that assigns value to certain remains while stripping others of it. The Agora, as a material memory of Athens' glory days, has also been used as a stage for political legitimacy, from the reception of King Otto in 1833 to the signing of Greece's EU accession treaty in 2003.

419. 2500 Years Later: Archaeology and the Making of National Identity in Greece and Persia. Part II: Iran and Conclusion

Authors: Ehsan Behbahani-Nia (University of Wisconsin-Madison) – Nicolas Nicolaides (Centre for Asia Minor Studies)
Format: Oral

A parallel dynamic can be observed at Pasargadae, the first capital of the Achaemenid Empire (6th Century BC) and the burial

place of Cyrus the Great. Known as a just and generous ruler, Cyrus is widely regarded as a symbolic father of the Iranian people. Yet Pasargadae, like the Agora, experienced a long and complex post-antique history. Following the fall of the Persian Empire, the memory of Cyrus gradually diminished, and his tomb was reinterpreted as the Tomb of the Mother of Solomon and later transferred into a mosque during the Atabakan period in the 13th century CE. Reidentified as the tomb of Cyrus by early European travelers, the site was subsequently re-framed within a nationalist narrative. In the 1970s, Islamic architectural elements around the tomb were removed in order to foreground an idealized pre-Islamic past. Pasargadae also became a stage for political legitimacy, where during the opening ceremony of the 2500th anniversary of the Persian Empire, Mohammad Reza Shah Pahlavi paid tribute to Cyrus the Great. Taken together, the two case studies demonstrate how archaeology, through processes of selection, erasure, and political performance, actively produces national meaning rather than simply preserving the past. By placing Greece and Iran in comparative perspective, the paper highlights the shared factors through which archaeological heritage severs as modern notational identity building, despite different historical and political contexts.

2164. Rediscovering Vučedol: How Archaeological Heritage Shapes the Experiences and Impacts the Minds, Emotions and Social Lives of Older Adults (65+)

Authors: Mirna Šuljug – Mirela Hutinec – Petra Rajtarević (Vučedol Culture Museum)
Format: Poster

Since its opening in 2015, the Vučedol Culture Museum (Vukovar, Croatia) has attracted a broad audience and established itself as a frequently visited public institution located on the eponymous archaeological site. Based on archaeological and multidisciplinary research, the museum's permanent exhibition presents the Vučedol Culture of the Eneolithic period (3000 – 2500 BCE) one of the most significant prehistoric cultures in Croatia, but also in Europe. This paper places particular emphasis on visitors aged 65 and older, who account for nearly 10% of the museum's annual visitors. According to museum staff and survey data, the sophisticated storytelling in the permanent exhibition evokes positive emotional responses among this age group and fosters a sense of belonging, thereby reducing feelings of loneliness and social isolation, especially among individuals in residential care facilities. In addition, under controlled conditions, the museum offers specially designed educational programs at the archaeological site and in museum workshops, where interaction with original archaeological artefacts is permitted. In this way, through tactile and visual engagement with artefacts from the past, these programs stimulate curiosity, pride, a sense of belonging, and continuity of identity. They also encourage narrative thinking and facilitate the connection between personal experiences and the collective past. The museum further extends its activities to other institutions, such as homes for the elderly and for people with disabilities. Program content is carefully developed to stimulate a range of fine motor skills and cognitive processes, including memory, attention, verbal abilities, and executive functions. Another distinct visitor group consists primarily of highly educated senior citizens who, during retirement, enroll in specialized archaeology study programs adapted to their age. By engaging directly with archaeological heritage, these individuals not only fulfill long-cherished personal aspirations but also actively promote and contribute to their own active and healthy aging.

26 BURIALS AND CEMETERIES IN THE 12TH–13TH CENTURY AD EASTERN MEDITERRANEAN: PERSPECTIVES FROM ARCHAEOTHANATOLOGY AND BIOARCHAEOLOGY

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Yves Gleize (INRAP | UMR 5199 PACEA University of Bordeaux) – Natalie Milanese Branca (The Cyprus Institute) – Elise Mercier (University of Poitiers | HeRMA UR 15071)
Keywords: Funerary Archaeology, Biological Anthropology, ancient DNA, Isotopes, Middle Age, Eastern Mediterranean
Format: Regular session

SESSION ABSTRACT

The 12th and 13th centuries AD witnessed intense transformations across the Eastern Mediterranean, as the region was reshaped by the Crusades, shifting political powers, large-scale population movements, and evolving religious and cultural dynamics. These changes are reflected not only in written sources and material culture, but also in the ways communities treated their dead. Cemeteries and burial practices offer valuable insights into the identity, belief systems, social structure, health, and lived experiences of past populations. This session brings together researchers working on funerary contexts across the Eastern Mediterranean—from Anatolia and the Levant to Cyprus and the Aegean—dated to the 12th and 13th centuries. By combining archaeothanatological approaches with bioarchaeological data, contributors will explore how burial practices varied across regions and cultures, and what they reveal about the relationships between the living and the dead. Papers will address a range of themes, including funerary architecture and spatial organization, body treatment and positioning, evidence of disease or trauma, and ritual practices associated with death and commemoration. The session aims to foster interdisciplinary dialogue between specialists in human osteology, field archaeology, and cultural history. It highlights the methodological advances in archaeothanatology and bioarchaeology that allow for more nuanced reconstructions of past funerary behaviours, as well as broader interpretations of social identities, religious affiliations, and intercultural contacts in a time of significant geopolitical change. By focusing on the Eastern Mediterranean as a zone of

interaction, conflict, and coexistence, this session offers a comparative perspective on how different communities understood and navigated death and burial in the medieval world. Ultimately, it seeks to move beyond typological or descriptive studies, encouraging integrated analyses that place the human body at the centre of archaeological inquiry.

CONTRIBUTION ABSTRACTS

1424. At the Edge of the Sea: Coastal Erosion and the Atlit Medieval Cemetery

Authors: Mathilde Mura (Aix Marseille Université, CCJ, CNRS)
Format: Oral

The Medieval cemetery of Atlit (Israel), dated to the XIIIth century, is a key funerary assemblage for the study of Eastern Mediterranean populations during the Crusader period. Yet, beyond its archaeological significance, the site has been affected by major taphonomic processes and for at least a century by the evolution of the shoreline. Historical sources and early observations indicate that parts of the cemetery had already been destroyed by costal erosion as early as the 1960s, making erosion a long-term and enduring factor in the transformation and partial loss of this funerary landscape. This paper presents the results of a collaborative research conducted as part of the Patrimoine en Péril workshop, an optional workshop within the Master's program in Archaeology and Archaeological Sciences at Aix-Marseille University. The study focuses on documenting and assessing the impact of coastal erosion on the Atlit cemetery through a diachronic analysis of aerial photographs and satellite imagery. By constructing a temporal image series spanning several decades, the research reconstructs the evolution of the coastline adjacent to the cemetery and identifies phases of accelerated land loss. The spatial analysis highlights the progressive destruction and exposure of burial areas due to marine erosion, allowing the identification of zones most affected and those currently at highest risk. These results provide a clearer understanding of the scale and tempo of damage impacting the cemetery and contribute to the broader discussion of site formation, post-depositional processes as well as risk management and heritage protection. This approach offers an essential contextual framework. By documenting long-term taphonomic processes driven by coastal dynamics, this research emphasizes the necessity of integrating heritage risk assessment into the study of costal heritage sites in the Eastern Mediterranean and highlights the value of remote sensing and pedagogical collaboration for monitoring endangered sites.

735. The Extramuros Medieval Cemetery of Atlit: New Insights into Funerary Practices in the Latin Kingdom of Jerusalem (12th-13th c.)

Authors: Yves Gleize (INRAP) – Chloé Lacourarie (Service Archéologie Indre-et-Loire) – Elise Mercier (University of Poitiers) – Emeline Retournard (UR 1001 CHEC/TextrinArcheo) – Camille Bouffiès (Pôle Recherche de Nantes Métropole)
Format: Oral

The medieval cemetery of Atlit is an extensive extramural funerary area located on the Levantine coast of the eastern Mediterranean, in the vicinity of the Château Pèlerin, built in 1217–1218 and occupied by the Templars until 1291. This cemetery constitutes a key source for the study of funerary practices, cultural traditions, and populations of the Latin Kingdom of Jerusalem during the Crusader period. Since 2015, an interdisciplinary research programme combining archaeology, archaeothanatology, and bioarchaeology has been investigating this funerary space, providing substantial new data on burial practices at the site. This paper presents a synthesis of the results obtained on funerary practices. Numerous engraved grave markers attest to a clear intention to mark, perpetuate, and differentiate certain burials. However, the intensive use of the cemetery—apparently over a relatively short period of less than a century—led to the destruction of some surface markers and to the frequent intercutting of sepulchral pits. Archaeothanatological analysis makes it possible to specify the modes of body deposition, which predominantly involve covered pits and, more rarely, coffins or wooden formworks. Body positioning appears highly standardized across the cemetery. In addition, the presence of associated remains, such as ceramics and textile fibres, provides further insights into funerary gestures and practices. Considered at the scale of the entire site, these data contribute to a broader discussion on the organization, use, and social meaning of this imposing extramural cemetery within the Latin Kingdom of Jerusalem.

1363. Beyond the Pelvis: Sex Determination and Burial Population at the Medieval Cemetery of Atlit (12th–13th c.)

Authors: Chloé Lacourarie (Service Archéologique Départemental d'Indre-et-Loire) – Yves Gleize (INRAP) – Camille Bouffiès (Pôle Recherche de Nantes Métropole) – Fanny Mendisco – Marie-France Deguilloux (PACEA)
Format: Oral

The extramural cemetery of Atlit is contemporaneous with Château-Pèlerin, a Templar fortress built in 1217–1218, and the last Latin stronghold in the Levant before its abandonment in 1291. Since 2015, the cemetery has been investigated through an interdisciplinary research program combining archaeology, archaeothanatology, and bioarchaeology, providing an extensive dataset for the study of funerary practices in the Crusader Middle East. Bioarchaeological data are central to understanding the organization, identity, and burial population, defined here as the composition and selection of individuals interred in the cemetery. The generally good preservation of skeletal remains has allowed primary sex diagnosis for a substantial proportion of individuals, based on pelvic morphology and metric criteria. However, the intensive use of the cemetery over a relatively short time period, as indicated

by numerous overlapping burials, has resulted sometimes bones in secondary position and absence of pelvic bones, limiting the applicability of primary osteological methods. To address these limitations, complementary approaches have been progressively implemented. Secondary sex diagnosis, based on statistical models derived from metric data from other anatomical regions -particularly long bones- has significantly increased the number of individuals for whom sex could be estimated. In addition, genetic analyses conducted on selected skeletons have enabled the determination of genetic sex for individuals lacking both pelvic elements and sufficiently preserved long bones. This paper presents a synthesis of the results obtained through the combined use of primary osteological diagnosis, secondary metric approaches, and palaeogenomic analyses. These integrated data provide renewed perspectives on burial population at Atlit and, more broadly, on the role of Château-Pèlerin not only as a Crusader fortress, but also as a place of reception for pilgrims and a focal point for surrounding communities.

543. Diversity of Crusader settlements in the Latin East: Multi-isotopic analysis of human remains from the medieval necropolis at Atlit

Authors: Natalie Branca – Gwenaëlle Goude (CNRS, AMU, Minist. Culture, LAMPEA) – Aurélia Borvon (CNRS, UMR 7041 ArScAn & Oniris VetAgroBio) – Juliette Knockaert (CNRS, AMU, Minist. Culture, LAMPEA & CNRS, UPVM 3, UMR 5140 ASM) – Abel Guihou – Hélène Mariot – Pierre Deschamps (AMU, CNRS, IRD, CdF, INRAE, CEREGE) – Yves Gleize (Inrap, UMR 5199 PACEA, University of Bordeaux)
Format: Oral

The medieval necropolis of Atlit is the largest and best-preserved Crusader-period funerary site in the Latin East, estimated to contain over 1,900 graves. Located near the Templar fortress of Château Pèlerin (Pilgrim's Castle), which functioned as a Crusader stronghold during the 13th century (c. 80 years), the cemetery has traditionally been interpreted as a Frankish burial ground. However, more recent archaeological investigations by a team from the Inrap and the University of Bordeaux, with support from the Ministère de l'Europe et des Affaires Étrangères and the French Research Centre at Jerusalem, have revealed considerable variability in funerary practices and material culture, suggesting a more heterogeneous population than previously assumed. In this context, this paper presents the results of isotopic analyses as an additional line of evidence contributing to ongoing research at the site. Bone and tooth samples were analyzed for Carbon (C), Nitrogen (N), Sulfur (S), Strontium (Sr), and Oxygen (O) isotopes to investigate dietary practices and patterns of mobility. Modern and archaeological faunal remains were also analyzed to establish local isotopic baseline signatures, supplemented by paleoproteomic analysis of a single specimen enabling broad taxonomic classification. The first C, N, S results support recent reinterpretations of the site, highlighting population diversity and complex patterns of interaction. Future analysis of additional samples from Atlit, as well as from contemporaneous sites in the region, will further refine our understanding of Crusader interactions with local communities in settled regions. The medieval necropolis of Atlit, like many archaeological sites in the region, is currently threatened by climate change and regional political instability, and the multidisciplinary approach adopted in its investigation—beyond its timely nature—represents an effort to preserve the narrative of this cultural heritage site for future generations.

591. The Parish Church of Atlit (Israel) and its burials: An Archaeological reassessment of a late 13th century Latin Funerary Context.

Authors: Elise Mercier (University of Poitiers - UR 15071)
Format: Oral

In the second half of the thirteenth century, shortly before the fall of the Latin Kingdom of Jerusalem, the fortified town of Atlit offers a valuable case study of funerary practices in a period of political and military instability. Nevertheless, the parish church of Atlit, built late in a fortified suburb and never finished, received several burials in its cemetery, as well as one grave integrated into a floor of the nave, probably shortly before the abandonment of the site. Nearby, the castle church, which contained no burials but the relics of Saint Euphemia, formed an important and independent religious centre and seems to have influenced the funerary organization to the suburban church. This paper proposes an archaeological re-examination of the burials associated with the parish church previously mentioned, based on a data from excavations carried out in the 1930s. The study focuses on the body position, orientation, and the apparent absence of coffins, to reconstruct funerary gestures and the spatial organization of the graves, despite the limits of these early sources. Special attention is given to the burial in the church, whose orientation does not strictly follow the axis of the building and appears to establish a symbolic relationship with the nearby castle church. Comparisons with contemporary sites, such as Caesarea Cathedral and other Latin contexts from the late 13th century, place the tombs associated with the parish church in a larger reflection on the persistence and adaptation of preferred funerary practices. By placing the body at the centre of the analysis, this study highlights the contribution of archaeothanatology to a better understanding of medieval funerary practices in the eastern Mediterranean.

1764. Changes in repetition: Medieval burial practices at the Templar Church in Gora, Croatia

Authors: Juraj Belaj (Institute of Archaeology in Zagreb) – Filomena Sirovica (Archaeological Museum in Zagreb) – Željka Bedić (Institute for Anthropological Research) – Tea Kokotović – Sebastijan Stingl (Institute of Archaeology in Zagreb) – Marijana Belaj (Faculty of Humanities and Social Sciences, University of Zagreb)
Format: Poster

The Church of the Assumption of the Blessed Virgin Mary, situated in the village of Gora in Croatia, was constructed in the late 12th or early 13th century by the French members of the military order of the Knights Templar. Whether originating from France or the Eastern Mediterranean, upon their arrival, the Templars demolished an older church and erected a new knightly church. Archaeological excavation conducted around this church led to the excavation of numerous graves. The area was used as a cemetery from the beginning of the 11th until the end of the 18th century. Analysis of grave characteristics, which reveal clear shifts in funerary practice, has enabled the identification of five distinct burial phases, confirmed by numerous radiocarbon dates. Within this chronological framework, the appearance of graves in which larger stones were placed along their edges is a notable feature. This practice, well-documented in numerous medieval cemeteries across Central Europe, indicates the intentional, preconceived formation of the grave during interment. At Gora, this type of graves occur almost exclusively within the first two burial horizons. The first horizon spans the 11th and 12th centuries and is associated with an earlier Romanesque church, while the second corresponds to the 13th century, during which interments took place around the Templars' Gothic church. Although this was a period of attested socio-political changes, the recurrence of this practice persisted over three centuries. In both established burial phases, the practice is characterised by a general scarcity of grave goods. However, specific characteristics can be identified which testify to changes in certain customs. Based on an analysis of these finds and their correlation with the bioarchaeological data from the deceased, the authors explore the potential meanings and motivations behind this centuries-long practice and its enduring survival regardless of attested socio-political shifts.

2700. Ancient DNA on a cemetery level in Eastern Mediterranean: ancestry, relatedness, and potential

Authors: Zuzana Hofmanová (Masaryk university Brno)
Format: Oral

Practices related to reproductive behaviour have only recently become visible as a potential mechanism in the organisation of post-Roman societies. Recent systematic research on entire burial communities, integrating archaeological, anthropological, isotopic, historical and large-scale genetic information, offers multi-generational perspectives on Late Antique and Early Medieval communities. By its nature (especially for genetics), reproduction is intrinsically tied to these datasets, yet the long-term social role of reproduction (likely marriage) practices in shaping local identities has only begun to be explored. Archaeogenetic evidence suggests that formation of reproductive unions may have contributed to local identities in Central Europe. Relatedness analyses identified enduring relatedness units associated with specific cemeteries and settlement areas lasting up to 9 generations. At the same time, systematic exogamy appears to have regulated the incorporation of non-local individuals in some communities. Elsewhere, neighbouring communities remained genetically distinct despite close spatial proximity, a differentiation likely maintained through deliberate inclusion and exclusion within marriage networks. Relatedness links can be seen also over large distances showing the investment into marriage networks through the sheer space involved. At the same time, local upheavals in the communities could be associated to the shifts in paternal lineages, which may reflect local political realignment rather than any large population replacement. Reproductive networks seem to be heavily tied to markers of social status but interestingly not only linking individuals of the same status together but potentially even showcasing cases of deliberate construction of kinship for purposes of shaping social status. Reproduction and marriage unions between communities and social groups can be seen not as decisions of single individuals but as a communal social practice with long-term influence on cooperation, social and spatial boundaries and belonging. This approach invites further discussion on the analytical value and limits of integrating archaeogenetic data into interpretations of post-Roman Europe.

27 COLLECTIONS IN THE SHADOWS: PEOPLE, PLACES, POSSESSIONS AND PURPOSE IN DORMANT COLLECTIONS AND HERITAGE INFRASTRUCTURES

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Laura Thompson (University of Manchester) – Arianna Magyaricsová (University of Glasgow) – João Sequeira (University of Coimbra)
Keywords: Dormant Collections, Heritage Infrastructure, Responsibility and Ethics, Memory and Identity, Digital Reactivation, Cross-sector Perspectives
Format: Regular session

SESSION ABSTRACT

Archaeology is inherently political, with stories often told by those disconnected from their cultural contexts. As researchers, we hold a responsibility to the people, places, and things we study, but what happens when material culture becomes detached from those it belongs to? Across museums, universities, archives, and heritage sites worldwide, countless archaeological, ethnographic, natural history, teaching, and world cultures collections lie dormant, overlooked, or under-documented. Plagued by ethical, legal, financial, and moral considerations, these assemblages are more than residues of past practices; they are part of the hidden infrastructures of heritage that continue to shape research, teaching, institutional identity, and public engagement. Our session repositions such dormant collections and sites as active spaces for rethinking responsibility, memory, and relevance in the present, and invites

critical, inclusive, and imaginative approaches to material culture and built heritage. We invite contributions that explore: - Heritage infrastructures: Dormant collections as the unseen systems that underpin archaeological and heritage knowledge. - Ethics and responsibility: Institutional obligations towards forgotten holdings; issues of restitution, repatriation, and contested heritage in colonial, wartime, or extractive contexts; legal and policy challenges. - Institutions, memory, and identity: Forgotten collections as windows into disciplinary histories, biases, and silences, from teaching assemblages to national stores. - Digital reactivation: Digitisation, storytelling, and computational methods as strategies for rediscovering and reimagining dormant holdings, including collaborations with communities through digital archives. - Cross-sector perspectives: Insights from anthropology, art, natural history, and world cultures that broaden and challenge archaeological approaches. By bringing together archaeologists, museum and heritage professionals, policymakers, creative practitioners, and other stakeholders, this session seeks to highlight the significance of dormant collections as both challenge and opportunity. It asks how these dormant collections and hidden infrastructures can be ethically reactivated to shape more inclusive, responsible, and resilient futures for heritage.

CONTRIBUTION ABSTRACTS

2013. Stories of Gold and the Silent Archives

Authors: Mikael Eboskog – Roger Nyqvist (Bohusläns museum)
Format: Oral

Dreams of the past are powerful. Once formed, they tend to outlive both the contexts in which they emerged and the sources on which they were originally based. In archaeology, such dreams often solidify into narratives that are repeated until they are no longer questioned. The grave at Lilla Jored in Sweden is widely presented as one of the wealthiest burials. From the outset, the narrative of the grave was constructed around a small number of gold objects, which quickly came to stand in for its overall significance. Although the archival record preserves a rich and underutilised body of evidence capable of supporting a far more complex interpretation, attention has for more than two centuries remained fixed on the gold. Other elements of the burial - including grave construction, associated materials, and contextual observations - quickly disappeared from the story line. By re-examining the archival documentation, this paper demonstrates that the material and documentary record offers a substantially more nuanced understanding of the grave than that conveyed through its dominant representations. The continued emphasis on gold illustrates how visually and symbolically powerful objects can narrow archaeological storytelling, while the evidential possibilities preserved in archives remain largely unexploited. Using Lilla Jored as an example, the paper argues for the necessity of integrating archival research more fully into archaeological narratives, particularly within museum displays and public history formats, to produce interpretations that are both more complex and more source critical. This paper shows how archaeological narratives may become circumscribed by gold, allowing a small number of objects to define both meaning and value of the narrative, while the broader evidential possibilities preserved in archives remain unheard. Returning to these silent sources makes it possible to expand narratives that have been narrowed by repetition and visual appeal.

2435. Awakening a Dormant Collection of Ancient Art in National Museum in Poznań

Authors: Wojciech Jeneralek (The National Museum in Poznań)
Format: Oral

The archaeological collection of the National Museum in Poznań comprises approximately one thousand artefacts from the Mediterranean basin, assembled since 1899 following the establishment of the Kaiser Friedrich Museum in Poznań, under Prussian rule from 1793, produced a museum embedded in colonial and Kulturkampf politics. This Prussian provenance contributed to the collection's prolonged „dormancy" as an under-displayed assemblage. The Kaiser Friedrich Museum presented a linear art-historical narrative from Predynastic Egyptian art to modernity, positioning German culture as the inheritor of classical antiquity. Ancient material culture functioned ideologically within the museum's visual, architectural, and curatorial programmes, aligning with Germanisation policies in Greater Poland. After World War I the collections were incorporated into polish institution, yet Mediterranean artefacts remained peripheral. Although a Department of Ancient Art was established in 1945, the absence of permanent exhibition, stable curatorial posts, and sustained research infrastructure prolonged dormancy. A permanent display opened only in 2011 and closed in 2023. This paper examines the current phase preceding a new permanent Gallery of Ancient Art as a critical moment for rethinking on rethinking the new significance of this collection within the current programme of the National Museum in Poznań. The collection is now accessible via a study store with rotating displays and direct curator-visitor interaction, revealing hidden infrastructures of heritage production typically concealed from public view. This alternative mode of presenting a dormant collection - despite the absence of a permanent, conventional museum display provides full access to the material for scientific research and education, while simultaneously exposing the hidden infrastructures of archaeological knowledge production by allowing the public to engage directly with curators and volunteers in the Ancient Art Gallery. This approach makes visible the scholarly processes, institutional decisions, and ethical responsibilities that precede the formation of a permanent exhibition.

642. Discipline in Material Form: Re-activating the Postcolonial Afterlives of Wood and Water

Authors: Juewei Fan (University of Bristol)
Format: Oral

This research explores how wood and water, as material forms, reveal the ways in which colonial powers continue to discipline bodies and regulate behaviour. It examines how these materials, once dormant within colonial heritage, have resurfaced in contemporary contexts. This revival is not a neutral recovery of history. Instead, these formerly silent sites persist as politically charged spaces, where affective attachments and colonial ethics of order continue to provoke debates over authority and responsibility. The study investigates how such reactivations can be understood both as critical reflections on colonial legacies and as postcolonial forms of domestication, in which colonial governance continues through material practices, sensory regimes, and embodied conduct. The analysis juxtaposes two cases: woodcrafts of Shanghai Tushanwan Museum (formerly Tushanwan Catholic Orphanage) and water infrastructure of Beitou Hot Spring Museum in Taiwan. Wood facilitated shaping path, whereby missionary educational regimes moulded the moral subjectivities of marginalised orphans. Water underpinned regulatory training path, with hygiene and leisure infrastructures enforcing classed and gendered hierarchies, initially serving Japanese military elite before expanding into public sphere. After the collapse of colonial regimes, wood and water followed divergent historical trajectories. The narrative of wooden craftsmanship and related artefacts was interrupted by war and diaspora, receding from public visibility for nearly a century. Hot spring heritage, meanwhile, fell into dormancy through disuse, as its infrastructure was gradually marginalised by urban modernisation. In recent years, both have been re-excavated and re-coded through heritage revival, becoming re-articulated within local cultural narratives. Contemporary narratives frame wood as disciplined craft and water as fluid wellness, yet colonial logics persist not as overt forces but as haunting memories embedded in regimes of representation and perception. By repositioning these nearly forgotten collections as active interfaces of memory, the research contributes to pluralistic interpretations of postcolonial heritage and enriches urban heritage narratives.

976. From Storage to Significance: re-engaging dormant Museum collections in understanding past socio-political systems in northern Nigeria

Authors: Bolaji Owoseni – Abubakar Sule (Sainsbury Research Unit, University of East Anglia)
Format: Oral

This paper presents preliminary findings from British Academy Global Professorship research on early West Africa's socio-political development in northern Nigeria through the critical lens of museum collections. It examines how so called "dormant" archaeological and ethnographic holdings in Nigerian regional museums and the British Museum function as shadow heritage infrastructures; forgotten, rarely displayed, or community disconnected materials. They are seen as passive deposits of past research, where, when activated, they symbolise histories, responsibilities, and institutional power of historical negotiations. Drawing on archival sources and collaborative engagement with museum curators, the paper traces how objects from northern Nigeria have been classified, silenced, recontextualised, or confined to storage under the combined pressures of colonial legacies, postcolonial resource constraints, and shifting institutional priorities. These processes reveal the infrastructures: cataloguing systems, storage practices, funding regimes, and epistemological frameworks; that shape what can be known, taught, and remembered about West African pasts. The paper argues that re-engaging dormant collections requires both methodological innovation and a critical rethinking of museum authority, provenance, and community-centred heritage practice within global archaeology, offering a model for decolonial museum archaeological collaboration in West Africa. It concludes that by re engaging museum collections, new research offers opportunities to rethink archaeological responsibility, challenge extractive research traditions, and develop more inclusive modes of knowledge production, positioning the past northern Nigeria as a critical region in West African studies.

940. The Swelim-Omm Sety Letters: The Story of a Minor Step Pyramid, a British Egyptian High Priestess, and a Former Commodore

Authors: Courtney Crawford (The University of Alabama)
Format: Oral

In 1977, Dr. Nabil Swelim, a former Navy Commodore turned Egyptologist, discovered one of the seven minor step pyramids, Sinki, located 5.5 km southeast of Abydos. Although earlier scholars suggested the possibility of a site near Abydos, Sinki was not identified as a minor pyramid until Swelim. Throughout his career, Dr. Swelim developed a friendship with the well-known Omm Sety while traveling across Egypt. Although Omm Sety's beliefs were unconventional—she believed she was the reincarnation of a High Priestess of Pharaoh Sety I—many Egyptologists and the local Abydos community highly respected her. Her knowledge of Abydos and its surrounding areas helped Swelim interpret Sinki and understand its cultural significance to the modern Abydos community. The Swelim archival collection, housed in the Rare Books and Special Collections Library at the American University in Cairo, features personal letters exchanged between Swelim and Omm Sety, as well as photographs from her home in Abydos. Reviewing the collection reveals her importance in Swelim's early research and in the field of Egyptology. This study also references the letters to highlight the cultural significance of Sinki for modern Egyptians in the Abydos region. The letters describe Egyptian folklore and their interpretation of Sinki, emphasizing its cultural importance to their community. This paper highlights the significance of archival research in Egyptology and its role in the field's development. The Swelim-Omm Sety Letters and photographs offer context for how modern Egyptian communities connect with ancient sites. Furthermore, this collection documents Omm Sety, the eccentric British woman and Ancient Egyptian High Priestess who supported the work of Egyptian Egyptologists.

808. Waste Not, Want Not: Personal archives and unprovenanced collections as teaching and learning

tools in Higher Education

Authors: Laura Thompson (University of Manchester)
Format: Oral

How can you tell a story about the past when you don't even know where it starts? Sometimes we have to think outside the box... In 2023, The Museums Association declared the "clock is ticking" on archaeological archives with the demand for alternative uses for archival materials at the forefront of the UK heritage sector's agenda (Kendall, 2023). Three years on, we are still facing the same issues with unprovenanced and dormant collections remaining under-utilised and perceived as a burden. Concurrently, discussions around alternative teaching methods in archaeology have turned towards object-based learning and creative research skills proving the benefits of hands-on learning experiences (Wouter and Vansteenhuyse, 2025). The struggle comes in finding the learning materials and creating a meaningful way of interacting with them, embracing the stories of the archives and giving more autonomy to the learner. The Waste Not, Want Not project repositions these burdenous collections as an opportunity to re-excavate the archives and find new meaning in their mystery using the William Brice Archive housed at the University of Manchester, an under-explored multi-media map of the life and work of an ordinary man with an extraordinary story to share. To embrace the mysteries of this archive, I have developed four adaptable workshop frameworks using gamification and object-based learning methods in which participants can develop their creative research and interpretive skills using real stories and artefacts. With roughly two thousand largely unprovenanced artefacts ranging from prehistoric handaxes and pottery to 1940s newspapers, pressed flowers and colonial souvenirs, the William Brice Archive is an example of how creative uses of pedagogy can transform under-utilised dormant archives into valuable and unique teaching tools while sharing otherwise forgotten stories.

846. Dormant but not sleeping: archaeological collections in a XIXth Century sculpture museum

Authors: Nathalie Del Socorro (Musée Camille Claudel)
Format: Oral

According to the 2024 ICOM survey, 81% of museums in western Europe display less than 25% of their collections in permanent exhibitions. The majority of items in museum collections are rarely taken out of their storage. However, museums have the same obligations towards visible collections and those in storage: to preserve, interpret and promote the natural and cultural inheritance of humanity. The Camille Claudel Museum in France is a good example of this situation. Inaugurated in 2017, the permanent collection focuses on Camille Claudel and the sculptors of her time. Around 12 400 items remain in storage, over 8 000 of them belonging to the collection of archaeology. These items were excavated by a local archaeological society from the 1960s to the 1990s. Some were even exhibited in the permanent collections of the previous museum, until the early 2000s. Since the project of the new museum emerged, it became clear that choices had to be made to preserve a strong museographical identity. The archaeological collections could no longer be integrated in the narrative of the permanent exhibition. Ongoing efforts have been made by the museum in the past few years to finish documenting its dormant collections, registering items, assessing conservation and management issues. The scientific value of the archaeological collections has emerged, as well as reflections on alternative ways of communicating its existence to the public. Several projects were developed in order to re-create links with the local community, using the archaeological collection to give insights on everyday life in ancient periods.

886. The Unending Lives of Objects: Post-accession Biographies of the Tarsus Collection at Bryn Mawr College

Authors: Yusi Liu (Bryn Mawr College)
Format: Oral

In archaeology, object biographies have long facilitated historically and culturally contextualized interpretation of the past. More recently, this approach has gained prominence in the history of collecting, supporting the reconstruction of provenance and contributing to restitution efforts. However, comparatively little attention has been directed towards the post-acquisition phases of archaeological artifacts. In this paper, I address this gap by examining the biographies of the Tarsus Collection after its accession to the Bryn Mawr College Special Collections in the United States. My aim is to open new avenues for revitalizing the frequently dormant archaeological artifacts held in university collections. Comprising more than 1,684 objects, the Tarsus Collection consists largely of unassuming objects, such as vessels, figurines, and adornments, all fragmentary, as well as archaeological illustrations. This collection was donated to Bryn Mawr College in 1972 by Hetty Goldman, collected from her Tarsus-Gözlükule excavations in Türkiye during the early 20th century. While the scholarly focus has often been on either Goldman's pioneering role as one of the first female archaeologists to direct excavations or her discovery of significant Bronze and Iron Age settlements at the site, little has been discussed around the legacy of the artifacts she collected and later bequeathed to the college. To remedy this neglect, I draw from inherited institutional legacy data, archival documents, and historiographical analysis to demonstrate how the collection acquired a new pedagogical identity and became incorporated into the intellectual journey of both students and scholars. Goldman's donation helped Bryn Mawr build a diverse archaeological study collection of materials that enables students to work directly with artifacts, which continuously generates research projects for them. By illuminating the often-overlooked yet inspiring stories embedded in these artifacts, I demonstrate how their post-accession trajectories reshape our understanding of the ongoing roles between archaeological objects and academic and museological communities.

1289. Heritage scattered and hidden in the shadow of legal helplessness. Case of an academic Plaster Cast collection

Authors: Monika Dunajko-Ceglińska – Hubert Kowalski (Faculty of Archaeology of the University of Warsaw)
Format: Oral

The paper is devoted to the historical Warsaw Plaster Cast Collection and the present state of its dispersal. This is the oldest collection of this type in Poland and, at the same time, one of the most valuable in Europe. Its origins date back to the reign of the last King of Poland, Stanisław Augustus, and his educational collection comprising nearly 600 casts, primarily of ancient works of art. In 1817, the collection became the property of the University of Warsaw, whose professors ensured its systematic expansion through the acquisition of new casts produced in renowned European workshops. The collection included both works known for centuries (e.g. Laocoön Group) and casts of newly discovered monuments (e.g. sculptures from Olympia). The development of the collection was linked to the formation of classical archaeology in Warsaw. From its establishment until the outbreak of the Second World War, the collection was regarded as an essential teaching tool used in courses on the art and culture of ancient Greece and Rome. It is worth mentioning Kazimierz Michałowski, the last curator of the collection, who based his teaching on casts. The collection was brutally divided by the outbreak of the WWII. The figures, as well as the documentation related to them, fell victim to Nazi vandalism. Some objects were destroyed, while others were dispersed among various institutions and left forgotten in basements. The Collection was never resumed in the form in which it had functioned for over a hundred years. The paper presents an attempt to bring the collection out of the shadows through the analysis of archival documents, iconographic material, and the casts themselves. It discusses the legal and ethical issues involved, as well as the responsibility of institutions that, for over 80 years, have been unable to return fragments of the divided collection.

682. Humanizing Industrial Archaeology - Legal and Ethical Dilemmas in the Musealisation of Industrial Ghosts

Authors: João Sequeira (Universidade de Coimbra)
Format: Oral

This contribution explores the ethical, legal, and conceptual challenges when engaging with archaeological collections that are not only dormant but, in some cases, entirely absent. Using my own fieldwork from my PhD research on abandoned industrial sites, I reflect on the materialities that were never officially collected, thus left were they lay. I consider how fragments of the worker's life, like graffiti, tools, debris, posters and stickers, can be reimagined within museum frameworks, even when the physical objects belong to someone that is still alive somewhere. With my own incomplete archive, I often question what it means to work with the idea of a collection rather than its material certainty. What are the ethical implications of institutionalising traces of labour when former workers or their descendants might still claim ownership—emotional, symbolic, or legal—over these remnants? Could the hypothetical musealisation of such artefacts be contested as an act of appropriation, especially when the community ties to these objects remain unresolved? Rather than offering definitive answers, this presentation raises questions about visibility, absence, and the power dynamics inherent in curatorial authority. It asks whether dormant or lost collections can be mobilised not as static evidence of the past, but as catalysts for ethical reflection and institutional self-critique. With this reflection, I'll try to get to a broader rethinking of collecting practices in contexts marked by erasure, ambiguity, and living memory.

426. Dormant Collections and the Practice of Interpretation: Rethinking Storage, Significance, and Stewardship in Scottish Archaeology

Authors: Arianna Magyaricsova (University of Glasgow)
Format: Oral

This paper explores how dormant archaeological collections function as infrastructures of disciplinary knowledge, shaping what becomes visible, knowable, and narratable within archaeology. Focusing on the A. H. Bishop Collection at the Hunterian Museum, Glasgow, it argues that dormancy is not merely a logistical state of storage, but an epistemic condition produced through patterns of collection, classification, and institutional memory. To examine this, object itinerary theory is applied as both a methodological and theoretical tool. Rather than reconstructing linear life-histories, itinerary analysis traces artefacts through contingent transitions including acquisition, circulation, accession, and reclassification. Combining material analysis with stratigraphic reading of labels and packaging, alongside archival research into correspondence and registers, the paper charts how artefacts have moved physically and epistemically from farm fields to museum drawers, embedding them within layered social and institutional frameworks. By reframing dormant collections as relational and historically contingent assemblages, the paper positions them not as static archives but as active archives of intellectual history, social relations, and curatorial judgement. It demonstrates how dormant holdings can be mobilised as methodological and theoretical laboratories for rethinking interpretive authority, institutional responsibility, and the futures of archaeological stewardship.

28 ARCHAEOLOGY AS PERFORMANCE: EXCAVATING, DISPLAYING, AND REIMAGINING THE PAST

Theme: 1. Widening perspectives in material culture studies
Organisers: Claudia Pizzinato (University of Cà Foscari - Venice | Associazione Nazionale Archeologi) – Roberto Zancan (HEAD-Geneve HES-SO) – Raffaella Bortolin (Associazione Nazionale Archeologi)
Keywords: experience, Performance, Displaying, Reimagining, excavation site, narrative
Format: Regular session
Affiliation: Public Archaeology Community

SESSION ABSTRACT

Historically regarded as a discipline of collection, documentation, and interpretation, archaeology has increasingly embraced the embodied, spatial, and dramaturgical dimensions of its practice. Since the 1990s, performance archaeology has challenged traditional paradigms by conceiving the excavation site not merely as a source of data, but as a temporal and material stage where knowledge, presence, and representation intersect. This session explores how performative approaches to archaeology open new spaces for reflection and experimentation, renewing our relationship with existing structures, heritage sites, and historical objects. By engaging with immersive devices, situated narratives, in situ activation protocols, and contemporary technologies of capture and representation—such as moving images, sound, and 3D modeling—these practices transform excavation into a form of spatial storytelling and embodied knowledge. Stratigraphy, tools, and site protocols become scenographic elements that communicate research in real time, revealing the excavation as a performance that speaks as much to the present as to the past. The session aims to examine this performative turn in archaeological practice, foregrounding the convergence of excavation, scenography, and spatial design. It will interrogate key questions: How does a site become a space for narratives? How does an artifact acquire agency within contemporary debates? Which voices, memories, and experiences are excluded, and how might they be rendered tangible? We invite contributions that engage with these themes and propose innovative approaches to archaeology as an embodied, critical, and experimental field—one capable of reimagining memory, materiality, and narrative through performative methods and creative research.

CONTRIBUTION ABSTRACTS

675. Too Boring to Be Wrong: How Archaeological Exhibitions Perform Credibility

Authors: Ana Solter (Archaeologica museum in Zagreb)
Format: Oral

Archaeology is increasingly discussed as a performative discipline shaped by public visibility, narrative expectations, and design-driven communication. Yet archaeological exhibitions frequently stand in stark contrast to this trend. Many displays remain visually austere, densely textual, weakly contextualised, oriented primarily toward professional or specialist audiences, and deliberately indifferent to contemporary exhibition design standards. Despite growing expectations of accessibility and visitor-centred mediation, such exhibitions persist — and continue to be perceived as credible and authoritative within the discipline. This paper argues that the perceived "ugliness" of archaeological exhibitions is not a failure of communication but a productive form of disciplinary restraint. Drawing on examples of exhibitions characterised by minimal design, dense typological presentation, and limited mediation, the contribution explores how aesthetic restraint functions as a signal of seriousness, authenticity, and scientific credibility. For certain audiences, these qualities generate trust and authority precisely because they resist entertainment, emotionalisation, and spectacle. Rather than positioning restraint and performance as opposites, the paper examines restraint itself as a performative strategy through which archaeological authority is constructed and maintained. By analysing why restrained and "unattractive" exhibitions continue to work — and in some cases actively appeal — this contribution highlights a central paradox of contemporary archaeology: while public engagement is increasingly demanded, professional legitimacy often remains grounded in practices of exclusion and controlled accessibility, shaping what archaeology is — and who is allowed to engage with it.

813. Graves and Tombs: Archaeological Research as Performance, Memory, and Shared Experience

Authors: Ctibor Ostrý (Department of History, Masaryk University, Brno) – Michal Vágner (Department of Archaeology and Museology, Masaryk University, Brno) – Petr Vachůt (Brno City Museum) – Zdeněk Skokan (Department of Archaeology and Museology, Masaryk University, Brno)
Format: Oral

This paper presents the documentary-research project Graves and Tombs as a case study of performative archaeology, approaching archaeological investigation not as the production of finalized knowledge about the past, but as a situated, contemporary practice in which meanings are actively constructed. Excavation and post-excavation analysis are treated as temporally unfolding and materially grounded events, made visible through documentary film and process-based storytelling. The project follows archaeological, historical, and anthropological research into high-status medieval burials and the subsequent ceremonial reburial of human remains. Rather than presenting results retrospectively, the research process is exposed in real time through situated narrative and in situ activation of sites. Excavation areas, crypt interiors, and laboratory settings function as temporal and material stages

where methodological procedures, interpretive uncertainty, expert disagreement, ethical tensions, and even failure become visible as integral parts of knowledge production. Scientific protocols and analytical tools operate as communicative elements structuring how archaeological knowledge is produced and understood. The interpretive framework is further developed through widely known historical narratives associated with Emperor Sigismund of Luxembourg and Henry of Lipé, used as shared reference points for examining disrupted memory, fragmentary evidence, limits of interpretation, and the ethics of working with human remains. Burial sites whose historical memory has been interrupted become reactivated as lieux de mémoire through acts of identification and ritual deposition, where research turns into event and place becomes a renewed memory node. Methodologically, the project combines performative archaeology, memory studies, digital imaging technologies, and moving-image representation with a participatory communication model described as "underground science," in which public screenings and debates function as epistemic infrastructures rather than mere outreach. The paper argues that such performative and media-based approaches reframe archaeology as an embodied, reflexive, and socially shared practice of knowledge-making.

5. Understanding the past through a theater performance using Virtual Reality

Authors: Selma Rizvic (University of Sarajevo, Faculty of Electrical Engineering) – Bojan Mijatovic (Sarajevo School of Science and Technology) – Jelena Andjelkovic - Grasar (Archaeological Institute Belgrade)
Format: Oral

Stecaks are the medieval monumental gravestones, typical for the Western Balkan region and protected by UNESCO. The monuments as well as their decorations for decades are obtaining the special attention of scientists and heritage experts, but somehow among the wider audience the real meaning of the symbols and their significance remain without the interest or often is used for pseudo-science speculations. Through the Creative Europe StecakLand project, the team introduced the theater audience to these symbols through a performance displaying the physical reality of the stage and the virtual reality of an imagined land where the symbols "live". This is one of the very few theater performances using VR technology and the first one that uses it as part of scenography and aiming interaction between the actors and the audience. In this presentation, the authors will elaborate on the production process, technology challenges, and deeply emotional reactions of the audience. Further, we will present the work of an interdisciplinary team of historians, archaeologists, playwrights, visual artists, set and make-up designers, VR and theater directors, music and sound designers, actors, and VR developers on creating a unique experience for the theater audience. The main value of the project is that this concept can be replicated in other case studies, connecting the historical information with public perception and reception through state-of-the-art digital technology.

205. Experimental Archaeology as Performative Mediation: From Hypothesis Testing to Museum Scenography

Authors: Adina Amăriuței – Maria-Cristina Ciobanu – Analisa Foca – Elena-Camelia Pintilie – Bogdan-Ștefan Novac (Faculty of History, "Alexandru Ioan Cuza" University of Iași) – Felix-Adrian Tencariu (Institute of Interdisciplinary Research, "Al. I. Cuza" University of Iași)
Format: Oral

This paper explores experimental archaeology as performative translation system that fluidly connects archaeological evidence, hypothesis testing, and museum display. It is argued that experiments yield two complementary outcomes: (1) systematic scientific data that validate or invalidate reconstructive hypotheses, and (2) experiential, sensory expertise – a form of material familiarity – essential for translating prehistoric technologies into credible public narratives. Drawing on the ExArIS group projects, this study demonstrates how this cycle operates. Experimental work generated not only controlled measurements (such as the thermal efficiency of single-chambered structures or the fuel-to-temperature ratio in updraught firing) but also an accumulated empirical competence (e.g. understanding how clay responds to stress in both construction and ceramics, or how thermal regimes produce specific chromatic gradients on the kiln). This sensory competence became the primary tool during the "museification" phase. This process is exemplified through two installations, both preceded by outdoor field experiments: one built in the Museum of History in Piatra Neamț, Romania (2024) and the other in the National Székely Museum in Sfântu Gheorghe (2025). In this context, we do more than reconstruct models of ancient objects and structures – we also revive patterns of behaviour, crafting immersive experiences and sensations that bring the past closer. We combined authentic materials (clay, firewood), unfinished vessels and tournettes with concealed lighting, and used pigments and textures to simulate kiln scarring – "performing" much of the ceramic chaîne opératoire for visitors. The real materials are themselves performative, lending authenticity and introducing a degree of unpredictability. Ultimately, this approach transforms the experimenter's tacit knowledge into a stage where the invisible labour, skills, and techniques of the past become tangible and comprehensible. The museum exhibit thus transitions from a sterile model to a mediated reality, bridging the gap between abstract archaeological data and the public's sensory perception of prehistory.

1655. Reviving the Past: Costume Reconstruction Shows Based on Research in Early Modern Church Crypts

Authors: Danuta Greding – Mikołaj Dobek (Nicolaus Copernicus University in Toruń)
Format: Oral

Historical costume reconstructions are today widely used as tools for visualizing the past, appearing both in the activities of historical

reenactment groups and in film and theatrical productions. In dominant public perception, such reconstructions are often regarded as faithful representations of historical reality, shaping collective imaginaries of past epochs. Archaeological research and analyses of garments uncovered in Early Modern church crypts, however, demonstrate that many established reconstruction schemes rely on simplifications or erroneous assumptions, leading to the reproduction of inadequate narratives about the past. For over a decade, archaeologists from the Nicolaus Copernicus University in Toruń have been developing an alternative practice in which costume reconstruction becomes a form of performative communication of archaeological knowledge. Costume reconstruction shows, organized on the occasion of the completion of crypt excavations, exhibition openings and conferences, take the form of performative events in which archaeologists - acting simultaneously as researchers, reconstructors, and performers - present accurate replicas of garments created based on specific archaeological finds. In this context, the researcher's body becomes a medium through which artifacts acquire contemporary presence and agency. Drawing on tools from performance studies and cultural studies, the paper analyzes costume reconstruction shows organized by researchers from Toruń as practices situated at the intersection of archaeology and performance. Using cultural analytical methods, the study examines the role of such events, their structure, and modes of reception. The analysis demonstrates how archaeologists, through these performative practices, not only transmit knowledge but also actively shape contemporary historical consciousness, revealing the performative potential of archaeological research.

1571. The Use of ICTs with regard to Novel Ways of Displaying and Reimagining the Past in Museums

Authors: Evren Sertalp – Erge Bütün – Ali Büyükkarakaya (Hacettepe University | Human Behavioral Ecology and Archaeometry Laboratory - IDEA lab)
Format: Oral

New technologies are driving rapid change and diversification in public archaeology activities. Archaeologists, particularly in collaboration with local communities for museum exhibitions, excavations, and research projects, have discovered that the use of these technologies brings unprecedented benefits to archaeological processes. Such technologies not only increase the general public's interest in cultural heritage but also strengthen support for its preservation. Concurrently with these developments, archaeological information is being disseminated in various creative ways, primarily through the use of information and communication technologies (ICTs). Utilized in public archaeology events, ICTs used in storytelling contribute to increasing audience engagement and public awareness regarding cultural heritage, as well as boosting interest in the world of archaeology. The exhibition on the ancient city of Juliopolis and its excavations, recently held at the Museum of Anatolian Civilizations (Ankara, Türkiye), exemplified these new forms of relationship well through its performative environment. Within this context, the Faces of Juliopolis exhibition, which utilizes new digital techniques, storytelling methods, and original stories, is an example of a contemporary exhibition concept. In the exhibition titled Faces of Juliopolis, reconstructions of the faces of people who lived in the ancient city, based on their remains, have been combined with new digital techniques. Using original stories based on historical narratives and various storytelling methods, a contemporary exhibition concept has been brought to life within the museum. This study discusses the use of ICTs in the context of their impact on the transmission of cultural heritage in terms of new narrative approaches, examining both the implementation details of this exhibition concept and the reflections obtained from museum visitors through interviews following their visit to the exhibition and online surveys administered one and a half months after the exhibition.

1928. Designing Immersive History: Projects, Visitors, and Experience

Authors: Küllike Tint (Tallinn City Museum)
Format: Oral

Immersive historical experiences are becoming increasingly prominent due to the growing range of technological solutions available. In contrast to monuments connected with recent history, archaeological sites often stem from distant and abstract periods, making them harder for visitors to comprehend and relate to. Nevertheless, the accumulation of thousands of years of history contributes to the site's uniqueness. Broader audiences may prefer forms of engagement that allow them to touch objects or reconstructions, listen to narrated histories, or experience the past through immersive virtual reality, potentially creating an emotional connection with the past (Kurisoo et al. 2024). In this presentation, I will discuss immersive historical experiences. I will begin by introducing some of my own visual and audio projects, developed in cooperation with performance artists for museum and archaeological/historical sites, together with observations based on visitor responses. I will then move on to my own experiences as a visitor. The aim of this presentation is to offer ideas and to spark discussion about what constitutes an immersive historical experience, whether it is fully achievable, and how much immersion a project or exhibition should include before the experience becomes overwhelming.

945. Citizen storytelling in archaeology: facilitating co-creative engagement with the past through narrativization

Authors: Sebastian Gerberg Høstrup (Aarhus University) – Laura Ahlqvist (Museum Vest)
Format: Oral

This project investigates citizen storytelling as an archaeological method: how narrative construction can surface contemporary perspectives on the past while prompting professional reflexivity about interpretation and narrativization. Building on the existing community infrastructure of DIME (Digital Metal Detecting), the project expanded the possibilities of public participation beyond data contribution by inviting citizens to become co-creators of archaeological narratives. Participants produced stories multimodally (text, audio, video and visual elements), which had to be linked to objects they had found themselves. The narratives are planned to be curated and disseminated as an open-access digital exhibition on the DIME website. Recruitment initially relied on open calls within metal detecting communities but generated limited engagement, necessitating a shift to more direct, personal outreach and facilitation. This challenge suggests persistent societal boundaries around who is perceived as authorized to narrate the past and indicates that citizen involvement in archaeological storytelling remains strongly dependent on professional encouragement and enabling structures.

534. Instant sharing in archaeological surveillance: a challenge

Authors: Claudia Pizzinato (Freelance | University of Cà Foscari-Venice)
Format: Oral

75% of archaeologists in Italy work as freelancers, and the majority of them in the field of civil excavations linked to the construction of new works, both private and public, of various kinds, aimed both at renewing the building stock and at upgrading or building from scratch infrastructures and underground utilities. Works that involve excavations very often, or almost always, entail the involvement of the freelance archaeologist; and very often from these excavations emerge materials, structures, traces of more or less ancient human activities. In Italy, finds are by law the property of the state, therefore of everyone, and they should be made accessible and visible to all, as the Faro Convention also teaches us—by some accounts already outdated (adopted in 2005, ratified by Italy in 2020, in reality never applied). But how can a construction site where excavations are underway for purposes very different from archaeological ones be made accessible? How can the local community, and not only them, be made part of the operations taking place under their balconies or in front of their front door? How can a temporary exhibition be organized that, like temporary shops, will have a very limited duration, since the execution of civil works cannot undergo overly prolonged suspensions? And how can any visit be made pleasant and understandable? How can it be publicized? The ethically responsible archaeologist knows that the true and ultimate purpose of their work is to communicate it to the public, to the whole community, to humanity. It would be wonderful to be able to show it as well, at least to those who have the good fortune, the opportunity, the interest to witness live a discovery that will add new pieces to the history of the place.

31 FORTIFICATIONS AND FRONTIER NETWORKS IN THE MEDIEVAL AEGEAN: EXPLORING DEFENSIVE STRATEGIES, CONNECTIVITY, AND REGIONAL DYNAMICS ACROSS SHIFTING BOUNDARIES AND PERIODS

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Georgia Delli (National and Kapodistrian University of Athens) – Christianna Veloudaki (University of Edinburgh)
Keywords: Fortifications, Networks, Aegean, Settlements, Medieval
Format: Regular session

SESSION ABSTRACT

From the 7th to the 13th centuries, the Aegean region experienced significant political, military, and economic shifts that reshaped its landscape. Fortifications—ranging from isolated constructions to complex networks—were constructed, adapted, or repurposed in response to changing threats, including Arab, Latin, and Turkish raids, and later Latin occupation. These fortifications were not merely isolated structures but often functioned as part of broader defensive networks, strategically positioned to control key maritime routes, mountain passes, and fertile plains. Their location reveals a deep understanding of geography, visibility, and communication. Crucially, this fortified world fundamentally altered the human settlement fabric of the region. The need for security often dictated a shift from dispersed agricultural communities to centralized, defensible settlements, impacting demographic distribution, local economies, and land-use patterns. This session will explore the multilayered role of fortifications across the Aegean frontier during this period, focusing on four interconnected themes: (a) the reasons behind their construction (e.g., coastal defence, urban protection, control of trade routes, etc.), (b) their impact on settlements patterns, (c) the formation and function of regional fortification networks, and (d) the role of visibility and spatial connectivity in enhancing defence. Special attention will be given to how visual communication formed warning systems or coordinated military responses. We also invite discussion on how technological and architectural developments influenced fortification strategies and defence patterns, and how different polities (including the Byzantines, Latins, and emerging local powers) adapted to evolving threats and frontiers. By integrating archaeological data, GIS-based landscape analysis, aerial analysis techniques, and historical sources, this panel seeks to highlight the dynamic interplay between geography, power, and defence in the medieval Aegean, emphasizing the region's role not only as a contested frontier but also as a connective space between empires, islands, and peoples.

CONTRIBUTION ABSTRACTS

1249. Steadfastness and Resilience: The Defence of Early Medieval Kalymnos

Authors: Drosos Kardulias (University of Michigan Museum of Anthropological Archaeology)
Format: Oral

The Early Medieval (7th c. AD) Aegean, though largely devastated by raiding and warfare, was home to several pockets of dogged civilian resistance. Fortifications are the clearest sign of such efforts, and the island of Kalymnos' three 7th c. kastra represent an impressive allocation of effort and expertise in a rugged landscape. These fortifications are absent from historical texts, well-designed, and unlike the centrally-planned installations in wealthier regions. I argue that the transformation from a demilitarized and scattered Late Antique population to a concentrated and militarized Early Medieval one is best understood by comparison to ethnographic literature on asymmetrical warfare. To understand the island as a martial landscape, I apply analogous logics of deterrence and battlefield preparation, both from modern and premodern examples. Finally, I will demonstrate the extensive planning and militarized logic which produced a fortified Kalymnos from an unfortified predecessor, and examine the political mechanisms used to cultivate cultures of resistance and steadfastness in the face of existential threats.

134. From Refuge to Theme: The Development of a Fortification Network on Byzantine Samos

Authors: Georgia Delli (National and Kapodistrian University of Athens)
Format: Oral

In De Thematibus, Constantine Porphyrogenitus mentions the toponym of Samos as referring to a landscape dominated by high mountains, a defining characteristic that facilitated the development of the island's fortification network following the first Arab incursions in the second half of the seventh century. Archaeological evidence from the city of Samos, together with new data derived from recent research in the Samian topography by the present author, indicates a violent disruption of the island's previously peaceful settlement pattern and the emergence of new modified one. It remains uncertain whether the establishment of Samos' fortifications resulted from initiatives of the central Byzantine administration or from local responses to external threat. The evidence suggests that the island's inhabitants systematically exploited its natural topography to organise defensive installations and safeguard agricultural production. Considered collectively, the fifteen byzantine fortified sites identified on Samos, reveal a discernible pattern within the island's defensive system, comprising fortified settlements and smaller castles integrated into a coherent network. Part of this network was further developed in the ninth century, following the establishment of Samos as a Theme, when additional fortified sites were introduced. These later additions enhanced intervisibility, communication, and the transmission of signals, while also strengthening the surveillance and protection of the island as a whole. The analysis presented here constitutes the first systematic and integrated study of this fortification network, underscoring its significance for the administrative, defensive, and economic organisation of the Theme of Samos and offering a pioneering contribution to the study of Byzantine insular defence in the Aegean.

1244. Nodes of Defence: Oria Kastro on Kythnos and the transformation of the Cycladic settlement fabric (7th–13th c.)

Authors: Christianna Veloudaki (The University of Edinburgh)
Format: Oral

From the 7th century onwards, the Cycladic landscape underwent a radical transformation as ancient coastal cities were abandoned in favour of kastra—fortified settlements usually established on remote, defensible hilltops. While traditional scholarship has framed this shift as a desperate response to Arab maritime raids after 640 AD, emerging archaeological evidence suggests a more complex, state-driven metamorphosis. Equipped with at least one fortified site, the islands became deliberate nodes within a sophisticated Byzantine defensive and economic network. As many of these sites survived well into the Latin, Ottoman, and modern periods, later interventions have often obscured their early Byzantine foundations. This paper utilises Oria Kastro on Kythnos as a critical case study to interrogate these transitional dynamics. Perched atop a remote cliff on the northwest coast, Oria has long been considered the island's medieval capital and a 7th-century foundation. However, the extant remains reflect predominantly the Latin phase, as Kythnos was among the islands incorporated into the Aegean Duchy after 1204. After falling to the Ottomans in the late 16th century, the site was abandoned, rendering it a rare "fossil" of the original form and layout of such settlements. Its walls enclose an area of 1.32 ha and include various domestic, religious, and public structures. Combining literary sources with evidence from extensive field surveys, this study analyses the site's form, structure and strategic viewshed, seeking to contextualise Oria's function within both the local and wider Aegean landscapes across different historical periods.

1658. The Fortifications of Medieval Vodonitsa: Origins and Strategic Purpose

Authors: Aikaterini Vavaliou (University of Oxford)
Format: Oral

The fortifications of medieval Vodonitsa, modern-day Mendenitsa, stand on the northern slopes of Mount Kallidromo and overlook the coastal plain of modern-day Molos, as well as the strait of Artemisium between Euboea and the Thessalian coasts. As one

of the largest medieval castles of Eastern Central Greece (ECG), also associated with prominent historical figures of the 13th-14th centuries, Vodonitsa holds a central place in the historiography of the crusader states of the Aegean world. For more than a century, secondary literature has interpreted Vodonitsa as the medieval successor of Thermopylae, i.e., the northern gatekeeper of ECG. The same literature considers Vodonitsa's fortifications to be a Frankish foundation, built in the aftermath of the Fourth Crusade, on the site of an ancient acropolis. This interpretation of Vodonitsa was constructed on historiographical grounds but does not hold up to historiographical scrutiny. Topographical, archaeological, and architectural evidence also suggest a different story. My paper will first dismantle this century-old narrative by examining the historical geography of the region and juxtaposing the political history and defensive potential of Vodonitsa with that of neighbouring fortifications. It will put forward an alternative interpretation for the site's strategic role in regional politics and warfare, which also explains the extraordinary longevity of the Latin fief that was established there in the 13th century. I will then discuss in greater detail the architectural remains of Vodonitsa's fortifications. I have identified previously unknown construction phases and established a relative chronology for them. As the construction styles and the extent of the architectural interventions indicate a much longer construction history than suggested in secondary literature, I will offer new dating proposals for each of the major construction phases. Finally, my paper will demonstrate how my findings on Mendenitsa can unlock new interpretations for less studied fortifications on the same network.

1203. Maritime Defence in the Medieval Aegean: Venetian Crete and the Control of Ships, Ports, and Coastal Space (1344-1366)

Authors: Emre Kaymakçi (Niğde Ömer Halisdemir University)
Format: Oral

This paper examines maritime defence strategies and port activities in Venetian Crete between 1344 and 1366, with particular focus on the major coastal centres of Candia, Rethymno, and Chania. Following the establishment of Venetian rule on the island in 1211, the Republic of Venice faced persistent internal and external challenges, including conflicts with the Genoese and resistance from local Cretan elites. In response, Venetian authorities invested heavily in fortifications and port infrastructures, including arsenals, to secure their largest and most strategically important colony in the Aegean. However, rising pirate threats, climatic events, and growing Turkish maritime pressure prompted a significant shift in Venetian defensive thinking during the fourteenth century. Venetian authorities began to take a particular interest in the construction and regulation of ports and fortifications in Crete. This paper argues that maritime defence in Venetian Crete was not limited to military architecture but also relied on the regulation of port spaces, the movement and anchoring of ships, and the policing of maritime activities. Drawing on archival material from the Duca di Candia (Bandi) and Senato Misti series preserved in the Venetian State Archives, it analyses decrees, proclamations, and administrative orders that governed port use, shipping practices, and coastal security. Through a comparative reading of these documents, the paper demonstrates that administrative regulation functioned as a central defensive strategy, enabling Venice to maintain its authority in Crete and integrate the island into its broader Aegean and Mediterranean networks during a period of crisis.

32 PAST HUMAN PRACTICES AND PLANT DIVERSITY: ARCHAEOBOTANICAL PERSPECTIVES ON BIODIVERSITY

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Ayelen Delgado Orellana (Institute of Archaeology, University College London) – Anna Den Hollander (Institute of Archaeology, University College London | Museum of London Archaeology) – Yu-Chun Kan (Institute of Archaeology, University College London) – Antonio Peralta Gomez (Instituto de Historia, CSIC CCHS, Madrid)
Discussant: Meriel McClatchie (University College Dublin)
Keywords: Archaeobotany, Paleoethnobotany, Anthropic landscapes, Biodiversity, Cultural diversity
Format: Regular session

SESSION ABSTRACT

Climate change, global industrialisation and the development of capitalist economy, are driving species extinctions at historically unprecedented and accelerating rates. This rapid loss of biodiversity has been primarily addressed within the earth and environmental sciences. However, in the global context of the climate crisis, anthropological and archaeological data have revealed that many of today's most biodiverse ecosystems are not solely natural but shaped by centuries of human, particularly Indigenous, management. Human activity influences all current biodiversity hotspots, with anthropogenic pressures such as habitat loss, pollution, and resource extraction accelerating species decline. Yet, not all human impacts are destructive: interdisciplinary approaches increasingly highlight the critical role of long-standing indigenous stewardship and traditional ecological knowledge in restoration and conservation efforts. Biodiversity is thus inseparable from diverse cultural practices, both now and in the past. Archaeobotany presents a unique opportunity to understand these relationships between past social practices and diversity of plant uses. Unlike broader paleoenvironmental approaches, archaeobotanical data offers a more precise and temporarily bounded dataset, directly tied to specific social groups and their surrounding landscape. As such, archaeobotanical datasets can reveal detailed information about past environmental conditions, species distribution, and past human-plant interactions. Integrating different lines of archaeobotanical evidence allows for a long-term temporal perspective on key topics such as shifts in the structure of plant communities, the introduction and adoption of allochthonous species, the replacement of cultivated plants, and the possible extinction of certain

varieties. These ecological changes directly impact food availability, dietary practices, and the spatial dynamics of resource procurement. These factors can drive resilience strategies or, conversely, lead to the abandonment of territories. We welcome a variety of topics, not limited to: landscape management, indigenous practices, stewardship, food practices, and (agri)cultural diversity. We appreciate contributions from different archaeobotanical methodologies (anthracology, pollen, and phytoliths), as well as ethnoarchaeological aproaches.

CONTRIBUTION ABSTRACTS

1700. Fuelwood collection practices in shifting environments: The case of Late Upper Palaeolithic in NE Iberian Peninsula

Authors: Tomás Fernández Iriarte (UIB | Iphes) – Ethel Allué (Iphes) – Llorenç Gelabert (UIB) – Bàrbara Mas (CEPAM)
Format: Oral

The Late Palaeolithic occurred during an environmental context characterised by a progressive increase in temperatures since the last glacial maximum (ca 19 Kyrs). This resulted in a change in the landscape that involved the expansion of forests in areas that were previously characterized by open steppes. The diversity and type of plant species also changed, with deciduous species gaining ground (or "being expansive in their proportion"). These expansions were sometimes facilitated by the preservation of species in climate refuges specially in the Mediterranean Peninsulas. The anthracological study of archaeological sites allows us to characterize the vegetation landscape immediate to the areas occupied by humans. In this work, we will compare the anthracological record of sites from different ecological zones in the northeast of the Iberian Peninsula in the period between 15 Kyrs and 11500 Kyrs BP. The analysis of anthracological data contained in the database created by the PALFUEL project allows comparing sites and biogeographical regions, answering questions related to fuel management and species diversity both within the sites (intra-site) and between sites (inter-site). These questions inquire about the variability in anthracological assemblages in contexts of higher and lesser diversity, the human-environment relationship and what this can tell us about fuelwood gathering practices. Furthermore, this anthracological dataset allows to discuss the relationship between the increase of biodiversity in certain ecological context and energy practices among Late Upper Palaeolithic hunter-gatherer groups.

644. Enhanced biodiversity in a human shaped environment: The Late Neolithic pile dwelling sites in Salzkammergut (Austria)

Authors: Thorsten Jakobitsch (Austrian Archaeological Institute, Austrian Academy of Sciences)
Format: Oral

Pile dwelling sites are well known for their excellent preservation of organic materials in the archaeological sediments due to waterlogged conditions. They offer a wealth of insights into the daily life of the inhabitants, their food, agricultural practices, domestic animals, and the diversity of plants and their habitats around the settlements. Recent investigations of some pile dwelling sites in Austria's Salzkammergut at the lakes Mondsee and Attersee have shown, that humans had transformed the landscape into a mosaic of habitats, ranging from dense and damp forests, to modified open forests and hedges, lakeshore vegetation, semi-natural grasslands, and agricultural land. Especially animal husbandry activities, such as fodder harvest and forest-grazing, created open landscapes and provided a habitat for species, which otherwise would not thrive in this area. In addition, bringing crops into formerly non-agrarian regions introduced species which co-lived on the fields of cultivation with the crops. With the example of different plant species found in the macroremain assemblage of three Late Neolithic sites, the study will demonstrate how diverse the flora has been due to human intervention.

1310. Biodiversity as Practice: Harvesting and Crop Processing in Eneolithic (4th millennium BC) loess area of the Rzeszów Foothills (SE Poland)

Authors: Dariusz Król (Rzeszów University, Institute of Archaeology) – Agata Sady-Bugajska (Agata Sady-Bugajska Botanical Analysis Laboratory) – Iwona Sobkowiak-Tabaka – Alicja Kruszewska (Adam Mickiewicz University, Faculty of Archaeology) – Aleksandra Sznajdrowska-Pondel (Aleksandra Sznajdrowska-Pondel Archaeological Services)
Format: Oral

The paper presents observations from three Eneolithic Funnel Beaker culture settlements located in the Rzeszów Foothills (SE Poland): Orły, Hnatkowice, and Skołoszów. The study combines archaeobotanical evidence, plant impressions preserved in daub and use-wear observations on flint tools. We examine everyday practices related to crop cultivation and how these activities influenced the plant remains found at the sites. Radiocarbon evidence places all three settlements within the horizon of c. 3600–3300 BC. At all sites, hulled wheats - emmer (Triticum dicoccon) and einkorn (Triticum monococcum) - dominate the assemblages, accompanied by a small set of arable weeds such as Fallopia convolvulus and Chenopodium spp. Impressions in daub consist mainly of spikelet forks and glumes, while fragments of straw are less frequent. The prevalence of ear elements over straw suggests that the organic temper added to clay came mostly from the upper parts of threshed wheats. This raises a question about harvesting practices: were cereals cut just below the ear, with straw collected separately for other purposes? Use-wear traces on flint artefacts and phytolith analysis indicate cutting of plant materials and confirm that harvesting formed part of routine activities. The evidence does not permit a direct statement on cutting height or field organization, yet it provides insight into post-harvest routines shared

across the region. GIS-based assessment of terrain and soils is used to outline possible locations of cultivation plots around the settlements. The archaeological context, the structure of processing waste and the character of tools suggest that agrobiodiversity resulted from practical choices made during reaping and crop processing. The analyzed sites show that Eneolithic agrobiodiversity developed through everyday decisions, technical habits and the organization of space around settlements, allowing consideration of possible cultivation zones in the local landscape.

645. Adapting to Change: Archaeobotanical Evidence on Plant Use and Subsistence Strategies during the Early Bronze Age in Upper Thrace

Authors: Hanna Aleksandrova (National Archaeological Institute with Museum, Bulgarian Academy of Sciences)
Format: Oral

This study provides a synthesis of plant subsistence strategies in Upper Thrace during the Early Bronze Age, based on archaeobotanical data from key archaeological sites in the region. The materials derive predominantly from well-defined stratigraphic contexts, including storage facilities, hearths, construction elements, etc. This dataset enables an assessment of plant biodiversity, subsistence practices, and the organisation of plant-based economies within a key prehistoric landscape during a period of socio-cultural transformations and climatic change. The evidence indicates that Early Bronze Age communities employed flexible strategies integrating the cultivation of cereals and pulses with the exploitation of wild plant resources. Hulled wheats - einkorn and emmer - and barley constituted the principal staple crops, supplemented by pulses such as lentil and bitter vetch. From the later phases of the Early Bronze Age, the increasing presence of millet and free-threshing wheats reflects gradual diversification. Weed assemblages, comprising approximately fifty taxa, provide insights into cultivation intensity, land management, and soil utilisation, while chaff and straw in construction materials indicate systematic use of agricultural by-products. Plant remains bearing traces of technological processing were analysed to reconstruct food preparation. Scanning electron microscopy (SEM) revealed features associated with grinding, crushing, and the preparation of cereal-based foods, possibly including flatbread-like products, supporting the reconstruction of chaîne opératoire – from harvest to the final product. Wood charcoal analysis complements these data, reconstructing local vegetation and woodland management, and indicating a mosaic landscape of deciduous forests, riparian zones, and open agricultural areas. Selective use of wood taxa reflects strategic choices for fuel, construction, and technical purposes. Evidence for wild plant gathering emphasizes the economic and cultural dimensions of plant exploitation. This integrated archaeobotanical and interdisciplinary approach provides a comprehensive framework for understanding biodiversity, plant use and subsistence organisation in Early Bronze Age Upper Thrace.

2186. Exploring diversity and specialization in Neolithic and Early Bronze Age Dikili Tash through charred plant remains

Authors: Evangelia Brachou – Soultana-Maria Valamoti (School of History and Archaeology, Aristotle University of Thessaloniki | LIRA, School of History and Archaeology, Aristotle University of Thessaloniki | PlantCult Laboratory, CIRI, Aristotle University of Thessaloniki)
Format: Oral

Dikili Tash is a prehistoric settlement in eastern Macedonia in northern Greece. It is a mound that rises up to 15 meters above the current ground surface. Prehistoric occupation at the site is attested from the Early Neolithic up to the Late Bronze Age. The archaeobotanical work conducted over the past decades has revealed numerous plant remains, providing valuable insights into the daily life of the prehistoric inhabitants, particularly during the Neolithic period. This paper aims to enrich the archaeobotanical knowledge gathered so far, focusing on continuity and change as regards the range of field crops and associated weed floras as well as the use of fruit crops and wild plants during the Neolithic and the Early Bronze Age at the site of Dikili Tash. We compare the archaeobotanical assemblages from a neolithic house and four Early Bronze Age pits and explore aspects of biodiversity changes as regards plant food choices and vegetation management though cultivation and wild plant food procurement. The evidence from Dikili Tash is discussed within the wider context of crop choices and vegetation management, based on published archaeobotanical evidence.

905. CORNUS SANGUINEA: Archaeobotanical discovery that reveals new insights both from the past and for the future

Authors: Tjaša Tolar (ZRC SAZU, Institute of Archaeology)
Format: Oral

Although Neolithic communities rely extensively on wild plant resources, the use of wild plants remains poorly understood in archaeobotanical research. In particular, non-edible and potentially toxic wild fruits are rarely discussed, as their archaeological traces are difficult to identify and seldom preserved. It is reasonable to assume that the remains of such plants may often been discarded outside settlement areas – locations that are rarely archaeologically investigated – rather than within the cultural layers. Off-site sampling is therefore important. Nevertheless, it is certain that prehistoric communities skillfully exploited natural resources for different purposes, and that many substances used in modern chemistry and pharmacy are ultimately derived from plant-based knowledge with the origins in the distant prehistory. This study presents exceptional evidence from the Late Neolithic pile-dwelling site of Strojanova voda in Slovenia, where ca. 6,000-year-old processed remains of fruit stones of Cornus sanguinea (red dogwood) were recovered. These finds provide clear proof of the intentional use of a nutritionally insignificant wild fruit and suggest that its

importance in prehistory (and history) has been substantially underestimated. Comparable remains have been sporadically identified at other European sites, but their rarity has so far prevented broader scholarly interest. By integrating archaeobotanical data with experimental archaeology, ethnobotanical parallels, and chemical analyses, we demonstrate that C. sanguinea fruits were once far more valued than previously assumed. The Strojanova voda assemblage offers rare insight into complex non-dietary plant use in prehistory and highlights the need for a broader research framework. We aim to identify similar case study evidences elsewhere in Europe and to initiate a large-scale ERC project on wild fruit use in prehistory. Such a project idea may also contribute to future sustainable practices, such as the green transition and the reduction of carbon emissions, what is also well aligned with Horizon Europe priorities.

226. Comparison and validation of analysis methodologies in the detection of forest management and arboriculture practices for archaeobotanical study

Authors: Eva Maria López Castillo (Universitat Autònoma de Barcelona) – Oriol López Bultó (Museu d'Arqueologia de Catalunya) – Pere Castanyer Masoliver (Grup de Recerca Arqueològica del Pla de l'Estany) – Raquel Piqué Huerta (Universitat Autònoma de Barcelona)
Format: Oral

The aim of the research is to study the forest management and arboriculture practices in the north-east of the Iberian Peninsula during the Roman and Late Antiquity periods by analysing carbonised wooden archaeological remains from two settlements: Vilauba (Camós, Girona) and Can Ring (Besalú, Girona). The Roman agricultural uilla of Vilauba dates from the 2nd century BC to the 7th century AD and presents carbonised and organic archaeobotanical material inside one well and other archaeological contexts. The Roman uilla of Can Ring was occupied from the 1st to 3rd centuries BC and has only yielded charcoal remains. The methods used to determine the arboriculture practices varied according to the typology of the woody remains. In the case of wet material, we applied the Roundwood method (Out et al., 2013, 2018, 2020, 2023). For the carbonized remains we used the Eco-anatomical method (Limier et al., 2018; Terral et al., 1996, 1999, 2006). These methods, tested and validated by other researchers and other tree species, will be applied to a group that has never been tested before, the Prunaceae. To this end, a reference collection of both managed and unmanaged modern and initial tests was being carried out on modern fruit trees, such as Prunus avium/cerasus, Prunus domestica/spinosa and Prunus persica/armeniaca/amigdalus/dulcis. First standardisation over those species is being carried out in order to obtain the necessary reference to compare both archaeological and modern remains and infer which typology of practices had been applied on them, such as irrigation and pruning/coppicing activities. Thus, we contribute to the knowledge about what would have been the relationships between fruit-bearing trees and local communities, in this case, as allochthonous species introduced in the territory but also what the wild and natural resources were exploited, taking advantage of new arboriculture techniques and biodiversity.

1808. Shaping medieval agriculture: Biodiversity and Crop Introductions in Al-Andalus

Authors: Antonio Peralta-Gómez (Instituto de Historia, CSIC | University of Granada) – Leonor Peña-Chocarro – Carlos López De Calle Cámara (Instituto de Historia, CSIC)
Format: Oral

This paper examines the impact of human practices on plant diversity in Al-Andalus, the region of the Iberian Peninsula under Muslim rule from 711 CE, through an integrated archaeobotanical perspective. Drawing on plant remains recovered from both urban centers and rural settlements, the study highlights how the introduction of new species from the 8th century onward, coupled with innovative agricultural techniques, irrigation systems, and cultivation methods, profoundly reshaped local foodways, economies, and landscapes. Archaeobotanical evidence, reveals the adoption of a diverse array of crops that transformed diets, farming strategies, and market networks. By documenting both cultivated and wild plant species, the research underscores the remarkable botanical diversity present in Al-Andalus and illustrates the complex ways in which human agency and ecological conditions interacted to produce multifaceted agro-ecological systems. Ultimately, this study illuminates the dynamic interplay between human communities, environmental management, and plant diversity, offering nuanced insights into how cultural practices, technological innovations, and ecological factors collectively shaped the social and natural landscapes of medieval Iberia.

1884. The archaeobotanical record of woody plants in Southern Chile: archaeology and biodiversity in the temperate forest of South America

Authors: Ayelen Delgado Orellana (Institute of Archaeology, University College London)
Format: Oral

The temperate forests of South America, globally known for its biodiversity, host a significant percentage of endemic woody plants. Since as early as the Pleistocene-Holocene Transition, human groups consumed the forest woody species not only as food but also for their medicinal properties. Although most of the traditional forest knowledge comes mainly from the ethnographic and ethnobotany studies among indigenous Mapuche people (19th century onwards), today forest resources are still collected, traded, and consumed in broader scales than just local communities. This paper discusses published and original archaeobotanical data from Southern Chile (36°-42°S), area considered marginal in relation to the pre-Hispanic domestication processes of the Americas implying that for most of the Holocene humans depended on wild resources. Trought the comparison of wood charcoal and charred seed

analysis, the paper aims to first, offer a complementary view of the native woody species and the potential use in the past as food, fuel, medicine, and others. And second, discuss until what extend the archaeobotanical data can inform of the biodiversity of woody species in the past. As interpretative framework, this paper is critical in relation to the simplistic environmental views that still describe the temperate forests as pristine landscapes. On the contrary, based on the ethnographic and ecological studies, the data will be discussing understanding that there is a link between indigenous environmental management and biodiversity enhancement. Due to the rapid habitat fragmentation, wildfires and loss of native forest coverage observed in the last decades in Southern Chile, the paper also offers a novel approach to current bigger environmental and conservation issues.

1511. 'Forgotten seeds' under the Colonial Ground: archaeobotanical evidence, long-term indigenous knowledge, and biodiversity in Taiwan

Authors: Yu-Chun Kan (Institute of Archaeology, University College London)
Format: Oral

In academic literature and school textbooks, significant agricultural breakthroughs in Taiwan are often linked to foreign colonial powers while indigenous farming practices, if not entirely overlooked, were portrayed as 'simple' and 'static' since the early Neolithic. Historical sources emphasized that multiple kinds of cereal, fruits, and agrarian regimes were introduced by Dutch and Han Chinese immigrants. Not to mention the Japanese breeding entrepreneur of Penglai rice (or Hōrai rice) by Iso Eikichi, the renowned 'father of Taiwanese rice farming', was deemed as innovative, with far-reaching legacies. Contrary to the banal picture of prehistory, the latest evidence from archaeology, ethnobotany and plant DNA analysis implied a more complex and dynamic human-plant relationship. More than clinging to the original agricultural 'package' carried by early Austronesian settlers, people have long been engaged with new varieties of crops and horticultural technologies for thousands of years. While cultivars like Djulis (Chenopodium formosanum) or Taiwan oil millet (Spodiopogon formosanus) may have been products of local secondary domestication, diverse landraces of rice (Oryza Sativa), finger millets (eleusine coracana) and pigeon peas (Cajanus cajan) were probably derived from long-term inter-island encounters. Many of these important aboriginal grains had long been obliterated from public memories, and the indigenous practice and its contribution to biodiversity are overlooked. Here by providing a systematic review of recent archaeobotanical results, some of the 'forgotten crops' in prehistory will be addressed, challenging the colonial discourses of farming history in Taiwan and shedding light on indigenous knowledge of maintaining biodiversity.

476. People and Changing landscapes: Palynological and Archaeological Analysis of Landscape Change in the Scottish Highlands, 1250 AD-present

Authors: Phil Gould (University of Stirling)
Format: Oral

This project investigates the cultural, ecological and social effects of the 'Little Ice Age' in the Northwest Highlands in Scotland. Land managers are making decisions around the future management plans for northern Scotland, with the aim of increasing the resilience of areas of conservation value, increasing biodiversity, supporting rural economies and cultural heritage retention. Intergenerational/indigenous knowledge and relationships to landscape have been historically undervalued in these landscapes; and the ecological legacy of the Improvements and the Clearances are under investigated. Palynological and archaeological investigations of landscapes can reveal detailed information of past adaptation, change, and resilience to climate pressures. This will explore how Scottish 'wilderness' has been fundamentally altered by capitalism and industrialisation over the past 500 years. The methods proposed include: generating new high-resolution vegetation change (pollen records) in poorly researched areas; analysis of new and existing pollen records to assess community continuity and threshold response to climatic and social change; evaluate the archaeological and historical records of the landscape to assess how relationships to landscape have changed; suggesting baselines and potential for increasing biodiversity; and highlight challenging legacies of places connected to the cultural and ecological impact of the Clearances. By taking an interdisciplinary approach, this project aims to present localised frameworks for conservation and management of landscape, integrating cultural knowledge and pasts with future landscape management to the benefit of local communities, supporting intention to increase biodiversity by presenting past landscapes to imagine future potential, and furthering deep place knowledge, place attachment and sense of belonging in the landscape.

1379. Etnoarchaeology of fuels: Observing short-term transformations in changing environments throughout Traditional Ecological Knowledge

Authors: Ethel Allué (IPHES) – Llorenç Picornell Gelabert – Tomas Fernadez Iriarte – Nina Laming Lopez (UIB) – Aitor Burguet Coca – Isabel Exposito (IPHES) – Narmada Hansani (University of Peradeniya) – Canisius Kayombo (Tengeru Insitute of Community Development) – Mhoza Felix (Forestry Training Institute) – Rmm Chandraratne (University of Peradeniya)
Format: Oral

Ethnoarchaeological approaches to the study of fuel have been developed for a few decades. Specific studies on contexts from different areas and different cultural traditions have provided data on fuel gathering and management practices (see Picornell-Gelabert 2020). These studies and other ethnographic sources suggest that women oversee these activities and that fuel and energy consumption in domestic contexts constitutes an important social activity. In this presentation we are sharing the methodological approach

for ethnoarchaeology of fuels in two different groups, the Maasai in Tanzania and the Vedda in Sri Lanka. The Maasai from the Longido district in northern Tanzania are pastoralists groups living in an open savannah with important environmental challenges due to drought; challenges that include the eventual need of longer trips to collect firewood. The Vedda community, former hunter-gatherers' group in Sri Lanka, currently live as settled agriculturalists with available wood in the tropical rainforest. For the past two years we have been carrying out semi-directed interviews design to questioning Maasai and Vedda women about fuel and energy practices. The semi-directed interviews include a range of questions that gather to get as much information as possible regarding the past, present and future of these practices among each community. The voices of these women are recorded in phone devices enable to revise their explanations and preserve their knowledge. Although these communities have gone through important sociocultural and economic changes and been affected by climate changes, firewood-related practices seem to be steady through time. This fact allows us to use this information to question the theoretical and methodological approaches to past practices to reach an informative and critical archaeological approach to energy issues. Picornell-Gelabert, L. (2020). Journal of Archaeological Science: Reports, 34, 102591.

1531. Archaeomycology: An Exploration of Mushrooms in Palaeodiet

Authors: Jenna Deep (University of Oxford)
Format: Oral

I aim to explore the role of fungi in archaeological human diets. Foraged goods have been overlooked in favor of domesticates and agricultural transitions, which has led to a major mycological gap in human dietary research. Ignoring the potential role of fungi obscures the importance of non-domesticates in subsistence. Though research has been done on fungi in pig diets, human consumption of edible mushrooms has not been addressed. To investigate the potential importance of fungi in ancient human diets, I use legacy data from prehistoric British sites like Must Farm and Star Carr. While these sites are temporally and spatially different, there is underexplored evidence at both sites which suggest human preparation of fungi. The mushrooms at these sites have been charred and waterlogged, leading to their excellent preservation. However, such conditions are rare, and I advocate for alternative methods to exploring fungi archaeologically. While spores are frequently found in pollen samples, they are not treated as subsistence, but rather as environmental proxies. Though identifying what mushrooms may have been around a site is useful, it is not necessarily evidence that they were being consumed. Lipid residue analysis may provide an avenue by which archaeological fungi can be better identified and understood. According to mycological and archaeological studies mushrooms may also be visible isotopically. I intend to explore the potentials and pitfalls of these methods of identification while positing the roles fungi may have played in past societies. To best explore these ideas, a social lens must be applied to food. This encompasses concepts of taste, knowledge, taboo, preference, incorporation, and identity. While mushrooms may be a complicated and thus far poorly understood subsistence item, careful study, creative new methods, and an emphasis on the social meanings imbued in food will enable more holistic studies of past subsistence practices.

1256. Wild plant resources at Early Neolithic sites in Southern and South-Eastern Poland: Archaeobotanical evidence

Authors: Magda Kapcia – Gabriela Juźwińska (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) – Maria Lityńska-Zając (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Kraków) – Magdalena Moskal Del-Hoyo (W. Szafer Institute of Botany, Polish Academy of Sciences, Kraków) – Paweł Jarosz – Anita Szczepanek (Institute of Archaeology and Ethnology, Polish Academy of Sciences, Kraków) – Kamila Peschel (Atia-archeologia prace archeologiczne) – Wojciech Tabaszewski (Independent researcher) – Maciej Dębiec (Institute of Archaeology, University of Rzeszów)
Format: Poster

Even after the advent of animal husbandry and agriculture, strategies such as foraging for wild plants remained reliable methods of food sourcing. The exploitation of wild plant resources complemented cultivated crops and provided dietary diversity, as well as materials for everyday economic practices. Evidence for these activities is primarily derived from archaeobotanical analyses of plant macro-remains recovered from settlement contexts. This study presents the results of archaeobotanical research from four Early Neolithic sites in southern and south-eastern Poland: Łańcut site 3, Zwięczyca site 3, Morawica site 18, and Kraków-Chełm site 2, associated with the Linear Pottery Culture (LBK). The identified taxa are interpreted as evidence for the exploitation of wild plant resources from various habitats such as arable fields, grasslands, ruderal and woodland environments. In addition, the assemblages provide indirect information on the vegetation and landscape surrounding LBK settlements. The archaeobotanical data on wild plants and fruits show a regular presence of Chenopodium album (white goosefoot), Fallopia convolvulus (black bindweed), and Bromus sp. (brome grass). Additionally, remains of Corylus avellana (common hazel) were identified, a species of economic significance to prehistoric communities. Seeds of goosefoot, including white goosefoot, are traditionally regarded as edible, similarly to black bindweed. The gathering of wild plants was crucial for food diversity during the Neolithic, as evidenced by finds from Early Neolithic sites. However, wild plants were also likely used for different purposes; for example, Phleum pratense (timothy grass), a perennial species with rigid culms, was well suited for use after drying, for example, as animal bedding or insulation material. This research was funded by two grants from the National Science Centre, Poland (grant nos. 2024/53/N/HS3/03915 and 2025/57/N/HS3/04567).

1392. Between the desert and the sea: plant management in the Bronze Age site of Umm an-Nar Island, Abu Dhabi (UAE)

Authors: Filipe Vaz (Department of Culture and Tourism - Abu Dhabi) – Lucas Proctor (Dartmouth College)
Format: Poster

The site of Umm an-Nar island (Abu Dhabi, UAE) is one of the largest and most significant Bronze Age archaeological sites identified along the shores of the Arabian Gulf. The typical Umm an-Nar period tombs and the adjacent settlement excavated revealed evidence of trading networks that connected Arabia, Bahrain, Mesopotamia, Baluchistan, and the Indus Valley. Following excavations conducted between 1959 and 1965 by a Danish team and between 1970 and 1975 by an Iraqi team, the Department of Culture and Tourism Abu Dhabi (DCT) initiated a new four-year excavation program (2021-2023), primarily focused on the Early Bronze Age settlement, its detailed stratigraphy and nature of habitation. During this new project, over 100 sediment samples were recovered from targeted contexts for archaeobotanical analysis, marking the first systematic study of its kind conducted at this important site. This presentation will explore the results of archaeobotanical analysis, focusing on the management and use of local and regional wood resources in domestic and functional contexts and structures. This is particularly relevant in an area with extremely scarce sources of firewood and other combustible plant materials, allowing us a rare glimpse into past biodiversity in the coastal areas of the Gulf of Arabia. Despite the limitations in preservation, the carpological remains identified will also shed light on the food consumption habits of these communities.

33 TRAVELLING GODS AND HEROES: RESONANT PATHWAYS IN THE ANCIENT WORLD

Theme: 1. Widening perspectives in material culture studies
Organisers: Ioannis Nikou Filaretos – Paraskevi Motsiou (National and Kapodistrian University of Athens) – Adrien Delahaye (Université de Montpellier Paul-Valéry)
Keywords: ancient religion and ritual, ancient mythistory, gods and heroes, cultural mobility and interaction, cross-cultural studies, material culture
Format: Regular session

SESSION ABSTRACT

Over the long course of archaeologically recorded human mythistory, travel has been a universal key-element of interaction and association of groups and individuals within and between cultures worldwide through the ages. The vast array of literature and rich excavation material on the topic is clear evidence that, alongside mere mortals, various powerful gods and illustrious heroes have constantly been portrayed, among others, as great adventurers and masterly travellers in 'real' or 'symbolic' journeys of utmost importance in the ancient world on a local, (inter)regional, or global scale; by land, sea or air, through space and time, across cultures, realms and dimensions. Either as inspirers and orchestrators of unprecedented missions and trials or being themselves the actual advocates and protagonists of legendary voyages and quests, travelling gods and heroes in myth and folklore emerge as dominant figures who navigated, traversed, and transcended earthly and cosmic realities by every possible means of conveyance, to fulfill a personal task, for private gain or for the common good. Eventually consolidated as patrons of merchants, sailors, heralds, pilgrims, commuters, passengers, wanderers, thieves, pirates, as protectors of roads and borders, guides over a specified route or terrain, crossers of boundaries, liminal entities who presided over thresholds, gates or doorways in the mundane sphere and the Beyond, as divine messengers and transporters, or as hyper-explorers and pathfinders, expedition leaders, conquerors or defenders, pioneers of progress and enlightenment, they were envisioned as civilizers, founders of cities and institutions, liaisons between men and gods, who radically influenced the evolution of humanity in meaningful ways. This session assesses the nature, role, and impact of divine/heroic travellers on cultural activity, their intellectual and emotional resonance in antiquity and today, discusses possible cross-cultural affinities, and highlights their value to understanding the past, challenging the present, and shaping the future of human societies.

CONTRIBUTION ABSTRACTS

80. From Hellenistic Figure to East Asian Efficacy: Why Certain Greek Deities "Traveled" into 5th-6th Century China

Authors: Mengyi Li (Ludwig-Maximilians-Universität München)
Format: Oral

This presentation examines the selective reception of Greek gods and heroes in East Asia, focusing on 5th-century visual culture in northwestern China, an early phase of Eurasian cross-cultural exchange in material and artistic forms. While scholarship has long emphasized the "Hellenistic" features of Buddhist imagery (e.g., drapery, naturalism, and figural types) transmitted through Gandhāra and the Serindian corridor, less attention has been paid to which mythic figures were adopted, why they were preferred, and how they were re-coded within local religious and funerary regimes. Drawing on a corpus of Dunhuang murals (early phases), funerary goods and tomb imagery from northwest China, and comparable Central Asian visual templates, I argue that the appearance

of Greek-derived figures (e.g., Heracles-type protectors, winged Victory/Nike motifs, Erotes-like attendants, Dionysus, and solar/astral personifications in some contexts) reflects not a diffuse "Hellenization," but a mechanism of iconographic filtering. This filtering operated through (1) transmission bottlenecks (workshop repertoires, portable objects, and merchant-mediated models), (2) functional compatibility (apotropaic protection, auspicious victory, escort/attendant roles, and astral order), and (3) semantic docking with indigenous categories (guardians, martial protectors, immortality/afterlife aspirations, and star cults). By tracing how these figures were visually stabilized, selectively replicated, and ultimately transformed into efficacious images within Buddhist and mortuary settings, the paper proposes a resonance-based model for "travelling gods and heroes": imported divinities endured when their forms could be mapped onto local ritual needs and cosmologies, producing new hybrid agents of protection and transcendence in early middle ages East Asian art.

1665. The Depiction of Dionysus in Indian Art: A Syncretism of Mediterranean and Indian Arts

Authors: Sujit Yadav (Banaras Hindu University)
Format: Oral

The Greek god Dionysus is known for his associations with wine, ecstasy, fertility and theater. He occupies a fascinating image in the Indian art, primarily through Greco-Buddhist syncretism. This fusion emerged with Alexander the Great's conquests in Asia which introduced Hellenistic elements in the northwestern parts of the Indian subcontinent. The depiction of Dionysus in Indian art is most evident in the Gandharan school of art which flourished under Kushan rule. Greek gods were reimagined in Buddhist contexts, blending iconography to create hybrid figures. Dionysus appears as a standalone deity and was also integrated into friezes and reliefs that adorn stupas and monasteries. Panels from Gandhara show Dionysian processions featuring the god riding a panther or chariot. Syncretism extends to potential identifications with Indian deities. Some scholars link Dionysus to Hindu God Shiva, due to shared attributes like ecstatic dance, association with mountains. In Buddhist reliefs, Dionysian elements shows didactic purposes, the god's journey paralleled the Buddha's path to enlightenment, where wine symbolizing the nectar of wisdom. Dionysian depictions captivate with their dynamic compositions. One iconic Gandharan panel shows a bearded, ivy-crowned figure harvesting grapes, evoking Dionysus's viticultural legacy. Another relief captures the triumphal procession, with elephants and satyrs blending Greek realism with Indianization. The portrayal of Dionysus in Indian art exemplifies the profound Hellenistic impact on Indian aesthetics, a cross-cultural narrative of conquest, fertility and spiritual revelry. This legacy endures as a testament to ancient globalization where a Greek god found new life in Buddhist stone.

254. Resonant Pathways of the Dharma: Excavating the Buddha and Travelling Hero-Gods

Authors: Lidu Yi (Florida International University)
Format: Oral

In recent years, new archaeological discoveries have continued to reshape our understanding of early Chinese Buddhist art. Each unearthed object brings with it fresh evidence that challenges long-held assumptions and invites us to rethink established art-historical and archaeological frameworks. This paper focuses on one such discovery—a newly excavated Buddhist stele commissioned by an individual named Tanfu. The devotional stele bears a lengthy inscription on its reverse side, offering invaluable clues for understanding its religious, social, and cultural significance. Iconographically, the central Buddha is flanked by protector figures, whose artistic display shows striking similarities with Gandharan images, suggesting a direct stylistic resonance that traveled across the ancient world. These deities act as "Travelling Hero-Gods," representing a transregional transmission of Buddhist motifs. Through a typological analysis of this stele, I explore how material culture and religious belief circulated and transformed across resonant pathways between civilizations. In particular, I examine the cultural exchanges between the major capitals of the Northern Dynasties and the intricate ways in which Buddhist and secular worlds intertwined within these urban centers.

1652. Tracking the Gods of the Ancient World: A Study of the Dynamics of Levantine Polytheism

Authors: Andrzej Szotek (Doctoral School of Humanities University of Warsaw | The Museum of the University of Warsaw)
Format: Oral

With the end of the Bronze Age, the Mediterranean world underwent profound political and cultural transformations. Old empires collapsed, new political entities emerged, and populations moved across the Mediterranean. Along with these movements, religious beliefs and deities also spread beyond their original homelands. Population mobility and expanding trade networks became major drivers of religious syncretism in the ancient world. This process is particularly visible in the Phoenician kingdoms of the Levant, whose deities of Canaanite origin gradually spread throughout the Mediterranean during the Iron Age—from their earliest attestations in Cyprus and Egypt to the westernmost regions of the Phoenician expansion, including present-day Cádiz and the Atlantic coast of Morocco. Understanding how these cults expanded and evolved requires a methodology capable of tracing both their geographical distribution and their chronological development. Such research depends on reliable archaeological evidence that provides secure dating, provenance, and contextual information. For this reason, this study draws on the database developed within the MAP – Mapping Ancient Polytheisms project, led by Professor Corinne Bonnet. The structure of this database makes it possible to analyse the occurrence of Levantine deities—including Baal, Melqart, Resheph, and others—not only as individual divine names but also as elements of broader religious and cultural networks across different regions and periods. This paper argues that combining the analysis of divine onomastic sequences preserved in inscriptions and papyri with statistical and demographic methods offers

an effective approach to reconstructing the dynamics of Levantine religious cults in antiquity. By integrating epigraphic evidence with quantitative analysis, the study seeks to reveal patterns in the diffusion, persistence, and transformation of Levantine polytheistic traditions throughout the Mediterranean world.

518. Travelling Gods, Locomotive Mythscapes: Apollo's Hyperborean Horizons and the Archaeology of Sacred Elsewhere

Authors: Ioannis Nikou Filaretos (National and Kapodistrian University of Athens)
Format: Oral

Apollo's mythic journey to the enigmatic land of Hyperborea stands amongst the most evocative and enduring ancient narratives of divine mobility and transcendence in Greek religious thought. Year after year, the god leaves the centre of the world. He abandons Delphi and goes to a place no map can hold, a distant and idealized realm, a sacred elsewhere beyond the limits of empirical space, yet vital to ritual time, cosmological array, and the sacred mind. Far from a mere literary conceit consistently recounted in written sources, or just a peripheral or ornamental tale, this bold cyclical pattern of Apollo's seasonal withdrawal from and return to the inhabited world, seen as a course back and forth to a quasi-utopian 'supernorth' terra incognita, numinous yet elusive, at the edges of the known and the remembered ecumene, is here understood as an essential structuring principle of Apolline cult, both literally and conceptually. At once familiar and remote, perhaps virtually unreachable but still historically sensitive and culturally productive, it sets the third pole in a meaningful religious triangle between Delphi, Delos, and Hyperborea, offering a compelling insight into why and how ancient communities constructed or interpreted sacred topography and ritual enactment within and beyond the ordinary or direct human access. Drawing upon resonant pathways in literary tradition alongside archaeological evidence, this study foregrounds Apollo's itinerant dynamic as a constituent force that articulates religious experience. Rather than being treated as a poetic fantasy, failed geography, ethnographic speculation, or purely symbolic, hence a marginal curiosity, Hyperborea is addressed as a religiously operative locomotive mythscape, a relational horizon sanctified via the authority of divine occurrence and performance, consecrated by mythic lore, ritual observance, and material practice. Thus, questioning how archaeology can engage with spatial alterity, imagined geographies, and uncharted territories that are nonetheless materially and ritually consequential.

536. Apollo on the Move: Cult, Connectivity, and Dedications in Olbia Pontica

Authors: Iryna Chechulina (The Institute of Archaeology of the National Academy of Science of Ukraine | Taras Shevchenko National University of Kyiv)
Format: Oral

The cult of Apollo played a central role in the religious and civic life of Olbia Pontica, one of the key Greek poleis of the Northern Black Sea region. From its foundation, Apollo functioned not only as the principal civic deity but also as a symbol of mobility, mediation, and connectivity between the Greek world and the Pontic frontier. This paper examines the specific characteristics of Apollo's cult in Olbia through an integrated analysis of architectural remains, coinage, and ceramic evidence, with particular attention to Attic black-figured and black-glazed pottery dedicated to the god. The sanctuary of Apollo, together with numerous votive offerings and coin issues bearing Apolline imagery, reflects the god's role as protector of maritime routes, guarantor of order, and patron of colonial identity. Imported Attic vessels, especially black-glazed and black-figured wares, constitute an important group of dedications, shedding light on ritual practices within the sanctuary and on Olbia's involvement in long-distance exchange networks. Travelling across the Aegean and Pontic seas, these objects illustrate the transregional character of Apollo's cult and demonstrate how religious ideas moved alongside goods and people. By situating ceramic dedications within the broader cultic landscape of Olbia, this paper explores how Apollo's cult acquired local features while remaining closely connected to wider Greek religious traditions, highlighting the role of material culture in expressing the mobility of divine power at the northern edge of the Greek world.

862. Travelling Isis: Insights into the goddess of the open sea and of sailors in the ancient Greco-Roman world

Authors: Stamatis Fritzilas (Research Center of Antiquity, Academy of Athens)
Format: Oral

This presentation examines the depiction of Isis as Mistress of the Sea, a role attested to since Hellenistic times. Evidence of her presence as a sea goddess can be found on coins, gems and statues. She is often depicted holding a sail, and her role as a protector of sailor's dates to Hellenistic and Roman times. Her symbolism, including the cornucopia and the rudder, is associated with good fortune for seafarers. As mistress of the open sea and protector of sailors, Isis is also associated with the Egyptian triad. Statues of Isis holding a sail can be found in many shrines and sites. Evidence of Isis's connection to sea voyages dates back to Hellenistic times and has been found at various sites across the Mediterranean, including in Greece and the coastal cities of Asia Minor and the Near East. She is known by various titles, including Euploia, Pelagia, Pharia, and Goddess of the Seas or of Good Sailing. The following essay will explore the iconography of the Wandering Goddess and her role as a sailor's protector. The worship of Egyptian deities in Greece reached its peak in Roman times. There is a close relationship between statues of Isis, the goddess of seafaring, and inscriptions related to navigation found on some Greek islands and along the coast. Her role was important not only for travellers, but also for the wider community whose economy depended on trading routes. Consequently, cultic expressions and dedications emphasise Isis' significance as a protector of navigation and sailors. Her status as mistress of the sea is emphasised in numerous

literary texts and aretalogies.

1021. Cults in Circulation: Eastern Gods, Rites, and Temples in the Levantine Ports of the Iberian Peninsula

Authors: Marcos Esteban Barbieri (University of Alicante)
Format: Oral

The presence of deities, ritual practices, and cultic spaces originating in the eastern Mediterranean in the ports along the eastern coasts of the Iberian Peninsula constitutes one of the most significant indicators of human and cultural mobility in the ancient western Mediterranean. This paper analyses the implantation and development of eastern religious elements in port contexts along the Iberian Levantine littoral, understood as privileged nodes of contact, transit, and identity negotiation. Based on the combined study of archaeological (temples, coastal sanctuaries, votive offerings, iconography), epigraphic, and literary evidence, it is proposed that these cults were not merely exogenous or residual manifestations, but rather structural components in the configuration of eastern communities stably settled in these enclaves. In this context, certain gods from the eastern Mediterranean associated with the sea, commerce, and the protection of movement acted as identity markers and symbolic mediators between local and foreign populations, facilitating processes of integration, adaptation, and cultural re-signification. The objectives of this study are framed within the theoretical approaches of religious mobility and port sacred landscapes, highlighting the role of these cults as material expressions of long-distance Mediterranean networks. The paper seeks to reflect on how these gods and their cultic spaces embody shared trajectories, intercultural resonances, and dynamics of circulation that allow for a better understanding of the construction of a broad sector of the ancient western Mediterranean.

1184. Heracles on the Move: Mobility, Exchange and Supra-civic Spaces in the Tyrrhenian Mediterranean

Authors: Tommasina Matrone (Kiel University)
Format: Oral

Within the long mythistorical tradition of travelling gods and heroes, Hercules emerges as one of the most emblematic figures of mobility, boundary-crossing, and cultural mediation. In the ancient Mediterranean, his journeys were not only mythic narratives of heroic trials, but also symbolic frameworks through which communities articulated political, economic, and territorial claims. This paper focuses on Heracles as a genuinely Italic deity who also functioned as a trans-cultural and highly intelligible divine figure, capable of mediating shared meanings across different cultural and political contexts. In Campania, Heracles was deeply embedded in local mythologies and landscapes that preserve his name and memory, such as Herculaneum and the islet of Rovigliano (Petra Herculis). These sites define a sacred geography that consistently places Heracles in liminal and connective spaces, including coastal zones, river mouths, and areas of economic interaction. Beyond Campania, similar patterns appear along the Tyrrhenian seaboard, from southern Etruria to Latium and Magna Graecia, where Heracles occurs in sanctuaries near ports, emporia, river crossings, and commercial corridors. In all these contexts, he is consistently associated with Athena/Minerva, a pairing attested exclusively in Italy, suggesting a shared symbolic language through which communities articulated mobility, protection, and exchange. In several cases, Heracles' cult is linked to salt production and exchange routes, highlighting the god's connection with a strategic economic resource. The paper tests the hypothesis that, between the 6th and 4th centuries BCE, Heracles functioned as a divine guarantor of exchange, or as a symbolic vector for the temporary suspension of local norms within supra-civic spaces of interaction, such as the Forum Boarium in Rome. This spatial and cultural coherence suggests that Heracles acted as a recognisable Tyrrhenian trans-cultural marker, mediating political, economic, and cultural connectivity across the region.

2558. A Travelling God or Hero of the Nordic Bronze Age? - The Kallerup Figurines in a Mythological Context

Authors: Niels Møller (Museum Thy)
Format: Oral

During the 11th to 6th centuries BC, the societies of southern Scandinavia developed a highly informative iconography expressed in rock art, bronze figurines and detailed motifs on bronze artifacts. Much of the iconography depicts scenes of a mythological nature merging natural forms into hybrid supernatural beings in combination with a recursive set of symbols depicting amongst others the sun's journey across the sky helped by various animals and a solar barge. Related to the sun's journey, but less well understood, are pairs of warriors with horned helmets and axes, by some scholars interpreted as divine twins with a root in Proto-Indo-European beliefs, but often associated with horses, ships and travel. A recent find of a group of figurines from Kallerup in Northwestern Jutland, Denmark complicate the interpretation of horned warriors. In the Kallerup-deposit the normal pair of warriors are merged into one man with two faces and two pairs of horns on his helmet and related to horses and a ship. The figurine, a depiction of a hybrid and highly supernatural creature, has contemporary parallels in the Western Mediterranean. Whether he is to be interpreted as a guardian presiding over thresholds, not unlike the somewhat later gods Culsans and Janus, or understood as a travelling hero, he and the rest of the Kallerup-deposit is an example of long-distance exchange of ideas between the Western Mediterranean and the Nordic Bronce Age. This paper will discuss the nature of the bi-faced man from Kallerup in his iconographic and cosmological context and thus discuss the hybrid nature of both the mythological creatures and the Late Bronze Age cosmology in which they are embedded.

250. Heroic journeys of Dardanos and the epic foundations across the Eastern Mediterranean

Authors: Arianit Buqinca (Institute of Albanology in Prishtina | Kosova Council for Cultural Heritage)
Format: Oral

The mythic itineraries of Dardanos, the eponymous ancestor of the Dardanians, are examined in this contribution, which is transmitted in Greek and Roman literary traditions and is interwoven with ancient notions of geography and movement. Ancient sources situate Dardanos within a divine framework as son of Zeus and Electra, thereby integrating him into a network of heroic and divine affiliations extending from Arcadia, Etruria, and Phoenicia to Samothrace, the Troad, and Phrygia. Diodorus describes Dardanos as a man of great undertakings (μεγαλεπίβολος), recounting his passage from Samothrace to the Troad on a waterskin and the subsequent migration of his people beyond Thrace into Illyria. Kallimachus preserves the archaic designation of Samothrace as "Dardania" a tradition corroborated by Pausanias, while Virgil and the First Vatican Mythographer propose alternative origins of Dardanos in Etruria or Corinth, resonant with historical Corinthian migrations to Italy. The wanderings of Dardanos also bear a cultic dimension: Diodorus records the role of Dardanos, accompanied by Cybele and Corybas, in transmitting the cult of the "Mother of the Gods" into Phrygia. The mythical frameworks for the founding of cities, the legitimacy of genealogies, and the weaving of cultural exchange were created through these narratives of heroic movement, maritime crossings, territorial migrations, and religious transmissions. By foregrounding these interconnected trajectories, our contribution argues that the "wanderings of Dardanos" were not merely episodes of mythic migration of heroes and deities, but probably symbolic narratives of wanderings and establishments of communities, reinforcing genealogical legitimacy through heroic and religious affinities across diverse regions of the ancient Mediterranean.

50. The travels of Demeter along the North Aegean Coast: Cult mobility in the Classical Antiquity

Authors: Paraskevi Motsiou (National and Kapodistrian University of Athens)
Format: Oral

This paper investigates the travels of the cult of Demeter as a deliberate and practical strategy in the establishment and stabilization of Greek colonies along the North Aegean coast during Classical Antiquity. The study emphasizes the functional role of Demeter's worship in -symbolically as well as politically- securing agricultural prosperity, territorial protection, and long-term colonial sustainability. The early transfer of Demeter's cult and the foundation of rural-oriented sanctuaries emerge as key mechanisms through which newly founded colonies sought divine favor over fertile land and productive resources. Particular attention is given to Abdera, an Ionian colony established on the coasts of ancient Thrace, where the location and character of Demeter's sanctuaries suggest a conscious integration of cult practice into the agricultural, economic and political foundations of the colony. Through a comparative analysis of sanctuary topography and architectural settings in metropolitan centers and their colonies, the paper explores how Demeter's cult was adapted to new environments. Differences in spatial organization, ritual practices, votive offerings and the emphasized attributes of the goddess reveal significant shifts in cultic character between metropolis and colony. These variations reflect local priorities and environmental conditions, highlighting the flexibility of Demeter's worship as a tool for colonial consolidation in the North Aegean.

1174. Across the Aegean and the Black Sea: Colonists, Heroes and Cults in Abdera and Phanagoria

Authors: Antigoni-Maria Mastorakou (National and Kapodistrian University of Athens)
Format: Oral

Abdera and Phanagoria, in Thrace and the Asian Bosporus respectively, are two colonies of Teos. They are both associated with the forced flight of the population of their metropolis during the Persian siege around 545 BC. The presentation examines the cults that developed in these two cities during the turbulent period of their founding for the purpose of validating rights to the new land. A mythical colonist was invented and honored in Abdera, Abderos—a beloved friend of Herakles—associated with the already known labors of the hero in Thrace. On the other hand, in Phanagoria, the colonist was probably a historical yet enigmatic figure named Phanagoras, the man who seems to have undertaken the difficult task of safely transporting the settlers to the distant colony. Finally, indicative for the case of Phanagoria is the cult of Aphrodite Apatouros, a deity who is also associated with the process of colonization and the role of the water element.

266. A couple of Greek Travelling Deities in Sicily: Cybele and Velchanos

Authors: Paolo Scirpo (National and Kapodistrian University of Athens | Società Siracusana di Storia Patria)
Format: Oral

Throughout Antiquity, the Mediterranean basin was traversed by people from its shores, bringing with them not only hopes for a better future but also the beliefs of their homeland. The same phenomenon was observed during the first and second Greek colonizations, when the Mediterranean was dotted with new Hellenic settlements. In these settlements, the pantheon of the apoikia played a fundamental role in the growth of the new poleitic community, as it assumed the burden of maintaining the fragile social equilibrium. Among the many examples of traveling deities, this contribution briefly examines the cases of two very ancient cults, traces

of which can be glimpsed in the varied and complex religious stratigraphy of the Sicilian poleis. The cult of the Mother Goddess "Cybele" and that of Velchanos, originating respectively in Phrygia and Crete, spread through the colonial movements that swept across the Aegean to two of the islands at the extremes of the Greek world: Sicily and Cyprus.

249. The Travelling Founders of Metapontum: Myth, Mobility, and Colonial Origins

Authors: Fryni Grevenioti (National and Kapodistrian University of Athens)
Format: Oral

This paper explores the role of travelling heroes and narratives of failed nostos in the foundation traditions of Metapontum, an ancient Greek colony in southern Italy, located in the Gulf of Taras and traditionally founded by Achaean settlers in the late 7th century BC. Literary sources associate the origins of the city with post-Trojan War journeys undertaken by Pylians, particularly the heroic figures of Nestor and Epeios, whose unsuccessful return home led to prolonged sea wanderings and the establishment of a new settlement. These mythic narratives are examined as retrospective constructions that connected the historical Achaean foundation of Metapontum with a prestigious heroic past, while also evoking memories of Mycenaean presence in the region. Alternative traditions attribute the foundation to Leukippos, an Achaean leader who secured the territory through deception against the neighbouring Spartan colony of Taras and was subsequently recognised as the city's founder. His foundational role is materially attested by his depiction on Metapontine coinage of the mid-4th century B.C. By combining literary evidence with archaeological data, the paper investigates how travelling heroes operated as agents of mobility, memory, and legitimation in colonial contexts. It argues that heroic journeys functioned as powerful narrative frameworks through which displacement was transformed into origin, continuity, and collective identity in the ancient Greek colonial world.

416. Travel as Mythic Strategy: Aeneas and the Making of Civic Identity in the Mediterranean

Authors: Cecilia Perinelli (St Andrews)
Format: Oral

Travel played a constitutive role in ancient myth, not merely as a narrative framework but as a strategy through which communities articulated identity, authority, and belonging. The figure of Aeneas offers a privileged vantage point for exploring this dynamic, yet his role as a travelling hero has rarely been examined comparatively across regions, media, and political contexts. This paper argues that Aeneas' mobility functioned as an operative cultural strategy through which communities negotiated civic identity and affiliation, both before and under Roman power. Rather than a fixed legendary figure, Aeneas emerges as a mobile founder whose authority was generated through repeated local reactivation in response to shifting historical and political conditions. Through a comparative analysis of selected sites associated with Aeneas' travels, including Aineia on the Chalkidic peninsula, Orkomenos in Arcadia, and Segesta in Sicily, the paper brings together poetic sources, fragmentary historiography, archaeological evidence, cult practices, and coinage. The case of Aineia illustrates a pre-Roman use of Aeneas as heros ktistes, materialized through cult and coinage to anchor civic identity. By contrast, Orkomenos and Segesta, though very distant from each other (Arkadia, Sicily) demonstrate how claims of Trojan descent were reactivated under Roman rule as strategies for negotiating status, legitimacy, and continuity within an imperial framework. Ancient authors already reflected on this phenomenon: Dionysius of Halicarnassus observed that the many tombs of Aeneas scattered across the Mediterranean were not contradictions, but monuments erected by different communities in recognition of the benefits received from an itinerant founder. By foregrounding travel as a productive force rather than a narrative backdrop, this paper rethinks the relationship between mobility, myth, and power. It shows that itinerant heroes did not merely connect places, but actively generated frameworks of belonging capable of absorbing political change while sustaining claims to shared origins across the Mediterranean.

35 ILLUSTRATING THE PAST: GENDER REPRESENTATIONS IN PREHISTORY AND PROTOHISTORY

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Matteo Colombini (Massa Marittima Museums - Zoe Cultural Cooperative) – Francesca Fulminante (Oxford and Cambridge Universities, Continuing Education | Bristol University | University Roma Tre)
Keywords: Gender Representations, Science Communication, Didactic representations, Pre- and Protohistory, Antiquity
Format: Regular session
Affiliation: Archaeology and Gender in Europe - AGE

SESSION ABSTRACT

Visual representations displayed in museums, interpretive centers, school textbooks, popular science books, and outreach activities related to Pre- and Protohistory are powerful instruments in shaping historical consciousness. Yet, a recurring question persists: do these images still reproduce stereotypical views, with men associated with public and creative activities, while women are relegated to domestic and private spheres? This session invites a critical discussion on strategies of representing past human communities, particularly in educational and scientific communication contexts. While archaeological research increasingly raises new questions and produces data that challenge traditional assumptions, visual and didactic representations often remain bound to outdated narratives. How do archaeologists engage with the images used in outreach? To what extent does science communication reflect contemporary debates on gender, the critique of binary categories, and the influence of modern Western biases? Moreover, how are recent developments—such as the archaeology of childhood and care practices—impacting visual and discursive representations of past societies? We welcome case studies, theoretical reflections, and proposals for action that critically examine representations of human beings in Pre- and Protohistoric contexts and other historical periods, as well, for the purpose of comparison or contrast. Contributions addressing the intersections between archaeology and other research fields, such as heritage studies, science communication, gender studies, education and visual studies, are particularly encouraged.

CONTRIBUTION ABSTRACTS

2680. Enthrone, dethrone, rethrone: Interpreting Matrilineal Kinship in Aegean Prehistory

Authors: Sabina Cvecek (Field Museum of Natural History | Austrian Academy of Sciences | University of Illinois Chicago)
Format: Oral

Matrilineal kinship in Aegean prehistory has often been proposed as a form of social organization for Neolithic communities and selected Bronze Age contexts. In many cases, claims for matrilineality have been inferred from the prominence of figurines interpreted as female within particular archaeological settings. Drawing on archaeological, bioarchaeological, and comparative anthropological evidence, this paper traces how matrilineal kinship in Aegean prehistory has been repeatedly enthroned, dethroned, and more recently rethroned within scholarly interpretation. By placing kinship theory in dialogue with Neolithic and Bronze Age imaginaries, it highlights how shifts in interpretive frameworks—rather than new data alone—have shaped understandings of gender, descent, and social organization. The paper argues that matrilineal kinship is better understood not as a singular or dominant model, nor as a speculative alternative to patrilineal social structures, but as one of several possible ways in which Neolithic and Bronze Age societies may have organized social relations. Moreover, based on ethnographic record, matrilineal kinship represents many rather than one form of social organization. This presentation is based on the article published in Archaeological Dialogues (2025), "Enthrone, Dethrone, Rethrone? The Multiple Lives of Matrilineal Kinship in Aegean Prehistory."

2282. Representing physical or symbolic gender differentiation in the Neolithic – reflections of reality, transition, liminality and ambiguity?

Authors: Christina Marangou (Independent scholar)
Format: Oral

Neolithic representations may have belonged to various semiotic systems, with variety, polysemy and multifunctionality probably constituting promising interpretative directions. Besides embodying physical reality, images may reflect a mental, social or intangible entity in the real world, and even materialize fiction, alluding to symbolic, imaginary realms. If what seems to have been everyday life routine is often represented, some common situations may be rarely materialized, even constitute exceptional themes. Moreover, images may be distinguished into categories that might define gender, not only physical, but also social. In a larger sense, they might also imply conceptual or ritual status or expertise of individuals, either in reality or in imagination. In other cases, any obvious gender indication is absent, apparently deliberately. Besides, even their role and function as material objects may have contributed to differentiate symbolic meanings of images. The present paper considers examples of Neolithic representations insinuating gender (in the large sense) categorization, mainly from Greece and neighbouring regions, including in a socio-archaeological approach.

1866. From "Man the Artist" to Plural Artists: Gender, Evidence, and New Visual Narratives in the Study of Prehistoric Art

Authors: Ines Domingo Sanz (ICREA | Universitat de Barcelona)
Format: Oral

For over a century, both archaeological research and popular illustrations have reinforced the mistaken idea that only men created art in prehistoric times. This "man the artist" model, rooted in nineteenth-century evolutionary thought, androcentric scientific traditions, and male-centered ethnographic accounts, cast women as models, muses, or passive observers, despite having no solid evidence. Recent research is challenging these views. Biometric and morphometric analyses of hand stencils and fingerprints show participation by individuals of different ages and possibly sexes. Archaeological contexts, including footprints and burials associated with decorated spaces, suggest intergenerational and mixed-gender involvement. Ethnographic studies document women's and children's active roles in art production and transmission. Reassessing prehistoric imagery also highlights female figures and questions the automatic gendering of ambiguous representations. Together, these insights support a more inclusive understanding of prehistoric creativity and art reshaping how we visualize the past. Museums, textbooks and media now increasingly depict women as artists, hunters, and decision-makers, and men in caregiving or collaborative roles. By challenging outdated stereotypes, these new narratives empower women, recognize all humans as active agents, and help us reconstruct a more accurate, diverse vision of the past. This presentation reviews the origins of the old "man the artist" theory and provides an updated and critical view that reflects new evidence and more inclusive interpretations of prehistoric art.

2028. Making Gender Visible at Lake Accesa (Massa Marittima, Italy): From Archaeological Evidence to Public Narrative

Authors: Matteo Colombini (Massa Marittima Museum) – Francesca Fulminante (Bristol University, Oxford University, Università di Roma Tre)
Format: Oral

The Etruscan settlement at Lake Accesa was discovered in the early twentieth century and has been intensively investigated by the University of Florence since 1980. The site is located on the southern side of the Metalliferous Hills, 20 km northeast of the Etruscan city of Vetulonia (Tuscany, Italy). Excavations have revealed a four-quarter town occupied from at least the late eighth to the late sixth centuries BCE. Material culture from elite graves and houses provides evidence of an aristocracy whose wealth was based on the exploitation of mineral resources, agriculture, fishing, and animal husbandry. Traditional archaeological interpretations have often divided this elite into two gendered categories: men as warriors wielding political power, and women as household keepers and weavers. The Massa Marittima Museums, in collaboration with the Universities of Bristol, Durham, and Siena, and supported by the British Academy (2023-24, SRG2324\241025), have developed a new approach combining material culture analysis, spatial analysis, anthropological study, and archaeometry to bridge this gap and deconstruct gender stereotypes. This contribution presents preliminary results based on the analysis of tombs 6, 33, and 37, alongside the communication strategy implemented in the museum to disseminate research findings to diverse audiences.

2583. The marginalization of women within sculpture- Classical Civilization A Level

Authors: Olivia Naylor- Allison (Clifton College)
Format: Oral

This presentation aims to target the gendered imbalance of compulsory sculpture within the Classical Civilization A Level course, with a particular focus on the contrasting depictions of male and female statues. It will interrogate the thematic structure and assessment limitations which enable a more diverse illustration of male figures, which are frequently depicted as more dynamic and artistically innovative while outlining female sculpture as somewhat underdeveloped or simply less stylistically commendable in comparison, meaning the course offers a less academically rigorous exploration of female statues. A more balanced juxtaposition of gendered art would easily reveal a rich and enrapturing depiction of women through sculpture and material culture. The discussion will centre around how prescribed male statues, which are frequently explored through a broad variety of lenses, further exemplify how the mandatory female statues tend to fall into narrow categories. This limits interpretive range and reinforces a reductive visual impression without a full consideration of equal thematic development. Finally, the analysis will reflect upon the historical context of male archaeologists shaping representations of women within classical research. It will consider whether our modern curriculum still echoes this androcentrism, which is perpetuated through selective emphasis and leads us to question the consequences of these decisions on the student and their understanding of the classical world. This paper will aim to demonstrate how biases within the A-level Greet Art curriculum parallel the selection and study of prehistoric archaeology, where scholars have noted the projection of a possibly more reductive or docile lens when studying female roles and women through material culture.

2765. The exceptional and the erased: A critique of gender representation in A-Level Latin and Greek

Authors: Elizabeth Laredo (Clifton College)
Format: Oral

This presentation will examine a pattern I find troubling in Classical education (A Level OCR). Everything we learn about women is through the lens of male authors who only ever promote women of high status or women with noble connections. However, the lived realities of ordinary ancient women remain absent from our curricula. Drawing on my own experience of the Latin and Greek syllabus, I want to argue that prioritising exceptional women creates the illusion of gender-inclusive teaching while actually obscuring the structural inequalities that defined most women's lives in antiquity. I aim to challenge classical educators to move beyond tokenistic inclusion of famous women and instead centre questions of marriage law, bodily autonomy, labour exploitation and more. Additionally, I will suggest what seem to be the most appropriate solutions. Ultimately, I believe that by examining what our curriculum forgets, we could allow and encourage classical studies to engage with gender as a fundamental force shaping ancient societies.

232. Gendered Representation and Reconstructions of Prehistory and Protohistory in Museum Displays and Course-books in Europe: Are Binary Perspectives Still Prevailing?

Authors: Francesca Fulminante (Bristol University | Institute of Continuing Education, Oxford and Cambridge | University Roma Tre)
Format: Poster

Two years ago, an EAA session, 'To gender or not to gender' organised by Bisserka Gaydarska, Katharina Rebay-Salisbury, Paz Ramirez-Valiente and Jana Esther Friez, challenged the then dominating view of gender development and symbolism in Euro-Mediterranean Antiquity, as elaborated by Robb and Harris (1990s-2020s). According to the latter, Neolithic gender representation

is ambiguous and blurred, with a transition occurring in the Copper-Bronze Age towards greater distinction in the Iron Age-Archaic Period, of an emerging binary ideology which related men to the 'martial warrior' and female to the 'beautiful weaver' (Robb 1994, 1997; Robb and Harris 2017). Still the visual and performative representation of men and women in Museums/Archaeological sites and book iconographic representations across Italy and UK with reference to Pre-Roman population maintains to date this standard dichotomy. Males are always represented in posters and illustrations associated with weapons and females are always associated with textile tools. I will present older and more recent Museums displays and objects present in Museums for interacting activities, as well as archaeological site reconstructions and various publications from a few decades ago and from more recent times to show that nothing has changed even in more recent years. Instead the 2020 EAA session turned our focus to the association between gender and biological sex, with a number of studies now revealing that the interplay between indicators of different personhood and identity aspects, such as age, status, class and even ethnicity, is much more complex than the old binary suggests, including now the emergence of different genders in the prehistoric data. But how long will it take before the new gender identifications and perspectives will be hosted in Museum displays and/or popular illustrations?

1431. Gendered narratives of the Prehistoric past in commercial board games

Authors: Victor Jimenez-Jaimez (University of Malaga)
Format: Poster

Contemporary games—digital and analog—have become influential media for shaping public understandings of the past. Their immersive and participatory nature often makes them more impactful than traditional academic publications, granting them a broad societal reach. Despite their narrative potential, representations of Prehistory in tabletop games frequently reproduce outdated and stereotypical images of early human communities. In particular, many commercially successful board games portraying the Paleolithic period continue to associate men with creativity, leadership, and outdoor activities, while women are depicted in auxiliary or domestic roles. This paper focuses on the visual and discursive strategies through which gendered roles are communicated in a few selected cases that are exceptions to the dominant discourse, or that provide more nuanced stories about the Prehistoric past. To this end, I analyze artwork, rulebooks, mechanics, and marketing materials to explore how these elements collectively shape historical consciousness. Comparing these representations with current archaeological debates holds great potential, particularly as regards important issues such as binary categories, care and cooperation, and the expanding archaeology of childhood.

2728. The representation of women in protohistory in school textbooks: a look at the reality in Portugal

Authors: Ana Cristina Martins (IHC-Universidade de Évora / IN2PAST)
Format: Poster

Though traditionally dominated by male figures and roles that reinforce conventional stereotypes, efforts are increasing to bring in more inclusive perspectives. Studies show that women are less frequently represented in text and images, often mainly in relation to men. Usually, there is numerical underrepresentation, where women appear in smaller numbers than men in textbooks and images, suggesting that their historical participation was less significant. Women are often portrayed as participating in domestic, family, or social activities, while men are commonly depicted in public positions, leadership roles, hunting, or taking part in conflicts. Besides, they are rarely portrayed as active agents in cultural development or in positions of power, unlike men who dominate leadership roles. Frequently, women's achievements are overlooked, and the focus shifts to their connections with men, such as husbands or fathers, rather than to their personal successes. In Portugal, recent initiatives and developments are taking place, with academic researchers and gender equality organisations advocating for the revision of curricula and teaching materials. Additionally, gender archaeology critically addresses the traditional acceptance of gender roles. Analysing Portuguese schools' textbooks published between the totalitarian regime 'New State' (1927-1974), and nowadays, we aim to understand how women are being depicted, evaluating their role in the perpetuation or renovation of traditional gender roles.

36 SEAFARING MODELLING AS PART OF INTER- AND INTRADISCIPLINARY INQUIRY

Theme: 7. Interaction, connectivity and mobility
Organisers: Wesa Perttola – Elisabeth Holmqvist-Sipilä (University of Helsinki) – Ermioni Vereketi (National and Kapodistrian University of Athens)
Keywords: Seafaring Models, Maritime Movement, Connectivity, Interdisciplinarity, Trade And Exchange
Format: Regular session

SESSION ABSTRACT

Seafaring represents the interplay of human endeavour, wind, and water, while seafaring models seek to computationally simulate these intricate relationships. Consequently, such models are inherently, and by necessity, inter- and intradisciplinary (i.e. involving multiple fields or subfields, hereafter IID) efforts, combining data from fields such as archaeology, history, GIS, and the environmental sciences. The maritime connections they simulate did not operate in isolation but functioned often as integral components

of past societies, which makes it possible to utilise seafaring models as tools for other forms of scientific inquiry, further amplifying their IID character. This session aims to bring together scholars who explore seafaring and maritimity — encompassing seas, rivers, lakes, and other aquatic landscapes — to showcase the diverse ways in which seafaring models can shed light on human interactions and/or the environmental conditions that underpin them. The reconstructed maritime connections are viewed as components of wider social, economic, and cultural networks, and by situating modelling within these contexts, the session will examine both its interpretative and methodological dimensions. Particularly welcomed are submissions that look beyond the technical aspects of modelling and examine how seafaring models are used to build interpretative narratives within IID frameworks. The wide range of topics to be addressed in this session includes seafaring modelling in conjunction with, for example, artefact provenancing, maritime dispersal of humans and other species alongside them, trade networks, and economic calendars, among others. Papers that combine maritime and terrestrial mobility are also encouraged to submit. Overall, the session will highlight how seafaring modelling contributes IID perspectives to the current archaeological discourse in Europe and beyond.

CONTRIBUTION ABSTRACTS

220. Identities Beyond the "Warrior": Modelling Maritime Agency in Western Greece

Authors: Ermioni Vereketi (National and Kapodistrian University)
Format: Oral

During the post-palatial period (LH IIIC), Western Greece flourished as a node of connectivity while the wider Eastern Mediterranean faced turbulence. This phenomenon is epitomized by the wealthy "warrior burials" of the Ionian Islands, which contain foreign bronzes and Italian-influenced imports. This paper employs seafaring modelling as a primary tool of interdisciplinary inquiry to reevaluate the social identities of these individuals. Moving beyond static distribution maps, this study integrates archaeological data with environmental variables, such as wind patterns and sea currents, using Circuit Theory to simulate maritime mobility. Unlike standard route analyses, this approach models the seascape as a surface of conductivity, identifying high-probability corridors, where environmental factors influenced maritime traffic. The results highlight that, specific areas between the Ionian Islands served as unavoidable bottlenecks for seasonal maritime flows. The strong correlation between these strategic nodes and the location of weapon burials supports a reevaluation of the deceased's social identity. These individuals, rather than being strictly classified as "warriors", may have served as gatekeepers, merchants, or pirates and their status was associated with controlling or obscuring the flow of goods along these key passages. The study highlights how modeling environmental factors can enhance our understanding of complex social associations within the dispersed networks of the 12th century BC.

400. The Voyage of the Isis Revisited

Authors: David Gal (University of Haifa)
Format: Oral

While the existence of maritime links in Antiquity is well supported by archaeological evidence, there is a gap in the evidence regarding how these links were conducted. One of the few existing seafaring resources is a handful of sailing-voyage narratives found in the textual evidence. One of these is the account of the sailing of the Isis, an Alexandrian grain ship bound for Rome. This narrative is part of the work of fiction Navigium by Lucian of Samosata, but even as a work of fiction, the description of the voyage and its parameters has been widely referred to by scholars in analyses of seafaring. The University of Haifa model for investigating potential sailing mobility was applied to elements of Isis's sailing, with the objective of gaining new insights into events that have eluded previous scholars. One of the contested issues is the cause of the excursion as far eastward as Sidon. In the study, new understandings and discoveries have unravelled, as in a detective story, through the application of the new quantitative sailing mobility model to investigate this voyage. The multidisciplinary outcomes illuminate regional and seasonal wind patterns, seasonal routing preferences of the Alexandrian grain fleet, seafaring practices of the period, and new perspectives on the textual source and its translation.

139. Modelling seafaring: connecting Viking Age insular and maritime north-west Europe

Authors: Stephen Dickinson (Independent researcher)
Format: Oral

Since the 1990's archaeologists have been aware of a large number of small finds relating to Britain and Ireland in the early medieval period, which occur in numerous archaeological contexts in Scandinavia. These call into question the natures of artefact chronology and provenancing, trade, raids, settlement, and, in particular, pre-Viking and Viking Age ship and human transportation, terrestrial mobility, and the political and territorial organisation of early kingdoms around the North and the Irish Seas. Modelling seafaring for such transportation has occurred at the same time as a rise in pre-Viking and Viking Age ship reconstruction and voyaging. These pragmatic solutions to understanding the realities of seafaring over a thousand years ago rarely form part of the technical aspects of computer modelling of transportation in the Viking Age. A new monumental Viking Age ship burial find in West Cumbria, UK has highlighted, in particular, the nature of narratives relating to the understanding of the formation of Viking Age kingdoms around the Irish Sea, Eastern England, Scotland and SW Norway. A significant Viking Age silver hoard found in 2014 near, (and relating to) this burial has reignited the debate around the extent of Viking Age trade and market networks affecting these areas, which were, it is suggested, part of both a highly connected terrestrial and maritime transportation system. A new

IID interpretative narrative encompassing both reconstructed and modelled voyages by both sea and land is suggested connecting Ireland, Britain and Scandinavia in the late eighth to the early 10th centuries AD.

1722. Currents of Clay: Integrating Viking Age Ceramic Compositional Data Patterns with Sailing Simulations in the Northern Baltic Region

Authors: Elisabeth Holmqvist-Sipilä – Wesa Perttola (University of Helsinki) – Greer Jarrett (Lund University)
Format: Oral

Before, during and after the Viking Age (c. 800–1050 CE) the Baltic Sea was a major maritime thoroughfare, along which ships routinely sailed transporting people and goods across the region and beyond. One of the goods being circulated was pottery: archaeometric compositional analysis (XRF, SEM-EDS) of Viking Age ceramics sampled from sites in Finland, Sweden, Estonia and Russia suggests inter-regional and cross-Baltic Sea contacts between communities. Similarities in ceramic traditions have been explained by trading, cultural assimilation and relocating individuals or groups (e.g. women). However, as information about Viking Age routes in the northern Baltic is scarce, and the region has received less attention from recent scholars of seafaring than other parts of the Viking world, sailing modelling offers a means of gaining insight into this essential facet of life. The Baltic Sea is a small, shallow, semi-enclosed sea, with brackish water, extensive archipelagos, isostatic land uplift, negligible tides, air temperatures ranging from –30 to +30 °C, and daylight from 6 to 19 hours at mid-latitudes. These are some of the characteristics that contribute to its status as a highly distinctive marine basin on a global scale. The extensive work done on Viking ship reconstructions and their sea trials, and the good availability of high-resolution environmental data make it a compelling target for sailing simulations. Nevertheless, even with the rising popularity of this methodology, the Northern Baltic Sea has so far remained a white spot on the map in this regard. Here, we draw together results from these two sources of information to form a picture of Viking Age ceramics connection network, what it took to transport wares across the sea, and what kind of environment the sailors would face. Ultimately, our aim is to move from ceramic sourcing to the practical logistics of movement across a challenging seascape.

986. All aboard, participative maritime experimental archaeology and computational approaches dialogue : an example for Martinique (F.W.I.)

Authors: Benoit Berard (Université des Antilles | UMR 8096 "Archéologie des Amériques") – Slayton Emma (Carnegie Melon University) – Alvaro Montenegro (Ohio State University)
Format: Oral

A comprehensive understanding of the navigational capabilities of pre-Columbian populations in the Antilles is imperative to our comprehension of these island societies, for whom maritimity was of paramount importance. For several years, significant efforts have been made in the region to address this issue. These efforts have combined traditional archaeological and historical approaches, work with communities of descendants, experimental maritime archaeology projects, and computational approaches. This work has been part of a paradigm shift from the notion of insularity to that of archipelagicity. The objective of this presentation is twofold: first, to assess the predominant issues currently surrounding the maritime practices of the indigenous societies of the Caribbean, and second, to explore potential solutions to these issues. The presentation of a research program carried out in Martinique (F.W.I.) in 2025 will provide a detailed example of a multidisciplinary practice. This practice is based on a dialogue between experimental maritime archaeology, participatory archaeology, and computational approaches. Beyond the methodological dimension, an effort will be made to illustrate how this type of approach is now essential to the construction of an interpretative narrative that can inform all the issues associated with knowledge of the indigenous societies of the Caribbean archipelago.

1721. Where was the monsoon when Angkor fell? Sailing modelling using palaeoclimate simulations in the 14th and 15th century Southeast Asia

Authors: Wesa Perttola (University of Helsinki) – Marko Kallio (Aalto University) – Marisa Borreggine (Harvard University)
Format: Oral

During the mid-14th and early 15th centuries CE, Mainland Southeast Asia experienced two megadrought events, the impacts of which extended as far as India and central China. Among their most significant and well-documented consequences was their contribution to the fall of Angkor: one of the largest urban centres of its time was largely abandoned and lost its status as the capital of the Khmer Empire. While the terrestrial effects of these climatic extremes have been widely studied, their potential influence on maritime trade networks remains poorly understood. Because modern, instrument-based, high-resolution wind datasets cover less than a hundred years, this question must be addressed using palaeoenvironmental simulations. In this presentation, we will introduce the results of a 200-year long (1300–1499 CE) series of weekly sailing simulations between Quanzhou, China and the mouth of the Mekong River, Vietnam. The simulations were conducted with Digital Navigator — a sequential least-cost path model — using wind data from a run from Last Millennium Ensemble (LME). Like other palaeoclimate models, the LME is stochastic in nature, and individual events —such as megadroughts — do not necessarily align chronologically with their historical counterparts. Nevertheless, they represent the current best understanding of past climate dynamics and provide a suitable framework for exploring interconnections between large-scale climatic processes and human mobility. Therefore, we compare the simulated sailing durations to climate metrics such as Oceanic Niño Index (ONI), Palmer Drought Severity Index (PDSI), Intertropical Convergence Zone (ITCZ) position, and the onset and withdrawal of the South China Sea Summer Monsoon, to assess whether sailing conditions

differed markedly in the 14th and 15th centuries. Additionally, our results are also useful for estimating if modern winds can be utilised as a proxy for this time period.

958. Maritime connections in the Baltic Sea in the Early Iron Age – "Bornholm – the island in the middle"

Authors: Tine Trolle (Aarhus University) – Piotr Luczkiewicz (Maria Curie-Sklodowska University) – Aneta Kuziola (Adam Mickiewicz University) – Michal Grygiel (Nicolaus Copernicus University)
Format: Poster

The project "Bornholm – the island in the middle" aims to shed light on societies, contacts and alliance systems in the Baltic Sea region in the Early Iron Age (500 BC – 400 AD). It-is based on material from Bornholm's largest cremation ground, Store Frigård with 1250 graves. With its central geographical location in the middle of the Baltic Sea, the island of Bornholm has always been an obvious link and a treasured "stepping stone" between the Continent and Scandinavia. The project's scientific analyses therefore include exploring the interactions of the Bornholm community, maritime connections and seafaring patterns in the Iron Age. Store Frigård with its 900-year continuous history offers an obvious material for investigating the dynamics of long-distance exchange – and thus implicitly seafaring – in a 'longue duree'. A picture emerges of local centres in the Baltic Sea region in the Early Iron Age, where people interacted exchanging ideas, knowledge and objects, and Bornholm communities were connected to the European networks. The unique material consists of clothing, jewelry, tools, weapons and pottery as well as cremated bones. The research work uses methods from both archaeology, natural sciences, sociology and ethnography. Several of the natural science methods are aimed at determining provenance of raw material or persons, including metal, glass, ICP- and isotope analyses - carried out on a larger scale and unique for the period at Bornholm. The analyses help to clarify interactions such as trade, exchange, mobility, migration and thus the maritime connections with the island. For the studies of the overseas exchange networks we have used a theoretical model developed by Feugnet et. al. (2021) on the economic and social exchanges between the Greco-Roman culture and the Celtic world in the 3rd-1st century BC.

37 RESONANT LANDSCAPES: SACRED PLACES, MATERIAL AFFORDANCES, AND COSMOLOGICAL ORIENTATIONS IN THE ANCIENT MEDITERRANEAN

Theme: 7. Interaction, connectivity and mobility
Organisers: Silvia Fogliazza (International study Center of Ancient Religions CRA, Ca' Foscari) – Ilaria Cristofaro (University of Peloponnese)
Keywords: Sacred landscapes, Material religion, Cosmology, Temporality, Ritual practice
Format: Regular session

SESSION ABSTRACT

The panel 'Resonant Landscapes' aims to bring together scholars interested in natural places and built environments as contact zones between humans and the "sacred". The geographical and chronological focus spans the wider Mediterranean basin, from the Bronze Age to the Late Antiquity. The session focuses on five thematic pillars: 1. Sense of place, agency and power of sites: how natural places (caves, hill top, hills, rivers, sea, astral elements) and artificially built environments (sanctuaries, altars, temples) may produce ritual experiences, bringing in communication different cosmological levels. This topic is well represented by the concepts of landscape, seascape, skyscape and other -scapes approaches. 2. Material religion and sacred architecture: how objects, materials, built environments, and bodies may act as mediator of the sacred—facilitating or obstructing the connection between humans and the extra-ordinary. 3. Affordances and performativity: how the intrinsic material and sensory properties of places (echoes, light, stones, water, soils depth, visibility of the sky) shaped gestures, perceptions, and ritual actions. Rather than passive backdrops, these environments invited and shaped performative engagements that could trigger or amplify divine manifestations (epiphanies). 4. Stratified cosmologies: the focus is on the material traces on the relationship between the celestial, terrestrial, and subterranean worlds; 'verticality', astral and sacred orientations (mountains, caves, sun, stars, temples); how ritual acts might have reverberated echoing major cosmic systems. 5. Temporal resonances: continuity and discontinuity on the re-use of specific places for 'religious' and 'ceremonial' aims, given the same affordances as prompter of the sacred experience (landscapes of memory, ritual movements, processions, festivity, periodicity, cycles of ritual frequentation of sites, and seasonality). In summary, the panel integrates landscape archaeology, history of religion, sacred architecture, inviting specific case studies or methodological contributions aiming to unveil the role of 'place' as resonant element in the sacred experiences of ancient Mediterranean cultures.

CONTRIBUTION ABSTRACTS

466. Ritual Reflections of the Land-, Sea and Sky-scape of the Minoan Peak Sanctuary at Ayios Yeoryios sto Vouno, Kythera

Authors: Emilia Banou (University of the Peloponnese)
Format: Oral

The Minoan peak sanctuary at Ayios Yeoryios sto Vouno, Kythera, came to light by the late Y. Sakellarakis (1992-1994); excavation at the site was resumed later on (2011-1015) by the speaker. The sanctuary is situated on the 356 m. high western edge of a 1 km. long ridge named Vigla, after a ruined tower of probably Venetian origin visible on its eastern end, and it is named after one of the two Byzantine churches built on its top. The site commands a wide view of the southeastern shore and the central hinterland of Kythera, and of the bay of Neapolis in southwestern Laconia; it also offers a panoramic view to the southern Aegean, including the Cretan mountains. The sanctuary was founded in MMIB and reached its acme in the Neopalatial period, especially in MMIIIB-LMIA. Among categories of votives well known from peak sanctuaries in Crete, like clay human and animal figurines, votive limbs, and stone vessels, the Kytherean sanctuary yielded an unexpectedly great number of bronze statuettes of Minoan adorants together with a variety of other metal finds, a considerable number of clay buildings, as well as some finds not known from other peak sanctuaries, like clay and bronze figurines of scorpions. The paper focuses on the natural setting of the peak sanctuary as reflected on ritual activities, namely: a) on its visual and natural relation to the settlement of Kastri in connection with probable processions from the settlement to the sanctuary; b) on its visit by Minoan elite members involved in metal trade by sea, as implied by relative votives, especially bronze finds and clay building models; and c) its frequency by seafarers, related to its function as a landmark as well as a place suitable for possible navigational observations, as indicated by the dedication of scorpion figurines.

850. High Places, Living Memory: Mountain Affordances and Ritual Action in the Piacenza Apennines

Authors: Silvia Fogliazza (International Study Center of Ancient Religions CRA, Ca' Foscari)
Format: Oral

Accidental finds and archaeological investigations conducted in selected areas of the Piacenza Apennines have revealed material traces of ritual activities connected to mountain tops and dating from the Iron Age to the Roman conquest and early Imperial period. These data offer an opportunity to reflect on the role of high places as ritual locations and on their function in the construction and transmission of cultural memory within local communities. Drawing on the concept of sense of place, developed in ethnobotany and cultural ecology to describe a culturally mediated attachment between people and specific landscapes, this paper explores mountain environments as active agents in shaping ritual experience and collective identity. Particular attention is given to the affordances of the Apennine landscape—such as elevation, visibility, intervisibility, liminality, and exposure—which structured ritual practices in antiquity by enabling specific gestures and movements. The paper further examines a contemporary collective rite still practiced in several villages of the Piacenza Apennines at the end of winter, involving the ignition of large wood piles on mountain summits. The ritual sequence—characterised by shared gestures, the use of aromatic woods (pine and juniper), sound signals, and augural readings—follows an internal logic linked to seasonal transition, purification, and renewal of the agrarian cycle. While historically and culturally distant from ancient cult practices, this modern rite engages the same landscape affordances, revealing the enduring ritual agency of mountain spaces. This contribution argues that the long-term resonance of mountain rituality lies in the performative efficacy of place itself. The Apennine peaks emerge as resonant landscapes, where material and sensory properties enable the repeated reactivation of memory, identity, and collective engagement across different historical contexts.

2241. Into the Deep Water: Rituals of Immersion, Deposition, and the Agency of Thermal Waters at San Casciano dei Bagni

Authors: Edoardo Vanni – Jacopo Tabolli (University for Foreigners of Siena)
Format: Oral

The sacred thermal complex of San Casciano dei Bagni (ancient Etruria) provides an exceptional case for investigating the role of water as a privileged medium for ritual deposition and controlled disappearance. At the core of the sanctuary lies the Bagno Grande, a monumental basin fed by hot mineral springs, whose continuity of use from the late Republican period to Late Antiquity structured both ritual practices and architectural choices. Archaeological evidence demonstrates that the basin was not a neutral container but the central focus of cult activity. Over centuries, since Etruscan-Roman age, offerings—including bronze statues, anatomical votives, coins, and organic materials—were intentionally immersed in the thermal waters. The long-term respect for the basin, even during major architectural renovations, and its final sealing in the early 5th century AD through the deliberate collapse of architectural elements, reveal a conscious management of deposition and closure rather than accidental loss or simple disposal. The physical properties of the water—heat, mineral opacity, continuous flow, and depth—played an active role in shaping depositional practices. Water functioned simultaneously as a purifying agent, a medium of communication with divine powers, and a mechanism for removing objects from human circulation while preserving them within a sacred domain. Notably, faunal remains associated with sacrifice and consumption were largely excluded from the basin, suggesting a clear conceptual boundary between ritual deposition and both sacred and quotidian waste. By focusing on the relationship between a built thermal installation and the material practices enacted within it, this paper addresses questions of agency: did water itself "receive" offerings, or was agency located in the regulated act of immersion performed by worshippers? Finally, the basin emerges as a spatial device that actively produced sacred space, transforming immersion into a ritual act that negotiated visibility, absence, and permanence.

327. The evening star Venus, Aeneas, and the Orientation of Altars at Castrum Inui Sanctuary (Ardea, Latium)

Authors: Ilaria Cristofaro (Laboratory of Archaeometry, University of Peloponnese)
Format: Oral

The ancient historian Dionysius of Halicarnassus (1st cent. BC) described the arrival of Aeneas on the Latium coast and his offerings of thanks to the god for the fresh spring water, sacred to the Sun, he found there. Nearby stood two altars, one oriented to the east and the other to the west (Dion. Hal. Ant. Rom., 1.55.1–2). This description closely corresponds with the archaeological features of Castrum Inui (Ardea, Latium), where a spring–well and two altars facing opposite directions have been identified (Torelli 2011, Di Mario 2016). The sanctuary started to be structured in the Archaic period near the mouth of a river, in a marshy watery dunes landscape. Although previous studies have acknowledged the dedication to the Sun and the general east–west orientation of the altars, a realistic celestial analysis of their alignment remains lacking (Moser 2014). The present study aims to address this gap by conducting a skyscape archaeology analysis to provide new insights into the topography of the sanctuary and the cultic significance of the local solar god Inuus, Aeneas, and his mythical mother Venus. Beyond the orientation to winter solstice sunrise for the 3rd cent. in–antis altar, the primal Archaic cult seems to have been connected with the westerly vespertine phase of Venus, astral goddess who led the hero to the Latium coast. The astral cult was kept resonant and vivid by a monolith inscribed with the letter 'V' (Marcattili 2024), later buried in the Temple A of the sanctuary, and explicit by the orientation of Temple B and the rectangular altar. As for other Tyrrhenian costal emporia such as Pyrgi, the astral cult of Venus clearly indicates the importance of the observation of this astral body for the maritime life and seafaring journeys across the Mediterranean Sea in the Archaic period.

707. Comparing the Class Dynamics of Religious Hybridization in Urban Landscapes in Hellenistic and post-Hellenistic Bactria and Gandhara

Authors: Christos Nikolaou (University of Cambridge)
Format: Oral

The project investigates how the political agendas of different classes of people affected the religious hybridization that took place in the regions of Bactria and Gandhara during the Hellenistic (defined as Graeco-Bactrian and Indo-Greek) and Post-Hellenistic (defined as Indo-Scythian, Indo-Parthian, and Early Kushan) Periods. The thesis proposes that these class dynamics were the main factor in the religious change of the period and that this affected the urban landscapes and their surrounding regions. The thesis advances the view that the development of Bactrian and Gandharan cityscapes was the result of cultural (counter-)hegemony projects by both elite and subaltern classes, as well as religious traditions like Buddhism and Mazdaeism in their respective attempts at propagation. The material configuration of individual shrines within cities is thought to have produced religious hybridisation hierarchies through the investment of patrons into specific cults. These investments, driven by class agendas, impacted the primary affiliation and symbolic language of individual cults. When combined, the disparate cults within a city formed a cityscape that reflected the practices and class tensions of its inhabitants. Shifts in the configuration of different streams of patronage produced shifts in existing cityscapes. Individual urban sites and shrines are investigated through the use of basic statistical and distribution analysis to understand how class relations patronised specific shrines to understand how specific religions could assimilate others within their own iconographic vogues. In addition, qualitative analysis is used to understand the possible agendas of the patrons and audience that consumed the art. The thesis proposes some models of how different religious traditions and imagery (collectively called 'religious ecosystems') affected urbanism in different sites. It also links the survival, competition, and co-existence of various cults in urban landscapes to the political economy of Bactria and Gandhara in general, as well as the urban sites in particular.

73. Sacred architecture in the Sicilian megalithic archaeological landscape. The cultic acropolis of the megalithic site of Pietra Tara (Palermo)

Authors: Francesca Mercadante (Studio GeoArchPa)
Format: Oral

The coastal megalithic site of Pietra Tara, located on the northernmost slope of western Sicily, on the coast of Monte Gallo, Palermo, facing the Tyrrhenian Sea, is the only known site in Sicily with megalithic/cyclopean structures still intact, with landslide carbonate blocks adapted for megaliths and/or menhirs/totems. (Calibrated dating 3183 ± 100 BP). The area was divided into two portions: a Lower Zone, from the coastline up to 60 meters above sea level, and an Upper Zone, from 60 meters above sea level to below the cliff of the mountain. The funerary architecture is widespread and connected with the structures throughout the site, primarily with the intramural dolmen hypogea. From an altitude of 50 meters above sea level, The slope becomes steep (30-40% gradient), with the presence of some reliefs of groundwater debris and accumulations of stone material along the steep slopes. In July 2023, a drone flight was carried out which highlighted a small acropolis with megalithic constructions in the Upper Zone. The acropolis has different architectural landscape characteristics from the underlying Zone B, featuring a polygonal enclosure formed by cyclopean blocks, with double-faced walls. It is a secluded area, whose complex Sacred Architectural Landscape System is determined by cyclopean constructions and megaliths (ZA.2 and ZA.3) connected to a cult/funerary space with the presence of tumuli, in which Megalith ZA.2 takes on the condition of an "anthropomorphic monolith" as a reference to the female Goddess, while the second ZA.3, behind it, serves as a funerary hypogeum. The cult/funerary system features a ritual path flanked by megalithic epiphanies with connections between man and the divine and places the site as the first intact megalithic archaeological landscape of the second millennium of the Mediterranean.

222. Facilitated Porosity of Ground in South Italian Funerary Monuments

Authors: Savannah Marquardt (Yale University)
Format: Oral

On a fourth-century BCE Metapontine pseudo-panathenaic amphora attributed to the Brooklyn Budapest Painter, Orestes and Electra meet at the funerary monument of Agamemnon (MANN inv. 81735). Between them, a stele is transformed by grave goods into a semi-figural composite body, the eerie enduring presence of the dead king. This scene appears to take place on the surface of the grave. But considered in relation to heterogenous funerary cultures of turn-of-the-fourth-century BCE Southern Italy, this vase troubles the seemingly straightforward division between the earth's surface and its interior. How, and to what ends, do depictions of grave sites in Southern Italy describe a vertical cosmology in which divisions between the "real" world and the underworld are governed by facilitated porosity? How does the surface of the earth break down? This paper examines depictions the funerary monuments in South Italian vase painting, contextualizing these images within archaeological evidence of funerary rites from select Greek and Italic sites of their potential production and deposition. I argue that the depiction of grave goods we might expect to be interred (such as bronze armor or pseudo-panathenaic amphorae) instead incorporated into an external monument visualizes the desired effects of funerary rites—the real co-presence of the tomb's interior and the surface world of the living. The enduring presence of the deceased at/in their grave is dependent on the recognition that ground is not a conceptual void. When the dead are physically mixed with the ground, the apparent barrier of the earth's surface instead becomes the means by which the living and the dead continue to coexist. This argument has implications for the materiality of personal eschatology. Ritual action at the tomb is not merely social performance. It could be received by the persistent dead.

77. The astral cults in Bronze Age Europe

Authors: Anna Biondi (Postgraduate School in Archaeological Heritage Or.Sa)
Format: Poster

This study aims to analyze the archaeological evidence and the earliest representations of astral cults in Europe during the Period from the Early Bronze Age to the Late Bronze Age, seeking to outline their centres of dissemination and spread across the entire European continent. Through the study and comparison between the artefacts (contestualization, typological analysis, functional use, decorations.....) and the most ancient representations it will be possible to reconstruct the belief system that characterised some of the most ancient European cultures of the Bronze Age, comparing this system with that of contemporary societies that had a written production (Egypt and ancient Near East). The study of the social organization of European Bronze Age communities, based on the earliest evidence of astronomical knowledge and the movement of the stars, has also made It possibile to develop new hyphotheses on the use of ritual objects both in the funerary contexts and in the daily Life. The study of Nebra sun disk and the golden disks of Roca and Gualdo Tadino proved to be particularly interesting. An effort will also be made to highlight the conceptual similarities and differences that these objects could have held among the various populations of the European continent. In particular, the transmission of astral cults that characterized the funerary and religious sphere of Early Bronze Age societies will be examined, as well as the sacred spaces within which these cults were practiced.

38 RETHINKING THE LONG HOUSE–MATRILOCALITY NEXUS: CROSS-CULTURAL COMPARISONS AND ARCHAEOLOGICAL EVIDENCE

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Sabina Cvecek (Austrian Archaeological Institute | Field Museum of Natural History) – Stella Souvatzi (University of Thessaly)
Keywords: long house, matrilocality, postmarital residence, kinship, gender, household and social organization
Format: Discussion session
Affiliation: Archaeology and Gender in Europe - AGE

SESSION ABSTRACT

The association between long houses and matrilocal residence has long attracted attention in both ethnographic (Morgan 1851; Loeb & Broek 1947; Ember 1973; Divale 1977; Metcalf 2010; Cveček 2025) and archaeological research (Hayden 1968; Milisaukas 1986; Ehrnberg 1989; O'Gorman 2010; Creese 2016, Souvatzi 2017). Ethnography has often emphasized the matrilocal character of long houses, where women and their kin formed the enduring core of household groups and architectural continuity (Ember 1973; Divale 1977). Yet archaeological evidence suggests that this relationship was neither universal nor static: long houses across different regions and periods point to a diversity of residential arrangements, descent systems, and household dynamics that challenge simple one-to-one correspondences between built form and kinship. At the same time, smaller domestic dwellings may not only be associated with patrilocal but also bilateral or matrilocal groups, suggesting that the same architectural arrangements could host a diversity of social practices. This session brings together scholars to revisit the long house–matrilocality nexus by comparing ethnographic cases with new archaeological findings. We ask: how do architectural forms intersect with kinship and residence practices?

What kinds of archaeological, bioarchaeological, and ethnographic data allow us to trace household organization and descent? And how do long houses operate not only as material structures but also as lived environments and social institutions that shape gender, relatedness, and social reproduction? The session welcomes contributions from archaeologists, ethnographers, geneticists, specialists in stable isotope analysis, and others whose research can shed light on residence, kinship, and household organization in long houses and beyond. By critically assessing both the strengths and the limits of linking architectural forms to kinship practices, and by considering the variability between long houses and "small" houses, the session aims to refine our understanding of households, gendered space, and the constitution of relatedness across time and space.

CONTRIBUTION ABSTRACTS

1228. Rethinking the relationship between architecture, kinship and household in the Neolithic

Authors: Stella Souvatzi (University of Thessaly)
Format: Oral

While kinship finally receives attention in prehistoric archaeology and, indeed, it is becoming an active field, it remains considerably under-theorised. There is still often a reluctance to define what kinship is and even in the studies where kinship terms are used, they remain loosely defined, if not confused. This paper aims to prompt the need for improved conceptualisation as well as to argue that rather than merely borrowing models and analogies from ethnography, archaeology needs to evaluate them against its own data and disciplinary experience to develop its own distinctive theory and practice. Drawing on material and spatial archaeological data from the Neolithic of Greece and Türkiye (8th-4th millennium BC), I employ a practice-based methodology to trace forms of kinship, household and (co)residence and to explore their relationship. I argue against automatic associations of house types with family types and show that rather than cross-cultural homogeneity of residential arrangements and residential groups, there is instead considerable diversity across space and over time.

2376. Violence and the LBK long house

Authors: Mark Golitko (University of Notre Dame)
Format: Oral

Longhouses are one of the characteristic features of the Neolithic Linearbandkeramik (LBK, ~5650-4900 calBC) archaeological culture. These ancient longhouses have been extensively compared to the global ethnographic record, resulting in a number of plausible models related to their internal structure and the relationships between those who occupied them. Genetic and isotopic evidence suggests that LBK communities primarily practiced patrilocality, however, other aspects of Neolithic society are less well reconstructed, including patterns of descent, family structure, and degrees of social and political inequality. Longhouses may also have served as productive units for both foodstuffs and other goods, however, numerous studies suggest that production, trade, and decision making were likely not only situated within the longhouse as a physical and social entity, but also encompassed broader social networks in which longhouses were situated. These networks have been modeled as a form of risk mitigation along an expanding agricultural frontier, however, to date, these models have primarily focused on ecological and environmental risk. Given the high rates of violence that existed at times and places during the Neolithic, it is worth asking how the institution of the longhouse functioned in the context of social risk, including how increasing violence may impact residence patterns, descent structures, and the organization of production and exchange. Drawing on a number of ethnographic examples, I examine the role of the longhouse in the context of a sometimes-dangerous social world, focusing particularly on a case study of LBK communities in the Hesbaye region of eastern Belgium.

1064. Matrilocality Without Long Houses: Ethnographic Insights from the Khasi of Northeast India

Authors: Lenka Zahradkova (Charles University, Dept of Ethnology and Cultural Anthropology)
Format: Oral

Matrilocal residence has frequently been linked to the long house model, which correlates social expansion with linear architectural growth under a single roof. Drawing on ethnographic research among the matrilineal and matrilocal Khasi of Northeast India, this paper challenges this paradigm. While the monumental Iing Sad in Smit, one of the ritual and political centers of the region, approaches long house-like proportions to accommodate ceremonies, the standard domestic reality follows a different spatial logic. Traditional Khasi housing consists of smaller domestic units rather than a single extended structure. Houses are typically arranged in clusters around a natal ancestral house, which is inherited by the youngest daughter (ka khadduh) and carries additional symbolic and ritual significance. Moreover, the size and organization of these domestic units vary across the Khasi-inhabited areas, indicating significant internal diversity in both architectural form and residential patterns. Centering the analysis on archaeologically detectable features of domestic space, the paper further explores the role of the sacred central pillar, ritualized restrictions on the use of iron, and megalithic monuments within domestic landscapes as material anchors of clan belonging. By decoupling matrilocality from the necessity of long house architecture, this paper offers an alternative interpretative framework for understanding matrilineal and matrilocal social organization that foregrounds symbolic, ritual, and relational dimensions often invisible in archaeological contexts.

1583. Why and when does the average house size correlate with post-marital residence?

Authors: Aleksandr Diachenko (National Academy of Sciences of Ukraine, Institute of Archaeology)
Format: Oral

Over the decades, a number of archaeological and anthropological studies questioned a correspondence between the house size and post-marital residence patterns. A seminal paper by Melvin Ember (1973) and follow-up research have found that the average living floor area or house floor area in matrilocal societies is substantially larger than in patrilocal groups. Bringing together the ethnographic evidence (not limited to matri- or patrilocality), archaeological data on "small" houses, and simple simulations grounded on McGuire and Schiffer's theory of architectural design, this paper questions the intersection between architectural forms and residence practices. The obtained results contribute to the explanations of the positive correlation between house size and post-marital residence previously offered in the literature. The simulation outcomes also make possible the discussion of issues and limitations in identifying post-marital resident patterns from the distribution of archaeological dwelling size, as well as the consideration of equifinality among various factors that cause variability in house floor area.

1614. Are longhouses matrilocal? Questions from the ethnographic record

Authors: Peter Whiteley (American Museum of Natural History)
Format: Oral

The hypothesis that longhouses are associated with matrilocality requires substantive testing against empirically reported ethnographic phenomena. Does the association represent a conceptually robust, causal correlation—from the perspective either of matrilocality, or of longhouses cross-culturally. The concepts must be interrogated. What is matrilocality? How does it interdigitate with descent and/or kinship terminology? To what extent and under what circumstances is matrilocality separable from matriliny (or avunculocality)? Where separable, what are the implications for social structure (in "harmonic" vs. "dysharmonic" regimes)? Moreover, when is a residential structure a longhouse and when is it not? Is a longhouse a "house" in the Lévi-Straussian sense? If so, how are "houses" related to matrilocality (given that Lévi-Strauss predicated his concept on non-kinship social forms)? This paper examines these questions both with regard to kinship theory in sociocultural anthropology and vis-à-vis the ethnographic record, especially for those areas of Native North America where longhouses and/or great houses have been identified as characteristic (Northwest Coast, Eastern Woodlands, and Southwest). The aim is to critically evaluate the correlation of matrilocality and longhouses to see whether the pattern identified is a genuine phenomenon cross-culturally or merely the fortuitous result of selected cases.

39 MACROLITHIC TOOLS IN LATE PREHISTORIC EURASIA: DISTRIBUTION, CONTEXT, AND CULTURAL PRACTICES

Theme: 1. Widening perspectives in material culture studies
Organisers: Ana Rosa (UNIARQ - Centro de Arqueologia de Lisboa | Faculdade de Letras da Universidade de Lisboa) – Marcin Szydłowski (University of Szczecin)
Keywords: Ground stone tools, Eurasia, Late Prehistory
Format: Regular session

SESSION ABSTRACT

Macrolithic tools were integral to the material culture of late prehistoric communities throughout Eurasia. Many of these tools show a multifunctional character and were employed in both everyday and more specialized tasks, particularly those related to food and craft production. As such, they provide valuable insights into the evolution of agro-pastoral economies, the introduction of new technologies, and the changing technical skills and socio-cultural dynamics that transpired across this broad geographical area during the Neolithic–Bronze Age. Despite their significance for everyday subsistence and technological development, macrolithic tools have long received insufficient attention compared to other artefact classes. They rarely constitute the main research focus, and transregional narratives are particularly lacking. This session seeks to widen perspectives in material culture studies by integrating macrolithic tools into broader archaeological debates on the Neolithic–Bronze Age periods in Europe, the Caucasus, and Southwest Asia. Investigating the contextual settings of macrolithics, as well as their technology and functions allows us to explore the cultural practices surrounding their procurement, production, use, and discard. We particularly welcome contributions that address: - contextual analyses and distribution patterns; - procurement strategies, production techniques, and technological innovation; - the role of macrolithic tools in exchange networks and intercultural interaction, and processes of social and economic change; - functional and symbolic aspects in cultural and funerary contexts; - case studies highlighting local versus imported materials, regionality, and interregional connections; - interdisciplinary and methodological approaches. By bringing together specialists from different regions, the session aims to connect distributional data and build a comparative framework to explore the economic, social, and symbolic value of these tools within the changing economies of late prehistoric Eurasia. The goal is to trace broader transregional and cross-cultural trends and innovations in macrolithic technologies and related practices.

41. More Than Form: Function, Value and Meaning of Stone Objects in Late Neolithic–Early Bronze Age Poland

Authors: Marcin Szydlowski (University of Szczecin)
Format: Oral

This paper presents a use-wear (traceological) approach to stone artefacts, focusing on how microscopic and macroscopic surface modifications can be used to reconstruct past practices. By documenting edge damage, rounding, striations, polish development and their spatial distribution, traceology allows us to distinguish functional categories such as cutting, scraping, drilling, grinding or percussion, and to evaluate intensity and direction of motion as well as worked materials. Importantly, the study treats "absence of use-wear" not as a negative result but as an analytically meaningful observation. Objects that retain fresh surfaces, sharp edges, or only manufacturing traces may have circulated with limited or no utilitarian use. Such patterns can indicate alternative biographies and roles, including insignia of status, tokens of identity, exchange valuables, or items embedded in ritual and belief systems. Integrating wear analysis with technological and contextual data therefore enables a more nuanced interpretation of stone objects—one that moves beyond form and function toward broader questions of value, meaning and social practice.

144. Surveying the Stones of Daily Life: Grinding Stone Production at the Bronze Age Citadel of Kaymakçı in western Anatolia

Authors: Kristina Doležalová (Institute of Classical Archaeology, Faculty of Arts, Charles University | Institute of archaeology of the CAS, Prague) – Christina Luke (Department of Archaeology and History of Art, Koç University) – Christopher Roosevelt (Department of Archaeology and History of Art, Koç University | Research Center for Anatolian Civilizations, ANAMED, Koç University)
Format: Oral

The production of grinding stones was a multi-phase process that varied regionally and temporally, particularly with regard to the stage at which artefacts were transported from their sources to settlements. Tracing grinding stone production at Bronze Age settlements is methodologically challenging for several reasons. Production was generally not conducted on a large scale, and final shaping and finishing generated only minimal waste. In addition, semi-finished artefacts can be difficult to distinguish from finished tools. This paper aims to assess the representation of different grinding stone production phases at the Bronze Age site of Kaymakçı in western Anatolia. The grinding stone assemblage from excavations at Kaymakçı, comprising more than 400 artefacts, has so far provided no unequivocal evidence for on-site production. The tools were made predominantly of volcanic rock, which must have been transported to the settlement from considerable distances (approximately 100 km). However, it has remained unclear whether this material was brought to the site as raw material, semi-finished products, or finished tools, and whether grinding stones were produced locally. Kaymakçı therefore represents an ideal case study for testing the potential and limitations of a systematic surface survey designed to address these questions. Approximately 25% of the site was surveyed using a 10 m grid over a period of fifteen days, during which the production stage and technological characteristics of all grinding stone finds were recorded. The results of the survey suggest that grinding stone production did take place at Kaymakçı. All three final stages of the production sequence for upper grinding stones were identified. Nevertheless, the scale of production, the quantities involved, and the specific settlement phases during which production occurred remain uncertain.

1604. Polished stone from the Chalcolithic settlement of Vila Nova de São Pedro (Portugal): typology and functionality of axes under discussion

Authors: Ana Rosa (Uniarq-FLUL/FCT) – Mariana Diniz (Uniarq-FLUL) – César Neves (AAP/Uniarq-FLUL)
Format: Oral

The archaeological interventions carried out during the 20th century and into the 21st century at the site of Vila Nova de São Pedro (Portugal) made it possible to identify a fortified settlement covering an area of more than 1 hectare, which was intensively occupied throughout the 3rd millennium cal BC. From this occupation, an exceptionally large and diverse assemblage of artefacts has been preserved, displaying wide techno-typological and functional variability. This assemblage includes more than 600 polished stone tools which, unlike other artefact categories, have only recently been the subject of detailed study, forming the topic of the doctoral thesis of one of the authors (AR). The lesser attention given to one of the fundamental elements of agro-pastoral systems - namely polished stone tools, essential for working the land and wood, as well as for processing stone for construction - has contributed to a limited understanding of the relationship between typology and function of these artefacts. They are often classified into broad categories - axes, adzes, gouges, hammers - without greater precision regarding the meaning and function of each type. Taking the collection from VNSP as its starting point, this study aims to characterise the category of axes from a technical, morphological, and functional perspective, and to discuss their role in the Chalcolithic economy of the western Iberian Peninsula.

1897. Stone Tools from the Late Bronze Age and Iron Age Settlement at the Present-Day Town of Sisak

(Central Croatia)

Authors: Ivan Drnic – Ana Đukić (Archaeological museum in Zagreb)
Format: Oral

The Late Bronze Age and Iron Age settlement located at the confluence of the three rivers—the Sava, Kupa, and Odra—in the present-day town of Sisak in central Croatia is one of the best-researched settlements of the 1st millennium BC in the region. In addition to settlement structures, large assemblages of diverse archaeological finds have been unearthed during recent excavations, with pottery and animal bones being the most numerous. A somewhat smaller assemblage is represented by stone artefacts, such as querns, whetstones, and spindle whorls. There are currently no standalone, regionally focused studies of Late Bronze Age– Iron Age stone tools in Croatia or the wider Adriatic area. Existing publications include stone artefacts primarily as catalogue items, settlement inventories, appendices, or unanalyzed finds, reflecting their limited typological precision and low chronological sensitivity compared to metal or ceramic material. While these characteristics have contributed to their marginalization, the authors argue that stone tools remain analytically valuable when approached beyond typology-based dating. Drawing on object biography, and craft and household archaeology, stone artefacts are treated as contextual archaeological data rather than residual material. The analysis is conducted across multiple scales: artefact-level attributes (use-wear, modification, fragmentation), contextual associations (type of site, feature type, assemblage composition), site-scale spatial patterning. Through correlations with well-defined and dated contexts (such as those from Sisak-Pogorelac), this approach demonstrates how stone tools can meaningfully contribute to reconstructions of everyday practices, craft activities, and technological organization in Late Bronze–Iron Age communities.

307. A Peculiar Chalcolithic rotational Basalt Vessel from Northern Israel: Reassessment and new interpretation

Authors: Marina Bekker Shamir (The Hebrew University | Israel Antiquities Authority)
Format: Oral

2001. Macrolithic industries at settlement sites in Corsica from the Bronze Age to the Iron Age: the example of I Casteddi

Authors: Maelly Durox (Independent researcher) – Hélène Paolini-Saez (Laboratoire régional d'archéologie-Corse - LRA | UMR 5608, TRACES, Université Toulouse Jean Jaurès) – Elisabeth Pereira (Università di Corsica Pasquale Paoli | Laboratoire Sciences Pour l'Environnement - UMR CNRS 6134 SPE)
Format: Poster

This paper proposes a reflection on macrolithic tool assemblages in Corsican habitation sites between the end of the Neolithic and the Iron Age, based on the study of the hilltop site of I Casteddi (Tavera, southern Corsica), deriving from a master's research project. Long set aside in protohistoric contexts, macrolithic tools nonetheless constitute a significant indicator of technical, domestic, and specialized production activities, as well as of the ways lithic resources were managed within these societies. This research is based on a detailed analysis of the entire macrolithic assemblage uncovered at I Casteddi during excavation campaigns conducted between 2014 and 2023, complemented by an inventory of macrolithic remains recorded on Corsican habitation sites occupied from the Neolithic to the Iron Age. This dual approach aims to place the I Casteddi assemblage within a broader regional framework and to question its representativeness within insular dynamics. The methodology of this study relies on a morpho-technological analysis based on macroscopic observation of the supports, shaping techniques, and active surfaces, in order to identify the main functional categories of macrolithic tools (percussion, grinding and milling, abrasion and polishing). The study also seeks to examine issues related to raw material procurement, practices of tool re-use, and the massive presence of natural pebbles in hilltop settlements. Through the example of I Casteddi, this paper proposes to integrate Corsican macrolithic tools more systematically into the analysis of domestic economies, by questioning the modalities of use, management, and re-use of these tools within insular protohistoric habitats of the western Mediterranean.

2531. Tools and rocks from Gumelnița Eneolithic tell sites in south-eastern Romania

Authors: Constantin Haita (National Museum of Romania History)
Format: Poster

The proposed paper presents data of the petrographic analysis of the macrolithic tools recovered from two Eneolithic tell sites attributed to the Gumelnița culture, in south-eastern Romania. The studied inventories come from Hârşova Tell and Bordușani Popină, and the comparative analysis takes into account the proximity of the settlements, as well as the different geomorphological background.The site from Bordușani Popină is located in the floodplain of Balta Ialomiței and consists of a mound with about nine meters of Eneolithic deposits, on an erosional remnant. The tell from Hârşova is situated on the gentle slope of the lower Danube terrace, with about 12 meters of Eneolithic stratigraphy. Their deposits consist of stratigraphic sequences interpreted as built spaces, passage areas, and waste zones. These tell-type settlements are attributed to the Kodjadermen - Gumelnița - Karanovo VI complex, and dated to the second half of the Vth millennium BC. The lithic assemblage includes a variety of tools, including

grinders, abraders, sharpeners, polishers, hammers, and chisels, as the main types. The types of tools were analysed in close relation to the rock types of support and their physical properties. Special attention was given to identifying possible source areas and their locations within the Dobrudja province.

40 THE DISTRIBUTION OF POWER AND INCLUSIVENESS ACROSS DEEP TIME: ARCHAEOLOGICAL, HISTORICAL, AND COMPARATIVE PERSPECTIVES ON GOVERNANCE AND WELL-BEING

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Francesca Fulminante (Oxford and Cambridge Universities, Continuing Education | Bristol University | University Roma Tre) – Jacob Holland-Lulewicz (The Pennsylvania State University) – Gary Feinman (Social Science Field Museum of Natural History, Chicago)
Keywords: Governance, Well-being, Power, Evolution, Comparative Research
Format: Regular session

SESSION ABSTRACT

Recent work by the international team of the Working Group on Human Governing and Well-Being with the Coalition for Archaeological Synthesis has begun to question entrenched viewpoints about the origins and evolution of democratic institutions. In assessing governance along an empirical collective-autocratic axis, the results of their emerging quantitative, global synthetic study have destabilized and challenged traditional narratives, assumptions, and generalizing "grand theories" concerning the evolution, character, underpinnings, and outcomes of different forms of governance. More specifically, this work has illuminated and decoupled variation across two key dimensions of governance: the concentration of power and citizen inclusiveness. The papers included in this session build on these synthetic findings through specific case studies that center questions about the mechanics and processes associated with how power becomes concentrated or distributed and how inclusivity or exclusivity emerges or is facilitated. Through the interrogation of these key axes, contributors deconstruct long-reproduced nomothetic narratives and empirically evaluate how particular characteristics of governance articulate with other crucial variables including scale, complexity, economics and financing, subsistence, bureaucratic structure, ritual, and socioeconomic inequality, to name a few. The substantive contributions of this session are (1) to underscore the diversity and persistence of collective governance across varying regions and eras, illustrating a scalable methodological framework for continued and future comparative research, and (2) to reframe historical narratives about the development of democratic institutions globally.

CONTRIBUTION ABSTRACTS

215. Decoupling the concentration of power from polity scale and hierarchy: why and how

Authors: Gary Feinman – Linda Nicholas (Field Museum of Natural History)
Format: Oral

Comparative approaches to governance have traditionally presumed that prior to modernity rulers were despotic, tyrannical with power concentrated in the hands of a few. Building on prior studies by Blanton and Fargher and Feinman and Carballo, we, in conjunction with 11 colleagues, synthesized archaeological and textual data from 40 case observations across 31 polities, to develop a quantitative framework (an autocracy index) to assess governance along a collective–autocratic axis, defined by two key dimensions: concentration of power and citizen inclusiveness. We then examined the index in relation to population size, hierarchical complexity, geographic region, modes of fiscal financing, bureaucratic structure, ritual practices, and socioeconomic inequality. The findings from this sample illustrate that neither polity population nor geographic region tightly correlates with the collective–autocratic axis of governance, challenging extant models. Instead, the strongest associations for autocratic governance are with external financing, patrimonial bureaucracy, spectacular ritual, and high inequality. The study underscores the diversity and persistence of collective governance across regions and eras, offering a scalable methodology for future comparative research and reframing historical narratives about democracy's development.

229. The long-term dynamics of Power and Inclusiveness in Rome, Italy and the Empire, compared with Rank-Size Analysis. Continuity and Change

Authors: Francesca Fulminante (Bristol University | Institute of Continuing Education, Oxford and Cambridge | University Roma Tre)
Format: Oral

The evolution of Rome from a small pre-proto-history village in Latium Vetus, to the principal city of Republican Italy and then the centre of an Empire, offers a unique point of view to study variation and diachronicity in modes of governance, by observing dynamics of power and different level of inclusiveness and how they combine in different chronological and environmental settings. In this paper the evolution of governance for the policy of Rome in its long term perspective from its origin in the Bronze Age to its decline in Late Antiquity is presented within the wider context of the Coalition for Archaeological Synthesis study led by Gary Feinman and Linda Nicholas. This evolution is also compared with the analysis or power dynamics through Rank-Size Analysis. Over the last decade, rank-size analysis has become one of the main methods for investigating urban systems in the ancient world. This theoretical model establishes a correlation between a settlement size and their rank within a certain regional unity according to the different level of socio-political organization of that region. While there is still debate on the theoretical underpinning and the mathematical explanation of the rule, it seems to be generally predictive at least at the empirical level. By connecting and analysing three relevant databases: Fulminante 2014 for Pre-Roman Latium, Sewell-Witcher 2015 for Republican Italy, and Hanson 2016 for Rome and its Empire, this paper will present a long term perspectives of the dynamic of power of Rome through the lens of governance inclusiveness and Rank Size Analysis to assess elements of continuity and change and their significance also for wider comparative perspectives.

2756. Tracking governance at Angkor: A Metric-based analysis of political change over time

Authors: Sarah Klassen (CU Boulder) – Alison Carter (University of Oregon) – Linda Nicholas – Gary Feinman (The Field Museum)
Format: Oral

This paper assesses the nature of government at Angkor in present-day Cambodia through a diachronic, metric-based analysis of political organization. The analytical framework employed here was developed by a working group of the Coalition for Archaeological Synthesis, in which we participated, and is designed to operationalize and comparatively evaluate key dimensions of governance in past societies. Rather than treating Angkorian political organization as static or monolithic, we apply these standardized metrics across multiple phases of Angkor's development to track change over time. By quantifying and comparing shifts in institutional structure, administrative integration, infrastructural investment, and political centralization, we identify patterns in the evolution of governance across the Angkorian sequence. This longitudinal perspective allows us to move beyond descriptive accounts of kingship and monumentality to more systematically evaluate how governance transformed in response to demographic growth, urban expansion, and environmental pressures. Ultimately, this study contributes to broader comparative debates about the dynamics of governance in early complex societies and demonstrates the value of synthesis-driven, metric-based approaches for understanding long-term political change.

1356. Inclusive governance and its correlations among the ancient Maya

Authors: Scott Hutson (University of Kentucky)
Format: Oral

Ancient Maya polities are often thought to fall closer to the autocratic end of the spectrum of governance. Nevertheless, some city states exhibit a higher degree of inclusiveness than others. Recently, scholars have begun to search for patterns that explain variation in the degree of inclusivity and collectivity in political organization. This paper continues this trend by quantifying variables such as plaza size, monumental construction, population scale and measures of household inequality. The goal is to quantify sites in terms of inclusivity and then determine the degree to which these scores correlate with the variables stated above. Such a method builds from comparative studies and is scalable for additional research. The sample of sites derives largely from the Classic period (250-900 CE) and includes settlements from the Northern and Southern Maya lowlands. Though no clear chronological patterns have thus far been discerned, this study will attend to potential temporal trends.

373. The Guachimonton Matrix: Intersecting Institutions and Collective Governance in Central Jalisco, Mexico

Authors: Verenice Heredia (El Colegio de Michoacan)
Format: Oral

Circular complexes from West Mexico, known as guachimontones, consist of several architectural features: a conical or square altar (or central mound), a patio (sometimes sunken), and a series of platforms—either single or multi-bodied—that together form a single unit. Researchers have explored their symbolic meaning and function, but they also interpret the guachimonton as the embodiment or materialization of corporate political strategies in which different lineages ruled jointly. Many questions remain about the origins of these lineages and whom they represent. This paper argues that the guachimonton embodies a bundle of institutions in which religious, economic, and political spheres intersect. These architectural complexes are widespread in West Mexico but particularly ubiquitous in the central valleys of Jalisco, around Tequila Volcano. I examine the prevalence and spatial distribution of guachimontones throughout the Tequila region—registered through systematic, full-coverage surveys over 900 km²—to investigate the convergence of multiple institutions at their core that enabled collective governance.

216. Situational Inclusiveness in the Native American Politics of the U.S. Southeast

Authors: Jacob Holland-Lulewicz (The Pennsylvania State University) – Victor Thompson (The University of Georgia)
Format: Oral

Descriptors such as "collective" or "inclusive" are often applied by archaeologists, and social scientists broadly, to characterizations of whole societies or political systems. In reality however, who is included in decision-making, and by extension where those decisions might be made, is in part dependent on the kinds of decisions being made or subjects under discussion. In this way, descriptors like "inclusivity" are in fact a gross average of the decision-making mechanics that may define a particular sociopolitical system. Drawing on the rich ethnohistoric record of the Indigenous societies across the American Southeast, we evaluate situational inclusiveness. That is, how does the scale and structure of citizen inclusiveness change depending on the kinds of decisions being made? Our results highlight how "inclusiveness" within the political realm can be situational. This also raises key methodological questions regarding how we interpret the archaeological signatures of different kinds of spaces with regard to the kinds of inclusiveness they may have represented, and thus the various kinds of decision-making that existed among these groups.

764. Collective Governance in the Maya Preclassic Period

Authors: Timothy Pugh (Queens College | The Graduate Center) – Karina Osorio Klinger (The Graduate Center/CUNY)
Format: Oral

Unilinear delusions of ambitious elites expanding their power and propelling the development of social complexity once held sway over our reconstructions of the Middle Preclassic period (1000-300 BCE) Maya. The Middle Preclassic period was poorly known until relatively recently, but it included the earliest urbanization and the largest known monumental construction in the Maya region. Yet, as in many other regions of the world, initial social complexity in the Maya area was not associated with the emergence of monarchs. Middle Preclassic societies lacked imagery of monarchs and royal tombs. They seem to have invested in the greater good and appear to have been more cooperatively organized. The well-known monarchs of the Classic period (AD 200-900) appeared rather suddenly and coopted the already developed complex societies in the Maya region. Thus, their emergence was not gradual. While the lives of these elites were certainly improved at this time, those of the general population were not. This discussion is centered upon Nixtun-Ch'ich' and nearby sites in the Petén Lakes region of Petén, Guatemala.

1313. More than kings: Diverse forms of Classic Maya governance expressed in writing

Authors: Jessica Munson (Lycoming College)
Format: Oral

Comparative studies of Mesoamerican governance tend to characterize the Classic Maya as less collective than central Mexican polities based on their personalized rulership and exclusionary political strategies. As demonstration of their power, Maya rulers bore the title k'uhul ajaw or 'holy lord' claiming divine status that was legitimized through public rituals and commemorated on stone-carved monuments. These apical rulers, however, were not the only titled officials to appear in the inscriptions. Subsidiary lords, governors, and other priestly and military officials were also marked with royal titles that indicate their specific roles and position within Classic Maya royal courts. Drawing on a comprehensive database of Maya inscriptions, these hieroglyphic texts provide the necessary contexts to examine the distribution of power and range of strategies employed by different polities throughout the Classic period (ca. 300 – 900 CE). Recorded in their indigenous script, these dated texts include details about the wars, alliances, royal marriages, ritual ceremonies, and acts of subordination that gave shape to a shifting and fragmented political landscape. As indexes of political power, these monumental texts can also provide evidence for the concentration of power and relative importance of personal versus shared leadership. Examining the spatial distribution and diversity of these royal titles, we explore the different forms of governance that were expressed in hieroglyphic writing to question monolithic and unidimensional models of Classic Maya rulership.

898. Tracing Inequality Across Three Millennia: House Size Differentials, Governance, and Population Dynamics in Maya Communities

Authors: Amy Thompson (The University of Texas at Austin) – Jessica Munson (Lycoming College)
Format: Oral

Ancient Maya communities are often classified as "complex" and highly unequal, with vast kingdoms ruled by godly kings who were part of dynastic lineages. Beyond hieroglyphic texts and archaeological features associated with the uppermost echelon of society, robust settlement data, which has been amplified with recent lidar acquisitions, sheds light on the larger population dynamics of ancient Maya cities. Drawing on settlement data from more than 60 Maya centers spanning the Middle Preclassic (800-400 BCE) through present (1880s – present), we evaluate variations in inequality among these Maya communities based on house size measurements. The suite of Maya centers varies from small hamlets to the largest and most powerful cities in the Maya Lowlands at the apex of the Classic period. Specifically, we use the Gini coefficient as a standardized metric to assess inequality, allowing for broad comparisons through time in the Maya region. Over the course of 3000 years, political systems oscillated from more collective to more autocratic and back again and more recently are impacted by processes of colonization, civil war, and cultural imperialism. Our comparisons allow us to consider how shifts in governance and political systems, subsistence practices, environmental variability, resource availability, and population density articulate with wealth inequality. Our evaluation of inequality through time in the Maya Lowlands region of Mesoamerica contributes to our understanding of the underlying mechanisms and driving forces that manifest in variations of wealth inequality.

339. New Views on the Causal Links Between State Formation and Marketplace Evolution

Authors: Richard Blanton (Purdue University)
Format: Oral

Previous considerations by Hopkins, Grove, Habib, and others of the causal connections between state formation and marketplace economies require reframing in light of recent research. They argued that it was the growing burdens of taxation accompanying state formation that forced subjects to intensify production and to increase their participation a commercial economy. This view needs to be reconsidered in light of new discoveries that demonstrate variation in state formation from more collective to more autocratic. While the latter show little commercial development, in the more collective states there is a strong tendency toward increased commercialization resulting from regulatory involvement by states that enhanced the functionality of the highly egalitarian marketplace economies that was widely recognized as a beneficial public good. We see other causes of marketplace growth that are additional correlates of state-provided public goods, including urban growth, overall population growth and an increased material standard of living of commoner households.

1018. Power and Property in the Ethnographic Record of Indigenous California, USA: Tracking Variability in Authority, Inclusiveness, and Proprietorship

Authors: Isabelle Holland-Lulewicz – Jacob Holland-Lulewicz (Pennsylvania State University)
Format: Oral

Narratives for the evolution of property continue to uncritically link systems and relationships of proprietorship to particular modes of subsistence, demographic scale, mobility, and sociopolitical organization or complexity. While archaeologists have continued to challenge neoevolutionary models, decoupling, for instance, agriculture, complexity, and hierarchical governance, conceptions of property, especially the emergence of private property and inequality, continue to be tied to broad generalizations. In this paper, we explore the articulation between two domains: governance and systems of property relations. Using the extensive ethnographic record of Indigenous California, which encompasses dozens of unique Tribal Nations, we assess relationships between power distribution, citizen inclusiveness, and property regimes. As power becomes more or less concentrated, do conceptualizations of property become more or less collectively or privately oriented? Under what conditions of governance do particular modes of proprietorship emerge or breakdown? Alternatively, are there modes of proprietorship that underwrite or reinforce distributions of power and inclusiveness with regard to governance? We discuss the implications of these results in respect to theorizing governance and to archaeological interpretations of property and proprietorship in the past.

1556. The Archaeology of Collective Action and Environmental Governance: Histories of Ecological Degradation and Resilience

Authors: Lane Fargher Navarro (The Ohio State University | The PAST Foundation) – Tl Thurston (University at Buffalo, SUNY)
Format: Oral

Recent Research in Environmental Political Science has drawn attention to the links between political structure, governing policies, contextual factors, and environmental management/degradation. This research postulates that the orientation of governing regimes - a continuum of political structure bracketed by democracy-like and autocracy-like regimes - coupled with factors such as corruption, frequencies of extreme climatic events, local governance quality, and institutional capacity variously mitigate or exacerbate human impact on the environment. In this paper, we build on our earlier work related to collective action and environmental conditions to further explore variation in the impact of ancient societies on their environments. Here we discuss additional cases from from Europe, Asia, and the New World Our conclusion is that ancient societies with good governance (e.g., collectivity, joint production, low corruption, high quality local governance, and well-developed institutional capacity) correlate with better environmental management and lower ecological degradation; conversely, shifts towards characteristics associated with failed states couple with low quality local regimes tend to result in higher exploitation of natural resources and increased degradation. However, as with contemporary examples, variation in the archaeological record illustrates that sometimes policy, rather than politics, can impact such relationships.

2148. The Distribution of Power and Inclusiveness in Bronze Age Transylvania and Carpathian Basin: Identity, Interaction, and Inequality

Authors: Colin Quinn (University at Buffalo)
Format: Oral

The Carpathian Basin and Transylvania during the Bronze Age has been a laboratory for the study of the distribution of power, political authority, and social cohesion for over 30 years. Bronze Age societies in Transylvania and the Carpathian Basin were a multi-scalar mosaic of complexity, where local histories and variable landscape affordances shaped and were shaped by larger-scale political, social, and economic networks. One emergent phenomenon that was a key feature of the Middle Bronze Age (2000-1500

BCE) in the Carpathian Basin and Transylvania was the creation of distinctive regional cultural identities with inclusive cultural practices and marked, though traversable, boundaries. Significantly larger than any single polity, the emergence of regionally distinctive cultural identities occurred alongside a process of interconnecting the continent through expanding trade networks and commodity chains. Alongside the emergence of regional cultural identities that local communities create and maintain, there was a proliferation in the diversity of local strategies for how people organize themselves socially, economically, and politically. Combining network analysis, semiotics, and political economic approaches, this paper traces how this process of cultural identity-formation facilitated inclusivity and exclusivity within and between communities in Transylvania and the Carpathian Basin. These changes, perhaps counterintuitively, contributed to the diversification of socioeconomic and political strategies within this region and had significant consequences for the long-term trajectories of the distribution of power and the institutionalization of social, economic, and political inequality.

486. Ecologies of Governance in the First Millennium AD: Environment, Rulership and Inequality

Authors: Patrick Gleeson (Queen's University Belfast)
Format: Oral

This paper presents some of the approach and early findings of the Ecologies of Governance project. Ecologies of Governance interrogates the emergence of inequality and the economic basis of rulership in early medieval, kin-based societies by undertaking multi-proxy and comparative analyses of the environment and agrarian regimes of some of the major and iconic royal landscapes of first millennium AD Britain and Ireland. It addresses understandings of strategies of rulership and governance through a fundamental reassessment of the emergence of inequality and its implication in political production. Its case studies occupy seminal places within ethnically-centred but now outmoded models for the origins and functioning of northwest European kingdoms, commonly analysed within isolated and diametrically opposed 'Celtic'/'Germanic' historiographies. Deploying novel approaches to their (i) origins, (ii) settings, (iii) regionality, (iv) landscape context and (v) diachronic transformation, Ecologies of Governance shifts emphasis towards scale and scale-change within regime and community relationships, and the associated economic and ecological basis of rulership within emergent polities, to fundamentally redress previous biases, and present novel, empirically-grounded analyses. The paper will present some preliminary analysis of the project's key case studies, Navan Fort, Milfield, Llangorse, Dunned and Rendelsham, as a basis for questioning established models of kingship and political formation. It will sketch some implications of these landscapes and their development for wider understandings of strategies of governance and the formation of polities in a comparative context.

632. Ceramic production and exchange in the early Inka heartland: Interaction networks before the formation of an empire (AD 1000-1400)

Authors: Julia Earle (University of Warsaw) – E. Williams Franco Chávez (Independent Scholar) – Bill Sillar (University College London) – Alexei Vranich (University of Warsaw)
Format: Oral

The Inkas built the largest Indigenous empire in the Americas (AD 1400-1532), but the mechanisms that triggered state formation and territorial expansion remain unclear. Traditional approaches rooted in culture history and neo-evolutionary theory had identified top-down power and centrifugal coercion as the driving force behind social change in Cusco from the Late Intermediate Period (LIP, AD 1000-1400) until the Spanish invasion. This account was thought to be supported by coarse-grained ceramic seriation, which observed broad similarities among LIP pottery across the area that would eventually become the imperial heartland. Shared conventions in decoration and vessel form were attributed to the growing influence of the pre-imperial Inka ethnic group in the Cusco Basin, as indicated by the spread of a ceramic style known as Killke. Increasing applications of digital microscope imaging have permitted greater precision for classifying and comparing ceramic assemblages based on paste, form, and surface decoration. Building on these advances, this paper presents multi-scalar insights on ceramic production and consumption. Specifically, we draw on a regional ceramic data set from over 20 sites to contextualize recent excavations of an LIP component at the monumental site of Saqsaywaman, likely representing a pre-imperial Inka occupation. Initial results contradict prior expectations. Ceramic data from sites within approximately 50 km of the Cusco Basin suggest complex exchange relationships and permit the definition of multiple overlapping interaction spheres in which some groups cultivated far-reaching ties. Conversely, while pre-imperial Inka (Killke) pottery was notably limited in its distribution, the distinctive aesthetic repertoires and hospitality practices associated with Killke ceramics could help explain how the Inkas cultivated centripetal power and elevated social and cultural capital by AD 1400. Leveraging these data and drawing on colonial-era chronicles, we evaluate how the Inkas' autocratic governance emerged from a context characterized by an interactive network of diverse self-governing populations.

42 BURIAL PRACTICES AND FUNERARY ARCHITECTURE IN THE LEVANT (5TH C. BCE–7TH C. CE)

Theme: 1. Widening perspectives in material culture studies
Organisers: Michael Eisenberg (School of Archaeology and Maritime Cultures, University of Haifa | The Zinman Institute of Archaeology, University of Haifa) – Ionis (Yannis) Nakas (College Year in Athens - International Centre of Mediterranean Studies)
Keywords: Burial practices, Funerary architecture, Levant, Roman Syria, tombs
Format: Regular session

SESSION ABSTRACT

The last two decades have witnessed an immense revival of research on burial practices and funerary architecture of the wider Classical period (5th century BCE–7th century CE) in the Levant. Despite numerous excavations of necropoleis and smaller-scale burials, significant lacunae remain, particularly regarding regional burial practices and the synthesis of broader regions and their mutual influences. Partly, this is due to a recent trend focusing on proposing new theories rather than, first and foremost, publishing new data derived from rigorous archaeological investigation. However, it is the new excavations and surveys, which often use modern research tools, e.g., bioarchaeology, archaeobotany, spatial and focal analyses, remote sensing, and 3D documentation and modeling, that enable us to address unresolved questions in this field. The session welcomes contributors with fresh archaeological investigations from the field and the lab, focusing on the Levant during the Classical–Early Byzantine period (5th century BCE–7th century CE), with a particular emphasis on the topics listed below, though not restricted to them. • Urban versus rural burial practices • New large-scale excavations of necropoleis • New finds of burials that elude interpretations • Funerary architecture in Roman Syria • Murals of burial caves • Burial coffins typology and reconstruction: sarcophagi, clay, wood, and lead • Funerary architecture typo-chronology • Geo-analyses and remote sensing of necropoleis • Recreating the path – from the home of the deceased to the tomb • Bioarchaeology and archaeobotany of burials • The connection between geology and burial preferences • Funerary gifts • The shifting of Classical canons into provincial-regional funerary architecture • Funerary architecture sculptured in basalt

CONTRIBUTION ABSTRACTS

729. The unwritten, sacred law of the gods - Burial practices in Palestine during the Hellenistic period

Authors: Katarzyna Langenegger (University of Bern)
Format: Oral

Building on the premise—famously dramatized in Antigone—that funerary obligations are anchored in enduring norms, this paper examines burial practices in Palestine during the Hellenistic period as a domain where change is typically incremental and closely tied to shifts in political power, economy, and population dynamics. Despite the interpretive prominence of "Hellenization," a comprehensive archaeological synthesis of Hellenistic burials in the region has been lacking. This study addresses that gap through a systematic compilation and comparative analysis of published evidence, structured with the analytical framework proposed by Wodtke and informed by the concept of glocalization. Eight funerary forms can be documented, alongside inhumation and cremation, and primary/secondary deposition. Most burial types—shaft and pit graves, grotto burials, and rock-cut chamber tombs—represent long-lived local traditions. By contrast, conspicuous innovations such as monumental tomb architecture and roadside commemorative markers appear only in specific contexts and are especially visible in Jerusalem. The paper argues that the geopolitical volatility between Ptolemaic Kingdom, Seleucid Empire, and Hasmonean dynasty correlates with shifts from concealed, non-representational tomb access toward selectively monumental, status-coded funerary display. Case studies from Atlit and Maresha further reveal a cultural mosaic in which external motifs (Greek, Egyptian, and Near Eastern) were appropriated unevenly and primarily by elites, while collective family-oriented burial remained the dominant local practice.

129. Sealed Graves from the 3rd Century CE along the Road to Jerusalem: Funerary Finds from Nesher Ramla

Authors: Ayelet Segal Reznitsky (University of Haifa)
Format: Oral

The site of Nesher Ramla is a large-scale, ongoing rescue excavation conducted by the University of Haifa within an active quarry in modern Israel. Excavation takes place under challenging conditions, including ongoing industrial activity and modern disturbance. Recent work has focused on an area near the ancient route leading to Jerusalem, where a burial ground dating to the 3rd century CE was identified. The graves were found intact and undisturbed, carefully sealed with marble slabs or orderly rows of stones. This level of preservation is particularly striking given the long-term use of the nearby route as a major thoroughfare. The burials contained a funerary assemblage including gold jewellery and a bone figurine. Most small finds were recovered through systematic soil screening rather than in situ, limiting the ability to reconstruct their original placement within the graves. At the same time, intensive screening greatly improved the recovery of otherwise unnoticed elements of the assemblage. This paper presents the archaeological and methodological context of the excavation, the burial installations, and the funerary finds, with particular attention to the gold ornaments and the bone figurine. The discussion highlights the preservation and uniqueness of these graves and demonstrates how careful rescue excavation can contribute to understanding burial practices and social display in this region during the 3rd century CE. The finds from Nesher Ramla illustrate both the scientific potential and the interpretive limitations of assemblages recovered from highly impacted landscapes.

1425. The Roman-Byzantine Southern Necropolis at Hippos of the Decapolis: Demarcation,

Characterization, and Typological-Spatial Analysis

Authors: Alexander Khait (School of Archaeology and Maritime Cultures, University of Haifa)
Format: Oral

The Southern Necropolis of Hippos is the largest among the city's three distinct cemeteries. It takes up an entire slope and top of a hill to the south of the hill on which the city stood. The two hills are separated by a streambed through which ran a Roman road. Besides a cursory documentation of the various burial features in the central part of the necropolis, no research has been conducted there until recently. This study presents a spatial and geo-archaeological analysis of the Southern Necropolis, integrated into a GIS database, enabling a feature-level study. Based on field survey, drone-based documentation, historical data, and small- scale archaeological excavations, the various types of burials are counted, and the cemetery boundaries are established. Preliminary mapping indicates how the terrain and geology influenced the placement of the burials, creating zoning: soil-dug and rock-cut pit graves cluster on the terraces and gentle slopes, whereas burial caves are restricted to exposed nari-rock bedrock ledges. These results represent the initial phase of analysis, with further integration of field observations, topographic data, and aerial imagery expected to refine our understanding of the necropolis.

569. Copper-alloy Plates from Roman-period Funerary Contexts in the Decapolis and Beyond

Authors: Arleta Kowalewska (The Zinman Intitute of Archaeology, University of Haifa) – Michael Eisenberg (University of Haifa)
Format: Oral

One of the most common metal finds from the Southern Necropolis of Hippos and beyond are copper-alloy plates. The same kind of artefacts has been reported previously at Abila, another city of the Decapolis (a region of Graeco-Roman poleis in the southern Levant, in the Roman provinces of Syria and Arabia), situated just 20 km east from Hippos. At both locations, the necropoleis, and with them the metal plates, are dated to the Roman period, from the late 1st century BCE to the early 4th century CE. The plates are thin, circular sheets, decorated on one side with punched geometric designs. They are perforated by nail holes and a have a hole in the center of the boss where a bronze ring was installed. The lecture presents the details of these unusual finds and their findspots, explains their most probable use as decorations of wooden caskets, and traces the published examples of similar finds from around the Roman World to try and reveal their socio-cultural origin.

1837. Excavations in Khirbet-Sar (Jordan) revels monumental architecture with similarities to Roman temple tombs

Authors: Anna Kubicka-Sowińska (Wroclaw University of Science and Technology)
Format: Oral

Excavations at Khirbat es-Sar, along the western road to Amman, uncovered a monumental courtyard that may have been associated with a palace tomb of the Roman East. The study explores architectural ties with Amman's temple tombs, illustrating broader later Roman funerary practices and highlighting creation of memorial landscape of Transjordan. The site's strategic elevation and visibility underscore its significance, a fact noted by 19th-century travelers such as Claude R. Conder and Howard C. Butler. Their conflicting reports regarding the location of sarcophagi whether along the neighboring road or sheltered beneath the arcades—point to a funerary environment. The masonry craftsmanship and decorative programs align the complex with Roman mausolea of the 2nd to 3rd centuries AD located in Amman region. Recent 2025 excavations have further clarified the site's spatial logic, revealing a monumental eastern entrance characterized by at least two doorways and plain pilasters. The homogeneity between the voussoirs and door jambs suggests a singular, sophisticated construction phase. Furthermore, the discovery of a two-stepped limestone platform preceding the entrance provides a direct parallel to monolithic mausolea at the Nujais Shrine and Qasr al-Qwaysimah located as well in Amman. By synthesizing these architectural elements—specifically the standardized 2.55-meter arcade spans and specialized eastern mouldings—this paper argues that Khirbat es-Sar represents a example of Roman temple tombs with architectural vocabulary crafted especially for tombs located in Amman.

1791. New insights on the development and decline of the Beth She'arim necropolis

Authors: Adi Erlich (Zinman Institute of Archaeology, University of Haifa)
Format: Oral

Beth She'arim in the Lower Galilee was an important Jewish village in the Roman period, with an extensive necropolis containing lavish tombs that served as burial places for Jews from across the Roman East. The necropolis is renowned for its many inscriptions in Greek, Aramaic, Hebrew and more, and the art engraved and painted in the many catacombs. The main period of use for the necropolis is the Late Roman period, 3rd-4th centuries CE. However, the finds and inscriptions from the catacombs hint at a longer period of use, from the Early Roman period to Medieval times. There is a debate over the cemetery's last use. While the excavators claimed that it declined in the mid-4th century after the Gallus revolt, and interpret all the late finds as evidence of robbery and activity other than mortuary, others maintain that there has been a continuous burial at the site from the Roman period through the Byzantine period and even later. Recent excavations in the largest catacomb at Beth She'arim, catacomb 20, also known as the sarcophagi catacomb, have yielded new evidence for the different phases, based on stratigraphic and radiometric considerations, as well as the types of grave goods and their placement within the cave. Further insights come from the correlation between the use of Greek and Hebrew inscriptions, their different dates, and various locations. Thus, for the first time in the research of Beth She'arim, we can offer a new history for the Beth She'arim cemetery.

43 SCIENTIFIC DATING OF ARCHITECTURE: FROM METHODS AND CASE STUDIES TO SOCIAL IMPACT

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Pavla Tomanova (Institute of Archaeology of the CAS, Prague | ETH Zurich) – Irka Hajdas (ETH Zurich) – Marta Caroselli (SUPSI)
Keywords: scientific dating methods, archaeology of architecture, radiocarbon dating, material analyses, social impact
Format: Regular session
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

Determining precise age of historical buildings, or even of relics of masonry constructions, stands as a major problem in archaeology and construction history. Standard archaeological or stylistic dating methods can determine ages only in broad chronological intervals. However, scientific dating methods developed in last decades can particularly contribute to resolution of this problem, e.g. application of OSL, archaeomagnetism, dendrochronology and, finally, radiocarbon dating (14C) of lime mortars and of organic materials embedded in the mortars. Although, there are numerous obstacles to use those methods on routine basis, e.g. the need for special laboratory treatments, machinery, or the relatively high costs of the measurement or analyses. Nevertheless, there are already numerous positive case studies indicating the dawn of more frequent application of scientific dating methods, in particular of 14C dating of lime mortars. Moreover, radiocarbon analyses of historical lime mortar are often accompanied by characterisation of the petrographic composition and chemical properties of the investigated mortar samples. That way, the research contributes to our knowledge about past construction materials and techniques in a broader context. The aim of this session is to share experience in absolute dating of masonry constructions and buildings using scientific methods, primarily, but not only, the 14C dating of lime mortars. The session intents to discuss possibilities, limits and methodological aspects of various methods, contribution of additional analyses (petrographic analyses, cathodoluminescence, FTIR,…), but also the impact of scientific data on the heritage care and/or public perception of individual historical buildings under investigation.

CONTRIBUTION ABSTRACTS

1116. Architectural stratigraphy and scientific dating of masonry in historic buildings: methodological challenges from heritage management practice

Authors: Miha Murko – Gašper Rutar (Institute for the Protection of Cultural Heritage of Slovenia)
Format: Oral

The interpretation and dating of masonry structures within historic buildings remain a widely recognised methodological challenge in archaeology of architecture and heritage management. Architectural stratigraphy, stylistic assessment and relative archaeological indicators often provide only broad chronological frameworks, which are insufficient for a detailed understanding of construction phases, building sequences and later interventions. This poster offers a methodological reflection on the limits of traditional approaches to dating standing masonry from the perspective of preventive archaeology and conservation practice. Rather than presenting specific case studies or laboratory results, it focuses on recurring analytical questions encountered during architectural analysis, such as how construction phases are identified, how repairs and reused materials affect stratigraphic interpretation, and why correlating architectural observations with absolute chronologies often remains problematic. The contribution discusses the potential role of scientific dating methods – such as radiocarbon dating of lime mortars, dendrochronology and optically stimulated luminescence (OSL) – as complementary tools within architectural stratigraphy. Particular attention is given to the conditions under which such methods can meaningfully contribute to heritage management, including issues of sampling strategy, feasibility, costs and the integration of scientific data into archaeological interpretation and conservation decision-making. By emphasising interdisciplinary dialogue between archaeologists, conservation professionals and natural scientists, the poster frames scientific dating not as a replacement for architectural analysis, but as a methodological support for advancing interpretation and improving the protection and management of built heritage.

677. The MoReS Project: A Tephrochronological Approach to Mapping Modern Restoration Phases in Pompeii

Authors: Simone Dilaria – Michele Secco – Caterina Previato – Jacopo Bonetto – Maria Stella Busana (University of Padova

- Department of Cultural Heritage)
Format: Oral

Pompeii is internationally renowned for its exceptional state of preservation; however, the site's long and complex history of modern restoration interventions—many poorly documented since the 18th century—continues to complicate the interpretation of the original ancient architectural fabric. This issue is particularly evident at the Sarno Baths (Regio VIII, Insula 2, 17–21), a terraced, multi-storey building on the southern slope of the Pompeian plateau. Here, early 20th-century restorations frequently involved the reconstruction of collapsed walls and vaults using recycled Roman materials and locally sourced volcanic debris, often guided by philological principles of imitation rather than scientific criteria. Distinguishing ancient construction phases from modern repairs therefore remains a major challenge. Over the last decade, multidisciplinary research by the University of Padova has analyzed more than 100 mortar samples from the Sarno Baths, identifying distinct compositional groups that enable a reliable differentiation between ancient and modern building phases. Building on these results, the MoReS project (Modern Restorations in Pompeii: a Novel Tool to Solve the Vesuvian Heritage Conservation Dilemma), funded by the Gerda Henkel Stiftung, aims to develop a high-resolution analytical protocol to identify modern restoration mortars across Pompeii. The project targets tephra inclusions (pumices and lapilli) used as mortar additives, whose petrochemical fingerprints reflect their eruptive sources within the Phlegraean Fields and Vesuvian districts. Because pre-79 AD tephras differ geochemically from those of the 79 AD eruption and later events, widely recycled during modern restorations at the Sarno Baths, the MoReS workflow combines petro-mineralogical and high-resolution trace-element analyses to establish robust criteria for the tephrochronological attribution of volcanic inclusions. The approach enables the systematic identification of restoration mortars and supports the development of a standardized protocol for reconstructing building and rebuilding histories across the Vesuvian region.

691. Construction Chronologies of Late Antique Fortifications in the Eastern Adriatic: Insights from Preliminary Mortar Characterisation at Rab and Danilo

Authors: Natali Neral (Institute of archaeology, Zagreb) – Małgorzata Zaremba (Institute of archaeology, Cardinal Stefan Wyszynski University in Warsaw) – Agnese Kukela (University of Lativa, Riga) – Ana Konestra (Institute of archaeology, Zagreb) – Fabian Welc (Institute of archaeology, Cardinal Stefan Wyszynski University in Warsaw)
Format: Oral

The Late Antique period in the eastern Adriatic (4th–7th centuries AD) is characterized by intensified construction of forts, linear defensive systems, and the refurbishment of urban fortifications, with building activity likely beginning as early as the late 2nd–3rd centuries. Despite the presence of more than thirty coastal and insular fortification sites stretching from the Kvarner Gulf to the Dubrovnik region, the chronology of their construction, use, and successive phases of rebuilding remains poorly defined. Within the framework of the Croatian Science Foundation project Re:Set, three such sites are currently under investigation using an interdisciplinary approach that integrates materials analysis, radiocarbon dating of organic inclusions, and detailed archaeological contextualisation. The primary objective is to establish absolute chronologies for distinct construction phases and to assess regional patterns through comparative studies of nearby rural villas and urban centres. This paper outlines the project's methodological framework and presents initial results from two study areas: the island of Rab (Kvarner) and the Roman settlement of Rider (Danilo, near Šibenik) in northern Dalmatia. Preliminary radiocarbon dates from organic inclusions are discussed in relation to architectural phases and material analyses, highlighting both the potential of the approach and the methodological challenges encountered.

2484. Radiocarbon Dating of Encaustic Beeswax Used for Polychromy on the Athenian Acropolis

Authors: Melanie Roffet-Salque – Timothy Knowles (University of Bristol) – Asterios Bakolas (National Technical University of Athens) – Eleni Aggelakopoulou (National Technical University of Athens | Hellenic Ministry of Culture)
Format: Oral

Encaustic painting, based on beeswax as a binding medium, was widely employed in antiquity for architectural polychromy. Recent analytical investigations of the Acropolis monuments in Athens have identified beeswax within preserved paint layers on the Parthenon, Propylaea, and Erechtheion, raising questions regarding its chronology and whether it derives from original Classical-period decoration or later conservation treatments (ganosis) or repainting. Establishing the origin of this material is critical for assessing the authenticity of the surviving polychromy. This study reports the multi-analytical characterization and radiocarbon dating of three polychrome layers from these monuments. Non-invasive and microanalytical techniques, including Visible-Induced Luminescence (VIL), stereomicroscopy, μ-Raman spectroscopy, Gas Chromatography–Mass Spectrometry (GC–MS), and SEM/EDX, were applied to determine the composition and preservation state of the paint layers. Radiocarbon dating was performed by Accelerator Mass Spectrometry (AMS). Results demonstrate a high concentration of well-preserved beeswax intimately mixed with mineral pigments, consistent with the encaustic technique. AMS radiocarbon dating places the beeswax in the 5th century BCE, confirming the Classical origin of the paint layers and providing the first direct scientific dating of architectural polychromy from the Acropolis monuments.

1177. An analysis of consolidant contaminated structural timbers for radiocarbon dating

Authors: Daniel Morris – Gerard Barrett (Queen's University Belfast)
Format: Oral

The archaeological remains of buildings can yield large timbers which are suitable for dendrochronological dating, but in some cases the number of available rings is insufficient for technique to produce an accurate age. While radiocarbon dating can offer an alternative in such cases, these timbers are also often treated with conservation materials. Conservation materials, such as consolidants, preservatives and glues, are a well-known source of contamination in the radiocarbon dating of organic materials. These contaminants introduce carbon of a different radiocarbon age to that of the archaeological substrate, and so if not entirely removed, will shift the measured age by an unknown amount. Studies which aim to assess the effectiveness of common pretreatment methods which are used to remove these contaminants commonly make use of analogue samples: materials of known age which are then purposefully contaminated. However, over long periods of time, conservation materials, particularly organic polymers, are susceptible to ageing effects which make them more recalcitrant. Therefore, it is not clear whether analogue substrates such as these suitably model the behaviour of real archaeological material, which are often conserved many years before dating is attempted. Dendro-dated timbers from archaeological structures are therefore ideal for investigations of consolidant contamination, as they are of known age, contaminated, and importantly, have aged for several years since being contaminated. This work presents investigations on contaminated structural timbers, characterising and modelling the effects of the contamination using FTIR, TGMS and ramped combustion/pyrolysis radiocarbon dating methods. Finally, these results are compared to those for analogue samples.

2126. Dry-Stone Architecture under Constraints: A Multi-Proxy and Bayesian Approach from the Megalithic Monuments of Menjez (Lebanon)

Authors: Méryl Defours Rivoira (University of Geneva)
Format: Oral

Establishing reliable chronologies for dry-stone architecture remains a major methodological challenge, particularly in contexts lacking organic material and affected by disturbance, reuse, and early excavation practices. This paper presents a methodological case study from the late prehistoric megalithic funerary monuments of Menjez (Akkar, northern Lebanon), exploring how an integrated dating strategy can be developed for dry-stone-built architecture under such constraints. The Menjez assemblage is marked by conditions that severely limit chronological resolution, including the exclusive use of basalt, extensive looting, incomplete archival documentation from excavations conducted in the 1960s, and complex architectural sequences resulting from reuse and reconfiguration. These factors restrict the applicability of single dating techniques and required the implementation of an adaptive, multi-proxy approach. Relative chronological sequences were established through building archaeology, combining the reading of architectural elevations, reconstruction of building chaînes opératoires, and architectural phasing with stratigraphic data from recent excavations conducted as part of the MEG-A project, associated material culture, and archival sources. Absolute dating relied on optically stimulated luminescence (OSL) dating of sediments, OSL dating of ceramic sherds, and bioapatite analyses, each subject to specific constraints related to sampling context, post-depositional processes, and signal preservation. All datasets were integrated within a Bayesian chronological modelling framework, allowing stratigraphic relationships, architectural sequences, and prior archaeological information to be formally incorporated in the assessment of date reliability, outlier detection, and sampling strategy refinement. This approach resulted in a robust chrono-typological framework for the Menjez monuments. Beyond the Menjez case, this contribution discusses methodological lessons that may inform the scientific dating of dry-stone architecture in similarly constrained contexts, highlighting the role of Bayesian modelling in integrating heterogeneous dating proxies and in linking architectural chronology to interpretations of construction practices, technical traditions, and long-term social dynamics.

1152. Luminescence dating of mortars through single grain procedure at European scale : potential and drawbacks

Authors: Petra Urbanova (CNRS French National Center for Scientific Research)
Format: Oral

With the beginning of the 21st century, the methodologies used in archaeology of architecture noted considerable transformations with an increasing role of natural science disciplines in the analyses of building materials, and of mortars in particular. In this context, a great progress has been made in the field of dating with optically stimulated luminescence. Thanks to the development of the single grain procedure (Duller 1999, SG-OSL) that allows overcoming the problems of heterogeneous exposure of mortars to light at the moment of mortar making, luminescence dating of quartz extracted from mortars has progressively become a reliable research method that has been employed in various archaeological research projects across Western Mediterranean (Javel et al. 2019; Urbanová et al. 2020; Urbanová et al. 2023; Sanjurjo-Sanchez et al. 2024). The large scope of geological contexts in which this dating technique was used in the last 15 years allowed mapping its potential but also better understanding its limits. In particular, it turned out that depending on its provenance across Europe, quartz sensitivity to SG-OSL stimulation is highly variable and difficult to predict. In luminescence dating of mortars, only a little proportion of analyzed grains gives a detectable signal. In some cases, it can be up to 5 %, while in many other cases it can be less than 1 % or even less than 0.5 %. At some point, the proportion of luminescent grains becomes so low that we have to ask about the feasibility of dating. The goal of this paper is to show the impact of the luminescence dating methods on the re-examination of chronology of early medieval monuments and to put the collected data on quartz sensitivity collected on about 40 historical sites in Croatia, Italy, France and Spain in context in order to make non-specialists aware of this particular issue.

993. Examples of radiocarbon dating of Roman and Medieval mortars

Authors: Irka Hajdas (Laboratory of Ion Beam Physics, ETH Zurich) – Walter Caseri (Laboratory for Multifunctional Materials, ETH Zurich) – Negar Haghipour (Laboratory of Ion Beam Physics, ETH Zurich | Geology Department, ETH Zurich) – Marek Krąpiec (AGH, Geophysics and Environmental Protection, Krakow) – Danuta Michalska (Geochronology, Institute of Geology, Adam Mickiewicz University Poznań) – Petra Ohnsorg (ProSpect GmBH, Aarau) – Jacek Pawlyta (AGH, Geophysics and Environmental Protection, Krakow)
Format: Oral

The first attempts to date mortars using the conventional counting method highlighted the potential and difficulties of separating carbonate fractions to accurately date the binders. The significant development was only possible with the AMS measurement technique and the interdisciplinary work summarized by Ringbom et al. (2014). Interest in radiocarbon dating of mortars is expressed across multidisciplinary fields, including archaeology, art history, architectural history, and conservation. Despite the challenges of dating mortars, ongoing research continues to elucidate the material and improve dating methods. This paper presents several ongoing studies that illustrate the complexity and potential of dating mortars and the methods employed (Hajdas et al., 2020). Roman mortars are known to be challenging, as illustrated by samples from two sites. One sample was collected from the Roman site located on the eastern Zürichsee lakeshore in Kempraten, Canton of St. Gallen, Switzerland. The second sample was mortar from the Aqueduct of Augusta Raurica in Augst, near Basel, Switzerland. Medieval mortars were collected from the underground of the Fraumünster, a protestant church in the center of Zurich. We attempt to date the different phases of the construction. The initial results are promising; however, the amount of carbonate separated was insufficient for graphitization, and a new separation is needed to improve precision. A promising result has been obtained as part of a pilot study to date Wawel Castle in Krakow. An ongoing project led by M Krąpiec (AGH) will provide more detailed chronologies of this prominent construction.

2261. The radiocarbon dating of Mg- mortars: Specific characteristics of the material, characterization, sample preparation and interpretation of results

Authors: Marta Caroselli (University of Applied Arts and Sciences of Southern Switzerland SUPSI) – Danuta Michalska (Faculty of Geographical and Geological Sciences, Adam Mickiewicz University) – Irka Hajdas (Laboratory of Ion Beam Physics, ETH Zurich)
Format: Oral

Due to their technological preparation process and the impossibility of reuse, lime mortars are one of the few inorganic materials for which it is possible to date the construction of a building using radiocarbon dating. The carbon that enters the mortar as CO_2 during carbonation within the lime cycle can indeed be dated. One specific type of historical mortar is magnesian mortar, which is derived from dolomitic raw material. In certain geographical areas where limestone outcrops are rich in magnesium, this material has been used historically both as a construction material and, after thermal treatment, for preparing mortars and plasters. Magnesian limes are obtained from dolomite, a limestone in which magnesium (Mg) replaces calcium (Ca) in the crystal lattice of calcite due to geological processes. Dolomitic limes are widely distributed, particularly in the southern Alpine region, where they were historically the main material used for producing mortar. Unlike high calcium lime, magnesian lime does not follow a similar cycle: Mg-hydroxide (brucite, $Mg(OH)_2$) slowly forms carbonates and, under certain conditions, may not carbonate at all. Consequently, the products of these reactions are chemically complex and exhibit different solubilities, which complicates the process of mortar radiocarbon dating. Preliminary characterization of the mortar through petrographic analysis is crucial to identify potential issues, determine the most appropriate methodology for sample preparation and ensure the correct interpretation of the results. This paper will explore this issue through specific examples and case studies from different historical periods and geographical locations. The results demonstrate the value of interdisciplinary collaboration to improve dating practices of potentially problematic materials.

481. Radiocarbon dating of lime mortars: intercomparison of labs and methods. A Case study of Břeclav - Pohansko (CZ)

Authors: Pavla Tomanova (Institute of Archaeology of the CAS, Prague, v. v. i. | Laboratory of Ion Beam Physics, ETH Zurich) – Jan Válek (Institute of Theoretical and Applied Mechanics, CAS, v. v. i.) – Irka Hajdas (Laboratory of Ion Beam Physics, ETH Zurich) – Gerard Barrett (14CHRONO, Queen's University Belfast) – Ivo Světlík (Czech Radiocarbon Laboratory, Prague) – Petr Dresler – Renáta Přichystalová (Department of Archaeology and Museology, Masaryk University Brno)
Format: Oral

The main challenge of radiocarbon (14C) dating of mortars is separation of the carbon from CO2 that was fixed in the mortar at the time of construction, therefore is essential for determination of the age of the object. To achieve this, 14C laboratories use various methods of sample treatment. In terms of the MORDAT research project, selected mortar samples are being 14C dated in parallel in different laboratories (ETH Zurich, 14CHRONO Belfast, CRL Prague) with the aim to compare and investigate the methods used. The most sophisticated intercomparison to date was conducted on mortar samples from the rotunda at the Břeclav – Pohansko site. Břeclav – Pohansko is an early medieval fortified settlement located in the Czech Republic. In 2007, remains of a rotunda have been unexpectedly discovered and dated to the 9th century based on the archaeological context. In 2021, three mortar samples from the

rotunda were 14C dated at ETH Zurich and at CRL Prague in cooperation with ITAM. To remove potential contamination from the samples, ETH laboratory applied sequential dissolution which removes potential geogenic carbon (Hajdas et al., 2020), whereas ITAM used suspension and sedimentation (Válek at al., 2026). In 2026, in terms of the MORDAT project, the samples were repeatedly analysed into more details. They were homogenised, purified by suspension and sedimentation at ITAM, and further processed and dated at ETH Zurich (using sequential dissolution) and in parallel at 14CHRONO Belfast (using ramped pyrolises; Barrett et al. 2021). Moreover, additional material analyses have been applied (optical microscopy, cathodoluminescence, FTIR) to characterise the binder and identify its potentially contaminating compounds. The aim of this research is to determine the age of the rotunda at Břeclav – Pohansko more accurately, and to examine the possibilities of treatment procedures for more reliable 14C dating of mortars.

883. The Castles Project: a new challenge to reconstruct the chronology of Medieval Castles in Central-Northern Italy

Authors: Giovanna Bianchi – Andrea Arrighetti (University of Siena) – Giulia Bellato (University of Cambridge) – Mauro Buonincontri (University of Siena) – Sara Calandra (University of Florence) – Alessio Fiore (University of Turin) – Carlo Garzonio (University of Florence) – Carmine Lubritto – Noemi Mantile (University of Campania "Luigi Vanvitelli") – Elena Pecchioni (University of Florence)
Format: Oral

The study of medieval castles and of their transformations, in both structural and socio-political terms, is a long-standing key theme of Italian historiographical research. Though it has been tackled extensively through historical, archaeological, and archaeometric study, it still retains numerous open questions that carry significant historiographical implications. The precise chronology of the transformations of castles between the second half of the 11th century and the 13th, for instance, remains unclear. One of the key elements of this transformation involves the shift to durable materials, accompanied by the increasing use of lime-based binders. This paper presents the results of an ambitious project developed by the universities of Siena, Florence, Turin, and Campania. It is based on a study of a set of Italian medieval castles from Tuscany, Piemonte, and Liguria, selected because of their historical and archaeological significance. It is aimed as refining our understanding of castles construction phases, specifically through the development of new protocol for the dating of historical lime-based mortars. The field of archaeometry has seen great strides in recent years, especially in terms of the development of increasingly precise procedures for the dating of historical mortars. However, these types of analyses still retain significant challenges, not least that of successfully integrating the archaeometric data with that produced through historico-archaeological research. The paper presents an innovative framework of research which centres mortar dating in the creation of historical models. At the same time, it also explores the contribution that historico-archaeological analysis can bring to archaeometry, especially regarding the creation of new protocols of analysis. It aims at offering a valuable example of interdisciplinary research and at opening a fruitful discussion regarding the challenges and the advantages of creating research frameworks that can integrate data from different specialisations.

1432. Radiocarbon Dating of Mortars from Fortified Churches in Southern Transylvania: Methods, Case Studies, and Architectural Implications

Authors: Ioan Marian Tiplic (Lucian Blaga University of Sibiu) – Corina Anca Simion – Maria Valentina Ilie – Cristian Mănăilescu – Doru Gheorghe Păceșilă (Institute for R&D in Physics and Nuclear Engineering - IFIN-HH)
Format: Oral

Scientific dating methods have become increasingly important for refining architectural chronologies, particularly in contexts where written sources are scarce or ambiguous. Among these approaches, radiocarbon (14C) dating of lime mortars provides a direct chronological indicator for construction and rebuilding phases, offering valuable insights into the history of medieval architecture. This paper presents new results from 14C dating of mortars sampled from fortified churches in southern Transylvania, focusing on the sites of Agnita, Șaroș, and Ruja. The study addresses both methodological and interpretative aspects of mortar dating. Particular attention is paid to issues commonly associated with this technique, such as the selection of suitable samples, the separation of the binder fraction from aggregates, and the identification of potential contamination caused by secondary carbonation or later repair phases. A controlled laboratory protocol was applied prior to AMS measurement in order to improve the reliability of the obtained dates. The calibrated results allow for a more precise attribution of major construction and modification phases, in several cases diverging from chronologies previously inferred on stylistic or typological grounds. Beyond the presentation of individual case studies, the paper discusses the broader implications of scientific dating for the study of fortified ecclesiastical architecture. Establishing absolute chronologies contributes to a clearer understanding of building dynamics in a frontier region marked by social change, defensive needs, and community investment in monumental architecture. In this respect, radiocarbon dating of mortars not only refines architectural histories but also enhances the interpretation of social processes embedded in the built environment. The Transylvanian examples demonstrate the potential of this method to inform interdisciplinary research and to support evidence-based heritage management and conservation strategies.

672. Radiocarbon dating of lime mortars from four medieval churches in south-western Transylvania

Authors: Maria Emilia Cringaci Tiplic (Institute of Social Sciences and Humanities Sibiu, Romanian Academy) – Corina Anca Simion – Maria Ilie – Cristian Mănăilescu (Horia Hulubei National Institute for R&D in Physics and Nuclear

Engineering)
Format: Oral

Recent archaeological investigations at four medieval churches in south-western Transylvania in modern-day Romania, key monuments for understanding the development of medieval ecclesiastical architecture in the region, have provided significant new data on their chronology and construction phases. The research was conducted in the context of extensive restoration works, which allowed the collection of lime mortar samples for radiocarbon (^{14}C) analysis from the Romanesque and/or Gothic foundations of the churches at Câlnic (a UNESCO World Heritage monument), Miercurea Sibiului, Sibiu, and Cisnădie. The main aim was to refine the chronology of the Romanesque buildings and their subsequent Gothic reconstructions. This paper presents radiocarbon dates for the Romanesque and Gothic phases of the aforementioned medieval churches. A total of 12 lime mortar samples were analyzed using different pretreatment methods. The radiocarbon results confirm that the construction phases took place in distinct periods, spanning from the 11th to the 14th centuries. Some calibrated ^{14}C dates are consistent with chronologies previously proposed on the basis of archaeological analysis, while others indicate either significantly earlier or more recent dates. Notably, the results suggest an earlier chronology for the churches at Câlnic and Miercurea Sibiului compared to previous historiographical interpretations. The interpretation of the mortar ^{14}C data is based on their correlation with the radiocarbon dates obtained from osteological samples, documented stratigraphic relationships, and the archaeological evidence available for each site, and is further supported by a comparative analysis of the four investigated sites. The radiocarbon dating was supported under Research Programme Partnership in Priority Areas PNII MEN-UEFISCDI, contract PN 23210102 and PN 23210201. Experiments were carried out at the 1 MV Tandetron™ accelerator from "Horia Hulubei" National Institute for Physics and Nuclear Engineering (IFIN-HH) and were supported by the Romanian Government Programme through the National Programme for Infrastructure of National Interest (IOSIN).

2573. Geogenic and Diagenetic Contaminants in Mortar Radiocarbon Dating: The Role of Characterization and Targeted Pretreatment Protocols

Authors: Irka Hajdas (Laboratory of Ion Beam Physics, ETH Zurich) – Danuta Michalska (Institute of Geology, Adam Mickiewicz University Poznań) – Marta Caroselli (University of Applied Arts and Sciences of Southern Switzerland SUPSI) – Negar Haghipour (Geology Department ETH Zurich | Laboratory of Ion Beam Physics, ETH Zurich) – Małgorzata Mrozek-Wysocka (Institute of Geology, Adam Mickiewicz University Poznań)
Format: Poster

Radiocarbon dating of historical mortars offers a direct method for establishing the chronology of construction. The accuracy of this technique is dependent on a comprehensive understanding of mortar composition and its degradation state, both of which are linked to regional and site-specific factors. The local geological environment dictates the mineralogical provenance of raw materials—primarily the limestone used for binder production and the sands or aggregates used as inert components. The presence of carbonate aggregates (geologically "dead carbon") is a primary source of contamination, necessitating detailed petrographic analysis to differentiate these lithic fragments from the atmospheric CO_2-derived binder. Furthermore, geology influences the availability of materials that impart hydraulic properties (e.g., pozzolans), altering the setting reaction and carbonation pathway. Equally consequential are the local climatic and environmental conditions, which exert a long-term control on the physicochemical state of samples. Parameters such as precipitation regimes, temperature fluctuations, and exposure to soluble salts govern the kinetics of the initial carbonation process and subsequent diagenetic alteration. These conditions can lead to the dissolution and reprecipitation of carbonates, recrystallization processes, and the formation of secondary mineral phases. Therefore, mortar dating requires an integrated methodology. This contextual understanding directly informs the selection of advanced pretreatment protocols, such as stepped acid hydrolysis or thermal decomposition, which are designed to isolate the most representative binder fraction. By systematically accounting for the constraints imposed by local geology and environmental history, together with knowledge about mortar components, the reliability and interpretative power of ^{14}C measurements in chronology are significantly enhanced.

2769. When radiocarbon mortar dates do not match the archeological context

Authors: Andreja Sironić – Lara Mikac – Vjekoslav Štrukil (Ruđer Bošković Institute) – Matija Deak – Krasanka Majer Jurišić – Duško Čikara (Croatian Conservation Institute)
Format: Poster

Radiocarbon dating of mortar is based on the fact that mortar hardens by absorbing CO2 forming carbonate binder and thus storing the 14C signal from atmosphere. However, mortar is a complex matrix consisting of carbonates originating from various sources, and it is challenging to isolate pure binder carbon for radiocarbon dating because it is chemically and crystalographically indistinguishable from the aggregate carbonate. The Zagreb Radiocarbon Laboratory process for obtaining the true radiocarbon mortar age involves sequential hydrolysis with extrapolation. The radiocarbon dating is performed after the phenolphthalein test and physical analysis, thin leaves petrography and XRD, showing no active mortar absorption, no recrystallisation or magnesite content present and nonhydraulic characteristic. However, sometimes even when all the pre-testing of mortar sample is acceptable, its radiocarbon date still does not agree with the archeological analysis, often failing by couple of hundreds to thousand years. The cause can be high content of fine-grained aggregate or the aggregate morphology. Here we perform FTIR and Raman spectroscopy, to try to distinguish between the binder and aggregate phase in the processed sample. The preliminary results will be presented for the samples of pure binder and aggregate. Further, it will be compared to the real samples that showed radiocarbon ages agreeable and unagreeable to archeological analysis on the historical monuments in the case of the Zagreb Cathedral, the Our Lady of the

Mountain at Lobor in the continental part and the St. Nicholas church at Jablanac in the coastal part of Croatia. The conference participation was funded by European Union program – NextGenerationEU.

45 ANCHORS OF MEMORY: SANCTUARIES, MONUMENTS AND VOTIVES IN THE CONSTRUCTION OF CULTURAL IDENTITY IN THE ANCIENT GREEK WORLD

Theme: 1. Widening perspectives in material culture studies
Organisers: Aura Piccioni (Universität Trier) – Clemente Marconi (University of Milan)
Keywords: Cultural memory, Cultural and social identity, Greek sanctuaries, Greek temples and their decoration, Greek Votive Offerings, Object biography
Format: Regular session

SESSION ABSTRACT

This session explores the role of sanctuaries, monuments, and votives as active agents in the formation, negotiation, and continual reinvention of communal identities in the ancient Greek world. Within the context of a highly visual culture, sacred spaces—together with the monuments and votives that animated them—functioned as dynamic mediators between different social groups. The focus of this session is on the capacity of sacred spaces—together with their monuments and votives—to function as "mnemonic anchors," transforming physical settings, in conjunction with ritual performances, into landscapes of memory. By displaying images of gods and heroes of particular significance to local communities, these spaces materialized shared identities and collective recollections. Monumental and artistic production itself—through the strategic selection of materials, stylistic language, scale, and spatial deployment—constituted an intentional act of communication, capable of giving tangible form to civic narratives and delineating the boundaries among different social groups. Central to this approach is the consideration of the biographies of monuments and votives, interpreting their diachronic processes of setting, spoliation, and re-signification as deliberate acts aimed at constituting or reconfiguring collective memory. By examining the interplay of temporality, materiality, and agency, this session seeks to illuminate the ways in which monuments constructed and negotiated both space and memory, as exemplified by the rebuilding of Athens after the Persian sack. The examination of these dynamics across the wider Greek Mediterranean will further contribute the perspective of the Greeks overseas. Contributors are invited to present case studies that, by combining visual analysis with broader theoretical frameworks, illuminate sanctuaries, monuments, and votives as dynamic contexts for the construction of collective cultural memory.

CONTRIBUTION ABSTRACTS

30. Anchoring Memory in Stone: Demeter's Votive Reliefs at Tegea

Authors: Aeneas Kapouranis (Independent researcher)
Format: Oral

Demeter has long been counted among the most significant deities of the Greek world. Her presence guaranteed agricultural fertility and the vital supply of food, while she also presided over key stages in the lives of women. Her numerous sanctuaries across mainland Greece and the colonies -often shared with Persephone and, in some cases, with Pluto- further underline her importance. This paper examines the cult of Demeter at Tegea. Whereas literary testimonia and archaeological finds from other Arcadian cities offer substantial information about the goddess' cult, her epithets, and her iconography, the situation at Tegea is strikingly different. Both the written sources and the archaeological record are comparatively meagre. Our principal literary witness is Pausanias (8.53.7), who briefly mentions a sanctuary in which Demeter and Persephone were worshipped as Karpophoroi (i.e. "Fruit-Bearers"). Alongside this testimony, four votive reliefs, dated to the first half of the fourth century BC and now preserved in the National Archaeological Museum and the Archaeological Museum of Tegea, provide crucial evidence. They depict Demeter either with Persephone alone, or together with Persephone and Pluto. These reliefs illuminate two central aspects of the cult at Tegea: on the one hand, the transition from female adolescence to maturity; on the other, the continual dependence of the community on Demeter's life-sustaining gifts.

2085. Regifting at the Sanctuary of Poseidon at the Isthmus

Authors: Martha Risser (Trinity College, Hartford CT)
Format: Oral

Located along a major road that traversed the land bridge joining Attica and the Peloponnese, and close to harbors on the Corinthian and Saronic Gulfs, Isthmia was for most visitors the easiest of the four panhellenic sanctuaries to access. The biennial games were a cultural bridge, uniting people from the many and varied city-states of ancient Greece. Even the ceramic record is suggestive of unity. The overwhelming majority of 6th and 5th century B.C. pots found at Isthmia are Corinthian in origin, locally-made, mass-produced, and repetitive in style, shape, and size. Most votive vessels were presumably sold in or near the sanctuary for near-at-hand use. Notable exceptions include two panathenaic amphoras (Broneer 1958, IP 1172 and IP 1173) that were on display in the Archaic

temple when it burned. "Regifting" a prize given at the Panathenaea to another sanctuary - even another deity –was a common practice. Martin Bentz (2003, p. 114) has shown that of the panathenaic amphoras with known proveniences, roughly 40% were found in sanctuaries or similar contexts outside of Athens. This paper argues that the Panathenaic vases at Isthmia - and likely also those found at other sanctuaries - were "regifted" for the purpose of generating a collective semantic memory from a visual narrative of victory in a place beyond Athens, in a setting chosen for both religious significance and physical centrality.

1657. Lustral basins at the Altar to Poseidon at Isthmia

Authors: Helga Felleisen (University of Chicago Excavations at Isthmia)
Format: Oral

Excavations at the panhellenic Sanctuary of Poseidon at Isthmia uncovered the rims of approximately 70 standed Corinthian coarse ware basins known as perirrhanteria. More than 50 date between the end of the 6th century and ca. 480 B.C. based on my chronology for this class of Corinthian vessel. Fragmentary basins and small vessels tentatively identified as cherniba of Attic-Cycladic marble are contemporary. The basins from the Sanctuary count among an unprecedented number of vessels associated with a lustral purpose found in contexts indicative of cult ritual activity in the Corinthia and in Attica in the final decades of the Archaic period. The paper examines their role at the shrine on the Isthmus. Beginning in the mid 7th century monumental standed basins of stone are documented close to the center of cult worship where, I argue, they served for ritual purification at the altar. Their scale reflects community investment. The Corinthian and Attic-Cycladic basins of Late Archaic times present new types with a renewed purpose. Dedicatory inscriptions on the marble vessels indicate these were votive offerings made by individuals. The appearance of so many standed basins is consonant with new construction and refurbishments at sanctuaries, as at the Sanctuary of Poseidon, with special emphasis on the altar to the god. I consider whether the Altar of the Twelve Gods in Athens presents another example of the manifestation of the zeitgeist or an impetus for the dedication of lustral basins.

1004. Same but different – A comparative approach on figurative Terracotta assemblages in sacral contexts on Samos

Authors: Katerina Kock (Universität Regensburg) – Maria Stathakiou (Εφορεία Αρχαιοτήτων Σάμου και Ικαρίας)
Format: Oral

Our paper aims to provide a better understanding of the use of mass-produced figurative terracotta as votive offerings in Archaic times by analyzing them within their context as part of a social entity. The research focuses on figurative terracottas from the 6th century BCE originating from Samos, one of the major southern Ionian centers that flourished during this period. The examined material comes from two sacred contexts: the extra-urban sanctuary of Hera, the main sanctuary of the polis, and the sanctuary of Artemis, located along the western flank of the city walls. The terracotta corpus consists predominantly of figurines and figural vessels belonging to the "Ionian repertoire". The Archaic terracottas from Samos have received little scholarly attention in their sacred context. However, they shed light on dedication practices on Samos and its strong connections to other southern Ionian centers. In our lecture, we will present many of these findings for the first time. By analyzing two assemblages from sanctuaries with reliably identified cult recipients, spanning the entire 6th century BCE, the paper provides a comprehensive understanding of dedicated terracottas within the context of a single polis, allowing for the inclusion of different groups of dedicants. The focus is placed on the typology and iconography of the terracottas and craftsmanship—considered within their archaeological context. This analysis reveals that identical basic types appear in sanctuaries dedicated to different deities and constitute a major component of their respective find assemblages. From this observation, we can conclude that the choice of votives is closely linked to the representation of the dedicator.

631. Viewing, Reading, and Speaking at the Sanctuary: Inscriptions Labelling Mythological Figures on Greek Sacred Architecture

Authors: Matilde Mossali (IMT School for Advanced Studies Lucca)
Format: Oral

This paper examines a small, yet coherent corpus of Greek sacred buildings and monuments characterised by the presence of labels identifying figures within their decorative apparatus. Unlike other types of epigraphs—such as dedicatory inscriptions—painted or engraved name-labels remain a comparatively understudied feature of Greek sacred architectural decoration. The paper asks why inscriptions were added to monumental imagery and how they functioned within the spatial, ritual, and perceptual dynamics of the sanctuary. Methodologically, it adopts an integrated approach that strives to situate the architectural decoration within its original structural and experiential setting, while also drawing comparative insights from contemporary practices in other crafts, most notably vase painting. In this perspective, inscriptions are situated within the visual economy of the sanctuary, with particular attention to their placement, scale, (in)visibility, degrees of (il)legibility, and interaction with movement and viewing conditions. Case studies from Archaic Aetolia and Delphi suggest that, in a predominantly oral culture, such inscriptions might have operated simultaneously on a semantic and visual level: even when difficult to read, they functioned as mnemonic anchors, signalling the presence of recognizable, nameable figures and prompting the reactivation of oral narration and collective recollection. Later examples, including Tegea and the Great Altar of Zeus at Pergamon, reveal significant transformations in both the visual syntax and the functional role of labels, possibly reflecting broader shifts in literacy, modes of viewing, and the relationship between text, image, and

memory in Greek sanctuaries. Overall, despite the quantitative scarcity of extant evidence for this epigraphical practice, through qualitative and contextual analysis the paper sheds light on the active role of writing within images in shaping how monuments anchored memory and mediated collective narratives, guiding viewers' engagement with the visual apparatus of Greek sanctuaries.

807. Athena on Greek acropoleis: protectress of the polis and of its memory

Authors: Alice Ognier (Université Bordeaux Montaigne - Laboratoire Ausonius)
Format: Oral

Athena's cult has helped shape the organisation of the polis from the archaic period and her sanctuaries remained important features of urban centres for centuries. Placing her sanctuaries on acropoleis was a very conscious choice and carried a strong symbolic intent. The use of a dominating space, looking over the city and its citizens, combined with the many offerings types that archaeology has revealed, shows the diversity of roles taken on by the goddess and her general protective function. The archaeological study of many of her sanctuaries has shown that, from their installation to their use beyond antiquity, they have always been anchors of memory occupying central place in the polis life and landscape. In shaping a landscape oftentimes already used for sacred purpose before the arrival of her cult, communities have put her in a position of power. The rough topographic characteristic of acropoleis heightens the symbolic of the sanctuaries as eternal sacred places. Many examples through the Aegean are proof that this is a shared trait of her sanctuaries all around the Greek world. Several case study such as Thasos, Emporio, Phokaia, Halai and Gortyn will help us show, through topography, architecture and votive, the importance of the goddess and her sanctuaries in the collective memory of poleis.

1276. Sacred Spoils: Octavian's Victory Monument of Actium in Nicopolis, Greece and the Weaponization of Sanctuaries and their Mnemonic Monuments

Authors: Arielle Hardy (University of Pennsylvania | American School of Classical Studies at Athens)
Format: Oral

Octavian memorialized his decisive naval victory near Actium, Greece with a 'tropaeum' (29–27 BCE) built on the site of the Roman encampment. The Victory Monument of Actium included an upper terrace with a pi-shaped stoa framing a decorated stone altar, and an inscribed lower terrace which displayed bronze rams of captured ships. Such memorials—derived from the Greek practice of erecting "trophies" of arms and armor on the battlefield—varied in form and material. By the Republican period, trophies were often displayed in Rome rather than on battlefields. Why, then, did Octavian choose to erect a large marble altar in Nicopolis, Greece to commemorate his victory for the Roman people? The visual language of the Victory Monument borrows heavily from Hellenistic Greek religious antecedents, and thereby speaks fluently to Roman and local communities alike. By the first century BCE, large, decorated altars were used across the Mediterranean to underscore the authority of their sponsors and to evoke event-memories. The Great Altar of Pergamon represents the epitome of this practice, but comparanda can be found throughout the Greek world. At Nicopolis, site specificity enhanced the communicative power of the Monument. The circumscribing stoa visually framed the Battle of Actium's martial landscape. This setting infused the memory of Rome's victory into the 'tropaeum' itself. The Victory Monument of Actium, an open-air sanctuary-sans-temple, owes its form and iconography to the architectural and artistic vernacular of Greek religious structures. The combination of material, image, and setting demonstrates Octavian's awareness of Greek monuments' influence while employing the significatory capacity of sacred spaces and sacred architectural forms to shape Roman collective memory and identity. Octavian's complex—including an altar decorated with mythic, historical, and triumphal imagery, which displayed rams of real warships—should be considered a transitional structure between mnemonic Hellenistic altars and religio-political monuments of the emergent Roman empire.

2565. A Cultic Center in Motion: The Sacred Area of the Sanctuary of Demeter at Siris-Heraclea in the Archaic Period

Authors: Ernst Tolksdorff – Annarita Doronzio (Humboldt-Universität zu Berlin) – Carmelo Colelli (Museo Archeologico Nazionale della Siritide)
Format: Oral

The sacred area situated east of the Sanctuary of Demeter at Policoro (ancient Siris-Herakleia), known as the "Ost-Temenos", provides a critical case study for investigating the long-term resilience of sacred landscapes in Magna Graecia. Rather than focusing on a single architectural monument, this paper aims to reconstruct the development, use, and meaning of a cultic space that was formally dedicated to Demeter from the 5th century BC onward, while specifically addressing its earlier phases of ritual activity. Recent results from the 2025–2026 SIRIS Project confirm that this area was frequented and ritually active as early as the Archaic period. Stratigraphic evidence and the discovery of an undisturbed votive deposit dated to the second half of the 6th century BC challenge traditional narratives that interpret the Achaian conquest of Ionian Siris as a moment of abrupt religious and cultural discontinuity. Instead, the data suggest a scenario of ritual persistence across a phase of profound political transformation. Architectural investigations reveal successive phases of spatial organization linked to a sacred spring, suggesting a progressive formalization of the landscape rather than episodic use. Votive assemblages provide strong evidence for the area's significance as a place of worship in the Archaic period, though the identity of the deity venerated in this early phase remains a central research question. The material culture reflects a transformative process in which new Achaian-style ritual practices were integrated into an established sacred space. By functioning as an "Anchor of Memory," the site allowed continuity to be negotiated through the reinterpretation of ritual.

Situating this area within a regional framework alongside sites such as the Achaian sanctuaries of San Biagio and Sant'Anna, this paper proposes a model for how sacred areas structured memory and identity within the cultural landscapes of Greek southern Italy.

2482. Sanctuaries and cultural identity at Locri Epizephyrii, Magna Graecia

Authors: Valeria Meirano (University of Turin | Standing Committee of the International Bronze Congress) – Diego Elia (University of Turin)
Format: Oral

At Locri Epizephyrii, the numerous shrines and sacred areas dedicated to the city's main female deities (Aphrodite, Persephone, and Demeter) reflect the distinct roles these goddesses play in civic narratives. These spaces of worship and ritual appear to be closely related to ongoing negotiations between different social groups, as well as to the construction of devotees' social identity. The spaces chosen for sacred practices are highly heterogeneous, and the landscape —natural or anthropic — accompanies the ritual forms chosen to shape various scenarios of memory, action and representation. These range from urban sanctuaries with the traditional association of temple, altar, secondary buildings, etc. withn the temenos, to sacred areas located along the urban perimeter, often in close proximity to the ancient shoreline or in evocative environments such as caves, ravines, gorges, and watercourses. The rich documentation collected during successful excavation campaigns since Paolo Orsi's time (late 19th–early 20th century), combined with recent investigations and reappraisals, provides an articulate framework for reflecting on the dynamics of constructing the collective memory of the Locrian community from the Archaic to the Hellenistic age. The "régime des offrandes" is also involved in these processes, so as to influence the relationship between local craftsmanship and local demand. The forms assumed by the sacred probably also reflect significant events that marked local society and resulted in the renegotiation of relationships between social groups. Evidence of these phenomena can be seen during the period of aristocratic control by the 'Hundred Houses' for more than three centuries, as well as after the regime change that led to democratic rule being established.

747. Architectural Succession at Selinus: Temple Replacement and Monumental Revival

Authors: Rebecca Salem (Institute of Fine Arts - New York University)
Format: Oral

Selinus (modern Selinunte), the westernmost Greek colony on Sicily, experienced one of the largest construction sprees in the ancient Greek world from its foundation in the latter half of the 7th century BCE until the sack of the city by the Carthaginians in 409. Over these two centuries, monumental religious buildings of the city were erected and replaced within a landscape that the population engaged with on a daily basis. Employing a temporal approach to the replacement of temples at Selinus clarifies what the local population retained and what they altered over time. As the reasons for replacing temples vary, so do the forms of successor structures. At Selinus, Temple R, the Temple of Demeter Malophoros, and Temple E all underwent palimpsestic reconstruction. This paper, by examining the archaeological remains of these structures, assesses the curated retentions, deletions, and innovations by means of which the Selinuntes ensured that the temples endured in time in response to the changing needs and identities of the people themselves. The Selinuntines renewed their connections to and reverence for their local deities while constructing and displaying both "Selinuntine" and "Greek" identities in aggrandizing monumental form. As the city grew and Selinuntine self-conceptions changed, so did their temples, in a manner that conservatively maintained elements of religious and stylistic continuity while largely replacing the predecessors with a new material expression. This paper presents these palimpsest temples at Selinus and discusses the implications of the choices made for their designs, whether in referencing predecessors, memorializing the present, or forging an architectural future.

1554. Anchors of Collective Memory on the Heights: The Material Agency of the Votive Offerings in the Attic Upland Sanctuaries

Authors: Aura Piccioni (Universität Trier)
Format: Poster

Attica is characterized by a series of uplands, which extend beyond mere topography and thus function as authentic hermeneutic agents. This phenomenon holds particular relevance when considering the function of the upland sanctuaries, which function as pivotal nexuses for the negotiation of concepts such as identity, territoriality, and ritual continuity. Contrary to the notion that they are merely marginal peripheries, these upland sanctuaries have been identified as significant markers of territoriality and identity. The analysis, which is supported by case studies such as Mount Hymettos, demonstrates the pivotal role of upland sanctuaries in their totality. It emphasizes the votive objects found in these sanctuaries, which are intricately linked to and significantly influence social life. Through the reiteration of rituals and the accumulation of votive gifts and ritual materials (ceramics, metalwork, and faunal remains), it will be demonstrated the role of such sites as multifunctional centers of memory that exhibit remarkable resilience against political shifts. The concept of "uplands" is of particular significance in the context of the "symbolic capital" of the community, as it serves to transform human religious consciousness into a tangible political and territorial reality. Their topographical resilience persisted into Late Antiquity, as such sanctuaries became ritual refuges.

46 THE LURE OF MEDITERRANEAN WATERS: ANCIENT MARINERS, ANCIENT SHIPWRECKS AND CONTEMPORARY COMMUNITIES

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Chryssanthi Papadopoulou (Hellenic Institute of Marine Archaeology) – Alexandros Sotiriou (Department des Sciences de l' Antiquite, University of Geneva)
Keywords: shipwrecks, identity, sea, maritime archaeology, ancient mariner
Format: Regular session

SESSION ABSTRACT

'An olive tree, a vineyard, and a ship' (Elytis, The Little Mariner). Easy enough to pin down the ingredients of the Mediterranean ecocultural composition. Considerably harder to comprehend the nature and extent of the Med's seductive powers. Where do these powers lie? Do they even have a name? How deeply and irreversibly can they touch a person, notwithstanding their understated life-threatening potential? This session focuses on the diachronic lure of ships and the Mediterranean waters. For years maritime archaeologists have unearthed the material evidence of the complex, ingrained and occasionally lethal bonds of humans with the middle sea, and through and on it with each other. In this session, we aim to explore the varying reasons that ancient mariners chose this life of hardship, and welcome papers that focus inter alia on the biographies of ancient mariners and (land-bound) passengers including those claimed by the waters and survivors of shipwrecks. We will also look into the lives, toils and deaths of ancient fishermen and frequent maritime travelers. Vis-a-vis those, we will explore the lure of ancient wreck sites in the Mediterranean on local and global communities focusing on how these communities often claim the sites as regional emblems, integral parts of their identities or sites of inspiration. Finally, we will look into the pull of these archaeological sites on the members of the diving community who visit them often. We are particularly interested in the perspectives of professional divers who work alongside archaeologist on underwater surveys and excavations. This session points attention to the individuals and groups of people who have shared the experience of walking the same sands, sailing or diving into the same seas, and have been hooked by the same salty allure that can be traced all the way back to prehistory.

CONTRIBUTION ABSTRACTS

615. Stopping by Antikythera, Greece, before crossing to the underworld on a 1st century BCE cargo ship

Authors: Alexandros Sotiriou (University of Geneva | IRIS Civil non profit association of scientific research and education)
Format: Oral

Transiting across the Mediterranean sea was a complex task for marine travelers to organize and safely complete during ancient times, nonetheless it was quite common especially from the Roman period onward. Both a ship's crew and its passengers were aware in those days that smooth sailing was subject to unpredictable weather changes, the mood swing expressions of sea Gods, as in the same time navigational errors, unknown reefs, equipment failures or bandit raids could present additional hazards. Several of such marine endeavors ended prematurely, as was also the case with the heavily loaded merchantman that sank off the north-eastern coast of Antikythera island, in Greece, during the 1st century BCE. It was not only a seaworthy vessel and its valuable cargo that were lost with this shipwreck, but also some of the souls onboard. Adequate relevant evidence has been found at this site, lately in 2025, also confirming four individuals among the casualties, one of whom was a young adult female passenger. How much is really known about the final moments of those onboard ancient vessels as they were going down? This contribution will attempt to open a narrow window on the possible end of the voyage of those that perished at the Antikythera shipwreck from their perspective, based on evidence from ship's parts and equipment, skeletal remains, personal items, utilitarian objects, and their contexts at the seabed, as they froze it time at the moment of the disaster.

494. "Why then...do we not...flee from the neighbourhood of death?" On ancient fishermen's life choices and lived experiences

Authors: Chryssanthi Papadopoulou (Hellenic Institute of Marine Archaeology)
Format: Oral

Fishing was a noble enough pastime in antiquity, but ancient fishermen did not enjoy much of a social standing. Instead, they appear to have occupied a rather precarious position between subsistence labor and sociopolitical marginality. They toiled at sea facing numerous hardships and dangers, made a meagre living, occasionally dealt with gruesome catches, and were prone to premature, unlikely deaths. Why then would they not flee from the neighbourhood of death, as the fisherman Glaucus asked his wife Galateia in a letter imagined by Alciphron (Letters of Fishermen 1.3.3)? This paper examines ancient literary, epigraphic and archaeological evidence. It presents some of the reasons why men became fishermen in antiquity, and the ways fishermen perceived themselves and their profession vis-à-vis the etic perceptions of their contemporaries. It challenges the popular myths of the poor and the unaccomplished fisherman, which endure and haunt fishermen to this day, and shifts its focus from fishermen's formulaic weaknesses and vulnerabilities to their agency and lived experiences.

1254. The Role of Mediterranean Anchors in Shaping Mariners' Experiences: Material Perspectives on Maritime Practice, Mortality, and Daily Life.

Authors: Karsyn Johnson (University of Haifa)
Format: Oral

The sea lays the foundation for ideas to take shape, and invention follows as mariners strive to resolve the challenges it presents. Although those who live beside the sea know it most intimately, its pull extends far inland; as a land-locked researcher, I came to rely on colleagues whose lives had been shaped by a maritime experience. Their perspectives gradually informed my own, revealing water as a unifying force that connects communities through trade, knowledge, and culture. A central component of my research involved determining the material composition of early wooden composite anchors, thereby illuminating both their construction and intended functions. Through experimental archaeology, I tested hypotheses about how these anchors were built and how they performed in practice. Drawing on an extensive dataset of anchors from antiquity, I then reconstructed broader patterns of reliance, usage, and distribution across the Mediterranean. This analytical process prompted questions about when tools and inventions become culturally embedded. Fieldwork with contemporary mariners underscored that there is never a single solution to a problem; each conversation revealed yet another inventive approach. Such adaptability suggests a similar phenomenon among ancient seafarers, whose ingenuity contributed to the development of maritime technologies, anchors among them, which existed in numerous composite forms. Iconographic, mortuary, and functional evidence together reveal a profound and enduring reliance on anchors throughout the Mediterranean. This research aims to bring that significance to light by situating anchors not only as practical tools but also as cultural objects shaped by the problem-solving traditions of the mariners who used them.

2075. Shaped by the sea: alternative engagements with ancient shipwrecks in Cyprus

Authors: Anna Demetriou-Patsalidou (Cyprus Marine and Maritime Institute)
Format: Oral

As a social and material place (Lambert et al 2006) the sea participates in social engagements and contributes to the building of identities, a sense of place, and histories (Cooney 2003: 323). Connected to the established "idea of the sea" (Mack 2011: 25), ancient shipwrecks, in turn trigger contemporary encounters and engagements that extend far beyond the shipwreck as a mere representation of the past. Instead, ancient shipwrecks are transformed into knowable places (Rainbird 2007:45) with their own features, bringing a variety of people together and generating distinctive negotiations of their identity. The presentation will focus on two shipwreck sites from Cyprus: the 3rd cent. BC shipwreck of Kyrenia that was excavated in the 1960s and earned an exceptional position within the field of shipwreck archaeology but also within the local community of Cyprus, and the 4th cent. BC Mazotos shipwreck, the second well preserved shipwreck site located in Cyprus, whose excavation is still on-going. The presentation will unfold the multiple engagements and negotiations and identified around the two sites, which bring to the fore the complex, multileveled, relational, and fluid qualities of maritime archaeological sites which could possibly reflect new research directories.

2386. Embodying underwater cultural heritage: ancient wreck sites and modern diving professionals

Authors: Nikolas Giannoulakis (Chania Diving | IRIS Civil non profit association of scientific research and education) – Chryssanthi Papadopoulou (Hellenic Institute of Marine Archaeology) – Alexandros Sotiriou (IRIS Civil non profit association of scientific research and education)
Format: Oral

Modern shipwreck sites have always been popular scuba diving destinations. Most diving centres are familiar with the shipwrecks located near their areas of operations, and take pride in advertising them as destinations of challenging and fascinating dives to their customers. This paper presents how, through these sites, scuba diving instructors and professional divers have formed embodied understandings of the ways one is supposed to approach and treat wrecks. Apart from modern wrecks, most scuba diving professionals in Greece have come across ancient artefacts on the seafloor, especially transport amphorae. These artefacts may have been jettisoned from an ancient ship or may be part of a wreck site, which – more often than not in Greek waters – is scattered and/or extensively looted, and seemingly incomprehensible. This paper examines the varying attitudes of the diving community towards these artefacts/potential sites, as well as why these attitudes can differ from the ways modern shipwreck sites are perceived. Subsequently, this paper presents the results of anthropological research conducted amongst professional divers and scuba diving instructors, who have participated alongside archaeologists in underwater survey and excavation projects. It examines the changes in those participants' understandings of shipwreck sites, the ways the notion of "underwater cultural heritage" is gradually embodied, and the process by which priorities – regarding not only to these sites but the past in general – shift.

957. Mobile Communities, Anchored Sites: Collaborative Practice at the Mycenaean Shipwreck off Modi Islet, Poros

Authors: Eirini Chrysocheri – Niovi Karapetsi (Hellenic Institute of Marine Archaeology)
Format: Oral

What draws people back to the sea, year after year? This paper examines years of volunteer-based underwater archaeology work at a Mycenaean shipwreck off Modi Islet, Poros, Greece, exploring how professional communities sustain long-term commitment to underwater sites despite the absence of employment contracts or financial incentives. While long-term archaeological projects commonly generate communities of practice, the underwater environment creates distinctive conditions that intensify these dynamics in particular ways. Based on interviews with team members from archaeology, conservation, engineering, and related fields—all qualified divers—we reveal an unexpected pattern. The Poros team members, affiliated with the Hellenic Institute of Marine Archaeology, have worked together across multiple Greek underwater sites for over two decades. They return to Poros each October even while participating in other projects throughout the year, creating what we term a "temporal anchor" for a mobile professional network. What sustains this voluntary, long- term commitment? Our analysis reveals that the "lure" operates through interconnected intellectual, social, institutional, and identity-based mechanisms that extend beyond conventional assumptions about archaeological fieldwork motivation. The decision to return is neither individual nor purely rational but emerges from complex negotiations between dedication to understanding the maritime past, personal relationships, collective responsibility, institutional frameworks, shared maritime identity and the particular nature of volunteer participation. This pattern offers insights into ancient Mediterranean maritime life. Ancient sailors formed mobile occupational networks, returning seasonally to known routes and partnerships. By examining our own experience reflexively, we demonstrate how individual passion for the sea transforms into sustained collective commitment as community bonds reinforce both what people do and who they are. The pull of Mediterranean waters—then and now—operates fundamentally through the social structures that sustain maritime practice. The lure of the sea, we conclude, is as much about the waters themselves as the people (or communities) who share it.

47 GENES, BONES, AND TRADE: BIOARCHAEOLOGICAL PERSPECTIVES ON ANCIENT MOBILITY

Theme: 7. Interaction, connectivity and mobility
Organisers: Branka Franicevic (University of Derby) – Asta Rand (Nicholas Copernicus University in Toruń)
Keywords: Genetic mixing, Afro-Eurasian trade, Bioarchaeology, Migration, Mobility
Format: Regular session

SESSION ABSTRACT

Trade has long served as a catalyst for multilayered networks of negotiation, fostering population mixing, migration, and cultural integration across diverse geographical regions. Yet, trade corridors are often studied through the lens of a single discipline, resulting in fragmented understandings of how they shaped societies and environments. This session adopts an interdisciplinary bioarchaeological approach to explore the influence of Afro-Eurasian trade on patterns of human interaction and mobility from the fall of the Western Roman Empire to the waning of the Black Death pandemic (5th to 14th century AD). Our first research area examines trade as a catalyst for genetic mixing through the movement of traders, soldiers, and settlers who enabled intermarriage and biological blending. For example, how did genetic admixture and trade influence migration, displacement and settlement? Our second research area concerns trade as a catalyst for the transmission of diseases. It traces the links between interaction and the spread of pathogens utilising Isotope analysis (e.g. diet, labour and migration), skeletal analysis (e.g. health and diseases) and genetic data (e.g. disease evolution and resistance). For instance, how can we trace the transmission routes and geographic origins of diseases that spread through the trade routes? Our third research area explores trade as a catalyst for cultural integration. It concentrates on burial customs, bone stress markers and dietary shifts to reveal social cohesion within trade hubs. For example, how do hybrid burial customs reflect cultural exchange among historically mobile populations? By framing trade as a braided river of intersecting currents, rather than a linear path, this session highlights how people and ideas flowed together to shape the human story across centuries.

CONTRIBUTION ABSTRACTS

664. Bones and Beliefs: Bioarchaeology and Material Culture from Himalayan Cave Burial Contexts

Authors: Sonam Dolma (Deccan College Post Graduate Research Institute)
Format: Oral

Cave burial contexts across the Himalayan region represent complex mortuary landscapes where human remains and material culture intersect to reflect ritual practice, environmental adaptation, and cultural connectivity. This paper presents an integrated bioarchaeological and archaeological analysis of human skeletal remains and associated material culture from the western Himalaya, a cave site named Gachu Lhabrog Cave (Ladakh) India, contextualised within broader Himalayan cave burial traditions dating to the early–mid first millennium CE. The skeletal assemblage, characterised by commingling and post-depositional disturbance, is examined through macroscopic assessment of age-at-death, sex (where preservation permits), pathological conditions, and activity-related stress markers, including degenerative joint disease and trauma. These data provide insights into demographic structure, health status, and habitual activity patterns of the population. In parallel, the analysis of associated material culture-including ritual objects, utilitarian items, and funerary deposits—offers evidence for symbolic behaviour, mortuary practices, and cultural affiliations within trans-Himalayan exchange networks. By integrating osteological evidence with archaeological materials, this study highlights the role of caves as liminal spaces used for complex funerary and ritual practices rather than solely as burial repositories.

The paper further addresses methodological challenges posed by disturbed and commingled assemblages and discusses their implications for interpreting mortuary behaviour in high-altitude environments.

2359. Mobility versus burial traditions. Horse Burials in cemeteries from the 5th to the early 7th century CE in Eastern Austria

Authors: Bendeguz Tobias (Austrian Academy of Sciences) – Konstantina Saliari (Natural History Museum, Vienna)
Format: Oral

The early medieval Middle Danube region was characterised by migration and high human mobility, as demonstrated by written sources and the latest genetic data. While human mobility has received increased attention, animal remains have not. Archaeozoological remains reveal essential information not only about the animals of the period and the humans with whom they were buried. An over regional comparison of animal bones and teeth from Lombard period graves indicates that the species mainly deposited were chicken, pig and horse. A high quantity of eggshells were also found. Of special interest in the current study are horses remains. Morphometric studies reveal at least two different morphotypes. The first morphotype exhibits a withers height between 120 and 130 cm and bears significant similarities to the Iron Age pony. Its appearance during this period is extremely rare. The second morphotype is larger, with withers height between 135 and 140 cm, suggesting Roman influence, and is commonly found in graves and settlements from this period. Craniological finds support the osteometric results and raise new questions about the identities of these animal#s owners.

907. Environmental and Cultural Signals in Human Remains: A $\delta^{34}S$ Multi-Isotope Study from Mainland Greece

Authors: Pavlos Meratzis (National Centre for Scientific Research N.C.S.R. "Demokritos" | School of Mineral Resources Engineering, Technical University of Crete) – Platon Gamaletsos (School of Mineral Resources Engineering, Technical University of Crete) – Petros Karalis (National Centre for Scientific Research N.C.S.R. "Demokritos" | CERTH, Centre for Research & Technology) – Panagiotis-Leandros Poutoukis (CERTH, Centre for Research & Technology) – Anastasia Chrysostomou (National Centre for Scientific Research N.C.S.R. "Demokritos" | Ministry of Culture, Athens) – Elissavet Dotsika (National Centre for Scientific Research N.C.S.R. "Demokritos")
Format: Oral

The investigation of past human diet and mobility increasingly relies on stable isotope analysis, as it provides direct biogeochemical evidence from human skeletal remains. Carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) isotopes in bone collagen are well-established indicators of dietary protein sources, while oxygen ($\delta^{18}O$) in bioapatite is widely used to approach palaeoclimatic conditions and patterns of water consumption. In recent years, sulfur isotopes ($\delta^{34}S$) have emerged as an additional critical tracer, capable of yielding information on both local environmental conditions and potential population movements. $\delta^{34}S$ values are strongly influenced by environmental and geographic factors, such as proximity to the sea, geology, and hydrology, enabling the distinction between marine and terrestrial protein intake as well as the identification of non-local origins when compared with local isotopic baselines. Despite their potential, sulfur isotope studies in the Eastern Mediterranean remain limited, creating a significant knowledge gap regarding their spatial variability and archaeological applications. The present study examines human skeletal remains from sites in mainland Greece which differ chronologically, environmentally, and culturally. The aim is to evaluate the contribution of $\delta^{34}S$ values to the understanding of local dietary practices and possible human mobility, due to environmental conditions, in combination with $\delta^{13}C$, $\delta^{15}N$, and $\delta^{18}O$ data. This multi-isotope approach seeks to highlight the importance of integrating sulfur as a complementary tool in the archaeological biogeochemistry of Greece and the wider Eastern Mediterranean.

2439. Artificial Cranial Deformation in the South Caucasus: Bioarchaeological and Paleogenomic Insights into Cultural Practice and Population Dynamics

Authors: Nino Tavartkiladze (Ivane Javakhishvili Institute of History and Ethnology) – Harald Ringbauer (Max Planck Institute for Evolutionary Anthropology) – Shorena Laliashvili (Ivane Javakhishvili Institute of History and Ethnology) – Anahit Khudaverdyan (Institute of Archaeology and Ethnography, National Academy of Science)
Format: Oral

Artificial cranial deformation (ACD) is a widespread cultural practice across Eurasia and is often linked to highly mobile populations of Late Antiquity and the Early Medieval period. In the South Caucasus, however, the social meaning and biological background of this practice remain poorly understood. In this study, we identify three main types of cranial deformation—circular, annular, and tabular—and explore their distribution and biological context through an integrated bioarchaeological and paleogenomic approach. Our analysis includes 51 individuals with artificially deformed crania from Georgia and 22 from Armenia, combining osteological observations with genome-wide ancient DNA data. Principal Component Analysis (PCA), along with ancestry modeling and identity-by-descent (IBD) analyses, shows that most individuals with ACD fall within the genetic variation of the South Caucasus and possess predominantly local ancestry. Only a small number of individuals—six from Georgia and one from Armenia—exhibit clearly non-local genetic profiles, pointing to limited gene flow into otherwise stable local populations. A notable exception is individual JET03, the earliest known case of ACD in Georgia, dated to the 2nd century BCE. This individual falls outside the main South Caucasus genetic cluster and displays an atypical genetic profile, suggesting that population interactions in the region began before Late Antiquity and that the adoption of ACD took place within a complex and heterogeneous demographic setting. Overall, our findings indicate that ACD in the South Caucasus was largely adopted and maintained within local communities rather than introduced through large-scale migration. Its long-term persistence, alongside the occasional presence of non-local individuals, supports an interpretation of ACD as a socially transmitted cultural practice embedded in local traditions while also circulating through broader interregional interaction networks. This work was supported by the Shota Rustaveli National Science Foundation of Georgia (SRNSFG) [23-17430].

193. Reframing Indo Levantine Anatolian Exchange Through Bioarchaeology and Mobility Studies

Authors: Branka Franicevic (University of Derby)
Format: Oral

Indo Levantine–Anatolian exchange networks, active from the late 4th to early 2nd millennium BCE, have long been recognised as key zones of interaction in western Asia, yet they remain predominantly interpreted through the circulation of luxury goods rather than the movement of people. This study integrates osteological indicators of activity and stress, ancient DNA, material culture distributions, and spatial network modelling to reconstruct the embodied experiences of mobility that shaped early maritime and overland routes linking the Indo-West Asian sphere between 3500 and 1500 BCE. Drawing on datasets from Arslantepe (Levels VIA–VII), Alalakh (Level VII), Ebla, Tell Brak, Titriş Höyük, and sites in the Upper Tigris region, the analysis identifies multi-scalar patterns of movement. Osteological evidence, including enthesopathies, vertebral compression, and trauma signatures, reveals labour regimes consistent with short-term mobility and task-specific relocation, particularly during the Old Assyrian Colony Period at Kültepe Kanesh (c. 1950–1750 BCE). Material culture distributions, such as the circulation of Red Lustrous Wheel Made Ware, Cilician metalwork, and northern Levantine ceramics, further demonstrate the integration of communities across the Levant, Cilicia, and central Anatolia. Ancient DNA from 3rd millennium BCE populations documents long-distance genetic admixture between Anatolian, Caucasus/Iranian, and Levantine groups, including the spread of CHG/Iran-related ancestry into central Anatolia. These patterns align with osteological evidence for increased mobility and with the emergence of multi ethnic households and enclaves in urban centres such as Ebla and Alalakh. Digital mapping, including Byblos, Ugarit, Cilicia, the Upper Euphrates corridor, and the Gulf of İskenderun illuminate the braided, multidirectional pathways through which people, ideas, and biological traits travelled. Together, these lines of evidence reposition Indo West Asian exchange as a deeply embodied system in which human movement was as consequential as the circulation of goods.

765. Bioarchaeology at the Ancient City of Apollonia Pontica: Research and Future Directions

Authors: Katharine Kolpan (University of Idaho)
Format: Oral

Founded by Milesian Greek colonists at the end of the 7th century BC, Apollonia pontica (7th-2nd century BC) is one of the oldest and largest Greek colonies on the Western Black Sea Coast. Though Apollonia was an important trade hub, it was seldom discussed by ancient historians, meaning we must rely on archaeological analysis to understand the daily lives of its inhabitants. Moreover, while Apollonia's mortuary context has been extensively examined, its population's skeletal remains have been less well studied. This presentation considers the legacy bioarchaeological collection at Apollonia, pulling together various strands of disparate evidence (isotope analysis, dental research, paleopathological examination, etc.) to examine what we know about its residents, and which directions we hope to explore in the future. Specifically, this analysis investigates all previously published examinations of the skeletal remains from the city's vast necropolises, exploring the information they provide regarding diet, migration, disease, and daily life. It also suggests how the skeletal collection might be utilized to answer future questions related to migration, social relations, violence, and health.

48 SKILLS AND CRAFTS IN RITUAL CONTEXTS: OBJECTS BIOGRAPHIES IN EAST MEDITERRANEAN SANCTUARIES/CULT CENTRES (LATE BRONZE AGE - HELLENISTIC PERIOD)

Theme: 1. Widening perspectives in material culture studies
Organisers: Ann Brysbaert (Katholieke Universiteit Leuven) – Natacha Massar (Koninklijk Museum for Kunst en Geschiedenis) – Helle Hochscheid (University College Roosevelt-University Utrecht) – Georgos Papasavvas (Archaeological Research Unit, Cyprus University)
Discussant: Veronique Chankowski (Ecole Francaise d'Athenes)
Keywords: object biographies, cult centres/sanctuaries, Greece, East Mediterranean, economic and ritual interactions, artisans and ritual activities
Format: Discussion session

SESSION ABSTRACT

From early on, craft interaction and object production have been defining elements in human lives. Making objects is at the heart of human identity, as fundamental as food, drink, ritual and housing. Even the most utilitarian object (drinking cup) may acquire additional meaning when moved into the ritual sphere (Holy Grail). The object's contexts of use define its function. From Prehistory onwards, sanctuaries and temene of ancient Greece testify to craft activities and to economic locales. A great deal of skill and resources were invested in monumentalizing and adorning buildings. Simultaneously, sanctuaries gathered many objects dedicated to gods or used in rituals. Some were specially made for these functions, whereas others had been used before entering the divine sphere. Despite the rule that divine belongings should not be removed, there is evidence that such material (e.g. metal) could be recycled and re-enter the economy. Many offerings, though, hardly survived (e.g. wood, agricultural products). Consequently, the crafts that turned them into usable, edible and sensory items are difficult to reconstruct. The focus on craftsmanship also raises questions about the ritual practices of artisans themselves both in sanctuaries and in their workplaces. This session investigates, therefore, multiple connections between ritual and craft production through contributions on the following (while avoiding funerary aspects): 1/ The manufacture of objects within sacred spaces and the economic role of sanctuaries as producers and consumers 2/ The interconnections of craft production and economies, and ritual activities in sanctuaries as evident in production, storage, possible redistribution, financing of various activities, etc. 3/ Craft spaces that temporarily become sacred, entirely or in part, due to rituals linked to crafting processes 4/ The role of artisans and the place of rituals in craft practices and workshops 5/ Sensory approaches to any of the above lines exemplified with case studies.

CONTRIBUTION ABSTRACTS

1616. Corinthian Frauenfest vases: a re-evaluation of their production and use in relation to Corinthian sanctuaries

Authors: Leonie Defonteyne (University of Oxford)
Format: Oral

Corinthian Frauenfest vases offer fertile ground for a discussion of the interaction between craft and ritual in Archaic Greece. The roughly 300 surviving pieces were mostly produced in the Middle to Late Corinthian periods (c. 595–550 BC) by a small number of workshops. They are characterised by their display of female chain dances and processions, sometimes alongside elements such as women seated with children or women with spinning implements. The Frauenfest often appears on kotylai, pyxides and bottles, and most scenes are of rather mediocre stylistic quality. Unlike the Brauron krateriskoi, the Corinthian Frauenfest vases have been found in a wide range of archaeological contexts, including the Corinthian Potters' Quarter, graves from Etruria to Rhodes, as well as Corinthian and Sicilian sanctuaries. Whereas the more elaborate examples derive from grave contexts, sanctuaries seem to have attracted the lower-quality vases with less detailed scenes. This paper considers both production and use of Frauenfest vases. It questions the idea that the Frauenfest painters always had a single 'festival of women' in mind. Instead, they might have drawn upon various rituals related to the cults of goddesses such as Demeter and Hera, which raises questions about the interaction of (male) vase-painters with such cults. Moreover, economic considerations could help to explain certain peculiarities of Frauenfest vases, as the painters seem to have responded to the demands created by sanctuaries of female deities (although they were not exclusively catering for sanctuaries). A comparison between the Frauenfest scenes from four sanctuaries within the Corinthia may reveal how particular people were about their offerings, and consequently to which extent the imagery can give us an insight into the actual rituals performed at those sanctuaries. In other words, Corinthian pottery deserves a more prominent place within discussions of Archaic Greek cult representations.

1790. What the Cult Centre Megaron does and does not tell us about craft and religion at Late Bronze Age Mycenae

Authors: Stephanie Aulsebrook (University of Warsaw)
Format: Oral

The Cult Centre at Mycenae is the only known example of this type of complex at a Late Bronze Age Mycenaean palatial site (1400–1200 BC). Consisting of five closely associated buildings, each with its own distinctive character in terms of both architecture and finds assemblage, various links can be drawn between this sacred space and craft practice across different dimensions, whether that be the specialist production of the large wheel-made figures found in the Temple, or the elements of monumentalisation and elaboration incorporated into each building and the later access route known as the Processional Way. The role of one of the lesser-known buildings in the complex within this relationship between craft and religion has recently come under scrutiny. This paper explains how the restudy of the Cult Centre Megaron has significantly changed our previous interpretation of a direct link between its basements and high-status craft activities, which was based upon a misunderstanding of the stratigraphic context of a significant deposit of production-related debris, whilst simultaneously revealing new aspects of the broader relationship between the Cult Centre and craft production.

2104. Sacred skills, self-definition, and scale: object and space biographies in Prehistoric East Mediterranean crafts and rituals

Authors: Ann Brysbaert (Katholieke Universiteit Leuven)
Format: Oral

I aim to explore lived experiences in places of ritual in the Prehistoric East-Mediterranean by exploring intertwined biographies of objects and people, their production and consumption patterns within corresponding spaces, and how human and material beings impacted each other along their biographies within ritual spheres. I investigate the procurement of materials, preparation of objects, execution of rituals, and the craft skills essential for their success. The complexity of objects biographies equally allows to interpret the role of specific spaces when they become active players in ritual practice. The biographies of spaces change with the biographies of objects, both in production and in use, because spaces and objects can have multiple lives going on simultaneously. But what if spaces and objects collapse together, especially when scale starts playing with the obvious roles in the mentioned biographies? Miniature forms form a unique cache of items in rituals and beyond and add other layers of complexity and meaning to the discussion of lived experiences in ritual practices. In contrast to the enduring shrines and monuments whose construction involved large teams of skilled craftspeople, artisans of miniatures will have played a very different but equally important role in creating and employing objects and/or space in ritual practices. A large part of worship expenditure was often in materials that rarely show up in East-Mediterranean archaeological contexts, in contrast to their importance in the experience and practice of that worship. Additional difficulties are that some of these materials 'lived' both in sacred and everyday settings and were often tied to agricultural produce and the crafts that turned them into edible or usable items. The sometimes ephemeral nature of both the materials involved, and the lived experiences in rituals will be highlighted in the context of miniature-making and -usage in the prehistoric East-Mediterranean.

1010. The craft of destruction : the case of the Geometric Delphic tripods

Authors: Alexis Gorgues (Université Bordaux Montaigne | CNRS UMR 5607 Ausonius) – Hélène Aurigny (Aix-Marseille Université | CNRS UMR 7299 Centre Camille Jullian)
Format: Oral

Patterns of destruction and fragmentation of ancient artefacts has for long been a central topic for Western and Central European archaeology, especially in the context of the study of Bronze and Iron ages hoards. Different hypothesis have been considered through time: pre-recycling parting of the objects, monetary use of weighed metal, ritual destruction, etc. In the Eastern Mediterranean, the study of these practices have emerged more recently. In the Greek world, the sanctuary of Olympia has obviously been a major center of attention, with the program Fragmentierung von Weihgaben im Heiligtum von Olympia- Forschungen zum Hintergrund einer rituellen Praxis (DFG-GZ.: BA 3197/2-1). The program Etude des Bronzes de Delphes de l'Ecole Française d'Athènes (EfA) has developed a similar approach for the sanctuary of Delphi, focusing first in copper-alloys tripods. These objects were central among all the ritual paraphernalia of the oracular sanctuary of Delphi. These large cauldrons standing on three long feet were originally cooking vessels that became prestigious offerings in the sanctuary, coinciding with the arrival of Apollo at Delphi. Fragments of these objects are well known: tens of them were recovered during the "Grande Fouille" of 1892 and after. Most belong to objects made during the Geometric Period. The date of their destruction and of the burial of their fragments is unknown, as a consequence of the lack of information about their discovery context. However, much information can be recovered through their observation and the analyses of the traces related with their making and their breaking. In 2025, a specific approach devolved to the study of fragmentation patterns was developed: it involves 3D modeling and statistic analysis, with the aim to consider the aforementioned hypothesis. This paper will present the first results of this research, focusing on the technical analysis of the destruction of the objects.

1206. The economy of metal votives: producing and recycling in Greek sanctuaries

Authors: George Papasavvas (Department of History and Archaeology, University of Cyprus)
Format: Oral

Although it is widely believed that votive offerings in the Greek sanctuaries were considered as property of the deities and were never to be removed from the sacred space or used in any other way, the examination of written sources and the archaeological evidence tells in some cases a completely different story. With regard to metal offerings, in particular, even if it was not uncommon for a large number of them to remain in the sacred grounds, even when broken or damaged, and to be deposited in bothroi, others had an altogether different fate: It was apparently not a sacrilegious act for some metal dedications to be removed from the sacred space and to be deprived of their association with the divine, specifically for economic purposes, that is for recycling their metal, when need arose. Though some ancient texts mention such cases and attribute them to plunder, or source them back to political decisions to finance military campaigns, for instance, the archaeological record from various sanctuaries in the Aegean reveals that it was a common practice to withdraw metal offerings, or parts of them, and use them for the production of other artifacts. In this sense, sanctuaries with access to accumulated metal offerings, appear to have been actively engaged in the management and trade of metal reserves, particularly of bronze, and to have played a major role in controlling access to and distribution of metals.

1686. The Role of Metalworkers, Metallurgy, and Their Deities in the Phoenicianization of the

Mediterranean

Authors: Ann Killebrew (Pennsylvania State University | Society for Eastern Mediterranean Archaeology and Heritage Studies)
Format: Oral

The role of Levantine Phoenicians in the search for metals and the spread of metalworking was a crucial catalyst for their westward expansion during the Iron Age and beyond. Archaeological evidence, along with Classical and biblical traditions, supports this view and demonstrates how these activities fundamentally reshaped the Mediterranean's cultural, economic, and religious landscape during the first millennium. This transformation is particularly evident in the establishment of new settlements characterized by Phoenician-style material culture, which modern scholarship often associates with Phoenician colonization. However, the relationship between metalworking activities, temples, deities, and cult practices at Phoenician sites is less frequently examined. This paper aims to address several key questions regarding the role of metalworkers in transmitting Phoenician ideology and culture. It will explore the archaeological contexts of metalworking remains, investigate the connections between temples, cultic activities, and metal production, and analyze the identity, status, and practices of metalworkers in relation to cults. Based on this evidence, can we establish a link between the quest for metals, the role of metalworkers and their rituals, and the dissemination of Phoenician religion in the formation of Phoenician identity?

58. Artful attire: cross-crafting ritual on the Athenian Akropolis and beyond

Authors: Helle Hochscheid (University College Roosevelt - Utrecht University)
Format: Oral

The Athenian Akropolis is not only a locus of virtuoso craft skill in its built environment but also in more transient objects and practices. One can think of many examples, for instance, votives that were of perishable materials or could be melted down or recycled, but also practices and ritual modes: sacrifice and other offerings, but also performances, from dance and athletics to songs and poetry. This paper investigates the cross-crafting practices of dress, performance, and their mimetic representation in sculpture and vase painting. In particular, it examines how the cloth and clothes of dancers and other performers are rendered in paint, stone and bronze. It then inventorizes the rituals that involved either dance or textiles, or both. By comparing these with literary sources and the religious contexts, the paper highlights the interwoven-ness of the different practices, craft, sacrifice and performance. This contrasts starkly with assumptions in modern scholarship that artistic and craft production of material objects is separate from (and sometimes below) artistic performance. Through an investigation of the common ground of practical enactments in this ritual setting, the paper proposes a path to avoid the separation of material, ritual and performative crafts. In this way, by uncovering how the strands of activity of these crafts are joined, we can attain new insights in the functioning of craft skill and ritual in ancient sanctuaries.

2295. The economic role of sanctuaries as producers and consumers: textiles/garments in sacred spaces during the Mycenaean period

Authors: Tina Boloti (University of Athens)
Format: Oral

Evidence from Linear B tablets suggest that religion, craft, and economy were entangled during the Aegean Late Bronze Age. Zooming on the Mycenaean mainland (ca. 1600–1100 BCE), it appears that sanctuaries were not just ritual venues; they were active economic nodes that commissioned, produced, stored, redistributed, and consumed a wide range of goods, among which textiles/garments. Within the aforementioned spatial and chronological framework, I aim at focusing on and compare the related written evidence from Pylos and Thebes, where differing administrative emphases reveal distinct modes of integration rather than fundamentally different systems. At Pylos, religious institutions appear firmly embedded within a highly centralized palatial economy: sanctuaries and deities are attested primarily through accounting records that document among others textiles, and cult personnel as components of palace-managed resource flows. Cult officials function as elite dependents, and religious demand—particularly for textiles, among others—constitutes one endpoint within a broader redistributive apparatus directed by the wanax and his administrators. By contrast, the evidence from Thebes suggests a more prominent and operationally visible role for cult institutions, especially in the organization and circulation of textiles. Religious personnel at Thebes appear more frequently in production-related contexts, implying that cult was not merely a recipient of palatial output but an active institutional node within regional economic networks. While neither center exhibits fully autonomous sanctuary economies, the contrast indicates meaningful variability in the degree to which religious institutions structured production and labor, reflecting differences in political organization, regional tradition, and administrative practice within the Mycenaean palatial world.

2519. Skilful Weavers and Crafting Spaces within Aegean Sanctuaries (Archaic to Classical)

Authors: Vicky Vlachou (Aristotle University of Thessaloniki)
Format: Oral

Following the presence of textiles as ritual offerings to Aegean sanctuaries, their preparation by skilful weavers is considered to have taken place within the space of the oikos, or in areas outside the sanctuary. On the other hand, textile tools, such as loom weights and spindle whorls, recovered from most Aegean sanctuaries during the Archaic and Classical periods, have been equally considered as symbolic offerings, embodying the skills and competence of mostly the female donors. Despite the presence of both the tools and the final products of the weaving process being present in Aegean sanctuaries, the existence of crafting spaces within the sanctuary areas has been only briefly addressed. Still, some evidence for the installation of weavers within specific sanctuaries may be found, both by considering the literary and archaeological record. Starting from the case of the sanctuary of Demeter on Xobourgo (Tenos) and its Cycladic milieu, this paper shall address the use of the sacred space for the preparation of ritual textiles that were eventually offered to the Goddess, as well as the preparation of exclusive cloths and textiles for specific ceremonies and festivals that served the donors. It may be argued that ritual and craft activities could intermingle within established or accepted traditions, inextricably connected to regional expressions and the character of ritual activities. In this way, sanctuaries may be considered as representing proper spaces for sustained interaction and shared competence, while providing the occasion for weavers to practice their craft and evolve their skills.

49 PRACTICE MAKES PERFECT - HUMAN EXPERIENCE AND THE MORPHOLOGICAL EVOLUTION OF MATERIAL CULTURE

Theme: 1. Widening perspectives in material culture studies
Organisers: David Brown (National and Kapodistrian University of Athens) – Bart Cornelis (Curt-Engelhorn-Zentrum Archäometrie gGmbH) – Léonard Dumont (Ghent University, Department of Archaeology)
Keywords: Morphology, Artefacts, Diachronic
Format: Regular session

SESSION ABSTRACT

From tools and weapons to ornaments and containers, the morphology of artefacts reflects a continuous dialogue between human intention, material constraints, and functional requirements. The object form evolves not only through technological innovation but also through changes in modes of production, performance, and purpose. This session explores how form follows both function and experience — how artefacts were designed, modified, or standardised to fulfil the specific tasks for which they were created as well as changes over time. We invite contributions that investigate how morphology mediates the interactive relationship between production and performance. Papers may address any period or region and can employ diverse analytical approaches — from typological studies and experimental archaeology to digital methods such as 3D modelling, geometric morphometrics, or computational analyses of shape variation. We particularly welcome research that links morphological change to production processes, technological adaptation, or the evolving needs and roles of material culture within human societies. By bringing together studies of artefact form, function, and production, this session aims to move beyond static typologies toward dynamic understandings of technological and functional evolution. How does shape record the requirements of production and use? In what ways did objects adapt to the demands of their task or to changing technological systems? Through this discussion, we aim to explore how material culture reflects both the persistence of human needs and the innovation that arises from reimagining how things are made to work.

CONTRIBUTION ABSTRACTS

81. Assessing Shape Variation in Mycenaean Artefacts Using 2D Geometric Morphometrics

Authors: David Brown (NKUA)
Format: Oral

This presentation presents preliminary results from a doctoral research project applying 2D Geometric Morphometrics (GM) to Late Bronze Age Aegean artefacts, with a focus on Mycenaean weapons and prestige objects. The study investigates shape variability and standardisation to reassess traditional typological classifications and explore technological and social choices in Mycenaean craftsmanship. High-resolution photographs of swords, daggers, and selected ornaments from Greek museum collections were used to capture outlines and landmarks for 2D GM analysis. Shape data were analysed using TPS and RStudio software to quantify morphological variation within and between established typological groups. The results are contextualised using excavation data, with particular emphasis on funerary assemblages from the Shaft Graves of Mycenae. The analysis is structured around two case studies: a synchronic assessment of variability within Shaft Grave assemblages, and a diachronic examination of shape change in swords and daggers across the Mycenaean period. These results demonstrate the value of 2D GM as a robust method for artefact analysis and typological research.

2220. Rethinking the Style/Function Dichotomy: An approach from the chaînes opératoires and the archaeology of learning

Authors: Alberto Cooper (University of Seville | University of Cambridge)
Format: Oral

The interpretation of ceramic variation from an evolutionary standpoint has laid its attention in the fundamental distinction between style and function, proposed by Robert Dunnell (1978). It essentially defines stylistic traits as neutral with respect to selection, and functional ones as subject to adaptive pressures. This framework has guided several studies of pottery variation (Neiman, 1995; Shennan and Wilkinson, 2001; Kohler, VanBuskirk and Ruscavage-Barz, 2004; Steele, Glatz and Kandler, 2010; Crema, Kandler and Shennan, 2016), which have relied on neutrality tests to assess qualitative evolutionary values (neutrality/selection) based on the frequency of cultural variants. Nonetheless, issues with respect to the demarcation of selection and departure from neutrality have raised questions regarding the archaeological interpretation and true significance of style and function. As an alternative, we introduce an approach based on chaînes opératoires, which examines the complete sequence of productive techniques as a manifestation of technical knowledge transmitted among potters. By reconstructing and probabilistically comparing these sequences, we aim to show that migratory and autochtonous groups can share a technological repertoire despite superficial typological differences (Kroon, 2024). Thus, revealing processes of interaction, social learning, and diversification that remain invisible under the style/function classification. This approach allows us to connect pottery morphology with modes of production, social interactions between potters, and use requirements. It is possible to use digital tools such as 3-D modeling, geometric morphometrics, or network simulations to quantify shape variation and its relationship with productive syntax (Kroon, 2024). By focusing on learning and cultural transmission dynamics, the chaînes opératoires methodology advances beyond the dichotomy of style and function. It offers a route to understanding the nuances of how social learning shapes pottery traditions from a more robust and dynamic viewpoint.

448. Expected Choices: Organization of Lithic Technology and Morphological Change in Neolithic and Chalcolithic Bulgaria

Authors: Nikolay Aleksandrov (Sofia Univerisity "St. Kliment Ohridski")
Format: Oral

This study reconsiders published lithic assemblages from Bulgaria dated to the late 6th–5th millennium BCE, with a focus on how patterns of technological practice are reflected in the morphological variability of stone tools. While recent studies have refined the chronological and regional frameworks of these assemblages, less attention has been paid to how repeated acts of production, learning, and use shaped lithic forms over time. The study examines diagnostic features of lithic production sequences and tool types across multiple assemblages, paying particular attention to core reduction strategies, degrees of standardization, and variability in tool morphology. These patterns are approached through the model of organization of lithic technology, which allows technological choices to be interpreted as results of behavior linked to specific environmental and social contexts. By focusing on technological practice, the research explores what lithic variability reveals about the experience and skill of knappers and their engagement with raw materials. Observed changes in production strategies and tool forms are discussed not only as ways to adapt to shifting economic or environmental conditions, but also as manifestations of changing social organization, mobility, and specialization. Through this re-evaluation, the analysis contributes a practice-oriented perspective on the morphological evolution of lithic assemblages and offers new insights into human experience in late prehistoric Bulgaria.

202. Divergent traditions, convergent solutions: the "inevitable inventions" of prehistoric pyrotechnology

Authors: Felix Adrian Tencariu (Institute of Interdisciplinary Research, "Al. I. Cuza" University of Iași) – Diana-Măriuca Vornicu (Institute of Archaeology, Romanian Academy-Iași Branch) – Andreea Țerna (Institute of Prehistoric and Protohistoric Archaeology, Kiel University) – Adina Amăriuței (Faculty of History, "Alexandru Ioan Cuza" University of Iași)
Format: Oral

This paper investigates the morphological evolution of prehistoric pottery-firing installations through the lens of a productive dichotomy: divergent traditions versus convergent solutions. The diffusion of Neolithic lifeways from the Near East to Europe involved the transmission of pyrotechnic knowledge, yet the materialisation of firing technologies followed distinct trajectories. A distant comparison in time (Neolithic-Chalcolithic, ca. the seventh to the fourth millennia BCE) and space reveals a striking pattern: while Mesopotamia and the Levant display a rich record of complex updraught kilns, the intermediate regions (Anatolia, the Aegean, and the Balkans) show a decrease in the visibility of permanent structures, suggesting a reliance on simpler, ephemeral installations. In sharp contrast to this intermediate 'hiatus', the forest-steppe zone between the Carpathians and the Dnieper (Cucuteni-Trypillia area) sees the re-emergence of complex firing technology, offering the most coherent European sequence for the standardisation of fixed, purpose-built kilns. We treat these kilns as technical devices whose form reflects production goals and material constraints. Using a comparative approach, we argue that the similarities between the distant kiln traditions of the Near East and the Cucuteni–Trypillia culture are not the result of direct linear transmission, but of convergence within a limited solution space. The argument is grounded primarily in data from Cucuteni-Trypillia sites with recent kiln discoveries, among which we highlight the monumental kiln at Ursoaia (Romania). In line with recent entropy-based models of technological evolution, we interpret the sunk, bicameral design as a stable morphology that communities independently converge upon when facing high-volume demand. We argue for the concept of 'inevitable inventions': when production scales up, specific technical solutions for draught and heat management converge repeatedly toward a limited set of optimal shapes, regardless of the geographical distance.

1226. How do we 'handle' this? Exploring vessel handles to reconstruct social practices

Authors: Lynne Kvapil (Butler University) – Kim Shelton (University of California Berkeley)
Format: Oral

This paper examines handles on Mycenaean drinking vessels as a means of understanding the complex behavioral codes for vessel handling and use that were embedded within this accessory element from the perspective of producers and consumers. We build on our research examining the dynamic relationship between potters and consumers and foreground these perspectives in this study. Our primary data comes from Petsas House, located in the settlement of Mycenae. Petsas House was both a domestic structure and ceramic production space during the 14th c BCE, a period of palatial expansion and centralization in the Argolid region of southern Greece. Handles are an under appreciated element of pottery. But they are also critical for understanding how a human encounters a vessel. Handles (or the lack thereof) can be guides to proper manipulation, but often they are not so straightforward. Rather, their presence or absence, size, and placement on a pot are encoded with information. The handles of drinking vessels in particular can tell multitudes about lifting, grasping, and sharing practices - to grip or guide, to hold or pass, and to use one or two hands - all of which reflect the social complexities of gatherings. Like users, potters had to understand these social codes to produce functional vessels that could be understood by consumers while also innovating shapes in response to changing social habits. Although Mycenaean vessel typologies often reflect the number and type of handles, few studies from Late Bronze Age Greece examine pottery from the perspective of potters who fulfilled the distinct needs of their communities but also played a role in actualizing social change. And, while morphology plays a clear role in understanding the social use of pottery, it is rare to see a study devoted specifically to the deictic function of handles.

1601. Changes in Function, Structure, and Morphology of Textile Impressions on Pottery from the Late Neolithic to the Late Bronze Age

Authors: Monika Kaczmarek – Kinga Winnicka (Faculty of Archaeology, University of Warsaw) – Magdalena Przymorska-Sztuczka (Archaeological Museum in Biskupin) – Marek Truszkowski – Agata Ulanowska (Faculty of Archaeology, University of Warsaw)
Format: Oral

In prehistoric societies, textile crafts were employed not only in the production of garments but also in the manufacture of utilitarian objects and luxury items. Textiles also played a significant role in pottery production, as evidenced by archaeological finds from the area of present-day Poland dating back to the Neolithic period. Fibre-based materials could be incorporated into clay vessels at various stages of the manufacturing process, from vessel formation to surface decoration. This paper examines the diachronic and regional development of textile imprints on ceramic vessels from the Late Neolithic to the Late Bronze Age in Poland. An integrated analytical approach is employed, combining Reflectance Transformation Imaging (RTI), Structure-from-Motion photogrammetry (SfM), portable digital microscopy, positive casts of textile imprints, and experimental replication to investigate surface morphologies and the cross-craft traditions that produced them. The study aims to demonstrate that textile imprints on ceramics provide valuable insights into changing pottery manufacturing practices and shifting functional priorities. It traces the evolution of textile applications on pottery surfaces, including changes in textile techniques and the types of raw materials used. The paper also identifies the functions of textile materials and explores relationships between vessel shape, size, and type, as well as the role of textiles in pottery production. By integrating imaging, microscopic analysis, and experimental approaches, this study shows how textile-generated surface morphologies reflect broader technological transformations within Bronze Age communities.

1019. Figurine Morphology as Record: Production and Embodied Practice in Late Neolithic North-East China

Authors: Jeong-Min Jeon – Gi-Dae Bok (Inha University)
Format: Oral

Research on prehistoric figurines has largely focused on interpreting what these objects symbolised, without adequately accounting for how figurine morphology structured bodily interaction, or how the physical conditions of production and use shaped that morphology. This paper examines anthropomorphic figurines from the Hongshan culture (c. 4500–3000 BC) of north-east China. Hongshan figurines encompass diverse materials (clay, stone, and jade), a size range from 3.5 cm miniatures to a 55 cm life-size example, and archaeological contexts spanning ritual sites, tombs, and residential areas. This range of variation makes them a productive case for investigating the relationship among production, morphology, and practice. The analysis focuses on how the physical properties of figurines afford or constrain specific bodily actions, and traces how production conditions shape morphological outcomes that structure embodied practice. These conditions include material selection, manufacturing technique, craft skill, and the dynamics between commissioners and makers. This process unfolds differently across material and technique. Large hollow coil-built clay figurines necessitate frontal encounters at fixed locations, whereas small hand-modelled clay figurines permit portability and concealment. Subtractive stone and jade figurines each exhibit a distinct trajectory. This paper suggests that figurine morphology is not a simple projection of symbolic meaning but can be understood as a material record of the relationship between production organisation and embodied practice.

1823. The shape of water: morphology of hunting and fishing gear from osseous raw materials in prehistory of SE Europe

Authors: Selena Vitezovic (Institute of Archaeology, Belgrade)
Format: Oral

Hunting and fishing weapons are artefacts that need to be carefully designed in order to successfully fulfil their function; their shape needs to be adjusted to laws of physics, but at the same time it depends from available raw materials and tools for working, from skills of craftsperson, as well as from cultural traditions in artefact production. In case of osseous materials (bones and antlers), the raw material itself pose numerous restriction to the final product regarding both shape and dimensions. Osseous raw materials were commonly used for the production of hunting and fishing weapons produced since the earliest prehistoric times, and even continued to be in use after metals were introduced. This paper will focus on morphological traits on osseous projectile points, harpoons and fishing hooks from Neolithic, Chalcolithic and Bronze Age in central Balkans and southern Carpathian basin and will discuss the following: to what extent is the shape determined by technological demands and raw material restrictions, and to what extent is it determined by cultural preference? The presence and level of standardisation will be examined, as well as technical traditions and innovations.

1895. Dionysiac Postures as Material Traces of Embodied Experience: A Cognitive Archaeological Approach to Greek Iconography

Authors: Sayoko Hirano (Sorbonne Université)
Format: Oral

This paper explores the possibility of a cognitive archaeology applied to art, considering Greek Dionysiac iconography as material traces of embodied cognitive processes. Rather than explaining Dionysiac postures solely through symbolic interpretation or workshop conventions, this study asks what conditions allowed these configurations to achieve historical stability and collective recognizability through the articulation of bodily constraints, mimetic selection, and material stabilization. The study is based on a corpus of fifty female Dionysiac dance figures on red-figure vases (500–300 BCE). Morphometric analysis reveals an asymmetrical pattern: body axis inclination and knee flexion remain relatively constrained, while head inclination and center-of-gravity position vary widely, consistent with the hierarchy of biomechanical constraints on human bipedal posture. This "controlled imbalance" combines stable structural conditions, which preserve the recognition of a coherent moving body, with a zone of expressive variability. This pattern is interpreted through strong embodied cognition, mimetic capacity, and Material Engagement Theory. These frameworks explain how bodily constraints define the space of possible configurations, how mimetic processes select particular forms within that space, and how material engagement contributes to the stabilization and persistence of these configurations through repeated production and circulation. This also clarifies a difficulty raised through qualitative comparison: similar postures—head thrown back, body off balance—recur across ecstatic maenads, dying warriors, and intoxicated symposiasts. These are structurally distinct: actively sustained instability in the maenad, passive collapse in the warrior, externally supported stability at the banquet. Their convergence reflects not a shared symbolic code, but the recurrent emergence of similar configurations within the same limited biomechanical space when mimetic processes operate on altered states of postural control. Dance-related configurations occupy a specific place in this account: not as the causal origin of Dionysiac iconography, but as a representational field where the constraints of the painter, the dancing body, and visual reception interact.

835. Pragmatic Innovation? The Relationship of Bronze Age Axe Designs with Mould Preservation

Authors: Bart Cornelis (University of Tübingen) – Jakob Thøsing Hvid (Museum Silkeborg)
Format: Poster

Since its inception, archaeology has relied on artefacts as the primary means of tracing shifts in cultural history. Artefacts embody variations in knowledge, production methods, styles, and modes of material engagement, and are often categorized through typologies. As such, they provide a unique perspective on the evolution of practices across generations, indicating how people interacted with and shaped their world. A potential example of material culture change during the Nordic Bronze Age is the transition from curved axes to smaller, straight-bladed axes. Traditionally, curved axes have been interpreted as symbolic display objects, while straight axes are viewed as common, utilitarian and easily replaceable. However, the archaeological record reveals a clear trend: as bronze metallurgy took hold in Northern Europe, straight-bladed axes became increasingly widespread. This poster challenges the traditional interpretation of unique versus utilitarian, by focusing on the prehistoric bronze casting process. Rather than merely reflecting a stylistic preference, the shift from curved to straight axes may represent a practical advancement in craftsmanship. Casting experiments show that producing curved axes places significant stress on stone or clay moulds: as the bronze cools and shrinks, it damages the mould material, particularly in curved sections. In contrast, straight axes exert less strain on moulds, suggesting that the transition to straighter designs was driven by a deliberate effort to preserve or reuse moulds as well as to increase and standardize production. By examining changes in axe shapes throughout the Nordic Bronze Age, this poster argues that the move toward straight axes could be a pragmatic innovation or a response to the limitations of early mould material, at least until the introduction of bronze moulds, which were better equipped to withstand the internal pressures caused by metal shrinkage.

50 TRACEOLOGY OF BONE ARTEFACTS: STATE OF THE ART AND RESEARCH PERSPECTIVES

Theme: 1. Widening perspectives in material culture studies
Organisers: Grzegorz Osipowicz – Justyna Orłowska (Nicolaus Copernicus University in Toruń) – Justin Bradfield (University of Johannesburg) – Monica Margarit (University Valahia Targoviste)
Keywords: traceology, bone, use-wear, technology, taphonomy, residues
Format: Regular session

SESSION ABSTRACT

There have been a growing number of traceological studies in recent years focused on artefacts made of osseous raw materials. They address very different research problems. Methodological work is constantly being carried out, aiming to develop an optimal method for the microscopic examination of bone products and precise classification of the technological and functional traces identified on them. Microscopic analysis is widely used for technological research, allowing the reconstruction of the chaîne opératoire of various types of artefacts from the raw materials in question. Complicated functional research is also carried out to interpret ancient bone tools' function. A complimentary aspect of traceological research is the identification of residues on bone tools, which can provide clues as to how various types of organic and inorganic raw materials were processed. These analyses are now carried out not only using optical and metallographic microscopes, but increasingly incorporate more advanced imaging techniques, such as confocal microscopy, micro-CT and OCT. The session we propose is meant to collect the latest research in all mentioned directions and determine the current state of traceological studies on bone products and research prospects for the near future. Proposed abstracts can be submitted to the session on the following topics: 1. New methods and research tools in traceological studies of bone artefacts. 2. Technological and functional studies on collections of bone products. 3. Taphonomy in the study of ancient bone industries. 4. Residue studies in traceological studies of osseous artefacts. Presentations in this session are not chronologically or geographically restricted.

CONTRIBUTION ABSTRACTS

2284. A protocol to identify the use–wear traces on osseous points used for fish hunting

Authors: Grzegorz Osipowicz – Justyna Orłowska (Institute of Archaeology, Nicolaus Copernicus University in Toruń) – Giedre Piličiauskienė (Department of Archaeology, Vilnius University) – Gytis Piličiauskas (Archaeology Department, Lithuanian Institute of History, Vilnius) – Ilga Zagorska (Institute of Latvian History, University of Latvia)
Format: Oral

The ability to distinguish bone points used for hunting in aquatic and terrestrial environments is key to understanding the economies of hunter-gatherer societies (and beyond) and the typological diversity of such tools observed worldwide. In our presentation, we present an analytical protocol for traceological research that enables the identification and correct interpretation of use–wear traces generated on bone points as a result of fish hunting. A starting point of our studies, which were conducted using optical and confocal microscopy, as well as microcomputed tomography (microCT), was the analysis of 72 experimental osseous points, which were used 1208 times in hunting experiments, where the targets were 110 kg of fish of various species and the bodies of terrestrial animals such as red or roe deer. We constructed a classification of use–wear traces formed on bone points after fish hunting based on the results of an analysis of 169 traceological observation areas on the barbed points used in such experiments. This classification significantly diverges from previous findings on use–wear patterns typical of projectile points, where impact fractures play a crucial role. Moreover, it demonstrates that in the case of fish hunting, other, previously undistinguished categories of microtraces, such as compression traces, osteon structure highlighting, specific polish, and several types of perpendicular linear traces, are of primary importance. We then tested the analytical protocol developed based on this analysis by analyzing 35 prehistoric bone points from 11 sites located in Poland, Lithuania, and Latvia. These studies fully confirmed its effectiveness.

116. Bone pointed tools of early farmers in Dobrudja (Romania): adapting to environment and economy

Authors: Monica Margarit ("Valahia" University of Targoviste) – Adrian-Daniel Irimia (Museum of National History and Archaeology Constanta | "Valahia" University of Targoviste) – Valentina Voinea (Museum of National History and Archaeology Constanta) – Valentin Radu (National Museum of Romanian History) – Adrian Balasescu ("Vasile Pârvan" Institute of Archaeology, Romanian Academy)
Format: Oral

Our study examines bone pointed tools found in the settlements of Palazu Mare (Prehamangia culture, c. 5700-5400 cal BC) and Cheia (Hamangia culture, c. 5400-4600 cal BC) in Dobrudja, Romania. This research highlights the significant preference for pointed tools made from the long bones of caprines, processed using a method involving quadri-partition by double grooving. We approached our investigation in two parts: first, identifying the technological transformation sequence, and second, determining the tools' functionality. To achieve our objectives, we employed a multi-faceted methodology that integrated direct analysis of

archaeological artifacts, comparative data from published archaeological assemblages, and our own experimental findings. Our focus was on diagnostic pieces such as preforms, blanks, and waste rather than finished tools, allowing us to reconstruct their transformation process experimentally. These created tools underwent functional testing through various actions, including skin perforation, bone breaking, shell perforations, or wood processing. We observed the active ends of the tools alongside other factors such as polish frequency, micro-topography, and functional striation patterns. By comparing our experimental replicas with archaeological specimens, we concluded that the pointed tools were utilized primarily for vegetable fibers processing and woodworking. Archaeozoological studies indicate a strong pastoral economy characterized by a high proportion of domestic animals, particularly cattle and caprines, suggesting significant environmental influences on the Prehamangia and Hamangia cultures, where hunting played a minor economic role. The acquisition of raw materials for tool production was tied to the breeding and slaughter of domestic animals. Our experimental findings demonstrate that bone pointed tools were integral to the domestic activities of these communities, reflecting their specific economic practices. Acknowledgments. This work was supported by two grant of the Romanian Ministry of Education and Research, CNCS - UEFISCDI, project number PN-IV-P1-PCE-2023-1547 (ExLiDo) and CCCDI - UEFISCDI, project number PN-IV-P6-6.1-CoEx-2024-0042, within PNCDI IV.

2091. Traceological Study of Osseous Artefact Assemblage from the Berezivzka HES Archaeological Complex

Authors: Hrytsiuta Oksana (Odesa Archaeological Museum of the National Academy of Sciences of Ukraine)
Format: Oral

This paper presents the results of a functional and traceological study of a bone and antler artefact assemblage from the Berezivzka HES (central Ukraine) Chalcolithic archaeological complex. The research aims to contribute to current discussions on the methodological potential of use-wear analysis for reconstructing craft practices and functional specialisation within osseous toolkits. The analytical framework integrates technological observations with functional traceology and use-wear analysis. This approach enables the identification of functional groups independently of formal typological classifications. Several distinct functional categories were identified. The most numerous group comprises awls and perforators used in the processing of soft organic materials, primarily hide and leather. These tools are characterised by intensive tip rounding, continuous bright polish, and transverse striations indicative of perforation with rotational motion. Antler implements form a distinct functional group used for soil working as hoes, characterised by intensive polish and edge rounding resulting from repeated contact with compact soil and mineral substrates. A limited number of bone tools also exhibit wear patterns associated with ceramic production, including edge rounding and broad striations resulting from shaping or smoothing wet clay surfaces. The results demonstrate a high degree of functional diversification within the osseous assemblage and underline the importance of traceological analysis for identifying craft activities that remain archaeologically invisible when approached through typology alone. This study contributes to the broader state of the art in bone tool traceology by illustrating how integrated functional analysis of assemblages can refine interpretations of everyday production practices and craft organisation.

1637. Bone tools from the early Bronze Age settlement at Lochenice in eastern Czechia. Between form and function

Authors: Justyna Baron (University of Wrocław) – Eva Schimerová (University of Hradec Králové) – Zdeňka Sůvová (Independent Researcher)
Format: Oral

A collection of 8,960 osseous finds was meticulously assembled through hand collection and flotation at the site of Lochenice. Ceramic-based dating indicates that 8,110 items derive from Early Bronze Age contexts associated with a settlement of the Únětice culture. Archaeozoological analysis identified domestic and wild taxa typical of Bronze Age assemblages. The material preserves traces of diverse processes, including taphonomic factors such as gnawing, exfoliation, etching, and burning, alongside anthropogenic modifications, particularly butchery marks. Sixty-seven artefacts were classified as half-products, finished objects, or fragments of broken items. The variety of raw materials and skeletal elements, together with formal diversity and distinctive use-wear patterns, highlights the importance of osseous resources in Early Bronze Age metal-using communities. These finds suggest organized production, repair, and discard practices within the settlement, reflecting both everyday subsistence activities and specialized craft behaviors. The assemblage therefore provides insight into resource management, technological choices, and the integration of bone working within economic and cultural systems of Únětice world.

1470. A multi-scalar wear and residue analysis of bone objects in the Bronze Age of southern Britain

Authors: Oliver Line (University College Dublin)
Format: Oral

This paper presents results from wear and residue analyses of bone objects from the Bronze Age of southern Britain (2500 BC-800 BC). Low and high-magnification microscopic analyses were conducted on bone artefacts from multiple depositional contexts (burials and settlements) spanning the entire period to investigate changes in how bone objects were manufactured, used, and deposited. The data produced attest to the importance of bone objects across many spheres of Bronze Age social life (e.g., pigment processing, goldworking, textile production, dress ornamentation). To verify the residues, several artefacts were sent to Leicester University for

SEM analysis with EDS/XRF, providing supporting evidence for the initial hypotheses. Two case studies, one from each sub-period of the Bronze Age (early and later), will be explored, providing an opportunity to contextualise the objects and microscopic data (e.g., depositional contexts, artefact associations) and to examine social change over time. The case studies will represent broader patterns in the function of bone artefacts in each period and can therefore add texture to pre-existing understandings of the societal changes that occurred at the end of the Early Bronze Age (c. 1500 BC) (e.g. cessation of burials with grave goods, the appearance of monumental domestic architecture and field systems). This multi-scalar analysis will highlight the potential of integrating a detailed contextual approach with wear and residue analyses to address social questions, going beyond purely functional analyses.

2672. Organic technologies in Bronze Age copper mining: functional insights from bone tools (Great Orme, UK)

Authors: Olga Zagorodnia (British Museum)
Format: Oral

Bone and antler tools form a recurrent component of Neolithic - Bronze Age mining assemblages across Europe. This study investigates the functional roles of bone tools from the Great Orme copper mines in North Wales (UK), a major mining complex exploited approximately 3000–4000 years ago. Over 35,000 osseous remains have been recorded at the site, predominantly derived from cattle, comprising food waste, manufacturing debris, and fragmented or discarded implements. Distinguishing between these categories is methodologically challenging but critical for interpreting mining practices. The analysed archaeological dataset consists of 650 bone samples, including different types of tools. They include wedges and picks made from limb bones, scoops fashioned from scapulae and pelvis elements, and rib tools used in mining and potentially ore-processing activities. The research combines morphological, technological, and traceological approaches, employing low-power optical microscopy, metallographic microscopy, and scanning electron microscopy (SEM), alongside SEM-EDS analysis. Observed surface modifications on bones reflect both human use and post-depositional processes. To refine functional interpretations, replica bone tools were experimentally produced and tested in mining-related tasks under site-specific geological conditions in the vicinity of the Great Orme. Comparative analysis between archaeological and experimental wear patterns enables the identification of diagnostic macro- and microscopic traces linked to specific tool motions, contact materials, and impact mechanisms. By integrating microwear data with experimental results and archaeological context, this study establishes robust criteria for recognising bone tool manufacture and use, highlighting the significant contribution of organic technologies to Bronze Age mining systems and providing a foundation for broader comparative research across prehistoric Europe.

162. Material entanglements and identity: traceological insights into bone tool authorship in South Africa

Authors: Justin Bradfield (University of Johannesburg)
Format: Oral

The worked bone component of archaeological sites seldom forms the focus of research, particularly when compared to less perishable materials like pottery and lithics. Consequently, worked bone is not usually incorporated into the technological descriptions of archaeological cultures. Drawing on the theory of material entanglement, archaeologists often use material culture as a proxy for people, with changes in ceramic design or stone tool technology serving as indicators of changes within human society, driven either by internal or external factors. Here, I will explore some South African case studies that have focused on the chaine operatoire and use-wear of worked bone from contemporaneous and associated Later Stone Age hunter-gatherer sites and Early Iron Age farmer sites. Bone tools in the farmer settlements were previously thought to signal amicable contact between the two groups, with the bone tools being made by the hunter-gatherers and exchanged for milk, cereals and pottery. Technological and microwear analyses, however, reveal distinct differences in the worked bones between the two sites. This would suggest that the bones tools in the farmer settlement were most likely made by the farmers themselves and do not in fact represent evidence of exchange between the two communities. I unpack how manufacturing technology and use-wear may profitably be used in studies of authorship and identity in the archaeological record, and how this component of the material record may be more meaningfully incorporated into broader discussions about the past.

1864. Technological studies of bone artefacts from the Neolithic period in the Balkans

Authors: Selena Vitezovic (Institute of Archaeology, Belgrade)
Format: Poster

Technological procedures for production of artefacts from osseous raw materials (bone, antler, teeth, shells) from the Neolithic period are relatively well studied; a number of different studies published in past years focused on the production and usage of osseous tools in different regions, although there are discrepancies in the level of research between different areas. The researches on bone artefacts from prehistoric periods in central and eastern Balkan area are still relatively limited. In this poster will be presented some of the results from researches on technological traits from several Neolithic assemblages in present-day Serbia and Bulgaria. The presence of manufacturing debris and technical pieces enabled the reconstruction of technological procedures and helped in outlining the local technological traditions. These researches also came across different obstacles that will be discussed as well. The main problems concern the preservation of the archaeological material and the damages from exposure to high temperature, creation of heavy carbonate crusts in the archaeological matrix, etc., and the working conditions for researches, since it is often

required to analyse the material during field work, with limited equipment.

51 WHERE THE WILD THINGS ARE – THE STONE AGE IN SCIENCE AND SOCIETY

Theme: 1. Widening perspectives in material culture studies
Organisers: Daniel Groß (Museum Lolland-Falster) – Andrej Maczkowski (University of Bern)
Keywords: Representation of Prehistory, Narratives, Research history, Scientific communication, Museology, Public Archaeology
Format: Discussion session
Affiliation: Palaeolithic and Mesolithic Community - PaM

SESSION ABSTRACT

The Stone Age is often portrayed through enduring caricatures: We envision a period of club-wielding troglodytes, mammoth-hunting brutes, simple coastal foragers, and grain-grinding pioneers. These images persist in textbooks, museums, and media – even as our understanding of prehistoric life has grown far more complex. Likewise these images show how scientific narratives and public imagination have shaped, perhaps distorted, our understanding of prehistory. In this session, we critically examine how the Palaeolithic and Mesolithic have been represented within both academic research and public discourse, and where outdated narratives continue to dominate. We want to explore the stories we tell about the past; how scientific discoveries are, or are not, translated into popular culture, and how social, political, and cultural contexts shape our interpretations. Our objectives are to analyze changing representations, assess influences on these shifts, and encourage critical reflection on our own approaches. By reflecting on our own research history, we aim to uncover the influence of social, political, and cultural contexts on the construction of "the Stone Age". What does the zeitgeist of different eras reveal about the way we frame the Palaeolithic and Mesolithic? How can we move beyond outdated tropes to foster a more nuanced understanding of the longest periods in human history? We invite scholars from diverse disciplines to share insights into the portrayal of the Stone Age, from museum exhibitions to scientific literature, digital media, and outreach programs. By uncovering persistent clichés and reflecting on the evolution of knowledge, this session aims to spark a conversation about how we can engage the public with a richer, more accurate picture of our earliest history.

CONTRIBUTION ABSTRACTS

429. Hidden in Plain Sight: The History of the (Non-)Discovery of the Early Mesolithic in Southern Ukraine

Authors: Dmytro Kiosak (LEIZA)
Format: Oral

National traditions in Stone Age research are well known, and their influence on research practices has been clearly demonstrated. It has been mostly done through the discussion of methodological differences between American and French approaches. However, even beyond this major divide, other national traditions shape interpretation in a variety of more subtle ways. These nuances can lead researchers, working from the same archaeological evidence, to reach conclusions that are markedly different or even not directly comparable. From this perspective, this paper examines the problem of the "missing" Early Mesolithic in southern Ukraine. Early on, the period was defined primarily on typochronological grounds and came to include assemblages that are now clearly recognized as Late Paleolithic. Paradoxically, the subsequent reassignment of these industries to the Late Paleolithic created a void in the regional chronological framework that was long accepted by default with little attempt to address it. This gap has only recently begun to be filled, largely through the re-evaluation of sites long known but only lately demonstrated to date to the Early Holocene. The reasons for this delay and the broader structure of the debate itself are deeply rooted in the specific intellectual background of Soviet archaeology and its later Ukrainian continuation, which in this respect functioned as a provincial branch of the Soviet tradition.

531. The "Hominization" of Neanderthals: What's Driving the Story?

Authors: Peter Sahlins (University of California, Berkeley)
Format: Oral

This paper explores the dialogue of science and popular culture that shaped over 170 years the changing reputation of Neanderthals. Since their discovery in 1856, the public reputation of Neanderthals has shifted dramatically: from "missing link" and ape-men without culture and language, their humanity has been slowly restored. The historical rehabilitation of Neanderthals, however, has hardly been the result of scientific "progress": indeed, the opposite case might be made. Early archaeologists and biological anthropologists were responsible for their construction as less-than-human; Marcellin Boule (and Franz Kupka's illustration) are a case in point. But their gradual and uneven redemption since the 1920s – first among creationists, then science fiction writers, and finally a handful of anthropologists before World War II – resulted from broader cultural shifts in thinking about race and difference. In the decades after the war, as Neanderthals became seen as direct human ancestors, the sciences of prehistory tended to favor their rehabilitation, while popular cultural representations moved in exactly the opposite direct, toward a portray of Neanderthals

as violent, monstrous, and stupid. In the 1980s, within the context of renewed debates in human origins studies over the recent African origins of Homo sapiens, the positions were exactly reversed: paleoanthropology and archaeology demoted Neanderthals to subhuman status, while popular culture began to humanize them. With the advent of paleogenetics, including personal ancestry testing in the United States, the early 2000s saw a dramatic shift, as both popular culture and archaeology joined to restore the full humanity of Neanderthals. The shift, once again, was not driven by the science, but by a broader reconsideration of race that framed Neanderthals as the white victims of (pre)historical violence and positioned them for "reparations" – after which archaeology, then genetics confirmed their essential humanity.

1430. Representations of the Stone Age in commercial board games: case studies

Authors: Victor Jimenez-Jaimez (University of Malaga)
Format: Oral

Representations of the past in contemporary games—digital and analog alike—have generated significant debate within History and Archaeology. Because games are interactive, players do not simply receive information; they actively shape the narrative through their choices. Moreover, games often communicate ideas about the past more effectively than academic texts due to their immersive qualities. By placing players in historical settings, they can cultivate historical empathy and help audiences grasp why events unfolded as they did. Their multimedia format and accessibility also give them far greater public reach and cultural impact than most scholarly publications. These factors help explain the rise, over the last two decades, of emerging fields such as Archaeogaming (Reinhard, 2024) and Historical Game Studies (Chapman et al., 2017), both focused on the examination of games that depict or engage with the past, the ways these games can be applied across different fields of practice and knowledge, and the motivations, interpretations, and behaviors of players and other stakeholders involved in their creation and use. While these disciplines have focused mainly on digital games, the board-game industry is also expanding rapidly. Numerous titles now portray aspects of human Prehistory, particularly the Paleolithic period. What narratives about the past do these games construct? This paper examines several case studies to explore how such representations are created and what they imply.

1949. Neanderthals as familiar strangers, distinction versus connectedness in human self-understanding

Authors: Susan Peeters (Erasmus School of Philosophy, Erasmus University) – Marie Soressi (Faculty of Archaeology, Leiden University) – Stine Jensen – Hub Zwart (Erasmus School of Philosophy, Erasmus University)
Format: Oral

Recently, our image of Neanderthals has changed dramatically, and this has philosophical implications as well, challenging us to reconsider our self-understanding: what makes us human? Neanderthals are now increasingly regarded as basically human, people like us. Yet, the persistent quest for a minimal difference which separates them from us, and defines us as 'winners', is still noticeable. This quest is a symptom of a worldview built on a dualistic framework. At the root of the dominant, western, self-narrative lies a 'hyperseparated' conception of the human, emphasizing autonomy, and separation from and domination of what is considered nature. This is not only problematic from a scientific point of view, where the evidence of coexistence and admixture is showing a more complicating picture than that of linear progression and 'inadequate' Neanderthals, but it also leads to a one-sided view of what it means to be human and persistent stereotypes. With the scientific literature serving as a backdrop and frame of reference, we studied a selection of case studies from popular discourse and novels that deal with Neanderthal – Homo sapiens encounters. Particular attention is paid to how the issue of difference (human exceptionality) is linked to heroic narratives of achieving 'world mastery' and to masculinity and concepts of gender. More recently there seems to be a growing unease with these narratives, introducing themes of vulnerability, interdependence and kinship. With this study, we capture a basic ambivalence in establishing identity: the need for self-assertion, distinguishing ourselves, coupled with the longing for connection. A more fluid and dynamic view of humanity, that no longer relies on the logic of dualist thinking that rigorously distinguishes human from the not yet fully human, will allow us to become open to more inclusive and comprehensive visions of the past, and of what it is to be human.

52 CONNECTING CAVE ARCHAEOLOGIES: SHARED PRACTICES AND CHALLENGES ACROSS THE MEDITERRANEAN

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Fotis Georgiadis (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture) – Konstantinos Trimmis (King's College London, Centre for Hellenic Studies) – Stella Katsarou (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture)
Keywords: cave archaeology, mediterranean caves, fieldwork, diachronicity, interdisciplinarity, cave shrines
Format: Regular session

SESSION ABSTRACT

Caves and rock shelters across Greece and the Mediterranean constitute unique cultural archives, preserving millennia of human activity, and reflecting every dimension of human culture, from daily subsistence to ritual expression. Exploring and interpreting

the complex nature of human—cave interaction has been an ongoing process of methodological development shaped by the challenges of subterranean research, from physical constraints of cave environments to stratigraphic/taphonomic ambiguities and uneven fieldwork opportunities among sites. In Greece, work conducted by the Ephorate of Palaeoanthropology-Speleology of the Hellenic Ministry of Culture—the state authority for cave archaeology—illustrates these disparities: only a few sites can be systematically investigated, while most caves remain known only from exploratory visits or have been lost to erosion, looting, or modern development. This session aims to provide a forum for cave archaeologists from across the Mediterranean—working in state services, research institutions, universities and more—to share their experiences, fieldwork practices, methodological and interpretive trajectories in cave archaeology. We welcome contributions that address not only the practical and methodological challenges of subterranean work but also the interpretive dimensions that arise from them. These include understanding caves as dynamic contexts of human evolution, mortuary performance, shrine establishment, refuge use, agropastoral activities, and beyond. Possible topics of discussion include, but are not limited to: • Location and exploration challenges of new caves • Diachronicity, thick stratigraphies and the 'longue durée' of cave sites • Contextual and taphonomic puzzles of human-cave interaction • Densities and metrics of caves at different scales • Landscape perspectives of cave sites • Research potential of brief investigations, non-invasive surveys, minor, damaged or neglected caves • New investigations and current projects across the Mediterranean • From material evidence to interpretation and underground narratives.

CONTRIBUTION ABSTRACTS

1255. Unfinished Tales: Towards a Diachronic and Interdisciplinary Approach in Mediterranean Cave Archaeology

Authors: Fotis Georgiadis (Ephorate of Palaeoanthropology - Speleology, Hellenic Ministry of Culture) – Konstantinos Trimmis (King's College London, Centre for Hellenic Studies) – Stella Katsarou (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture)
Format: Oral

Caves and rock shelters across the Mediterranean constitute exceptional cultural archives, preserving long-term records of human activity that extend from prehistory to the contemporary period. Despite their significance, research has often been fragmented by period-based traditions and disciplinary boundaries, with prehistoric human–cave interaction frequently studied in isolation from later historical, religious and socio-economic engagements with subterranean spaces. As a result, the narratives that caves reveal about the societies intertwined with them remain necessarily incomplete and open-ended. These "unfinished tales" have limited our ability to understand caves as dynamic settings of human–environment interaction across the longue durée. This paper argues for the necessity of a diachronic and interdisciplinary approach to Mediterranean cave archaeology that integrates archaeological, geoarchaeological, palaeoenvironmental, biological and historical perspectives alongside technological advances. By moving beyond narrowly defined chronological or functional interpretations, caves can be examined as evolving socio-cultural spaces shaped by changing practices of habitation, spiritual expression, refuge, production and mobility. Such an approach allows short-term and episodic engagements to be contextualised within broader regional and temporal trajectories of human activity. Focusing on case studies from Greece and the Adriatic, this paper highlights the importance of diachronicity, methodological innovation and interdisciplinary collaboration in the study of Mediterranean caves and their continuously evolving relationships with human societies. Ultimately, it calls for a renewed theoretical and methodological agenda in cave archaeology, positioning caves as active cultural landscapes whose meanings are both continually renegotiated within particular contexts, yet are also shaped by longer-term, diachronic traditions of cave use across the Mediterranean.

1238. Caves and nympholepts: Sotades' astragalos

Authors: Yulia Ustinova (Ben-Gurion University of the Negev)
Format: Oral

A unique mid-fifth-century vessel, attributed to Sotades and shaped as a knucklebone, features thirteen attractive women, ten of whom are levitating (BM 1860,1201.2). One side has an irregular opening, representing the mouth of a cave, with an emaciated, bearded man emerging from it and extending his hand toward the young women. This vessel has not yet been conclusively interpreted. I suggest that it evokes the caves of the nymphs that served as seats of lot-oracles, where knucklebones were used for divination. The bony man, his ribs clearly showing on his bare torso, is a nympholept who has spent much of his time in a cave, portrayed within his hallucinatory vision of a visitation by an airborne ensemble of flying nymphs. In order to prove this suggestion, I will juxtapose the portrait of the emaciated man with epigraphic and other written evidence attesting to the contents of nympholeptic hallucinations in caves. I will survey the sophisticated artistic devices used to convey the imagined actions and characteristics of the Nymphs in a hallucinatory vision, and explore the contribution of Sotades' astragalos, which depicts the nympholept's physical and mental condition, to the reconstruction of the cave cults of the Nymphs.

1357. Unveiling Zerynthia's Secrets in Samothrace

Authors: Marta López Aleixandre (University of Alcalá)
Format: Oral

Ancient literary sources attest to the existence on the Greek island of Samothrace of a city, a cave, and a goddess with the nickname of Zerynthia; as well as to the existence on the mainland coast opposite the island of a temple dedicated to a god with the nickname of Zerynthios. These epithets, probably of pre-Hellenic origin, could well have been Thracian, given that the Thracians inhabited both the island and the coast opposite it before being colonized by the Greeks during the 7th century BCE. Because Lycophron referred to the goddess Zerynthia of Samothrace as "queen of Strymon" and "goddess of Pherae", and most ancient authors affirm this, Zerynthia may have been a Thracian deity later assimilated with the Greek goddesses Hecate and/or Aphrodite. However, we know nothing about the cave where this goddess was worshipped, except that her secret rites or "Mysteries" were celebrated there and that dogs were sacrificed in her honour. We do not even know its approximate location; only that the "divine" Zerynthus was in the place "where the rocks are thronged with torchbearing mystics of the Maid." This statement by Nonnus of Panopolis leads us to imagine its location around Paleopolis, where the ancient polis and the mystery sanctuary dedicated to the Great Gods are located. However, some old cartographic maps conflict with this theory, placing these divine city and cave on the island's eastern coast, rather than the northern coast where Paleopolis lies. That is why the main objective of my paper will be to present an investigation, called Zerynthia Project, whose aim is trying to locate these city and cave on the Samothracian insular land, as well as to find out what characteristics defined the goddess Zerynthia through a multidisciplinary lens, combining ancient literary sources, archaeological evidence, and old cartographic maps.

14. Archaeological Investigations at the Te'omim Cave, Jerusalem Hills: Quarrying, Refuge, and Cult from the Middle Bronze Age to Late Antiquity

Authors: Boaz Zissu (Bar-Ilan University)
Format: Oral

Te'omim Cave is a large karst cave located in the western Jerusalem Hills. The cave features a main hall approximately 50 × 70 meters, a deep vertical shaft, additional chambers and ramifications and a natural spring. Recent surveys and excavations documented archaeological remains spanning the Neolithic to Ottoman periods. Three phases merit particular attention. The Middle Bronze Age quarrying operation extracted over 200 m^3 of flowstone for calcite-alabaster production. U-Th dating indicates quarrying ceased before 1500 BCE. This represents the first identified calcite-alabaster quarry in the southern Levant. The discovery necessitates reconsideration of the provenance of alabaster vessels previously attributed to Egyptian sources. Evidence from the Bar Kokhba Revolt (132-136 CE) includes three coin hoards, weapons, and pottery deposited in the cave's inner chambers by Jewish insurgents. One hoard contains 83 silver coins restruck by the rebel administration. Over 120 oil lamps from the Late Roman and Early Byzantine periods (late 2nd-4th centuries CE) were recovered from narrow crevices throughout the main chamber, particularly near a deep pit and spring. The deliberate placement of lamps in difficult-to-access locations suggests ritual deposition rather than utilitarian use. Parallels from Greco-Roman sanctuaries and the cave's topographic features—including a water source and deep vertical shafts—support interpretation as a cultic site, possibly associated with chthonic deities. The cave's Arabic name and local fertility traditions may reflect continuity from Late Antique practices.

2092. Between two "Worlds": In search of the origins of symbolism in the Caves and Rivers of Western Iberia

Authors: Dionysios Danelatos (Universidade Autónoma de Lisboa | Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências) – Sara Garcês (Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências) – Hipólito Collado Giraldo (Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências | Junta de Extremadura - Sección de Arqueología) – George Nash (Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências | University of Liverpool) – José García Arranz (Universidad de Extremadura) – Hugo Gomes (Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências) – Virginia Lattao (Museu de Arte Pré-Histórica de Mação | Instituto Terra e Memória - Centro de Geociências) – Pierluigi Rosina (Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências) – Telmo Pereira (Instituto de Ciências Sociais - Universidade do Minho | UNIARQ - Universidade de Lisboa | Instituto Terra e Memória - Centro de Geociências) – Luiz Oosterbeek (Instituto Politécnico de Tomar | Instituto Terra e Memória - Centro de Geociências | Museu de Arte Pré-Histórica de Mação)
Format: Oral

Palaeolithic rock art in Europe is traditionally associated with karstic environments. Nonetheless, the origins of symbolic behaviour "in situ" are considered to be a practise evident in both closed spaces (e.g. caves) and in open-air sites and rockshelters. This presentation focuses on rock art research conducted between the Tagus and the Guadiana rivers. Caves generally tend to preserve precious information about past human behaviour and occasionally unique symbolic remains which imply complex abstract thought. On the other hand, open-air rock art sites, particularly those located alongside rivers in Western Iberian Peninsula, stand as exceptional evidence of how widespread has been that behaviour in different landscapes, as demonstrated by the Late Pleistocene preserved common iconography. Here, we present this connection based on the results of two ongoing projects, the FirstArt and the OcrezArt. These projects will be presented briefly, using two key sites as case studies: the Escoural cave and the Ocreza river. Furthermore, the methodology applied to rock art research will be presented, together with the shared Upper Palaeolithic iconography of the sites, with a particular focus on zoomorphic figurative motifs. Finally, the importance of the current data in the context of Western Iberia and Southern Europe will be discussed.

1654. Iconographical Superimposition at Asphendou Cave on Crete: Practice and Meaning

Authors: Thomas Strasser (Providence College, Art & Art History)
Format: Oral

The practice of superimposing images is well documented in Palaeolithic art. The suggested reasons for this are manifold. At Asphendou cave, however, many of the superimpositions are certainly Holocene in date. I have argued elsewhere that the basal layer of the petroglyphs depicts a herd of now extinct deer, endemic to Crete during the Pleistocene. Unlike the Palaeolithic superimpositions that frequently seem to augment the art; the superimposed petroglyphs at Asphendou do not enhance the underlying figural imagery as much as it obfuscates it. They are not complimenting the previous images. It seems unlikely there was a narrative presented by the Holocene superimpositions. Nevertheless, they may not be accidental. Because there is evidence elsewhere on Crete that Homo sapiens and the extinct Pleistocene fauna coexisted, some questions can be asked. Why are none of the other extinct fauna (mice, hippopotami, elephants, shrews) presented in the basal layer? Is this perhaps marking a spot for hunters? Setting aside some modern graffiti, what could have been the purpose of the superimposed images? Similar examples from Europe, Australia and the American Southwest are analyzed to sharpen our analytical focus on these illustrations.

2255. When Behavioural Innovation Does Not Produce Social Complexity: Evidence from the Epipalaeolithic Ashkawta Rash Cave (Sulaymaniyah, Kurdistan Region of Iraq)

Authors: Eleni Asouti – Ceren Kabukcu – Douglas Baird – Hannah Morris (University of Liverpool) – Amanj Amin (Sulaymaniyah Directorate of Antiquities and Heritage)
Format: Oral

The Epipalaeolithic of Southwest Asia spanning the period from the Last Glacial Maximum to the end of the Pleistocene (~ 23,000–11,700 cal BP) is traditionally perceived as a profound transition from highly mobile foraging to sedentarising "complex" hunter-gatherer societies, which set the stage for the Neolithic Revolution of the Early Holocene. This period was characterised inter alia by population growth, resource intensification, increasing investment in residential sites and elaborate symbolic and mortuary practices, and nascent social differentiation, culminating in the Levantine Natufian, which marked the emergence of hunter-gatherer social complexity in the Levant and adjacent regions. In this paper, we present new securely dated evidence from our excavations at Ashkawta Rash Cave (Sulaymaniyah Province, Kurdistan Region of Iraq) indicating that in the northern Zagros, Epipalaeolithic behavioural and cultural innovations evolved following a very different trajectory, independent of cumulative shifts in demography, group size, architectural and social complexity, or resource ceilings.

2415. Reconstructing a Lost Cave Stratigraphy: Marine and Karst Processes at Limnopoula Rockshelter (Varassova, Western Greece)

Authors: Elli Karkazi – Stella Katsarou – Stefanos Ligkovanlis (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture) – Eleni Asouti – Ceren Kabukcu (Department of Archaeology, Classics and Egyptology, University of Liverpool) – Andreas Darlas (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture)
Format: Oral

The paper presents preliminary stratigraphic observations on the late Pleistocene–early Holocene deposits of Limnopoula rockshelter, a coastal site on Mount Varassova (western Greece). Our focus is on geoarchaeological evidence and on the complexity of the rockshelter fill, shaped by the interaction of karst and marine processes. The rockshelter lies at the base of a high vertical cliff on the southern Varassova massif, projecting into the Patraikos Gulf. Situated slightly above the modern sea level, Limnopoula has an arched opening that allows direct exposure of its interior to coastal conditions. Field research conducted by the Ephorate of Palaeoanthropology-Speleology has documented a fragmented archaeological fill with evidence for two main horizons: (a) a loose floor sediment of late Pleistocene–early Holocene date, occupying almost half the height of the rockshelter and showing clear signs of disturbance, and (b) a series of lithified deposits preserved discontinuously at various heights on the rock walls, both above and below the present level of the loose sediment. These cemented remnants incorporate cultural materials, dietary remains, and evidence of fire dated from the late Pleistocene through the Holocene and appear to have survived marine erosion by virtue of karst processes and carbonate cementation. The paper draws on macroscopic sediment observations, test excavation data, radiocarbon dating, lithic analysis, and archaeobotanical evidence to reconstruct the original sequence of human activity in the rockshelter and the geoarchaeological stages of its fragmentation. Sea-level fluctuations and wave action impacting the rockshelter from outside, combined with carbonate precipitation and speleothem formation in its interior, contributed to the preservation of some stratigraphic segments while erasing others. Limnopoula emerges as an illuminating case study of how coastal and karst dynamics can simultaneously erode, displace, and preserve archaeological stratigraphy, transforming an originally continuous deposit into fragmentary fills of contrasting texture, form, and depositional history.

2753. Constructing a chronostratigraphic framework for the Franchthi Cave and Paralia

Authors: Catherine Perlès (Université Paris Nanterre) – Mark Rose (Retired)
Format: Oral

Despite the wealth of data provided by the very long archaeological sequence at Franchthi, the use of independent phasing system by each specialist and the large number of discrete trenches renders a synthetic view extremely difficult, if not quasi-impossible. We have therefore elaborated a general chronostratigraphic framework based on all the available data —the sediments, the archaeological and bioarchaeological remains—, the phasing suggested by each author for its own material, the stratigraphic sections and the excavation notebooks. In a way, this amounted to an excavation of the excavation! Despite many contaminations, both prehistoric and recent, and cross-cutting during the excavation as no sterile layers separate the phases and subphases, we were able to isolate sequences of units in which contextual integrity, or at least the general associations of remains, was preserved. This led us to define 16 phases and a number of subphases many of which unrecognised so far, from the earliest Upper Palaeolithic to the Final Neolithic. We will here present the method we used, the underlying postulates, the difficulties we met, the different paces of change among the different categories of remains, and outline some of the unexpected results of our work.

2670. From subterranean to submerged: investigating the Bay of Kiladha, beyond Franchthi Cave

Authors: Julien Beck – Patrizia Birchler Emery (University of Geneva) – Dimitris Sakellariou (Hellenic Centre for Marine Research)
Format: Oral

Caves are inevitably linked to their external environment, whether as geological features or archaeological sites. Franchthi Cave, a well-known prehistoric site with an exceptional occupational sequence spanning the Upper Paleolithic, Mesolithic, and Neolithic periods, lies on the shores of the Bay of Kiladha, in the southern Argolid (Greece). As a result, much of the landscape that formed its prehistoric environment is now submerged because of the Holocene sea-level rise. Franchthi Cave was excavated in 1967-1976 by a team from Indiana University, with a particular focus on environmental studies. Research later extended beyond the cave, as investigations were carried out in the bay to reconstruct the prehistoric landscape linked to its occupation and look for traces of a Neolithic village (1979-1985). A new, interdisciplinary research program (the "Bay of Kiladha" project) started in 2012, with updated technology. More evidence of Neolithic activity was found in the bay, as well as a fortified Early Bronze Age settlement: underwater excavations showed that its oldest stratigraphic layers potentially dated back to the Final Neolithic and could thus have been contemporary with the occupation of the cave. Current research objectives range from studying submerged prehistoric landscapes on a wider scale to mapping Franchthi Cave and dating its partial collapse, further connecting the cave with the bay.

1983. Neolithic Alepotrypa Cave and memorialization: interpretive challenges of the ritual practices and the mortuary record

Authors: Anastasia Papathanasiou (Hellenic Ministry of Culture)
Format: Oral

The site of Alepotrypa Cave, Diros, Lakonia, Southern Greece is a 300m long, remote, cave, which was used during the entire Neolithic and more intensely during the Late and Final periods (6,000-3,200 cal. BC), in association with the surrounding area, as a burial site and a center for rich ceremonial activity. It is characterized by a massive quantity of material culture and great mortuary variability. The patterns of deposition and processing of the human remains include primary single or multiple burials, secondary depositions of multiple commingled remains, and scattered disarticulated bone. Perhaps the cave served as a mortuary monument for the specific or a broader area, as memorialization has constantly been emphasized by processes of which the memory of the dead was re-incorporated and extended into future generations through actions of disarticulation, fragmentation, commingling, and re- arrangement of the skeletal elements of the ancestors. Parallel repetition for millennia of specific activities of fragmentation, dispersal and structured accumulation of artefacts including mainly pottery, but also tools, plants, animal remains, and dung suggests a monumental and persisting ritual of worship and a place of social congregation, where the memory of the past was revived and reintroduced with ancestral importance for the living. Therefor Alepotrypa cave contributes information in the discussion of the use of remote places and caves as formalized centers for seasonal crowd aggregations, starting at least from the Early Neolithic and remaining constant till the Final Neolithic in the Mediterranean world. Except from repeated formalized rituals and structured depositions, evidence also exists for formalized attempts to create the notion of the lineage through secondary burial grounds, as well as for a broad web of contacts and traded items and tentatively information and "beliefs".

1818. The excavation of the Klenia Cave in Corinthia. Ritual practices in prehistoric Peloponnese and comparisons with Cretan caves

Authors: Dimitris Chadjiangelou (Ministry of Culture)
Format: Oral

The excavation of the Klenia Cave in Corinthia. Ritual practices in prehistoric Peloponnese and comparisons with Cretan caves It was the field research carried out by N. Bertos in the 1930s that first brought the Klenia Cave to scholarly attention. This early investigation revealed the site as a major archaeological landmark of northeastern Corinthia. Eighty years later, systematic excavations have not only confirmed the cave's topographic and geographical significance but have also brought to light remarkable finds spanning five millennia of human activity. An unexpectedly rich assemblage of pottery, lithics, and small finds has been unearthed, illuminating the earliest phases of the cave's use and offering the first insights into its remote past within the Neolithic landscape of

the Peloponnese. Bronze Age material, particularly of Mycenaean date, indicates that the cave remained in use—with a few minor interruptions—after the Neolithic, while religious finds from the historical periods further attest to its long-term ritual significance. More broadly, the Klenia cave is one of the multitude caves that have been located in the Peloponnese and all over Greece to date, while new ones continue to be discovered. Yet only a small number have been thoroughly explored archaeologically although rescue and brief digs have been carried out in many of them. This presentation presents how the Klenia cave fits in the prehistory of the mainland and focuses in particular on its ritual profile. On this basis, it concludes with a discussion of key differences in prehistoric ritual practices between caves in the Peloponnese and those in Crete. These contrasts highlight the distinctive cultural frameworks through which subterranean spaces were experienced and transformed into places of symbolic and religious meaning in the two regions.

2533. New Finds and Stratigraphic Evidence for the Diachronic Use of the Psychro Cave, Crete

Authors: Ioanna Efstathiou – Nikolaos Daskalakis (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture)
Format: Oral

The Psychro Cave (Diktaion Antron) has long been recognized as one of the major Minoan cult caves of eastern Crete, with evidence for use extending from the Neolithic into the Roman period. Early excavations at the end of the 19th and the beginning of the 20th century (by I. Chatzidakis, F. Halbherr, A. Evans, J. Demargne and D. G. Hogarth) revealed a rich and diachronic assemblage; however, controlled stratigraphic data for the earliest phases of activity within the cave have remained limited. In the context of recent works for the protection and enhancement of the cave, small-scale investigations were carried out in areas of earlier excavation trenches. These interventions brought to light new archaeological finds, while the stratigraphy revealed earlier phases of use that had not been adequately documented in previous research. In particular, a previously unrecorded Neolithic and Early Minoan stratigraphic horizon was identified, providing the first controlled evidence for the early occupation of the cave. Overall, the new data indicate that the Psychro Cave was not only a place of cult and social gathering during the Minoan and later periods, but also a space of earlier human activity. These preliminary results underline the potential of limited, targeted interventions within previously explored cave sites to refine our understanding of their long-term history, stratigraphy, and function.

2338. Making Sense of Taphonomic Processes in the Neolithic "Longue Durée" in the Pelekita Cave, Crete: An Ongoing Discussion

Authors: Susan Ferrence (INSTAP Academic Press) – Lily Bonga (INSTAP Study Center for East Crete) – Athanasia Kanta (Mediterranean Archaeological Society | Centre for the Study of Cretan and Mediterranean Civilization)
Format: Oral

The deep complex prehistoric stratigraphy of the Pelekita Cave—located near Kato Zakros in eastern Crete—is exemplified by the human use of the cave within its first chamber over the course of the "longue durée." The cave is a case study of challenging taphonomic processes inherent to the cavern's morphology and coastal yet mountainous setting with the additional layer of human-landscape interaction over the millennium. Discussing the longue durée at Pelekita contextualizes the use of the cave within the Cretan context and also the broader cave-use trends in the southern Aegean. The ongoing study of the Neolithic pottery has shown that joins among sherds revealed unexpected depositional and contextual locations. Interpreting their distribution and understanding the disparate find locations is further complicated by the absolute dates from the first round of radiocarbon samples, which yielded unexpected results, namely dates as early as the 7th millennium BCE—locating the first human use of the Pelekita Cave in the so-called "Initial Neolithic" of Greece—and placing it not only as contemporary with Stratum X and Levels 35–37 at Knossos, but also perhaps earlier in date. A series of stone-built successive Neolithic hearths provides the opportunity to discuss their use and chronology on the human scale in years, lifespans, and generations.

967. Surveying the Underground: Discovery Units, Deposits, and Non-Invasive Cave Archaeology in the Mediterranean

Authors: Konstantinos Trimmis (Australian Archaeological Institute at Athens, the University of Sydney)
Format: Oral

Caves and rock shelters across the Mediterranean preserve complex and stratified records of human activity, yet archaeological field survey within subterranean contexts remains methodologically underdeveloped compared to open-air landscapes. This paper presents the shared challenges but also opportunities of archaeological field survey in Caves. It proposes a non-invasive, surface-based archaeological survey methodology tailored specifically to cave environments, aiming to bridge landscape survey theory with cave archaeology practice. Drawing on case studies from volcanic caves on Santorini and karstic cave systems on Lastovo Islands, the paper explores how systematic cave survey can be structured through the concept of Discovery Units (DUs), adapted to the spatial, depositional, and visibility constraints of subterranean settings. Building on previous work by Mavridis and Trimmis (2020) and by Dinnis et al (2010), particular emphasis is placed on the role of depositional processes, sediment exposure, and surface characteristics in evaluating archaeological potential within caves. Rather than treating caves as uniform entities, the proposed approach understands them as internally differentiated spaces, where discrete deposits, geomorphological features, and sedimentary regimes guide both survey intensity and interpretative resolution. The methodology integrates detailed archaeological mapping with paperless recording workflows, enabling the development of cave-specific GIS environments. These digital systems function not only as tools for visualisation but as analytical platforms capable of integrating artefacts, features, sedimentary units, and geological elements within a coherent spatial framework. By combining non-invasive survey, deposit-led evaluation, and digital spatial analysis, this paper argues for a scalable and transferable approach to cave survey that enhances comparability across Mediterranean cave contexts while minimising impact on fragile subterranean archives.

1469. Archaeological CaveScapes in Central-West Greece

Authors: Apostolos Sarris (University of Cyprus) – Stella Katsarou (Hellenic Ministry of Culture)
Format: Oral

Caves have long attracted the attention of archaeologists, as they constitute loci of diverse anthropogenic activities, ranging from habitation to ceremonial, funerary, or sacred use, from the Palaeolithic period onwards. They often signify a symbolic separation between the divine, the secret, the sacred, or the funerary sphere and other aspects of human activity, although they were also used as habitation spaces, particularly during the early prehistoric period. This project focuses on the archaeological caves of Central–Western Greece. An IT platform was developed to record the various archaeological attributes of these caves, aiming to improve their management and to provide insights into their geographical characteristics. Spatial analyses addressing the topographic setting of the caves, their spatial distribution, continuity of use across different periods, catchment areas, visibility and control of the surrounding landscape, and patterns of connectivity can offer a more comprehensive understanding of these sites. This is particularly effective when the period of use, function, and associated finds have been clearly defined through archaeological investigation. The spatial analyses were based on environmental datasets collected from multiple sources. All datasets related to caves and rock shelters were analyzed collectively, and conclusions were drawn according to their period of use and function. The aim of the study was to examine long-term trends in site selection, use across different periods, and to explore the spatial characteristics of caves within their specific archaeological contexts.

2122. Caves as biocultural archives: Interdisciplinary methods for study and outreach

Authors: Asterios Aidonis – Elissavet Ganiatsou – Angelos Souleles – Christina Kakasa – Panagiota Bantavanou (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace) – Stella Katsarou – Ioanna Efstathiou – Andreas Darlas (Ephorate of Palaeoanthropology-Speleology, Hellenic Ministry of Culture) – Christina Papageorgopoulou (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, Democritus University of Thrace)
Format: Oral

Caves represent exceptional monuments of both natural and cultural heritage, preserving invaluable evidence of the Earth's geological history and human occupation from deep prehistory to the present. As complex natural archives, they document past environments, climatic variability, geomorphological processes, and biological evolution. At the same time, caves have been associated with human activity across cultures, functioning as early dwellings, ritual spaces, and sites of artistic and symbolic expression. This study employs advanced methods in Biological Anthropology to reconstruct key aspects of past human life through the integrated analysis of bioarchaeological, palaeogenetic, and palaeodietary data. Case studies include the Cave of Lakes (Peloponnese), the Cave of Negros (Astypalaia), and the Cave of Petralona (Chalkidiki), each offering exceptional archaeological and anthropological material spanning critical phases of human evolution and cultural development. The scientific investigation and systematic documentation of selected anthropological remains, combined with the application of advanced digital technologies, constitute a methodological framework for community engagement, educational initiatives, and sustainable heritage tourism. This approach is underpinned by interdisciplinary collaboration and active stakeholder participation, ensuring the effective dissemination of scientific knowledge beyond academic contexts. By enhancing the cultural and environmental value of caves, this framework promotes both their scientific and cultural significance.

2461. Radiocarbon Dating of caves and rockshelters in Greece – An overview

Authors: Yorgos Facorellis (University of West Attica)
Format: Oral

Over the past six decades, archaeological research on anthropogenic deposits in caves and rockshelters throughout Greece has brought to light new evidence regarding their use and has demonstrated that such use was very frequent and, in many cases, continuous from the Paleolithic period to the present day. Thus, in addition to well-preserved stratigraphic records, we now have series of published radiocarbon dates that assist archaeologists and other interested researchers in reassessing older theories concerning the reasons for and duration of their use. Furthermore, the often-undisturbed stratigraphy of coastal caves has made it possible to calculate the local deviation (ΔR) of the marine reservoir effect * from the global oceanic model, thereby enabling reliable dating of archaeological finds of marine origin (e.g. mollusk shells). In this study, 14C ages from all these sites across Greece are presented. Their conventional radiocarbon ages span the entire temporal range of applicability of the radiocarbon dating method, i.e. up to 50,000 years before present, and are uniformly calibrated and converted into calendar ages using the latest versions of the international calibration curves, IntCal20 and Marine20.

1444. Worshipping underground deities: caves and grottos at ancient Greek sanctuaries in the Cyclades and Attica

Authors: Erica Angliker (University of Sao Paulo)
Format: Poster

Although recent research has paid more attention to cultic practices in caves, relatively less focus has been given to caves and grottoes located within the immediate areas of sanctuaries. This poster explores the meaning of such caves and grottoes within the sacred landscapes of sanctuaries in the Cyclades and Attica. It treats caves as dynamic components of sanctuary settings and highlights the special relationships some developed in cultic contexts. By examining votive practices both within sanctuaries and in associated caves, comparing practices across these spaces, and studying the divinities connected to them, the poster investigates how these relationships evolved over time. Particular attention is given to how caves were incorporated into sanctuary settings and how their roles and meanings shifted. The connections between caves, grottoes, and sanctuaries are also explored by considering location and accessibility, challenges of exploration, diachronic use, and the complex dynamics of human–cave interaction. The poster demonstrates that the significance of caves — both cultic and conceptual — emerges from sustained interactions among people, practices, and place, revealing layered histories embedded within sanctuary landscapes.

1831. Caves, corridors, and prehistoric landscapes: a spatial analysis of the Penedès region (NE Iberian Peninsula)

Authors: Alba Sánchez De La Blanca Ramírez – Francesc Oms Arias – Xavier Rubio Campillo (Universitat de Barcelona)
Format: Poster

Prehistoric caves of the Penedès region (NE Iberian Peninsula) have traditionally been studied as individual sites, often detached from their broader spatial and landscape contexts. This paper presents a spatial analysis of prehistoric caves in the Penedès area, focusing on the relationship with natural corridors, such as valleys, passes, and routes of least-cost accessibility. By integrating cave locations with topography, hydrography, and corridor networks, the study explores how caves were embedded within wider systems of mobility and territorial organization. Rather than interpreting caves solely through their internal stratigraphy or material assemblages, this research approaches them as dynamic nodes within prehistoric landscapes, potentially linked to circulation routes and seasonal movements. The analysis includes both well-known and poorly documented caves, highlighting the research potential of minor or understudied sites. This spatial perspective allows for the identification of patterns in cave distribution at a regional scale and opens new interpretive avenues regarding their diachronic use and function, aligning closely with the methodological and interpretive themes addressed in this session.

2679. From Cave Stratigraphy to Landscape Reconstruction: Preliminary Micromorphological Results from Podlipe, Bosnia & Herzegovina

Authors: Aristeidis Varis (Department of Earth Sciences, University of Oxford | Senckenberg Centre; Human Evolution & Palaeoenvironment, University of Tübingen | German Research Foundation Centre for Advanced Studies, University of Tübingen) – Aleksandar Jašarević (Regional Museum in Doboj) – Panagiotis Karkanas (Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA) – Sofija Dragosavac (Department of Archaeology, Univesity of Belgrade) – Effrosyni Roditi (Paleoanthropology, Department of Geosciences, University of Tübingen | Senckenberg Centre; Human Evolution & Palaeoenvironment, University of Tübingen) – Jean-Luc Schwenninger (Research Laboratory for Archaeology & the History of Art, University of Oxford) – Dušan Mihailović (Department of Archaeology, University of Belgrade) – Katerina Harvati (Senckenberg Centre; Human Evolution & Palaeoenvironment, University of Tübingen | German Research Foundation Centre for Advanced Studies, University of Tübingen | Paleoanthropology, Department of Geosciences, University of Tübingen | HUMAN ORIGINS—Cluster of Excellence, University of Tübingen)
Format: Poster

Reconstructing past landscapes is crucial for archaeological research as it provides a framework for human activity in the landscape. This is especially important for understanding human subsistence during the Quaternary, when landscapes often differed substantially from modern analogues. Karst features, such as caves and rock shelters, can act as sediment traps and provide depositional archives that are often not preserved in open-air sites. This phenomenon is exemplified in Bosnia and Herzegovina, where stratified Palaeolithic sequences are currently best preserved at only two sites: the caves of Badanj and Podlipe (1, 2). Here, we draw on recent excavations at Podlipe, to investigate site formation processes and it's implications for human activity and landscape change. Using primarily micromorphology, we provide a unified stratigraphy across the three excavation sectors, disentangle key taphonomic issues, and contextualize diachronic site use. We demonstrate that human activity developed around a rockshelter rather than a cave environment, with Epigravettian hunter-gatherers most probably utilizing a past river terrace of the nearby Bioštica river. This finding is in accordance with earlier evidence for the preference of river terraces for human subsistence during the later parts of the Upper Palaeolithic (3). Our case study concludes that micromorphology and site-formation processes can disentangle the preservation biases resulting from Quaternary deglaciation and sea-level rise, which are commonly observed across the Mediterranean.

53 DIVINE BUREAUCRACIES: HOW TEMPLES WORKED IN THE ROMAN EASTERN MEDITERRANEAN - ECONOMY, ORGANIZATION AND MANAGEMENT

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Aleksandra Kubiak-Schneider (University of Wrocław) – Haggai Olshanetsky (University of Ghana)
Keywords: temple, Eastern Mediterranean, polytheism, monotheism, administration, economy
Format: Regular session

SESSION ABSTRACT

Studies dealing with ancient religions often revolve around the deities: their representation, names, religious perception, but also rituals and practices. Often, the structure built to worship and house the deity, or deities, is often ignored or purely examined as a built complex, rather than the economic and social institution of the temple. This panel proposes to explore the issue of temples as economic and social institutions in the eastern Mediterranean, including Greater Syria, Judaea/Palaestina, Asia Minor and Arabia. We aim to bring together papers analyzing various aspects of temple life, such as sources of personnel, economic resources, impact on the urban economy and development, as well as the interactions of these institutions with the Roman state powers. Presentations employing archaeological, textual, iconographical and epigraphical sources are welcome. Furthermore, these papers will also question the rigid definitions of what a temple is, and whether smaller religious institutions belonging to monotheistic religions can be considered a temple institution in an economic or social sense. The session thus hopes to foster a comparative and interdisciplinary dialogue on the role of temples as social and economic institutions, while challenging conventional approaches that view them merely as architectural or cultic entities. By re-evaluating their functions within urban, imperial, and religious frameworks, the session seeks to reveal temples as dynamic centres of economic management, social interaction, and negotiation with imperial power across the Eastern provinces of the Roman Empire. This will provide a basis to further discuss the similarities and differences between temples and places of worship belonging to various religions, cults and sects in the eastern Mediterranean during the Roman period.

CONTRIBUTION ABSTRACTS

1107. Where Temples Stand. Urban Space in the Northern Levant during the Roman Period.

Authors: Sophia Marxer (University of Bern)
Format: Oral

Temples in the eastern Mediterranean are often studied primarily as cultic or architectural entities, while their spatial embedding within the urban fabric and the ways this embedding changes over time have received comparatively little attention. This paper approaches temples as dynamic urban institutions by examining how their location within cities reflects their roles as social actors, and how these roles changed over time, with a particular focus on the Roman period. Focusing on selected case studies of public temples located within cities of the Northern Levant (e.g. Doliche, Jebel Khalid, Baalbek or Palmyra) , including temples founded in the Iron Age or the Hellenistic period, the paper analyses the spatial relationship between temples and key elements of the urban landscape in Roman cities. By combining architectural analysis, urban topography, and archaeological context, the study explores how the position of temples within the city led to different functions in urban and cultic life. In the Roman period in particular, new temple foundations or monumental reconstructions frequently reflect processes of urban reorganization and negotiation between local traditions and imperial frameworks. By analysing temples through their urban placement, this paper contributes to a broader understanding of temples as social institutions rather than static cult buildings. Ultimately, it demonstrates that the location of temples within the urban landscape provides crucial insights into their evolving roles in social organization, economic management and imperial interaction in the eastern provinces of the Roman Empire.

1368. What is a Synagogue For? A Temple for Every City? A Building for Every Purpose?

Authors: Haggai Olshanetsky (University of Ghana)
Format: Oral

There are numerous unresolved questions concerning ancient temples, their functions, and their place within society. Central among these is the question of what constitutes a "temple," and whether places of worship in the monotheistic religions are fundamentally similar and can be considered part of the same category. This issue is particularly salient in the case of the synagogue, the most common ritual building in Jewish society. Notably, synagogues began to appear during a period when the Temple in Jerusalem still existed and functioned as the primary religious centre. The original function of the synagogue is the subject of ongoing scholarly debate and is often influenced by modern forms of this institution and their functions. Nevertheless, it is clear that, like the modern synagogue, earlier synagogues fulfilled multiple roles, although these roles were likely more numerous and more diverse throughout antiquity. This presentation aims to map the rules, functions, and roles of synagogues across different Jewish communities across the first six centuries CE. It will then trace how these functions evolved, spread, and transformed from one community to another. Such an analysis will allow us to reconsider and possibly redefine what a synagogue is, and to assess whether it can, in some or all respects, be meaningfully compared to the temples of antiquity.

33. Temple life in Palmyra: management and economies

Authors: Aleksandra Kubiak-Schneider (University of Wrocław)
Format: Oral

Epigraphic and material evidence brings a scarce, but important information about the organisation of the temple work in Palmyra. This Syrian city had at least 9 temples, among which the most important and monumental was the Temple of Bel. In this talk I want to focus on the social structures as well as economy of the temples, pointing out a very important role of the priestly associations in organisation of the caravans and expeditions to different parts of the ancient world. The epigraphic evidence attests the procedure of selection of the priests and iconographic sources deliver the images of the priests. The material reveals the prominence of the cultic professions of the priests. For Palmyra it was more than an office to fulfil, it was attached to particular families, limited with certain rules. I will discuss the Aramaic inscriptions: both monumental in stone as well as enigmatic legends on the clay tokens, pointing out the supplies to the temples and provisions. I will pose the question and try to find the answer: what was the administrative and economic model of the temple work in different temples of Palmyra?

950. Keep on File: Human Agency and Documentary Management in Asia Minor's Sacred Spaces

Authors: Giuseppina Marano (Scuola Normale Superiore di Pisa)
Format: Oral

This paper explores how sanctuaries in the ancient world functioned as essential centers for public administration and the preservation of collective memory. Beyond their religious role, these sacred spaces provided a secure and prestigious environment for the management of official documents. The inviolability of the sanctuary, guaranteed by divine authority, made it the ideal location for storing sensitive records, such as citizen lists, financial accounts, and legal decrees. This progression ensured both transparency and durability, framing the sanctuary as a "laboratory" for administrative innovation where accounting techniques and archiving protocols were refined before being adopted by other civic institutions. In times of crisis or forgery, the community developed sophisticated countermeasures, such as creating authorized copies kept in separate archives, ensuring that the sacred space remained a dynamic political hub where divine protection validated the state's documentation. Central to this administrative machinery is the question of human agency: who were the individuals effectively entrusted with these responsibilities? This study interrogates the specific roles of cult officials, seeking to identify and trace the figures whose duties often differed significantly across various institutional contexts. By focusing on prominent sanctuaries in Asia Minor, such as those in Mylasa, Ephesus, and Iasos, the research highlights diverse and localized modalities of documentary management. Rethinking the "archive" through the lens of agency allows for a detailed reconstruction of the rigid protocols and technical practices governing document conservation. Furthermore, retracing these administrative actors reveals how their expertise and the strict adherence to preservation standards were not merely bureaucratic tasks, but essential contributions to the construction of public identity. Ultimately, this paper demonstrates that the interaction between human intervention and sacred space was fundamental in defining the authenticity, stability, and collective memory of the Greek polis.

1971. Sacred Economies on the Frontier: Local Temples and the Roman Army in Syria Coele during the Early Imperial period

Authors: Viktor Humennyi (Ivan Franko National University of Lviv)
Format: Oral

The paper focuses on the epigraphic evidence from Roman Syria that can help us to try to reconstruct the economic interplay between the Roman army and temple institutions in Syria Coele. Inscriptions from Antioch, Apamea, and Berytus attest to temples as major economic actors, administering land, managing endowments, and funding construction projects that relied on large-scale mobilization of labor and materials. Building inscriptions record sustained investment over several decades, reflecting coordinated imperial funding and the logistical capacities associated with nearby military forces. Military participation in temple economies is visible in dedicatory inscriptions by centurions, beneficiarii consularis, and veterans, who reinvested pay and donatives into local cults. Such practices parallel evidence from other frontier zones (the Danubian provinces), where sanctuaries similarly functioned as repositories of surplus military wealth. In Syria Coele, looking at the scale and durability of temple complexes, we can very carefully suggest a particularly strong integration of sacred economies into regional fiscal networks. Epigraphic references to military titles in honorific and administrative contexts further imply the army's role in protecting temple assets and stabilizing local revenue flows. These patterns underline temples as key intermediaries between imperial military finance and provincial economies along Rome's eastern frontier.

2472. The Distribution of Sacred Architecture in Mesopotamian Settlement Systems

Authors: Latif Oksuz (UKSW, Warsaw) – Christina Tsouparopoulou (UKSW, Warsaw | Durham University)
Format: Oral

This study analyses ancient Mesopotamia's religious landscape by investigating the connection between sacred sites and settlement distributions within the scope of Mesopotamian Material Religion (MeMaRE) project. Employing GIS spatial analysis, this research identified over 80 sites across two millennia to explore how temples functioned as institutional hubs within regional networks. The data demonstrates that rather than being widespread or randomly distributed, sacred structures appear at only approximately 2% of identified settlements, demonstrating that their construction was the result of deliberate, strategic choices rather than common practice. At major urban centres including Nippur, Babylon, and Assur, temple complexes served as organizational hubs for resource redistribution, workforce coordination, and tribute administration. Meanwhile, at secondary centres such as Carchemish, Harran, and Tell Halaf, temples were strategically positioned along major trade routes at regular intervals of approximately 90 km, suggesting intentional placement to facilitate trade and extend political influence across the landscape. Ultimately, temple distributions proved fluid rather than static, continuously adjusting to changing geopolitical realities. As centres of power shifted from the Khabur Triangle through the Middle Euphrates and later to the Tigris region, sacred architecture relocated accordingly. Analysing these structures within broader settlement patterns highlights these structures as dynamic institutions which seem to have played an important role in negotiating political and economic relations.

25. The Temple Before the Temple: Architectural Models as Administrative Tools in Hellenistic and Roman Egypt

Authors: Cesare Iezzi (University of Salento)
Format: Oral

The construction of a temple in the Hellenistic and Roman Eastern Mediterranean was not just a religious act, but a comlex economic enterprise requiring precise administrative control. This presentation aims to investigate the role of architectural models within the "divine bureaucracy" of Egypt, challenging their traditional interpretation as purely votive objects. Focusing on different case studies from Egypt (Soknopaiou Nesos, Tôd, a set of unprovenanced Hathoric capital models) and drawing comparisons with the well-known model from Niha (Lebanon), this study presents a rigorous metrological analysis. The data reveals a systematic recurrence of scale ratios, intrinsically linked to the subdivisions of the Egyptian reformed cubit, identifying these artifacts as technical instruments (paradeigmata) used to instruct the workforce, estimate material consumption and costs, and verify the project against the contract. Consequently, these objects allow us to analyze "the temple before the temple": they reveal the economic institution already at work, planning, budgeting, and contracting, prior to the physical materialization of the sacred edifice. In this light, the architectural model emerges as a bureaucratic interface between the sacred administration (the economic client) and the specialized workforce, embodying the standardization of the construction process. Finally, the presentation discusses the archaeological context of their discovery, suggesting a ritual refunctionalization: once their administrative function ceased, these tools were reabsorbed into the cultic sphere. This transition bridges the gap between the economic institution of the construction site and the final sacred nature of the built environment.

54 RE-WILDING THE NEOLITHIC: UNLOCKING THE DISRUPTIVE POTENTIALS OF CURRENT RESEARCH

Theme: 7. Interaction, connectivity and mobility
Organisers: Daniela Hofmann (University of Bergen) – Evita Kalogiropoulou (Foundation for Research and Technology Hellas: Heraklion)
Keywords: Neolithic, Europe, narratives
Format: Regular session

SESSION ABSTRACT

Neolithic research is highly innovative. Building on a long tradition of pioneering theoretical work and creative scientific approaches, Neolithic studies lead in applying new science-based methods, with discoveries covering various human expressions, customs and traditions that have fundamentally reshaped our understanding of the period. Large-scale collaborative projects continue to add more data in this complex framework, along with lively debates about the need to keep sight of the contextual and human aspects of past lives and social transformation. Yet after the third science revolution, dominant narratives have also emerged, centred among others on migration, patrilocality and ways of quantifying inequality. Complementary to these key themes, we argue, there are many divergent stories to be explored. We invite participants to delve into different interpretative avenues by focusing on the things that don't quite fit the big story. What are our new unknowns? We would like to invite participants to leverage archaeology's diverse methods and theories to ask speculative and challenging questions about how we conceptualise Neolithic identities and ways of life. These can include, but are not restricted to, blind spots in our current models, new models, interpretations destabilising the current status quo of one of the big themes, or indeed new ways of telling the Neolithic in various contexts and media, both in academia and to the wider public. Examples could, amongst many others, include: What happened to hunter-gatherer societies? How were gender roles challenged? How did Neolithic people define "outsiders"? What narratives or oral traditions were transmitted to children?

1803. Re-wilding the Neolithic – an introduction to the session

Authors: Daniela Hofmann (University of Bergen) – Evita Kalogiropoulou (Foundation for Research and Technology Hellas: Heraklion)
Format: Oral

The Neolithic, in all its regional definitions of this term, remains an exceptionally active field of research. New data are accumulating all the time, both through university-led projects and developer-funded excavations. We can now talk in great detail about, for example, the genetic relationships across a cemetery, or about the histories of mobility of individuals and groups, as well as reconstructing how artefacts were made, used and deposited. In this brief introduction, we argue that this wealth of new data has also left some blind spots in our narratives. By foregrounding these, we can ensure that the Neolithic has productive and challenging contributions to make also in the present. There is already an emergent shift in Neolithic scholarship that challenges the traditional archaeological view of stable, bounded settlement communities. Instead, they highlight the role of bottom-up agency in the formation of the social order, which involved strong communal elements, but also a variety of actors and strong local variation, with unpredictable outcomes. We illustrate this using two short case studies, on Greek and central European material. Both examples tackle established discussions on social order and inequality and attempt to stretch our narratives in the European Neolithic into new directions.

1516. Adaptation While Keeping Traditions Alive: Cultural Transmission and Social Reproduction at the PPNA–PPNB Transition

Authors: Uftade Muskara (Kocaeli University, Prehistoric Archaeology Department) – Seda Karayünlü Bozbaş (Kocaeli University, Chemistry Department)
Format: Oral

Gre Fılla, located in the Upper Tigris region, provides a rare opportunity to examine technological transmission and social reproduction across the PPNA–PPNB transition (PPNB ca. 9300–7500 cal BCE). We interpret change through household-centered "decision rules" that mediated shifts in access and provisioning, maintaining largely self-sufficient and non-standardized lithic practice rather than relocating production into communal "workshops." The strongest functional differentiation emerges at the domestic and communal interface and among communal buildings themselves: three communal buildings represent large assemblage settings with distinct emphases, indicating differentiated communal routines. Although Gre Fılla participates in broader regional traditions that imply shared knowledge and selective high-investment pyrotechnological engagements, technological organization remained primarily structured around household needs and locally configured daily practice. This interpretive model is supported by micro-context archaeometry. Sediment screening of features using spot tests, pH, and element measurements provides an independent test of feature use and helps link shared installations to communal routines through comparison with non-feature contexts. The results suggest a domestic technological continuity with structured variation among communal buildings. Gre Fılla suggests that community integration was negotiated through differentiated shared practices and places, while household practice remained the dominant arena for reproducing everyday ways of doing and making across the PPNA–PPNB transition.

665. Between Rivers and Mountains: Rethinking Movement in Early Neolithic Thrace

Authors: Atanas Tsurev – Petar Leshtakov (Bulgarian Academy of Sciences)
Format: Oral

This presentation reexamines communication networks and patterns of physical and cultural interaction among early Neolithic communities in Thrace during the first half of the 6th millennium BC, as reflected in pottery production and settlement distribution. Building on recent data and a critical reassessment of older evidence, it proposes new models for understanding movement and connectivity within the region and offers new interpretations of long-standing assumptions about routes of interaction. The analysis identifies distinct technological preferences and morphological traits in ceramic assemblages from Upper Thrace, suggesting at least two partially separate groups within the Thracian ceramic tradition. These patterns point to localized communication networks through which cultural and technological traditions circulated. The middle and lower Maritsa River and its watershed emerge as key contact zones where these traditions converged, reinforcing the well-established role of river corridors in structuring settlement development and interaction. At the same time, new data from field surveys in the Eastern Rhodope Mountains, combined with a reexamination of published material, suggest a more complex picture of movement in the early Neolithic. Beyond riverine corridors, a possible mountain route–showing stronger links with one of the identified ceramic groups–is proposed between Upper Thrace (present-day Bulgaria) and Western Thrace (present-day Greece), potentially bypassing or complementing the main river system. This challenges river-centered models of mobility and points to more diverse pathways of movement through mountainous landscapes. Together, these observations highlight the dynamic interplay between riverine and upland routes in shaping early Neolithic communication networks. They call for a reassessment of connectivity in Thrace and point to more complex patterns of movement that integrate both rivers and mountains, raising broader questions about the scale, directionality, and social mechanisms of interaction among interconnected communities in the region.

2624. Pottery and Domestic Space in Neolithic Eastern Attica

Authors: Spyros Stylios (National and Kapodistrian University of Athens)
Format: Oral

This paper will present a contextual study of the pottery assemblage from the Middle Neolithic settlement of Varambas in eastern Attica. This will be examined in relation to the site's architectural sequence and spatial organisation. Excavation data suggest a significant architectural shift, from semi-subterranean pit dwellings to above-ground buildings with stone foundations and more elaborate internal features. However, macroscopic analysis of the complete ceramic assemblage reveals continuity in vessel forms, functional categories and patterns of everyday use throughout these architectural phases. By correlating ceramic evidence with architectural contexts, the paper explores how domestic activities were organised within changing built environments. Attention is given to the spatial distribution of pottery within buildings and activity areas, as well as to potential distinctions between domestic and communal spaces. The results suggest that, although domestic architecture underwent significant reorganization, everyday economic practices associated with pottery use remained stable. This paper challenges the assumption that architectural innovation necessarily reflects economic or functional change. Instead, the evidence points to a reconfiguration of domestic space and the lived environment that did not disrupt established, everyday household practices. This study emphasises the importance of integrating ceramic analysis with architectural context to better understand the intricate relationship between continuity and change in Neolithic daily life.

2135. A microcosm of micromammals in Neolithic settlements of Greece: evidence for early synanthropy or just environmental indications?

Authors: Katerina Papayianni (Greek Ministry of Education)
Format: Oral

Soil flotation for archaeobotanical investigations has promoted the recovery and study of micromammals from archaeological sites. Although rarely indicative of economic and subsistence practices or ritual activities, micromammals indirectly show the relationship between humans and their natural environment. They are traditionally used to indicate vegetation and climatic conditions around sites. The proposed presentation will synthesise micromammal evidence from several Neolithic settlements in Greece to discuss why they are found in and around areas of human use. The presentation will focus beyond taphonomic implications and taxonomic interpretations and will attempt to reevaluate the relationship between the Neolithic communities and their micro-environment: were the Neolithic people aware of such creatures? If yes, how they dealt with them? The paper will attempt to show that the embedded concepts of the Neolithic lifestyle (sedentism, food storage, sociality etc) have led to the 'anthropisation' of the ecosystem around sites and to the synanthropic behaviour of certain micromammal species.

2678. Disrupting the Village People Model: Urban-Like Spatial Practices in the Neolithic

Authors: Hrvoje Kalafatic (Institute of Archaeology Zagreb) – Rajna Šošić Klindžić (University of Zagreb, Faculty of Humanities) – Bartul Šiljeg (Institute of Archaeology Zagreb) – Martina Rončević (Faculty of Humanities and Social Sciences, University of Zagreb)
Format: Oral

Fortified circular settlements of the fifth millennium BC in Eastern Slavonia, Croatia constitute one of the most distinctive spatial expressions of the Neolithic in central and south-eastern Europe. Defined by carefully planned circular layouts, concentric ditches and palisades, and formally organised internal space, these sites challenge traditional models that portray Neolithic communities as small, loosely structured villages. This paper examines whether such settlements allow for a meaningful discussion of early urbanism, long before the emergence of cities in the conventional sense. Rather than seeking direct evolutionary links to later urban centres, the analysis approaches these sites as socially constructed spaces shaped by interaction, connectivity and mobility. The scale of construction, degree of spatial standardisation and evidence for controlled access imply coordinated labour, shared social norms and clearly articulated boundaries between "inside" and "outside". These characteristics suggest forms of collective organisation that extend beyond purely domestic or subsistence-oriented concerns. Instead of positioning these sites within a linear evolutionary trajectory leading towards later urban centres, this contribution approaches fortified circular settlements as deliberate and recurrent spatial solutions. The repeated appearance of settlements organised in and around one, two or multiple concentric enclosures points to the existence of a shared architectural grammar that can be approached as a typological catalogue rather than a series of isolated anomalies. Such patterned variability reflects locally embedded yet widely communicated principles of spatial organisation, combining enclosure, internal zoning and monumentality in different configurations. These practices can be described as urban-like without projecting later urban categories onto Neolithic contexts. By foregrounding repetition, planning and spatial form, the paper argues that fortified circular settlements represent stable and recognizable models of Neolithic community organisation, offering a refined framework for re-evaluating social complexity and settlement dynamics in fifth-millennium BC Eastern Slavonia.

908. Vinča burials from the Klenak site, Serbia

Authors: Dragana Vulovic – Nataša Miladinović-Radmilović (Institute of Archaeology, Belgrade) – Sanja Nestorović

(Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)
Format: Oral

Archaeological finds from the Neolithic period in the Balkans, particularly on the territory of present-day Serbia, mostly come from settlement contexts, while evidence of burial practices is extremely rare. Despite the large number of known Vinča culture settlements in Serbia, traces of necropolises have been identified at only two sites (Botoš – Živanića Dolja and Gomolava), while other sites provide no evidence of funerary practices. The limited availability of data on Vinča burial practices not only complicates interpretations of their rituals and the treatment of the deceased, but also limits the anthropological analysis and the interpretation of the results themselves. In this presentation, we will present the results of the anthropological analysis of four skeletons belonging to Early Vinča burials (5300–5000 BCE) from a newly discovered necropolis at the site of Adžine Njive – Brajkovo II, near the village of Klenak in Serbia. We will also consider possible explanations for the relatively modest number of human remains dating to this period. This discovery, together with earlier findings of human osteological material, makes a small contribution but raises numerous questions regarding burial practices and the treatment of the deceased within Vinča culture communities.

86. Layers of group identity and cultural dynamics in the Late Neolithic of the Carpathian Basin

Authors: Katalin Sebok (Eötvös Loránd University, Budapest)
Format: Oral

With scientific methods becoming increasingly accessible over the past few decades, archaeology has rapidly evolved to a stage at which historical narratives are arguably less prominent, and the emphasis has shifted towards the reconstruction of 'natural' processes – including social and cognitive ones – and their transformation through time. While umbrella terms commonly associated with the concept of archaeological cultures have remained useful, the explosive growth in the quantity of data and the bewildering heterogeneity of the information now available have challenged established assumptions about the relevance of such terms and allow for their thorough reassessment. The Tisza culture complex, representing the Late Neolithic in the eastern part of the Carpathian Basin, is in its current form something of a poster child for the dated nature of top-down approaches in archaeology. Using the excavation results from three major sites – Pusztataskony-Ledence, Kisköre-Gát, and Polgár-Csőszhalom dűlő – as a point of departure, the presentation offers a brief outline of another interpretation of the related archaeological record. In this approach, the strands emerging from analyses of pottery and lithic assemblages, settlement structure, burial practices, and bioarchaeological research become the focus and interwoven to reach a higher level of understanding of past dynamics — as well as to redefine current labels and to revise their ideological, material, cultural, economic, and geopolitical relevance. Grasping the essence of such an unusually complex cultural phenomenon and its changes involves outlining levels of group identity, mobility and interaction patterns, and cultural coping mechanisms, particularly in areas highly exposed to cultural friction.

1732. LBK Hypothesis

Authors: Frantisek Trampota (Institute of Archaeology of the Czech Academy of Sciences, Prague)
Format: Oral

In mainstream interpretations of the spread of the agricultural way of life, the gradual process of Neolithisation is commonly explained as the outcome of technological innovation, which enabled early farming communities to achieve higher reproductive success and thus facilitated further expansion. However, an increasing body of archaeological evidence challenges the notion of a uniform mechanism underlying the spread of agriculture across Europe. A particularly striking phenomenon is the rapid Neolithisation of Central Europe, which stands in sharp contrast to the earlier, gradual and relatively slow expansion of the Neolithic in the Balkans. This paper aims to explain this discrepancy by situating the spread of the Neolithic within regionally specific environmental and social contexts. The study employs a comparative analysis of Early Neolithic populations in the Balkans and Central Europe, combining general archaeological knowledge with population proxy data derived from settlement numbers in both regions. By comparing demographic trends and settlement dynamics, the analysis highlights fundamental differences in population growth patterns and living conditions between the two areas. The results suggest that the rapid Neolithisation of Central Europe cannot be satisfactorily explained by agricultural innovation alone. Instead, unrestricted access to woodland resources emerges as a key factor, enabling large-scale construction of longhouses, improved living standards, and enhanced demographic growth.

120. New results on early Linear Pottery culture in the Hallstatt region

Authors: Gerald Raab – Michaela Schauer – Karina Grömer – Caroline Posch – Konstantina Saliari (Natural History Museum Vienna)
Format: Oral

Research into early Neolithic settlement processes in the Alpine region increasingly shows that models which link Linear Pottery Culture (LPC) exclusively to agriculturally favourable loess landscapes only represent part of the actual land use. The 2025 excavations at the Riezinger site in Hallstatt (Upper Austria) provide new, decisive evidence in this regard. An early Neolithic layer (SE 34), documented at a depth of around three metres, can be clearly attributed to the early LPC (ca. 5300 BC) on the basis of ceramic and lithic finds and represents the third known occurrence of this culture in Upper Austria till now. The location of the site in a geomorphologically and climatically challenging inner-Alpine basin raises the question of what factors determined the use of such

an area by early Neolithic groups. Instead of agricultural suitability, specific resources and transport geography aspects come into focus. Natural salt deposits played a central role in this. A radiocarbon-dated antler pickaxe from the Hallstatt mine (approx. 5000 BC) indicates early mining of rock salt and suggests that salt was already integrated into economic strategies and exchange networks in the early Neolithic period. The topographically favourable location of the site, with access to water, forest and pasture land, the lake Hallstatt and Traun river as a transport axis, encouraged flexible, multifunctional use of the landscape. Evidence of differentiated activity zones and an extensive lithic and ceramic inventory support this interpretation. Ongoing scientific analyses aim to further clarify the mobility, seasonal use and territorial strategies of early Neolithic groups in the inner Alpine region. The findings from Hallstatt thus contribute significantly to the discussion as to whether the Alps in the early Neolithic period should be understood as a marginal settlement area or as an integral part of dynamic economic and territorial systems.

375. Ethnogenesis as a conceptual framework for cultural transformations in the Neolithic. The Brześć Kujawski culture as a case study

Authors: Kalina Wiecaszek – Lech Czerniak (University of Gdańsk)
Format: Oral

The concepts of ethnogenesis and ethnicity have been avoided in archaeology for so long that they have almost been forgotten. Yet recent aDNA research on Neolithisation has made clear that without reactivating these concepts we are unable to adequately interpret the social consequences of migration and the confrontation of identities between hunter-gatherers and early farming communities. This situation forces a reassessment of long-standing concerns that interpreting material culture through the lenses of archaeological culture and ethnicity risks equating cultural or ethnic differences with biological ones. We argue that such fears overlook the major methodological advances and experience that archaeologists have gained over the past century. Abandoning these concerns allows ethnicity to be used as a powerful analytical tool that expands our ability to understand the lifeways and cultural transformations experienced by Neolithic communities. We understand ethnicity as a collective sense of fictive kinship that generates solidarity and obligations of cooperation, and ethnogenesis as a continuous process of creating, reproducing, and transforming group identities through manipulation of changing symbols, while accounting for habitus and the agency of things. As an example of an ethnogenetic process, we examine the formation of the Brześć Kujawski culture (4350-4000 BCE) in the Polish Lowlands. This case, rather than the emergence of an entirely new ethnic group, involved the renewal of an old Danubian Neolithic identity through its redefinition and consolidation around new symbols and a new historical narrative. Particular attention is given to the introduction of trapezoidal longhouses, interpreted as a key innovation that functioned in specific ethnographic landscape as an ethnic emblem - a symbol integrating the community by enabling mutual recognition and a collective sense of (fictive) kinship. Their widespread adoption triggered broader transformations in material culture as well as processes of settlement agglomeration and demographic growth.

2364. Less than typical: The Early Neolithic in Brandenburg, North-Eastern Germany

Authors: Sophie Schmidt (BerGSAS, Free University of Berlin and ESTER-Project, University of Kiel)
Format: Oral

This talk will focus on two narratives concerning the Neolithic which I found to be questionable in my PhD research on the 5th mill. BC in Brandenburg. The first narrative is concerned with our conceptualisation of Neolithic cultures as blocks in chronological succession and the second are the strict views on Neolithic subsistence strategies. In the research tradition of the Central German Neolithic, the Early to Middle Neolithic are clearly delineated, with a development from Linearbandkeramik (LBK) to Stroke Band Pottery (SBK) to Rössen Culture. These distinct cultural units are known to overlap slightly, but all in all they are – rightly so – given chronological significance. In Poland, the development is not quite as clear cut, as there is a stronger trend of regionalisation. Nonetheless, a similar pattern is described: LBK – SBK – several Polgar-Lengyel-Groups and Brześć-Kujawski Culture. In Brandenburg, at the "border" between the two areas, these distinct development blocks do not seem to exist. Here, we find LBK, SBK and Rössen sites, but SBK does not end when Rössen enters the stage. Also, the influence of Lengyel/Epi-Lengyel is similarly strong as in Poland, leading to mixed signals in the decoration of Rössen and SBK ceramics. Similar observations apply to the subsistence strategy of Neolithic people in this area. The leading subsistence strategy of Neolithic groups should be husbandry and crop farming. For the LBK in Brandenburg we are able to showcase both but also find rather large percentages of game. For the 5th mill. BC there are three sites with bone preservation. Of these, two show larger percentages of game than of husbanded animals. One site is especially rich in fish bones. Though the state of research is still fragmented it is possible to show that here some rather un-typical neolithic ways of life were practiced.

1888. Where the wild things were: investigating the Mesolithic–Neolithic transition through a wildlife lens

Authors: Nathalie Brusgaard (Leiden University)
Format: Oral

One the core facets of research on the Neolithic transition has been the domestication of animals and plants. The identification of domesticates continues to form a vital insight into the transitionary process, especially in regions such as western Europe where there are persisting uncertainties about the emergence of farming. Much (environmental) archaeological research has, in tandem, focused on the new relationships between humans and domesticates. In contrast, the change in an existing relationship – that of humans and wildlife – has not been systematically studied. Even after hunting and gathering ceased to be the primary subsistence

strategy, people continued to interact with wild animals. What is more, these interactions were now shaped by humans' need to protect animals and crops in their care. This paper introduces the new ERC-funded project WILDERFARM, which investigates how the rise of farming impacted human-wildlife relationships in western Europe. It reviews current knowledge on these transformations, focusing particularly on the Swifterbant culture in the Netherlands and zooming in on the interactions between humans and beavers. This paper argues that approaching the Mesolithic–Neolithic transition through a wildlife lens offers fresh perspectives on this pivotal period and it outlines how we can advance the discourse to conceptualise Neolithic way of life in a new way.

2107. On insiders and outsiders: Dolmens at the periphery of the Neolithic world (Southeast Norway) shed light on social encounters

Authors: Almut Schülke (University of Oslo, Museum of Cultural History)
Format: Oral

In recent years research on the neolithisation has shown temporally diverse occurrences of material phenomena and practices, which indicate diverse forms of coming into being of Neolithic lifeways in different areas of Europe. The variety of situations allows to approach Neolithic diversities from new interpretative angles. One of these are social encounters between hunter-gatherer groups and «Neolithic» newcomers, and the ways they might have communicated with each other and with what goals. This talk deals with an archaeological situation at the periphery of the Neolithic world which can shed light on such encounters in a new way: the few dolmens in Southern Norway, dolmens, which were erected around 3300 BC at the periphery of the Megalithic world. These dolmens are some of the rather few ritual expressions related to the phenomenon of the Northern group of the Funnel beaker Culture in the area and thus raise important questions on the significance and meanings of these monuments. For a better understanding of the social settings in which they were erected, these monuments are analysed in their socio-cultural context and within the long-term perspective of the 4th millennium BC. In the 4th millennium, there are continuities from late hunter-gatherer-societies, while at the same time Neolithic phenomena such as TRB-inspired pottery, use of polished flint axes and settling in areas which potentially are introduced. However, the dolmens seem to be erected at a time when other Neolithic influences cease. The paper discusses models of interpretation that can be applied to this setting to shed light on the contact between indigenous people and outsiders. This situation can generally contribute to a better understanding of the encounter between different groups, and especially hunter-gatherers and 'Neolithic' people in the Neolithic world.

2243. Revisiting the "Dual Model": Multiproxy Archaeological Perspectives on Neolithization in the Western Mediterranean

Authors: Oreto García-Puchol – Gianni Gallello (University of Valencia)
Format: Oral

The "Dual Model," developed to explain the process of neolithisation in eastern Iberia, was initially formulated in the 1980s based on archaeological material culture from major sites in the central Valencian region. The model identified significant differences in cultural and economic behaviours, establishing a duality between two distinct situations: sites representing incoming farming and herding communities, and contexts reflecting processes of acculturation among the last hunter-gatherer groups. Since its formulation, this narrative has been challenged by the expansion of the archaeological record through the discovery of new sites and the subsequent redefinition of settlement patterns, as well as, more recently, by the incorporation of a renewed range of archaeological proxies. These multiproxy datasets include ancient DNA from human remains, high-resolution radiocarbon dating programmes, biomolecular analyses addressing palaeoeconomic practices, sedimentary and palaeoenvironmental studies, and refined cultural proxies aimed at exploring cultural variability within a context of population expansion and interaction. This contribution seeks to synthesise this new body of evidence from eastern Iberia by reassessing the current explanatory paradigm and linking high-resolution archaeological records —generated through updated analytical approaches— with the Dual Model as a paradigmatic framework for understanding the neolithisation process in the western Mediterranean.

694. The Mesolithic-Neolithic Transition in Iberia

Authors: Michael Templer (Neuchâtel University)
Format: Oral

Iberia was a refuge area during the last glaciation; during the postglacial the population expanded so that by the Mesolithic many areas were well populated when the first Neolithic Impressed Ware migrants, followed by Cardial Ware migrants arrived by navigating from the the northwestern coast of Italy ca. 5600 BC. The geography of the Iberian Peninsula is complex, and the responses from the autochthonous populations to the Neolithic way of life differed from one area to another, so that their transitions from their mobile hunter-gatherer-collector way of life to that of sedentary or semi sedentary agro-pastoralists could take a few centuries to two millennia, making a nonsense of the simplistic academic binary dichotomy 'Mesolithic-Neolithic' applied to a region when the first evidence of Neolithic attributes appear. I have divided the Iberian Peninsula into 7 geographic regions based on the geography, population densities and the dates for the appearance of Neolithic attributes in each Region. Based on the archaeological record, I will present how the autochthonous populations responded to the arrival of the Neolithic and the duration of Transitions from hunter-gatherers to agro-pastoralists.

1852. Materiality of Neolithic silos: towards a new methodological approach. The case study from the northeastern Iberian peninsula

Authors: Alba Sánchez De La Blanca Ramírez – Francesc Oms Arias – Xavier Rubio Campillo (Universitat de Barcelona)
Format: Oral

This paper explores how the materiality documented within Neolithic silos can be used to distinguish between silos integrated into settlement life and those functioning primarily as storage facilities. Focusing on the northeastern Iberian Peninsula, especially in the known as "silos fields", the study examines silo contexts traditionally interpreted as isolated storage structures and reassesses them as potentially embedded within broader domestic and social landscapes. Drawing on a detailed analysis of material culture, faunal remains, combustion residues, and depositional patterns, this contribution evaluates the presence and significance of domestic indicators within silo fills. Through this approach, silos are examined not merely as functional storage units but as dynamic features whose material assemblages reflect practices of habitation, maintenance, abandonment, and transformation. Chronologically situated within the Neolithic, the case studies presented variability in the use and meaning of pit features and contribute to ongoing debates storage strategies, domestic space, and social practice. Rather than treating silos as purely functional, this contribution considers their materiality as a lens through which to question established narratives of Neolithic settlement and household organization.

56 ENTANGLED ECOLOGIES: NEW INTEGRATIVE APPROACHES TO UNDERSTANDING PAST HUMAN–ENVIRONMENT SYSTEMS

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Dominika Schmidtova (Institute of Archaeology of the Czech Academy of Sciences, Prague | Masaryk University) – Roberto Ragno (University of Cambridge) – Aikaterini Glykou (Stockholm University) – Ricardo Fernandes (Max Planck Institute of Geoanthropology | University of Warshaw | Masaryk University | Princeton University) – Jan Kolář (Institute of Archaeology of the Czech Academy of Sciences, Prague)
Keywords: environmental archaeology, isotopic analysis, radiocarbon dating, statistical modelling, agent-based simulation, human–environment interactions, agent-based simulation, human–environment interactions
Format: Regular session
Affiliation: Computational Modelling of Past Socio-ecological Systems - COMPS, Medieval Europe Research Community - MERC

SESSION ABSTRACT

Understanding past environments demands more than isolated single-strand datasets — it requires the integration of diverse lines of evidence in order to explore the interactions between humans, animals and plants within dynamic socio-ecological systems. This session focuses on novel multi-proxy approaches combining data from environmental archaeology (primarily faunal and botanical macroremains), isotopic analyses, aDNA analysis, radiocarbon dating, paleoecological archives, climate models, evidence from social and economic archaeology, and statistical modelling to examine these ecological entanglements prior to the Medieval landscape transformations that involved changes in arable regimes, animal herding strategies, and woodland management. As these processes may have occurred across a wide range of spatial and temporal scales, we will limit contributions to those concerning the period up to the end of the first millennium AD. We particularly welcome studies that address how social, economic, and environmental processes shaped — and were shaped by — ecological relationships. We encourage contributions that integrate Bayesian modelling, agent-based simulations, time-series analyses, and other quantitative frameworks as well as innovative methodological advances emerging from interdisciplinary collaborations. The latter includes the archaeological Big Data that allow for scalable investigations of environmental reconstructions in time and space and enhance our understanding of human–environment relationships. This session has a deliberately broad geographic and temporal scope, as it seeks to foster dialogue between specialists who employ novel analytical techniques and modelling tools to interpret past ecosystems holistically anywhere in the world.

CONTRIBUTION ABSTRACTS

2526. Entangled Disciplines? The Past, Present, and Future of Collaboration between Archaeology and Palaeoecology

Authors: Jan Kolar (Institute of Archaeology, Czech Academy of Sciences, Prague)
Format: Oral

Interactions between past human societies and vegetation are central to understanding long-term socio-ecological change. These interactions are intensively investigated in two closely related fields—palaeoecology and archaeology—whose shared temporal scope should, in principle, foster strong interdisciplinary collaboration. In practice, however, research on past human–vegetation dynamics often remains divided by disciplinary traditions, theoretical assumptions, and methodological approaches. This review identifies the most common theoretical and methodological limitations that hinder integration between these fields and proposes a new,

explicitly interdisciplinary framework for studying past socio-ecological interactions. The study addresses four key questions: (1) whether dominant narratives of past human–vegetation interactions are genuinely supported by both palaeoecological and archaeological evidence; (2) the extent to which the two disciplines share theoretical and methodological approaches; (3) whether the rise of big data and computational methods in the last decade has facilitated more frequent and productive interdisciplinary collaboration; and (4) what theoretical and methodological characteristics define the most innovative hubs of interdisciplinary research. To answer these questions, I will query bibliographic and citation data for articles published between 2000 and 2024 in major palaeoecological, archaeological, and interdisciplinary journals. In this presentation, I will offer a comprehensive review that not only maps current research practices but also provides a theoretical and methodological framework for future studies of past human–vegetation interactions so that these disciplines can collaborate effectively in close and integrative connection.

2127. Resilience as Response Diversity in Neolithic Wetland Settlements: An Analytical Framework Integrating Climate, Vegetation, and Behavioral Models for Archaeological Research

Authors: Nicholas Triozzi (Institute for Prehistoric Archaeology, Universität Bern | Oeschger Centre for Climate Change Research, Universität Bern) – Peter Ashwin (Department of Mathematics and Statistics, University of Exeter) – Catherine Bradshaw (Global Systems Institute, University of Exeter | Met Office Hadley Centre, Exeter) – Ignacio Del Amo Blanco (Niels Bohr Institute, University of Copenhagen) – Isma Abdelkader Di Carlo (Institute for Marine and Atmospheric Research, Utrecht University) – Hans Peeters (Groningen Institute of Archaeology, University of Groningen) – Anneli Poska (Tallinn University of Technology) – Jan Kolář (Institute of Archaeology, Czech Academy of Sciences, Prague) – Stefanie Jacomet (Universität Basel, IPNA) – Caroline Heitz (Institute for Prehistoric Archaeology, Universität Bern | Oeschger Centre for Climate Change Research, Universität Bern)
Format: Oral

Formal models for risk-sensitive decision making can reveal how particular combinations of subsistence activities minimize variance arising from climatic and environmental conditions. However, an analytical framework for assessing the extent to which the diversity of these activities promotes the capacity for human social-ecological systems (SESs) to absorb disturbances and reorganize and renew themselves is yet to be developed, and hence we are unable to reliably address resilience in ancient SESs. Here, we integrate features of behavioral ecology models into an adaptation of a population dynamics model of multiple interacting and mutualistic species to simulate the impacts of external (i.e., climate) variability on equilibria. We treat three alternative, yet complementary subsistence strategies (i.e., cultivation, pastoralism, and hunting) as interacting species in a heterogeneous environment. Both external and internal (e.g., risk sensitivity or opportunity costs) factors are assumed to place variable constraints on productivity and, consequently, the relative contribution of different food production activities to subsistence. We parameterize this dynamic as interaction effects between the three "species" using payoff matrices to define the relative costs and benefits of one strategy over another. We use downscaled TRACE21K-II output variables to simulate interannual variation in returns from each strategy. Our optimization model produces a time-series of the proportional contribution of each subsistence activity, assuming villages seek to maintain a positive energy budget. We then test the model predictions against macrobotanical and faunal remains recovered from lakeside settlements (i.e., pile dwellings) in the Northern Alpine Foreland spanning to the Neolithic (6.2-4.3 kya cal. BP). This research integrates optimal foraging theory, risk-sensitivity, population ecology, crop, vegetation, and climate models into a mathematical framework to understand resilience and vulnerability in past human societies.

1185. Floodplain subsistence strategy ín the Late Neolithic community of Hódmezővásárhely-Kökénydomb (Hungary)

Authors: András Füzesi (Hungarian National Museum) – Péter Csippán (Hungarian National Museum | Eötvös Loránd University) – Gabriella Darabos (Eötvös Loránd University) – Gabriella Kovács (Hungarian University of Agriculture and Life Sciences) – Enikő Magyari – Máté Merkl (Eötvös Loránd University)
Format: Oral

The Late Neolithic tell site of Hódmezővásárhely-Kökénydomb is located in the flooded area of the Great Hungarian Plain. The archaeological investigation was started in 1929, while new perspectives were opened by geomagnetic prospection in 2019. The field survey organized by Pál Raczky, Eszter Bánffy, and Knut Rassmann made it clear that the site has not just multilayered parts, but it was a well-organized settlement with a circular structure. Double ditches surrounded and separated the settlement into three sections, within which the burnt houses followed the lines of ditches. Since 2022, small-scale excavations have been organized using intensive archaeological methods to uncover one burnt house. Field methods were adapted to the multilayered character: documentation with densely constructed section walls, collection of finds per squaremeter and level. This way allowed wide analytical possibilities for the identification of multiple archeological features and activities. János Banner's earlier excavations discovered a lot of houses with rich furnishings, including unique ritual items. Anthropomorphic figures and altars upset the balance between subsistence and ritual activities in the narratives, but the new data show a different picture, with the flooded area at its center. The analysis of archaeological materials, especially animal and fish bones, is completed by examining pollen, wood-charcoal, and plant remains, as well as soil micromorphology. Stratigraphic and spatio-temporal correlations reveal distribution patterns that reflect the complex relationships between the economical, ecological, and socio-cultural spheres. The new project's excavation area is limited (98 m^2 total), but the frame of the narratives has been broadened by the analytical methods used and the theories of P-Arch and landscape. Special activities related to flooded areas include using trees from riparian forests, fishing, grazing, hunting various birds, and using different soils. Their intensity changed over the 82-177 year lifespan of the house, and this process may also have wider aspects.

2390. From Water Source to Sedimentary Archive: An Early Medieval Well as a Record of Human–Environment Interaction at Pohansko, Czechia

Authors: Michaela Prištáková (Masaryk University, Department of Archaeogy and Museology) – Hedvika Synková (Masaryk University, Department of Archaeogy and Museology | LAPE, University of South Bohemia) – Katarína Adameková (Institute of Archaeology of the Czech Academy of Sciences, Brno) – Michal Smíšek (Masaryk University, Department of Archaeogy and Museology) – Nela Doláková – Slavomír Nehyba (Masaryk University, Department of Geological Science) – Lukáš Kučera – Jakub Slačálek (Palacký University, Department of Analytical Chemistry) – Michal Kurka (University of Pardubice, Center of Materials and Nanotechnologies) – Petr Kočár (Institute of Archaeology of the Czech Academy of Sciences, Prague)
Format: Oral

Early medieval wells were important elements of settlement landscapes. They were built to secure water, but their role changed over time. Through use, maintenance, abandonment, and infilling, wells recorded human activities and decisions that shaped the local environment. As a result, they can be studied as sedimentary archives of past human–environment interactions. This study explores the archival potential of an early medieval well from the Pohansko site, located in the floodplain of the Thaya River in southeastern Czech Republic, with a focus on the life cycle of the structure. The study is based on a geoarchaeological analysis of the stratified sediment infill of the well. Multiple analytical methods were applied, including sedimentology, soil micromorphology, lipid biomarker analysis, physical and geochemical measurements, sedimentary ancient DNA (sedaDNA), and palaeoenvironmental proxies such as palynology, archaeobotany, and archaeozoology. Radiocarbon dating was used to establish the chronology of well use and infilling. A multi-proxy approach was applied to reconstruct the formation history, usage phases, and surrounding environmental conditions. Radiocarbon evidence and pottery finds places the use and infilling of the well in the 7th–8th centuries AD, making it one of the earliest such features linked to early Slavic settlement in the region. The well infill provides valuable insight into the composition of the surrounding landscape, with evidence of flooding, plant use, animal husbandry, and waste management within the settlement.

314. Molecular Biography of an Urban Centre: SedaDNA Reveals Two Millennia of Ecological Community Dynamics in London

Authors: Sam Hudson (University of Reading | London Natural History Museum) – Aleks Pluskowski (University of Reading) – Selina Brace (London Natural History Museum)
Format: Oral

The palaeoecology and palaeoenvironment of the city of London from its founding to the present day, is far less comprehensively understood than the more ubiquitous prehistoric sequences from the Middle and Lower Thames Valley. In particular, the changes wrought by urbanisation on the surrounding environs are understudied. In part, this is due to the scarcity and shallow breadth of palaeoenvironmental evidence from urban deposits within the city, but also due to a wider local depositionary change to alluvial sequences lacking in organic remains in the later Holocene. Here, we show that ancient sedimentary DNA analysis (sedaDNA) can be a useful tool for palaeoecological reconstruction in these more minerogenic sediments, which in many cases preserve DNA effectively. Data is presented from environmental samples from the Tower of London moat, Hampton Court Gardens, Lincoln's Inn Gardens, Holborn, and New Covent Garden, providing environmental evidence of land-use, livestock patterns, exotic planting, and crop exploitation in the Roman, Medieval, and post-Medieval city. Together with combined applications of more traditional methods such as pollen analysis and sedimentological analysis (pXRF, LOI), we aim to demonstrate that targeted sedaDNA sampling can bring a wealth of palaeoenvironmental evidence to deposits otherwise less valuable, even those outside of lakes and permafrost in more dynamic depositionary environments.

1706. Utilising advanced remote sensing techniques to reconstruct archaeological palaeohydrological landscapes in the Dead Heart of Australia

Authors: Oliver Hatswell – Ian Moffat – Amy Roberts – Jarrad Kowlessar (Flinders University) – Yandruwandha Yawarrawarrka Traditional Land Owners (Aboriginal Corporation) (Yandruwandha Yawarrawarrka Traditional Land Owners Aboriginal Corporation)
Format: Oral

The Coongie Lakes are a freshwater wetland system within Australia's Strzelecki Desert. Although Aboriginal peoples permanently inhabited the region at the time of European invasion and settlement, archaeological surveys have not revealed any cultural material older than ~3,000 years BP. This absence is notable given palaeoclimate evidence for extended water availability during the Pleistocene and longer Indigenous occupation histories in adjacent areas. Did Aboriginal peoples first populate this region in the Late Holocene, or is the absence of older archaeological evidence due to the region's inaccessibility and complex geomorphology? This research aims to explore this question by examining how flood-driven landscape dynamics shape the availability and stability of habitable areas. Much of the region receives less than 200 mm of annual rainfall and is intermittently replenished by large volumes of slow-moving monsoonal floodwaters from the desert margins. While Lake Coongie and parts of the main channel often contain water, most other lakes in the system are ephemeral and only inundate during major flood events. This research utilised supervised classification of daily MODIS satellite imagery alongside stream gauge data to explore water retention, lake

connectivity, and fill-and-drain sequences within the Coongie Lakes system. These datasets were compiled for multiple major flood events over three decades to identify patterns in water availability, assess how aeolian dunes influence water movement, and examine changes in lake behaviour. Such data is useful for understanding past contexts because they define the spatial distribution and persistence of surface water, informing habitability. These findings assist in understanding the extent to which the region was suitable for Aboriginal peopling, and the duration after a flood during which conditions were most favourable. By identifying areas with prolonged water availability, and therefore greater habitability, this research contributes to predicting where archaeological sites are most likely located within the Coongie Lakes system.

979. Agricultural strategies in the Neolithic of Central and Western Europe

Authors: Jelena Bulatovic (University of Gothenburg) – Simon Carrignon (University College London) – Natalia Riabogina (University of Gothenburg) – Jessie Woodbridge (University of Plymouth) – Adrian Timpson (University College London) – Ralph Fyfe (University of Plymouth) – Stephen Shennan (University College London)
Format: Oral

The practice of farming arrived in Scandinavia around 4000 BCE, approximately 1000 years after its introduction in regions located less than 300 kilometers away. Despite the advances in ancient DNA (aDNA) research that have illuminated population movements from that era, the reasons behind the observed resistance to agricultural adoption remain unclear. In this study, we integrate botanical and faunal data from the Big Interdisciplinary Archaeological Database (BIAD); product of the ERC synergy project COREX (Grant Agreement No. 95138)) with fossil pollen data to infer land cover and identify spatio-temporal patterns of change in select regions. To detect these patterns, we compiled zooarchaeological and archaeobotanical remains from France, Germany, the Low Countries, Poland and southern Scandinavia for the period 5500-3000 BCE. The BIAD dataset encompasses 2755 archaeological phases obtained from 2105 sites, comprising over 6.3 million animal remains (NISP) and approximately 5 million counts of botanical material. These data were utilized to test and compare three hypotheses that might explain the delay in the arrival of farming: 1. Local hunter-gatherers exhibited notable resistance, which was predominantly driven by their adept exploitation of aquatic resources; 2. Improved climatic conditions c. 4kBCE permitted migration into the northern frontier for successful cereal cultivation; 3. Agricultural strategies required time to evolve before they became suitable for the northerly climate and ecology, and therefore differed significantly from those that had been introduced to Central Europe 1000 years earlier.

2321. Entangled Ecologies in Transition: Modelling Land-Animal-Human Systems from the Iron Age to the Early Medieval Period in Europe

Authors: Ricardo Fernandes (MPI of Geoanthropology | University of Warsaw | Princeton University) – Dominika Schmidtova (Masaryk University) – Carlo Cocozza (MPI of Geoanthropology | Ludwig-Maximilians-Universität München) – Maaike Groot (Freie Universität Berlin) – Anthony King (University of Winchester)
Format: Oral

This paper proposes an integrated framework designed to examine the long-term transformation of European socio-ecological systems, with a focus on the critical transitions initiated by Roman imperial expansion and subsequent post-Roman fragmentation. We argue that deciphering the entangled ecologies of land management, animal husbandry, and urban-rural dynamics necessitates the synthesis of large-scale, multi-proxy datasets analysed through robust quantitative modelling. Directly responding to this session's call for scalable investigations, our study will integrate two major 'archaeological Big Data' resources: the RomAniDat archaeofaunal database and the combined IsoMemo isotopic archives of Isotòpia (c. 800 BCE – 500 CE) and the Compendium Isotoporum Medii Aevi (CIMA; 500–1500 CE). This integrated dataset will provide an unprecedented spatial and chronological scope, from the Late Iron Age through the early medieval period. Our methodology will employ Bayesian modelling and spatial-statistical analyses to investigate wide regional patterns. The core research questions are: (1) How did agro-pastoral practices, animal husbandry strategies, and dietary regimes change in response to the economic integration and urban demand of the Roman period? (2) What were the diverse ecological trajectories following the empire's political fragmentation, and how can we model variability in resilience and reorganisation? The project is specifically designed to test hypotheses regarding the intensity of ecological connectivity during the imperial period and the degree of regional diversification in land-use strategies in its aftermath. This study will demonstrate the potential of combining curated faunal and isotopic meta-datasets within explicit statistical frameworks to move beyond isolated case studies. It presents a scalable model for investigating how macro-historical social and economic processes are mediated by, and in turn reshape, foundational ecological relationships across millennia. The paper will conclude by discussing the anticipated challenges and opportunities of such large-scale data integration for holistic environmental reconstructions.

2515. Animal Husbandry Practices in Prehistoric Bohemia: Insights from Stable Isotopes and Zooarchaeological Data Modelling

Authors: Dominika Schmidtova (Institute of Archaeology of the Czech Academy of Sciences, Prague | Masaryk University) – Jan Kolář (Institute of Archaeology of the Czech Academy of Sciences, Prague)
Format: Poster

This paper presents the current state of research on human–animal interactions in prehistoric Bohemia, with a particular focus on animal husbandry practices reconstructed through stable isotope analysis and zooarchaeological data modelling. The study combines newly generated isotopic data (carbon, nitrogen, oxygen) from animal skeletal remains with a compilation of published datasets in order to explore diachronic changes in grazing strategies and land use. In the territory of the present-day Czech Republic, as well as in Central Europe more broadly, seasonal transhumance and direct forest grazing have been widely hypothesized as key components of animal management throughout prehistory. However, the extent to which these practices varied regionally and diachronically remains insufficiently understood. This study aims to assess whether regional and temporal differences in animal husbandry practices can be identified between the start of the Neolithic and the end of the Early Bronze Age (roughly 5400-1500 BCE) in modern-day Czech Republic. Preliminary results from stable isotope analyses are integrated with faunal data to investigate herding patterns, including the relative importance of open versus forested grazing environments. The results provide new insights into changing strategies of landscape management and the exploitation of a range of environments in prehistoric Bohemia and Moravia.

57 HOLOCENE ROCK ART IN THE IBERIAN PENINSULA: GRAPHIC EXPRESSIONS, MOBILITY AND COMMUNICATION NETWORKS

Theme: 7. Interaction, connectivity and mobility
Organisers: Maria Sanches (Faculty of Arts and Humanities-Oporto University | CITCEM-institucional DOI: https://doi.org/10.54499/UIDB/04059/2020) – Primitiva Bueno-Ramirez (Alcalá de Henares University) – Joana Teixeira (Faculty of Arts and Humanities-Oporto University | CITCEM-institucional DOI: https://doi.org/10.54499/UIDB/04059/2020)
Keywords: Holocene rock art, Mediterranean&Atlantic connections, Iberian Peninsula, Mediterranean & Atlantic France, Interregional contact networks, Collective identity
Format: Regular session

SESSION ABSTRACT

This session aims to address Holocene rock art in the Iberian Peninsula and adjacent geographical regions, as a marker of multiple connections: between the Mediterranean and the Atlantic, between North and South, visible through the circulation of ideas embodied in the mobility of people and the exchange of artifacts. Based on the stylistic characteristics and contexts analyzed, we intend to explore how the formal attributes of rock art/mobile art observable in each sub-region may be linked to specific social processes: mobility of ritual specialists; pilgrimages to shrines or places of community gathering; exchanges of artifacts; sharing of mythological narratives; or processes of emulation between communities. The goal is to go beyond purely typological readings to approach art as an active agent in the construction of collective identities, territorial negotiation, and cosmogonic transmission. Proposed articles may be related to, but are not limited to, the following themes: How do iconographic transformations reflect the ontological reconfigurations associated with neolithization in each region? To what extent does the representation of weapons and clothing linked to combat and personal adornments in the Bronze Age indicate a desire to adapt the landscape to new ideologies of settlement? What is the role of rock art in legitimizing emerging territorialities during the Late Neolithic and Chalcolithic periods, or the Bronze Age and Iron Age? We welcome the submission of recent overviews and case studies that can be broadly classified as part of the Holocene artistic cycles of the Iberian Peninsula and related geographical regions—Azilian art, painted and engraved schematic art, megalithic art, and engraved art (petroglyphs). Priority will be given to variables that allow us to infer regional and interregional contact networks, along with the creation of gathering places and various ideological communication strategies aimed at the cohesion of each group and communication with external groups.

CONTRIBUTION ABSTRACTS

716. Echoes from the sky? Engraved wheel-crosses in north-western Iberia (Portugal/Spain)

Authors: Diogo Marinho (Fundação para a Ciência e Tecnologia, FCT PhD scholarship at University of Minho | Lab2PT/IN2PAST) – Ana Bettencourt (Lab2PT/IN2PAST and History Department, University of Minho) – César González-Garcia (Institute of Heritage Sciences, Spanish National Research Council, INCIPIT, CSIC)
Format: Oral

The landscape is a dynamic entity shaped by the continuous interaction between humans and their surrounding environment, serving simultaneously as both a stage and an active agent in the construction of community identities. Within this context, certain natural features acquire symbolic and ritual significance that endures in collective memory, such as engraved rock outcrops. Among the various motifs found in rock art, the segmented circle stands out as a symbol of particular interest due to its possible association with ancient cosmologies and practices of a ritual or astronomical nature. This study builds on findings from research conducted in north-western Portugal, where around thirty sites with engraved rock outcrops featuring segmented circles have been identified. The present investigation seeks to extend this geographical and analytical framework to southern Galicia, Spain, where more than eighty new sites have recently been recorded. The main aim is to determine whether, on a broader territorial scale, the pattern of distribution, visibility, and orientation of these outcrops supports or contradicts the hypothesis already proposed, that such places may have served sacred or astronomical functions. To achieve this, the study employs methodologies from landscape archaeology and archaeoastronomy, integrating spatial, topographic, and astronomical data. It also examines the relationship between the outcrops and major circulation routes, as well as their proximity to settlements attributed to the Bronze Age and early Iron Age,

under the assumption that these motifs belong to those chronological periods. This research contributes to a deeper understanding of the significance of sites featuring segmented circles and, consequently, to the interpretation of the cosmologies of protohistoric populations in northwestern Iberia.

2063. Mapping Late Prehistoric Landscapes: Rock Art, Mythological Networks, and Settlement in the Carrazeda de Ansiães Plateau, Northern Portugal

Authors: João Santos (Faculty of Arts and Humanities - University of Porto | CITCEM - institucional DOI: https://doi.org/10.54499/UIDB/04059/2020 | MorphWorld | FCT)
Format: Oral

This presentation provides an in-depth understanding of the Late Prehistoric rock art sites (4th to 1st millennium BC) in the Carrazeda de Ansiães Plateau, Northern Portugal. Despite the territory's archaeological richness, no systematic field research projects focusing on the prehistoric settllement have been implemented in this area. Following Landscape Archaeology methodologies, we conducted fieldwork to relocate known sites and survey their surroundings, establishing comprehensive inventories through direct tracing and photographic documentation. This approach enabled us to establish correlations between rock art sites and other archaeological evidence in the search for Late Prehistoric settlements. The study of the rock art across all sites, including their superimpositions and graphic characteristics, allowed us to outline formal attributes, associations and identify the main cosmological "universes" of the plateau communities during Late Prehistory. The evidence demonstrates the sharing of mythological narratives within this territory. Although the grammar is predominantly schematic, it shows connections with surrounding territories in Portugal and Spain, indicating that close relations between communities extended over the long term, from at least the 3rd to the 1st millennium BC. Rock art studies reveal a territory frequented or occupied during periods when settlements have not yet been found (Middle and Late Bronze Age), emphasizing the need for systematic prospection to locate additional settlement evidence. Notably, Christian markings (crosses/crucifixes) are found at most of the engraved rock art sites, inviting interpretations related to the Christianization of these places, understood as pagan. This research aligns with Session #57"s objectives by examining how rock art served as an active agent in sharing mythological narratives, constructing collective identities, and establishing interregional contact networks. Within a Landscape Archaeology framework, these findings direct the investigation toward locating 2nd and 1st millennium BC settlements, whose material traces await discovery.

437. "Chaotic" palimpsests and structured compositions of rock art representations of weapons from the late Prehistory

Authors: Maria Sanches (Faculty of Arts and Humanities-Oporto University | CITCEM-institucional DOI: https://doi.org/10.54499/UIDB/04059/2020) – Mila Abreu (CCSP)
Format: Oral

This paper comparatively examines two engraved rock art sites in northeastern Portugal (Trás-os-Montes)—Fraga dos Fusos (Bragança) and Pedra Escrita de Ridevides (Alfândega da Fé)—both representing unique intersections between local engraving traditions and transregional iconographic systems operative throughout Late Prehistory. These case studies highlight how rock art functioned as an active agent in constructing collective identities and articulating interregional contact networks across north-western Iberia from at least the mid-to-late 3rd millennium through the mid-1st millennium BC, with hypotheses for even earlier Azilian representations. Both sites employ abrasion on schistose rock, producing characteristically linear and/or angular figures. Ridevides reveals a complex palimpsest where, although discrete stratigraphic layers cannot be identified, continuous re-engraving and transformation processes are evident. Earlier linear and schematic motifs were progressively resignified as hafted weapons (halberds, arrowheads, and a hafted spear morphologically similar to Fusos examples), particularly during the Ancient/Middle and Late Bronze Age. The final phase exhibits clear iconoclasm: pecked circular figures and anthropomorphs deliberately superimposed over earlier engravings. Fusos presents a contrasting strategy: an apparently unitary, structured composition associating sequences of linear (fusiform) figures with geometric forms—lozenge-shaped and pentagonal motifs simulating predominantly hafted spears, with others possibly representing standards or mirrors. These contrasting engraving strategies highlight how rock art mediated different social processes: Ridevides' palimpsest suggests multigenerational involvement with ancestral images, while Fusos evokes either (i) a processional scene—weapons oriented southwards towards the base of the Nogueira mountain, or (ii) a ritual deposit imitating metal weapon burial practices. Both case studies reveal the polysemic use of rock art loci, reiterating that supraregional artifact circulation networks simultaneously articulate with Atlantic and Mediterranean exchange systems. By materializing community participation in supraregional warrior iconography through locally-specific practices developed at aggregation sites, these sites evidence emerging ideologies that place confrontation as the axis of ideological and social valorization.

497. Schematic Rock Art and Mobility Networks in the Támega Valley during Late Prehistory

Authors: Lucía Rodríguez Álvarez (Universidad de Alcalá) – Beatriz Comendador Rey – Diego Herrero Alonso (Universidad de Vigo)
Format: Oral

Holocene schematic rock art in the interior of north-western Iberia has often been marginal to discussions of interaction and connectivity, which have traditionally prioritised coastal regions. This paper examines painted schematic rock art from the Támega

Valley (Monterrei, Galicia, and Trás-os-Montes, Portugal) as part of a transboundary cultural landscape structured by mobility and communication networks during the Late Prehistory (IV–III millennia cal BC). The analysis is grounded in recent doctoral research and adopts an integrated approach combining spatial distribution, stylistic attributes and archaeological context. Schematic rock art is considered alongside other material indicators of mobility, including lithic raw material circulation and decorated pottery, in order to evaluate its role within regional and interregional interaction processes. Rather than treating rock art as a passive reflection of social change, it is approached as an active component in the construction of meaningful landscapes and in the transmission of shared symbolic frameworks. The Támega Valley is interpreted as a strategic interior corridor articulating Atlantic and Mediterranean spheres. Within this context, rock art panels appear closely associated with routes of movement, areas of recurrent occupation and places of aggregation, suggesting their function as persistent graphic markers within communicative landscapes. These graphic expressions contributed to the negotiation of collective identities, the legitimisation of emerging territorialities and the circulation of ideas across communities located on both sides of the present-day border. By foregrounding an inland and traditionally under-represented region, this paper highlights the central role of schematic rock art in long-term networks of mobility and interaction across the Iberian Peninsula.

865. Engraved and carved dolmen pieces from Porto's Museum of History and Natural Science after more than a century of silence

Authors: Clara Tavares (Oporto University)
Format: Oral

This paper aims to trace the history of Prehistoric and Protohistoric art studies through a case study of the engraved and/or carved pieces from the Museum of Natural History and Science of the University of Porto, recovered from the "excavations of the Antas do Alvão" at the end of the 19th century. As this was a period of consolidation for such studies in Archaeology, our narrative will address: i) the methodology of the "amateur archaeologists" who excavated those dolmens; ii) the discussion surrounding the context of their recovery and its hasty public debate; iii) the originality of the pieces - engraved, proto-sculptural and sculptural - and the attempts to situate them within the cultural chronological framework of the time; and iv) their publication in the late 19th and early 20th centuries. Particular attention will be given to the creation of moulds and their dispatch to Emil Hübner. We also intend to disseminate knowledge of these pieces and of the reserach methods - namely petrological and technical execution analysis - currently underway to establish their authenticity. Drawing upon analysis of Prehistoric and Iron Age art in the Iberian Peninsula and the circumMediterranean region, we shall seek to weave the Alvão pieces into a narrative that traces the possible strands of local and inter-regional relationships at the heart of their production and subsequent concealment.

1653. In the Origins. Levantine Art and its Long-Lasting Connections

Authors: Juan Ruiz-López (Universidad de Castilla - La Mancha. LAPTE.)
Format: Oral

One of the most striking graphic expressions in Europe is the Levantine rock art located across eastern Spain. This phenomenon has frequently been considered an isolated one, without further explanation of its singularity. The cultural significance of this graphic expression is evident in the hundreds of rock art sites preserved, and in the long duration of their use, as manifest in the coexistence with other forms of rock art. In the last decades, evidence from the pioneering work of P. Bueno and other researchers indicates that Levantine rock art is connected to other artistic traditions in Western Europe when viewed from a broader perspective. The present paper will focus on the long-distance connections of Levantine art with other regions in Europe around, or immediately after, the Pleistocene-Holocene transition, and with supposedly different rock art styles in the Iberian Peninsula by means of some rock art sites such as Cueva de la Vieja, Fuente del Sapo, Cañada de Marco or Los Chaparros. Furthermore, the agency between these rock art styles will be explored and their relative chronology. All these connections will be used to support a hypothesis about the origin of Levantine art.

1863. Stylistic Variability and Diachronic Territorial Dynamics in Levantine Rock Art: A GIS-Based Spatial Analysis

Authors: Alfredo Sanchez-Hernandez (Universitat Jaume I) – Inés Domingo Sanz (ICREA | Universitat de Barcelona) – Dídac Roman Monroig (Universitat Jaume I)
Format: Oral

This paper presents a step further in the spatial analysis of Levantine rock art by introducing internal stylistic variability as a key analytical dimension. The study focuses on a specific territory in the eastern Iberian Peninsula, the province of Castellón. Using Geographic Information Systems (GIS) and cost-based spatial modelling, and moving beyond interpretations of this rock art corpus as a unitary artistic tradition, the research examines whether different stylistic expressions present differentiated spatial patterns in relation to landscape-scale patterns of movement and spatial organization. Spatial patterns linking rock art sites and stylistic variability are examined in relation to broader structures of mobility, understood as expressions of how space was used and re-used over time, offering insights into processes of continuity and transformation among the groups responsible for this art. Through this case study, the paper aims to contribute to ongoing theoretical and methodological discussions on the definition of Levantine rock art and its internal variability, emphasizing spatial practice and diversity rather than uniformity as a framework for future research.

1646. Connected arts? An initial approach based on the technological study of Levantine and Schematic art

Authors: Camila Muñoz-Soto – Juan Ruiz-López (Universidad de Castilla-La Mancha, LAPTE) – Vicente Jorquera-Jorquera (Universidad de Castilla-La Mancha)
Format: Oral

Traditionally, Levantine and Schematic art from the Iberian Peninsula have been viewed as distinct entities, primarily based on the morphology of the motifs (naturalistic versus schematic). The excessive focus on the chronology of Levantine art has delayed the exploration of other aspects of these artistic expressions, without considering the potential link between them. This communication therefore seeks to understand these two 'types' of art by analysing the technological processes involved in creating the paintings, such as how the raw materials were worked and what tools were used, as well as the places the depictions occupy within each panel and site. To this end, we will study representations at two sites in the Sierra de las Cuerdas in Cuenca, Spain, where motifs associated with both styles have been recorded as coexisting in the same place. The aim is to initially discuss the possible connection between these two traditions beyond the motif, through the way in which rock art is made, which could bring us closer to possible scenarios of communication or transmission of information.

2400. Material Traces of Style: Technical Traditions and Pigment Technologies in Spanish Levantine Rock Art

Authors: Esther López-Montalvo (French National Centre for Scientific Research-UMR 5608 TRACES)
Format: Oral

In Spanish Levantine rock art studies, stylistic variability has traditionally been approached through formal, thematic or compositional criteria, while technological aspects have often been treated as secondary or independent variables. This paper argues that technology constitutes a necessary dimension of style and that integrating technical practices into stylistic analysis is essential for understanding how variants operate within specific stylistic horizons. The research focuses on Paquipod human figures, a horizon characterised by wide territorial extension and pronounced internal variability. By confronting formal, thematic and compositional differences with the operational sequences of pigments, the study explores whether stylistic changes correspond to variations in technical gestures, raw material selection and pigment preparation, and examines the social and cultural significance of these relationships. The methodology combines stylistic analysis with a multi-analytical characterisation of pigments. Optical microscopy is employed to document microstratigraphy and textural features, while elemental composition is investigated through SEM–EDS and PIXE analyses. Statistical treatments of the elemental data allow the identification of patterns of variability and clustering, which are then compared with formal attributes and spatial distribution. This integrated approach makes it possible to assess how far the variants identified within the Paquipod horizon reflect shared technical traditions or distinct chaînes opératoires. At a territorial scale, the paper discusses how formal and technological criteria together contribute to delimiting the boundaries of this horizon and to identifying areas of continuity, interaction or rupture. By treating technology as an intrinsic component of style, this study offers a refined framework for interpreting stylistic variability, technical transmission and social practices in Spanish Levantine rock art.

1427. Contributions to an open-access inventory of Iberian figurines

Authors: Marta Francés-Negro (European University of Madrid | University of Alcalá) – Primitiva Bueno Ramírez – Esther Navajo-Samaniego – Alia Vázquez Martínez (University of Alcalá) – Jorge Soler Diaz (Archaeological Museum and Fine Art Museum of Alicante) – Ruth Maicas (Spain National Archeological Museum) – Antonio Carvalho (Portuguese National Archaeological Museum)
Format: Oral

Portable images commonly referred to as Ídolos in Iberian historiography are part of a broader European phenomenon usually classified as prehistoric figurines. These objects date from the sixth millennium cal BC, with their main period of production and circulation concentrated between the fourth and third millennia cal BC. They display considerable variability in form, size, and raw material, and most frequently represent stylised female bodies. Their marked regional clustering has traditionally supported interpretations that emphasize their role as expressions of social identity. Archaeological research has also identified workshops, alongside clear patterns of circulation and widespread evidence of reuse and recycling. The spatial distribution of these objects reveals complex networks of connectivity, as well as the circulation of shared graphic codes across the Subalpine, Mediterranean, and Atlantic regions. These dynamics highlight the broader significance of symbolic practices in Late Iberian prehistory and underline the role of portable imagery in the transmission of visual and social conventions. This paper presents an open-access database designed as a research, heritage management, and knowledge-dissemination tool aimed at systematizing the known corpus of Iberian Ídolos. The database addresses long-standing challenges related to institutional dissemination, terminological inconsistency, and uneven access to primary documentation. Data have been compiled through the systematic review of institutional databases, museum collections, and specialized literature, following standardized criteria for provenance, morphological description, raw material, archaeological context, and chronology. At present, the database includes more than 2500 documented objects, with further data integration ongoing, particularly concerning decorated plaques and figurines published in site reports or individual studies. By providing structured and accessible data, this project enables new analytical approaches to identities, gender, object biographies, and territorial and social practices, especially in funerary and domestic contexts. Framed within the principles of digital archaeology and open science, the database promotes transparent, collaborative, and socially engaged research.

924. Identity and craftsmanship in the Late Prehistory of Southeastern Iberia: the assemblage of decorated long bones from Almizaraque (Almería, Spain)

Authors: Francisco Martínez-Sevilla – Laura Romero-Pérez – Pedro Henróiquez-Valido (Área de Prehistoria. Universidad de Alcalá) – Rafael Mª Martínez-Sánchez (Universidad de Córdoba. Departamento de Historia) – Marta Francés-Negro (Área de Prehistoria. Universidad de Alcalá) – Ruth Maica-Ramos (Departamento de Prehistoria, Museo Arqueológico Nacional) – Rodrigo De Balbín-Behrmann (Área de Prehistoria. Universidad de Alcalá) – Mercedes Iriarte-Cela (Dpto. Ciencias y Técnicas Fisicoquímicas. UNED) – Primitiva Bueno-Ramirez (Área de Prehistoria. Universidad de Alcalá)
Format: Oral

Images constitute a fundamental component of the cultural and social expressions of human groups. In Iberia, portable representations of the human body from Late Prehistory show an exceptional diversity of forms and raw materials within the European context. Despite this variability, they share a recurrent iconography centred on facial depictions with so-called "sun-eyes," often accompanied by elongated noses and symmetrical transverse lines traditionally interpreted as tattoos. Some figures also include engravings interpreted as garments covering part or all of the body. While most figurines appear to represent individual figures, decorated long bones display sequences of repeated ocular motifs that suggest the depiction of multiple characters on a single object. These artefacts have therefore been interpreted as expressions of social pacts or, like other Iberian figurines, as representations of families and lineages functioning as markers of group identity. In the case of long bones, this symbolic role is reinforced by a stylised morphology combined with a carefully flattened base designed to ensure vertical stability, resulting in objects of greater height than most other Iberian figurine types. Moreover, they provide valuable information on the use of domestic and wild fauna in settlement and funerary contexts. Since the pioneering work of Siret in the late nineteenth century, the hypothesis that these objects were produced using pyro-engraving techniques and metal tools has been widely accepted in the literature. However, the Almizaraque assemblage remains the only example potentially associated with a workshop context. This study presents a technological and use-wear analysis of decorated long bones, together with the identification of the faunal species used as raw materials. Experimental replication was also conducted to reassess manufacturing processes, tool types, and the possible functions of these objects beyond traditional interpretations.

1805. The Painted Oculate Motifs of Serra de Passos/Santa Comba - Garraia (Northeast of Portugal)

Authors: Joana Teixeira (CITCEM / Faculty of Arts and Humanities-Oporto University)
Format: Oral

In Passos/Santa Comba - Garraia mountain (municipalities of Mirandela, Valpaços and Murça), one of the most important assemblages of painted schematic rock art in the Iberian Peninsula is found, within a chronological framework that may extend from the EarlyNeolithic through the Chalcolithic (c. 5000 - 2500 BC). Within this assemblage we highlight the oculate motifs. Passos/Santa Comba-Garraia contains the largest concentration of painted oculate motifs currently known in Iberia. Beyond their exceptional number what also makes it of special importance in this site is the unique typological diversity of their designs and techniques. Oculate imagery in Iberia is not limimited to rock art as it is also found in figurines, stelae and plaque idols, especially in the southern regions and in the Spanish Levant. In this presentation we aim to: 1) characterize the oculate paintings of Passos/Santa Comba - Garraia in terms of their locational context and typological diversity; 2) compare their formal attributes with the oculate imagery from other Iberian regions; 3) discuss these motifs as ontologically active elements in the construction of collective identities, territorial negotiation, and cosmogonic transmission among different regions and social groups; 4) hypothesize its intrinsic role in the identity of prehistoric communities at a regional scale.

2005. Visible routes of knowledge transfer II

Authors: Gail Higginbottom (Flinders University)
Format: Oral

'Visible Routes of Knowledge Transfer I' (EAA 2024) emphasised how dolmens and the elements that make them entail the answers to the central ontological question - "What is there?". Similar to that presentation, this paper continues to identify visible routes of knowledge transfer for past, present and future generations, and demonstrates the possibilities of how these 'knowledges' were transferred around Iberia. Using new detailed considerations and examples, this paper will demonstrate more fully how dolmens' relational place, or association with the world of death, is not constrained to the cult of the ancestors, but expands to encompass the passings and pasts of all things. It will underscore more fully what kinds of knowledge societies chose to pass on through time and across space, taking care to ensure the knowledge was transferred. Through the primary examination of Neolithic megalithic art in Galicia and Portugal, and rock art on both sides of Iberia, this work will show that dolmens and the elements that make them contain the foundational knowledges of societal survival, where Nature/Super-Nature is still given paramount status in the Cosmological Order of things, which is shared.

58 LOCALISM AND IMPERIALISM IN THE FOODWAYS OF EMPIRES

Theme: 7. Interaction, connectivity and mobility
Organisers: Jessica Feito – Alexandra Livarda (Catalan Institute of Classical Archaeology) – João Pedro Tereso (CIBIO-BIOPOLIS, University of Porto)
Keywords: foodways, imperial interactions, localism, archaeobotany, zooarchaeology, material culture
Format: Regular session

SESSION ABSTRACT

Foodways in past empires are often studied using large datasets and in broad strokes, tending to focus on empire-wide trends as manifested throughout imperial territories. These patterns, at times characterised as markers of a given empire, have shed important new light on aspects of imperial economy and societies. Research on economic connectivity, for example, as well as social identities and culture contact, have been greatly enriched by studies of past consumption patterns. Beyond big data studies focusing on imperial trends, foodways are also commonly examined in site-based analyses exploring local phenomena. However, the role of localism in the foodways of large entities such as empires is less often scrutinized in more detail. This session focuses on localism and imperialism in the consumption pattern of empires. The intersection of the two, such as local foods in imperial contexts, the impact of imperialism on local foodways, and/or the impact of local consumption patterns on imperial trends, is of particular interest. In considering local and imperial trends together, the highly complex nature of foodways in imperial territories may be further brought to light. Papers may utilise diverse evidence types, including archaeobotanical, zooarchaeological and bioarchaeological remains, ceramics, and more. Research focusing on any imperial society (e.g., Roman, Ottoman, Aztec, Achaemenid) is welcome.

CONTRIBUTION ABSTRACTS

35. Greek Locally, Roman Imperially: Food, Agriculture, and Husbandry in a Sicilian Town of Akrai/Acrae

Authors: Roksana Chowaniec (Institute of Archaeology, National institute of the Republic of Serbia)
Format: Oral

This presentation investigated the long-term changes in food strategies within the town of Akrai/Acrae, situated in the Sicilian interior and in its surrounding areas. The research is grounded in archaeological, archaeobotanical, archaeozoological, stable isotopes, and lipid-residue studies. The town Akrai/Acrae, located in Hyblaean Mountains, approximately 35km from the coast of Ionian Sea, preserves one of the most continuous and well-stratified sequences of domestic, artisanal, and industrial activity in the region, spanning from the middle of the 3rd century BC to the early 8th century AD. The comprehensive data gathered through methodological excavations and interdisciplinary studies allows for an in-depth exploration of the evolution of culinary preferences and the utilisation of plant and animal resources from the Greek period and subsequently after the Roman conquest of Sicily. These changes are visible in the assemblage of animals (farmed and wild) and plants used for the food preparation, along with the strategies employed in agriculture and husbandry. The arrival of the Romans in the Sicily and Akrai/Acrae gradually transformed agriculture, first through the introduction of various plants (e.g. fruit trees and later flax), at the same time, culinary preferences evolved, with the diet shifting toward a greater reliance on domesticated animals rather than wild game. The data from Akrai/Acrae contributes significantly to understanding the environmental, economic, and cultural transformations that occurred in Sicily, the first province of the Roman Empire, following its conquest.

587. In between empires: crops in Lisbon and the Lower Tagus (Portugal) in Roman and Medieval times

Authors: João Tereso (NOVA University of Lisbon, Institute for Medieval Studies)
Format: Oral

The Lower Tagus and the city of Lisbon are located at the westernmost edge of Europe, corresponding at different times to the western limit of empires and trade routes, while also constituting an important link between the Mediterranean and the Atlantic. In this sense, the region is key to understanding the timing and sociocultural context of the diffusion of different products since prehistoric times, including crops that would later form the basis of the diet of the communities that lived here. However, despite Lisbon being the place in Portugal with the highest number of archaeological interventions in recent decades, few archaeobotanical studies have been carried out in the region. This paper will present a synthesis of the existing carpological data from the Roman and medieval periods in the Lower Tagus region. When possible, this data will be integrated with other paleoenvironmental data and information derived from written documentation, while also placing the region within an Iberian context. At present, there are discrepancies in data availability, with a greater accumulation of information for the medieval period. During this time, a wide variety of plants are documented, including cereals, fruit trees and aromatic species, which contrasts with earlier periods. Nonetheless, it is clear that there are biases related to the preservation of plant macroremains and the nature of the archaeological contexts. This makes understanding chronological trends more difficult, which both calls for and complicates a broader integration of these data within wider Iberian perspectives.

1003. Seeds of Change: Archaeobotanical Traces of Tomatoes, Chilies, and Other Exotic Plants in Early Modern Lisbon

Authors: Mariana Rodrigues – José Bettencourt (CHAM – Centre for the Humanities, NOVA University of Lisbon) – João Tereso (IEM – Institute for Medieval Studies, NOVA University of Lisbon) – Dulce Freire (CEIS20 – Centre for Interdisciplinary studies; University of Coimbra)
Format: Oral

Early modern Lisbon has long been described as a central node in the circulation of plants and commodities generated by the Portuguese empire. While recent archaeobotanical research has demonstrated the arrival of American crops in the city, less attention has been paid to how different exotic plants occupied distinct roles within Lisbon's urban and maritime landscapes. This paper explores how imperial connectivity and local foodways intersected through the differentiated use, deposition, and consumption of non-European plants in seventeenth- and eighteenth-century Lisbon. The study draws on archaeobotanical macroremains recovered from waterlogged waterfront contexts in the former Boa Vista beach area (Boqueirão do Duro, Av. 24 de Julho/Boa Vista 5, EDP II, and Metro Lisboa). American-origin taxa, including cacao (Theobroma cacao), tomato (Solanum lycopersicum), chili pepper (Capsicum annuum), and squash (Cucurbita maxima/pepo), are examined alongside long-established fruits such as grape (Vitis vinifera) and fig (Ficus carica). Their spatial distribution and depositional contexts reveal marked contrasts between imported commodities handled within port infrastructures and crops integrated into everyday urban consumption. Cacao, coconut (Cocos nucifera), and sugarcane (Saccharum officinarum) appear predominantly in ship-related and waterfront working contexts, suggesting their role as bulk goods, ship provisions, or semi-processed commodities tied to imperial trade networks. In contrast, tomatoes, peppers, and squashes occur mainly in urban beach and landfill deposits predating the 1755 earthquake, pointing to their incorporation into local diets and small-scale horticulture. These patterns highlight selective adoption rather than uniform diffusion of exotic plants. Although a sampling bias is also considered. By focusing on context, deposition, and use rather than first arrival, this paper argues that Lisbon's foodways were shaped by local agency operating within imperial structures. The results underline the importance of urban-scale archaeobotanical evidence for understanding how global food systems were negotiated, transformed, and embedded in everyday life in early modern empires.

2684. Diet and Identity in 500 years of Colonial Mexico

Authors: Colin Smith (Universidad de Burgos | La Trobe University) – Rocío Covadonga Valladares Gutiérrez – Nico Cirotto – Julián Puig Guevara – Wayra Herz Zacarias – Rebeca García González (Universidad de Burgos) – Jorge Arturo Talavera González (Instituto Nacional de Antropología e Historia) – Cristina Valdiosera (Universidad de Burgos | La Trobe University)
Format: Oral

The AdMEXture Project is using a multi-disciplinary approach to explore inequality and identity following the polemic meeting of two imperial forces, the Spanish Monarchy and the Mexica Empire. One focus is the use of an osteobiographical approach to explore the life history of individuals, especially their diet, with key evidence coming from stable isotope data. The European colonisation of the Basin of Mexico resulted in unprecedented demographic changes, with the admixture of Europeans and Mesoamericans, and the creation of new social classes such as "mestizos". However, this also caused disruption to the indigenous way of life and ecosystem, disease and demographic decline. While identity and social class could be fluid, it has been suggested that food remained aligned with group identity, i.e. introduced European foods (crops and livestock) for Europeans and local foods for the local populations. This leaves an open question as to what food group did "mestizos" belong to (if these distinctions really existed and were maintained over time)? What was their food identity? We will present our first results and discuss the role of diet in defining the identity of individuals (or vice versa) in this complex, changing situation.

1699. Beyond the "Encounter of Two Worlds": Coexistence and Juxtapositions of Culinary Ceramic Technologies in the Atacama Desert (15th–18th Centuries)

Authors: Claudio Wande – Mauricio Uribe (University of Chile) – Ale Vidal-Elgueta (Pontifical Catholic University of Chile)
Format: Oral

In the hyperarid core of the Atacama Desert, in the Tarapacá region, millennia of local social developments gave rise to the Pica-Tarapacá Cultural Complex, within which segmentary societies articulated themselves around shared cultural notions, while each maintained distinct productive orientations. These societies connected the coast, pampa, precordillera, and even the highlands through diverse strategies that enabled them to inhabit and be nurtured by the most arid desert in the world. After nearly four centuries of local developments, this Complex confronted the expansion of the Inca Empire, which generated new relationships between people and practices of consumption. However, following a brief horizon of less than a century, local societies, already entangled with the Inca imperial project, were forced to face the colonizing advance of European empires, particularly the Spanish Empire. This process resulted not only in the so-called "encounter of two worlds" or syncretism, but in a baroque and complex web of relations involving imposition, violence, resistance, coexistence, and accommodation, which cannot be reduced to narratives portraying Indigenous communities as "passive recipients" of change. Among these transformations was the entanglement of ancestral local, Inca, and European flavours and bodies of culinary and technological knowledge. Adopting a long-term perspective, we examine

these intertwined pasts through ancestral and emerging ceramic assemblages that contained and mediated colonial culinary practices and foodways, which we discuss alongside archaeobotanical, zooarchaeological, and isotopic evidence. Comparing two key colonial enclaves at the margin of the imperial system, the Spanish port of Pisagua and Pica, an inland wine-production center, our results reveal a complex scenario in which concepts such as mixture and hybridity are insufficient to capture the coexistence of juxtaposed technologies and flavours that asymmetrically nourished new colonial realities.

1982. 'Black soup' or 'herbathé'? – Influence of the Ottoman and Habsburg Empires on Hungarian foodways in the 17th-18th centuries

Authors: Ágnes Kolláth – Gyöngyi Kovács (ELTE Research Centre for the Humanities, Institute of Archaeology)
Format: Oral

The territory of the medieval Hungarian Kingdom became a conflict zone between the mighty Ottoman and Habsburg Empires in the 16th-17th centuries, with each of them occupying a significant part of the country. The local Hungarians felt strong animosity towards both. Besides turning their homeland into a warzone for 150 years, the Ottomans were representatives of the Islam and eastern habits, while the Habsburgs tried to erase the local language and traditions, and force Roman Catholicism on the people. The customs of the Turkish and the Germans, although to a different degree, were both considered alien to many, desirable to some. They influenced every aspect of life, no matter how fiercely the inhabitants tried to maintain their own ways. These effects can be observed in the study of foodways as well. The clearest proof of cultural resistance is that Ottoman pottery types, even Chinese porcelain – then highly fashionable both in the west and the east – almost exclusively occur in archaeological sites, where the Sultan's army had a garrison, as the difference between table manners was impassable. Meanwhile, several of the meals themselves have been incorporated in the local cuisine. At the same time, few German and Austrian recipes were popular, but their good quality ceramic wares were widely used. The influx of these objects increased exponentially after the reconquest at the end of the 17th century and new local pottery types also emerged, signalling change for example in dairy practices. Zooarchaeological evidence from features containing layers from before, during and after the Ottoman occupation also highlights the differences between consumption patterns. Comparing these data with the numerous and colourful written sources and images of the era gives us a multifaceted view on the dual imperial influence on Hungary's early modern foodways.

60 LANDSCAPES IN MOTION: CHANGE AND RESILIENCE IN MEDITERRANEAN LANDSCAPES ACROSS THE LONGUE DURÉE

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Amanda Gaggioli (University of Memphis) – Effimia Angeli (Maria Curie-Skłodowska University)
Keywords: landscape, resilience, disaster, environmental archaeology, longue durée, Mediterranean
Format: Regular session

SESSION ABSTRACT

Relationships between environmental change and settlement patterns in Mediterranean landscapes from prehistory to the present have received increased attention, offering entry points to grapple with precarity, fragility, and disaster in places and times distant from our own. This session responds to the growing demand for longue durée landscape histories that weave together traditional archaeological sources with modern scientific data and newly accessible environmental proxies. By integrating these lines of evidence, this session aims to capture the complexity of socio-natural systems and their transformation within the broader dynamics of ancient Mediterranean society and culture. Rather than simply identifying disasters, catastrophes, or crises, this session focuses on resilience—how communities responded to and recovered from environmental pressures and hazards such as earthquakes, landslides, floods, coastal shifts, and volcanic eruptions as evidenced in sedimentary, botanical, faunal, hydrological, and isotopic paleoenvironmental records. It examines both immediate and enduring adaptive strategies in landscape modification, material practices, artifact distribution, settlement organization, and cultural memory. We seek to explore how short-term reactions became embedded in long-term adaptive strategies, and vice versa. Contributions are invited from across environmental archaeology, particularly those engaging with geoarchaeology, landscape archaeology, digital methods, and diverse archaeometric and archaeological scientific techniques, as well as those advancing theoretical debates in resilience, cultural ecology, historical ecology, political ecology, political geology, phenomenology, and decolonial approaches. Ultimately, Landscapes in Motion invites us to interpret Mediterranean landscapes as socially constituted, dynamic archives of resilience. Human-environment relationships were less about countering destructive forces in nature itself than about negotiating power, labor, and knowledge within communities that shaped possibilities for persistence, renewal, and transformation. Mediterranean landscapes, viewed in this way, offer frameworks for understanding resilience across temporal and environmental contexts, illuminating historical registers of survival that echo amid today's intensifying environmental risks.

CONTRIBUTION ABSTRACTS

214. Human impact and climate change in the natural environment of the Ionian Archipelago in Greece

Authors: Chendi Wang (Amsterdam Centre for Ancient Studies and Archaeology, University of Amsterdam)
Format: Oral

The Ionian Archipelago possesses a rich prehistoric and early historic cultural heritage; however, compared with other regions of Greece, its past natural environment remains relatively understudied. Research from other parts of the Eastern Mediterranean has demonstrated that alternating dry and wet precipitation regimes significantly influenced human activities, while human land-use practices, in turn, substantially shaped vegetation composition. Examining these reciprocal interactions through time is essential for understanding long-term climate–human–environment dynamics. This poster presents preliminary results from an ongoing study investigating land use and ecological change in the Ionian Islands from the Late Pleistocene to the Roman period. Focusing on Livadi marsh on Kefalonia and Keri lake on Zakynthos, we collect, analyze, and compare sediment cores in order to reconstruct vegetation history, fire regimes, and environmental change within a long-term framework. A multi-proxy approach is employed, integrating phytolith, pollen, and charcoal analyses, which are systematically compared with existing geological and archaeological datasets. By concentrating on local-scale environmental responses across extended timescales, this research aims to clarify how climatic variability and human activities jointly shaped Ionian landscapes. Ultimately, this study seeks to enhance our understanding of prehistorical land-use practices in the Ionian Islands and their environmental consequences, while also providing a long-term perspective relevant to contemporary landscape management and sustainable development strategies under current climate change conditions.

372. Settlement Transformations, Interaction and Connectivity in Chalcolithic Volcanic Cappadocia: New Evidence from Büyük Deller and the Aksaray Prehistoric Survey

Authors: Fadime Demirtaş (Aksaray University-Department of Archaeology) – Pınar Çaylı (Nevşehir Hacı Bektaş Veli University-Department of Archaeology) – Sevil Gülçur (İstanbul University- Department of Prehistory)
Format: Oral

The formation of prehistoric settlement patterns in Volcanic Cappadocia reflects not only the relationship between human communities and the landscape, but also networks of interaction and connectivity between communities. While early research in the region has primarily focused on the initial phases of the Neolithic period, knowledge of the Chalcolithic has largely relied on data from a limited number of excavated sites. Tepecik-Çiftlik, Köşk Höyük, Güvercinkayası, and Büyük Deller represent key reference points for understanding cultural development and settlement systems in the sixth millennium BC. These data suggest that settlements concentrated in lowland plains during the late Neolithic increasingly shifted towards rocky and elevated locations throughout the Chalcolithic period. This paper examines settlement transformations in Volcanic Cappadocia within the framework of interaction and connectivity by integrating evidence from sites identified through the Aksaray Prehistoric Survey (AKYA), conducted since 2021, with data from the excavations at Büyük Deller and Güvercinkayası. Rocky hilltop settlements such as Büyük Deller, Gelveri, Kayanınaltı, Uluyol Tepeüstü, Tilki Deliği Tepeüstü, and Gülçur Kayaüstü, together with lowland sites including Çakılbaşı and Sapmaz Höyük, indicate the simultaneous existence of different settlement strategies across contrasting topographic settings. Survey and excavation data are evaluated alongside preliminary assessments of ceramic typology and technology, as well as obsidian production techniques and raw material sources. Similarities and differences in ceramic production and obsidian procurement practices demonstrate the continuity of local traditions while also pointing to Volcanic Cappadocia's integration within broader regional networks. In this respect, material culture constitutes a primary indicator of intercommunity interaction, knowledge transmission, and circulation. The study argues that the spatial reorganization of settlement systems in Volcanic Cappadocia during the sixth millennium BC was not merely an environmental response, but part of a multidimensional transformation closely linked to interaction, connectivity, and indirect mobility practices observable through ceramic and obsidian evidence.

381. In search of the lost river: A new narrative of fluvial dynamics and human-landscape interplay in the Ebro Delta (Catalonia-Spain)

Authors: Giannis Apostolou (University of Oxford - All Souls College) – Alfredo Mayoral (Landscape Archaeology Research Group/Catalan Institute of Classical Archaeology) – Carles Ibáñez – Pep Cabanes (EURECAT Technology Center of Catalonia) – Ekta Gupta – Arnau Garcia-Molsosa (Landscape Archaeology Research Group/Catalan Institute of Classical Archaeology) – Marc Prades (University Rovira i Virgili) – Josep-Maria Palet (Landscape Archaeology Research Group/Catalan Institute of Classical Archaeology) – Jordi Diloli Fons – Samuel Sardà (University Rovira i Virgili)
Format: Oral

This paper presents new fluvial evidence for landscape evolution and human-environmental dynamics in the Ebro Delta (Catalonia, Spain) during the Holocene, based on a multi-scalar geoarchaeological approach. The deltaic environment of the Ebro River constitutes one of the largest wetlands in the Mediterranean basin encompassing a wide range of ecosystems and natural habitats. Despite extensive research on regional ecology and biodiversity, human-landscape dynamics prior to the Middle Ages remain poorly-understood. By developing a cross-disciplinary research programme that integrates drillings, radiocarbon dating, remote-sensing

applications, historic map regression, and archaeological excavations, we provide new insights into the palaeogeography of the region and its relationship to past habitation models. In particular, sediment cores demonstrate the existence of a previously-unknown, active deltaic plain in the southern part of the Delta between approximately 5000 cal BCE and 1000 cal CE. This floodplain sedimentary sequence records a mid-Holocene context of marine transgression, followed by prolonged fluvial aggradation characterised by recurrent floods and channel migration over nearly six millennia. Fluvial activity declined and ultimately ceased during the late Middle Ages, when it was replaced by the formation of extensive marshlands. One or several palaeocourses of the Ebro must have flowed southwards through this area from the early Neolithic onwards, while they may have also been associated with protohistoric settlements positioned in strategic locations, such as the Iberian site of L'Antic. During the Middle Ages, the river shifted northwards towards its present course. Altogether, the results enable to propose radically revised palaeogeographic and environmental scenarios for the Ebro Delta during key phases of the Holocene, going well beyond previous reconstructions. More broadly, this approach offers the stand of a new narrative in deltaic formation and transformation with major implications for understanding human–environment interactions as well as resilience and change in deltaic landscapes over the longue durée.

2260. Neolithic Landscapes in Transformation: Geoarchaeological Perspectives on the Onset of Enduring Human-Environment Relationships

Authors: Amanda Gaggioli (University of Memphis | Cornell University) – Effimia Angeli (Maria Curie-Skłodowska University) – Kristine Martirosyan – Olshansky (University of California, Los Angeles)
Format: Oral

The Neolithic marks a fundamental reconfiguration of human-environment relationships, as emerging agricultural practices reshaped landscapes at scales and intensities unseen in earlier periods. Rather than positioning the Neolithic as an early onset of the Anthropocene— this exploratory paper uses geoarchaeological evidence from two Neolithic sites — Masis Blur in Armenia and Halai in Central Greece — to examine the Neolithic as a critical starting point for longue durée anthropogenic landscape transformation with enduring consequences through antiquity and even into the present. Drawing on microstratigraphic, mineralogical, geochemical, and sedimentological analyses, the paper compares how early agricultural communities engaged with distinct but persistently dynamic environments: a seismically active, lacustrine and alluvial landscape at Masis Blur and a fluctuating seismic coastal setting at Halai. At both sites, geoarchaeological signatures reveal sustained human intervention in landscape processes, including architectural material sourcing, spatial reorganization, and the management of hydrological and geological instability. These interventions were not short-term responses to isolated environmental events but became embedded in longer-term patterns of land use, construction, and settlement organization. By placing these site-specific datasets in dialogue, the paper argues that Neolithic human-environment interactions constituted a foundational phase of anthropogenic landscape modification characterized by cumulative, path-dependent effects. These early transformations structured later environmental trajectories and social possibilities, highlighting the Neolithic as a formative moment in the deep history of human-shaped landscapes across the Mediterranean and adjacent regions.

160. Resilience at the Margins: Rethinking Prehistoric Settlement in the Underexplored Landscapes of Southwest Crete

Authors: Dawid Borowka (University of Crete)
Format: Oral

Southwest Crete remains one of the least systematically investigated regions of the island, despite its strategic position between the Libyan Sea and the mountainous interior. Archaeological knowledge of the Palaiochora area is still based on dispersed observations, short-term field visits, and a limited number of identified sites, primarily dating from the Final Neolithic to the Proto-Geometric period (ca. 4000–900 BC). This paper critically reassesses the current state of research and explores how existing evidence can be reinterpreted within a longue durée framework of landscape resilience. Rather than viewing the mountainous zones north of the Palaiochora coast as marginal or episodically occupied refuges, the paper argues that these landscapes played an active role in long-term adaptive strategies. Known sites such as Palaiochora Nerovolakoi, Archangel Michael, and Palaiochora Vigles suggest recurring patterns of settlement relocation, strategic use of elevated terrain, and continued occupation during periods of broader instability, including transitions at the beginning and end of the Bronze Age. By synthesizing legacy archaeological data, topographic observations, and regional comparisons, the paper highlights how short-term responses to environmental stress, seismic activity, and socio-political disruption became embedded in longer-term settlement logics. The contribution emphasizes the interpretive potential of underexplored Mediterranean landscapes and outlines how future non-invasive research can transform our understanding of resilience, mobility, and human–environment interaction in Southwest Crete across the longue durée.

1350. Untangling the Late Bronze Age Collapse: An interdisciplinary study of landscape dynamics and resilience strategies in the Larnaca Bay (Cyprus)

Authors: Ralf Vandam (Vrije Universiteit Brussel) – Gitte Stoffels (KU Leuven | Vrije Universiteit Brussel) – Polte De Weirdt (Vrije Universiteit Brussel) – Miltiadis Polidorou (University of Cyprus) – Ella Egberts (Vrije Universiteit Brussel) – Renske Hoevers (KU Leuven) – Soetkin Vervust (Vrije Universiteit Brussel) – Gert Verstraeten – Matthias Vanmaercke – Christian Schwarz (KU Leuven)
Format: Oral

The Late Bronze Age (LBA) collapse in the Eastern Mediterranean remains a compelling enigma, marking the end of a period of remarkable prosperity characterized by extensive interregional connectivity and complex socio-economic systems. Between the mid-13th and 12th centuries BCE, the region underwent profound political and socio-economic transformations, accompanied by documented environmental change. Rather than representing a single catastrophic event, the LBA collapse reflects a complex interplay of human and environmental dynamics. Advancing our understanding of this period therefore requires closer examination of how multiple interacting processes unfolded across time and space, and how local communities responded to and negotiated these challenges within their landscapes. This paper introduces Untangling the Late Bronze Age Collapse, an interdisciplinary research project supported by the Research Foundation Flanders, which investigates collapse dynamics and resilience strategies through a long-term, bottom-up analysis of the Larnaca Bay area in southeastern Cyprus before, during, and after the Late Bronze Age. The Bay of Larnaca, which was once a lagoon but now a salt lake closed off from the sea, represents a highly dynamic coastal landscape. It includes the site of Hala Sultan Tekke, a major Late Bronze Age hub of international exchange. Its archaeological and environmental archives offer exceptional potential for exploring vulnerability, adaptability, and continuity across the collapse period. Integrating archaeological prospection and refined chronological frameworks with geoarchaeological, palaeobotanical, and coastal modelling approaches, this paper outlines the project's research design and presents first results on landscape dynamics and settlement responses.

2197. Weighing anchored narratives: a new geoarchaeological history for the ancient Abdera's harbour beyond the "race to the sea" paradigm

Authors: Alfredo Mayoral – Arnau Garcia-Molsosa (ICAC-Catalan Institute of Classical Archaeology, Tarragona) – Mercourios Georgiadis (University of Crete) – Eurydice Kefalidou (National and Kapodistrian University of Athens) – Nikos Papadopoulos (GeoSat ReSeArch Lab, IMS-FORTH, Rethymno) – Ana Ejarque (ISEM, Univ Montpellier, CNRS, IRD) – Eftychia Kosmidou (Ephorate of Antiquities at Xanthe) – Josep Maria Palet (ICAC-Catalan Institute of Classical Archaeology, Tarragona) – Gerasimos Trasanis (National and Kapodistrian University of Athens) – Constantina Kallintzi (Emeritus Ephor of Antiquities)
Format: Oral

Ancient harbours in the Aegean have been object of abundant research, as they are excellent case studies to investigate long-term socioenvironmental interactions. In several sites, it has been shown that coastal progradation since late prehistoric times led to their landlocking and consequent relocation in a so-called "race to the sea". However, the abuse of this paradigm has also led to misinterpretations and groundless but long-lasting narratives. In ancient Abdera, an Ionian colony in coastal Thrace, it was traditionally assumed that the city and its harbour had to move southwards in the 4th c. BC to adapt their location to coastal advances and silting. Since 2020, we carried within APAX project new geoarchaeological research to reconstruct paleogeographic changes and geomorphological dynamics around Abdera since its foundation, and to analyze the Archaic-Classical harbour's interaction with changing coastal environments. We developed an integrated approach combining coring, trenching, radiocarbon dating, geophysics, geomorphological mapping, RSL modelling and remote sensing. The gathered data allowed us to reconstruct the life history of this ancient infrastructure from Archaic to Hellenistic times, but also sea-level and paleogeographic changes in the area, including a late Antiquity tsunami. Our findings challenge previous narratives about Abdera and its harbour, shedding light on the decisive chronosequence of events: 1) In the 4th c. BC, the city moved south certainly due to historical events as the silting of the bay was only incipient; 2) In the 3rd c. BC the coastal progradation started, more likely due to regional anthropogenic forcing of sedimentary budgets than to Nestos alluvial dynamics; and 3) In the 3rd-2nd c. BC, the Archaic-Classical harbour was silted as a consequence of the abandonment of the first enceinte. Ultimately, this research demonstrates how a thorough and chronologically precise geoarchaeological approach can outdate older interpretations replacing them with accurate data-driven socioenvironmental narratives.

2455. Landscape in Motion: River, Roads and Settlement in the Lower Mondego (Portugal)

Authors: Newton Ribeiro Machado Neto (Universidade de Évora)
Format: Oral

This communication analyses landscape change and settlement patterns in the Lower Mondego region (central Portugal) from the Iron Age through the Roman period to Late Antiquity. Central to this discussion is the Mondego River, which once formed a wide paleo-estuary, considerably broader than its present course, structuring mobility, connectivity, and territorial organization. Pre-Roman occupation established stable movement corridors linking Iron Age hillforts to zones of resource exploitation, along a north–south axis between coastal plains and mountain ridges. These inherited patterns were consolidated during the Roman period, reinforcing a settlement system shaped by enduring environmental and cultural factors. From the 2nd century BC, these corridors were integrated into a Roman administrative framework centred around the former oppida of Conímbriga and Aeminium and connected through estuarine navigation and the road network, linking the Lower Mondego to other regions of Lusitania and to the Roman Empire as a whole. During the 1st century AD, the territory was reorganized as part of the Roman province of Lusitania.The transition to the 2nd century saw a slowdown in civic construction and public investment. Rather than signalling decline, this phase reflects the consolidation of the landscape , with continued social and economic functionality. During the 3rd century AD, political instability and economic crisis triggered a second major transformation, marked by urban fortification and rural reorganization. The Germanic invasions further reshaped territorial centrality. Conímbriga became a ruralized landscape of ruins, while Aeminium retained its role as a strategic crossroads. The Lower Mondego case illustrates how landscapes are shaped

by environmental factors, inherited infrastructures, and selective continuity, with routes and settlement logics remaining embedded long after the transformation of the territory.

2431. On the Axis of the River: Roman Townscape in the Middle Axios Valley

Authors: Jakub Mosiejczyk (Institute of Archaeology, Nicolaus Copernicus University, Toruń)
Format: Oral

The Axios is the longest river in the historical region of Macedonia. Flowing through fertile valleys from its source in the Scardus Mountains to the Aegean Sea, it created favorable conditions for settlement in antiquity. These environmental advantages, together with strategic considerations, influenced the gradual urbanization of the region during the Roman period, reflecting a long-term interaction between human communities and a dynamic fluvial landscape. For four consecutive centuries following the end of the Macedonian Wars, the area underwent processes of Romanization. Macedonian cities experienced significant cultural transformations, with Stobi and Thessaloniki emerging as the principal economic, cultural, and political centers. This development was reflected in the administrative reforms of Emperor Diocletian (AD 293), which led to the division of the province into Macedonia Prima and Macedonia Secunda. Both centers were connected by an important route of exchange expressed through the organization of the Via Egnatia, whose exact course remains uncertain. Nevertheless, the Axios River remained the principal natural feature and a major axis of communication, while also shaping settlement distribution and spatial organization. As a result, smaller urban centers developed along its course, including Antigonea, Stenae, Idomenae, and Gortynia, supported by their rural hinterlands. A key testimony to this Roman townscape is the Tabula Peutingeriana. This paper addresses current issues in the study of Roman urban planning in the region, including the identification of ancient towns and the analysis of their development in relation to environmental conditions and long-term landscape dynamics. Particular attention is given to settlement adaptation and spatial continuity within a changing riverine environment. GIS-based spatial analysis integrates historical and archaeological data to explore these processes.

811. Historical maps and fluvial landscape dynamics during the Little Ice Age: evidence from the Rhône delta

Authors: Anna Kharlanova – Claude Vella (Aix-Marseille Univ, CNRS, IRD, INRAE, Coll de France, CEREGE, Aix-en-Provence) – Veronique Rinalducci (ciham, umr5648) – Philippe Rigaud (LA3M, umr7298) – Jules Fleury – Doriane Delanghe – Olivier Bellier (Aix-Marseille Univ, CNRS, IRD, INRAE, Coll de France, CEREGE, Aix-en-Provence)
Format: Oral

Mediterranean deltaic landscapes are dynamic systems shaped by long-term interactions between fluvial processes, climate variability and human activities. Historical maps constitute a key archive for documenting these dynamics, particularly in low-relief deltaic environments where river mobility is high and landscape change can be rapid. Such changes are especially pronounced during climatic cooling phases such as the Little Ice Age (LIA). The LIA is a recent period that coincides with abundant cartographic production. Although these maps were produced for non-geomorphological purposes, they provide a basis for spatial reconstruction when georeferenced and interpreted from a geomorphological perspective. In the Rhône Delta, georeferencing 16th-18th century maps enables high spatial and temporal resolution reconstructions of palaeochannel evolution, meander mobility and delta-lobe progradation. Earlier studies relied on qualitative interpretation of historical maps to analyse shoreline and delta-front evolution. Building on these approaches, the present work extends cartographic analysis and focuses on fluvial dynamics and meander-scale evolution, which have remained largely unexplored. Map-based reconstructions are compared with recent imagery, DTM and sedimentary archives to validate interpretations and refine morphodynamic chronologies. For the eastern Rhône Delta during the LIA, results reveal rapid phases of landscape reorganisation marked by avulsions, pronounced lateral channel migration and enhanced land-sea connectivity, supported by sedimentological evidence. These dynamics directly influenced human activities, including canal excavation and reorganisation, the development of saltworks such as those of "La Vernède", and the reuse of pre-existing pathways during defluviation phases. The Rhône delta thus provides a reference framework for exploring landscape mobility and for future comparative analyses across Mediterranean deltas.

1589. Change and Resilience of Zadar centuriae through the ages

Authors: Filipa Jurkovic Pešic (Department of Archaeology University of Zadar)
Format: Poster

The city of Zadar, located in coastal area of Croatia, became a Roman colony by the end of 1st century BCE. Beside the fortified city, ager of the Roman colony encompassed a larger area organized according to the Roman land-division system of centuriation. Traces of this centuriated grid are still clearly recognizable in the cultural landscape of Zadar, particularly in the modern street network within the city and in the remains of drystone walls, plot boundaries, and roads preserved outside the contemporary urban area. Although clearly legible in today's spatial organization, the ancient land division of Zadar remains little known to the general public. This research forms part of a broader scientific project whose main objective is the valorization of spatial and social transformations within the territory of Zadar's ancient cadastre, with a particular emphasis on documenting changes that occurred over time. The project is a response to the urban planning crisis - a crisis of space and a crisis of identity, as land that for thousands of years was exclusively agricultural is being transformed at an unsustainable pace. The poster focuses on four isolated centuriaes and the

changes that took place over a period of 2000 years. The area was centurated in 1st century during the Roman empire. Throughout the Middle Ages and until the 20th century the area was predominantly agricultural land. During 20th century the city rapidly expands, but despite the accelerated construction and rapid urban expansion spatial organization of contemporary streets largely follows the ancient cadastral framework. At great speed, the landscape that for thousands of years was agricultural land is disappearing. We have not managed to adapt or respond. Archaeology offers a way forward: through the stratigraphy of history and the gathering of memory.

62 THE NICOSIA CONVENTION: SESSION OF THE EAA ILLICIT TRADE IN CULTURAL MATERIAL COMMUNITY

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Evelyne Godfrey (Uffington Heritage Watch) – Marianne Mödlinger (University of Innsbruck) – Andris Kairiss (ICOMOS-Latvia)
Keywords: Heritage Crime, Decolonisation, Art Market, Theft, Reconciliation, Justice
Format: Session with keynote presentation
Affiliation: Community on Illicit Trade in Cultural Material

SESSION ABSTRACT

The Council of Europe's Convention on Offences relating to Cultural Property, commonly known as the Nicosia Convention, was adopted in 2017 and entered into force in April 2022. The Nicosia Convention aims to foster international co-operation and to prevent and combat the trafficking and destruction of cultural property. It remains the only international treaty specifically dedicated to the criminalisation of offences related to the trade in cultural property, establishing a legal framework that includes: theft; unlawful excavation, importation, and exportation; illegal acquisition and placing on the market; falsification of documents; and the intentional destruction or damage of cultural property. While the Convention primarily targets tangible heritage and criminal liability, heritage studies and international policy frameworks - including those of, for example, UNESCO, ICOMOS, ICOM, and ICCROM - underline that the loss or destruction of cultural property produces non-material harm: the erosion of identity, collective memory, social trust, and cultural continuity. Such damage affects a broad spectrum of stakeholders - e.g., local communities, museum and heritage professionals, educators, researchers, and the wider public - who rely on the integrity of heritage for knowledge, belonging, and ethical accountability. Despite this, current legal instruments still lack explicit mechanisms to acknowledge or redress this non-material dimension of harm. This session of the EAA Community on the Illicit Trade in Cultural Material will examine the global context and implications of the Nicosia Convention, including but not limiting discussion to States that have ratified (Cyprus, Greece, Italy, Albania, Hungary, Latvia, and Mexico), while critically exploring these normative gaps and their implications for justice, reconciliation, and the restoration of cultural agency.

CONTRIBUTION ABSTRACTS

395. Unprecedented practices of cultural genocide organised by Russia on Ukrainian lands, and the problem of illicit trafficking of archaeological artefacts

Authors: Oksana Lifantii (National Museum of the History of Ukraine)
Format: Oral

The National Museum of the History of Ukraine (NMHU) has gained experience over the last decade in combating the illicit trafficking of cultural property and protecting Ukraine`s cultural heritage. It works in collaboration with the legal services (the National Police, the National Customs Service, the General Prosecutor`s Office, etc.). As a result of these collaborations, the NMHU's collections are replenished with new artefacts. Since 2014, a new problem has arisen with the occupation of parts of three regions of Ukraine, where illicit excavations provided by Russian occupiers have lasted for all these years. During the time of occupation of Crimean museums, only one small collection escaped "imprisonment" by the Russian state — the so-called Crimean gold collection, which was exhibited in the Netherlands in 2014. After 9 years of litigation, it finally came into safekeeping at the NMHU at the end of 2023. Since 2022, and the beginning of the Full-scale invasion, Russians have occupied more Ukrainian territories and looted museum collections there. In 2024, the Russian Ministry of Culture began issuing official permits for excavations in Zaporizhzhia and Kherson oblasts, parts of which the Russian occupied in 2022. At the same time, since 2022, the amount of illegally obtained archaeological materials returned to the state`s possession in Ukraine has significantly increased. Only in one "Horbatov's collections" case, the legal services confiscated almost 6,000 artefacts, some of which were recognised as probable property of Crimean museums. Thus, Ukraine is now forced to face illicit archaeological trafficking organised by non-state groups, and the Russian state meticulously planned a cultural genocide that includes massive illicit excavations aimed at eliminating the presence of the Ukrainian past in the occupied territories.

46. Beyond Material Damage: Addressing Non-Material Harm in The Context of Heritage Crime

Authors: Andris Kairiss (ICOMOS Latvia)
Format: Oral

This presentation critically examines the absence of meaningful recognition of non-material (intangible) harm in international legal responses to heritage crimes, with particular attention to the Nicosia Convention. While this Convention constitutes the only international treaty specifically dedicated to the criminalisation of heritage-related offences, its legal architecture remains narrowly focused on material damage, leaving the wider societal consequences of heritage crime largely outside the scope of legal assessment and response. Drawing on heritage studies and international policy discourse, the presentation argues that the destruction and damage of cultural property produces profound non-material harm, including the erosion of collective memory, identity, social cohesion, and cultural continuity. These harms affect not only states, but also communities, heritage professionals, educators, researchers, and the wider public, for whom cultural heritage constitutes a shared social resource and a foundation for cultural agency. Despite increasing recognition of these impacts in academic and policy contexts, they are not reflected in binding international legal norms, and almost not translated into enforceable legal consequences. The presentation will identify key structural weaknesses in the existing international legal framework, including the lack of legal concepts capable of capturing non-material harm, the limited recognition of communities as affected stakeholders, and the disconnection between criminal accountability and processes aimed at repair, reconciliation, and the restoration of cultural agency.

63. Criminalising Heritage Crime in Europe: Divergent Legal Approaches and the Nicosia Convention

Authors: Irina Olevska-Kairisa (Maastricht University)
Format: Oral

This presentation explores how heritage crime is criminalised and addressed across different European jurisdictions, focusing on the legal treatment of offences affecting cultural (and in particular, archaeological) heritage. Despite growing recognition of heritage crime as a serious threat to cultural resources, national legal systems continue to adopt divergent approaches, frequently prosecuting such acts under general categories of property crime, environmental offences, general harmful acts, etc. These differences result in uneven protection standards, inconsistent thresholds of criminal liability, and variable recognition of harm, particularly in archaeological contexts. Adopted in 2017, the Council of Europe's Nicosia Convention represents the only binding international instrument specifically dedicated to the criminalisation of offences relating to cultural property and aims to promote greater legal harmonisation through a shared catalogue of heritage-related crimes. However, an examination of its practical and theoretical application across European jurisdictions reveals persistent divergences in how States interpret and operationalise key concepts such as damage, intent, and the scope of protected interests. The presentation will illustrate these issues through selected examples of national practice, highlighting both emerging best practices and recurring legal and institutional challenges. Drawing on comparative examples and damage-assessment models, the presentation highlights how different legal systems continue to prioritise material loss and economic valuation, while underestimating non-material harm such as the loss of scientific knowledge, cultural meaning, and collective memory. The presentation concludes by reflecting on the potential of the Nicosia Convention to act as a bridging framework between heritage protection and criminal law, while emphasising the need for greater coherence and sensitivity to archaeological harm in national criminalisation practices.

2314. Illicit Trafficking of Cultural Property in Cyprus: Historical Context, Legal Responses, and the Example of the Nicosia Convention (2017)

Authors: Anna Demetriou (Paris 1 Pantheon Sorbonne - University of Bologne)
Format: Oral

The third-largest island in the Mediterranean Sea, Cyprus stands as a genuine treasure of civilization and culture. Its rich cultural heritage, both archaeological and ecclesiastical, has long made it a significant source country in the international trade in cultural goods. This status, however, has also rendered Cyprus vulnerable to the illicit trafficking of cultural property—a phenomenon that has developed and adapted to the political, social, and economic conditions of successive eras. Armed conflicts have historically intensified these vulnerabilities, as looting, illicit trade, and deliberate destruction frequently accompany military operations. In this respect, Cyprus, like many states in the Eastern Mediterranean, has not been exempt. The Turkish invasion of 1974 exemplified the continuation of longstanding patterns of cultural dispossession rather than an isolated episode. In response, the Republic of Cyprus has progressively strengthened its legal and institutional framework to address these challenges through the ratification of international conventions such as the UNESCO Conventions of 1954 and 1970, the UNIDROIT Convention of 1995, and the Nicosia Convention of 2017, the conclusion of bilateral agreements, and the adoption of targeted heritage protection measures. This study seeks to examine the phenomenon of illicit trade in cultural goods in Cyprus over time and to analyze the existing legal framework and preventive mechanisms, with particular emphasis on international conventions, especially the Nicosia Convention of 2017.

870. Loot, Legitimacy and Ownership: ending the trade archaeological artefacts

Authors: Evelyne Godfrey (Uffington Heritage Watch)
Format: Oral

A generation ago, Colin Renfrew's discussion on "Loot, Legitimacy and Ownership" centred on the ethical crisis caused by illicit excavation of antiquities. Looting destroys the archaeological context that is essential for understanding the past. Renfrew asserted that the Art Market was rife with unprovenanced artefacts. Attribution of false provenance was often facilitated by legal sellers of the artefacts, turning centres like New York and London into 'thieves' kitchens', driven by greed. Today, the market has spread online. Artefacts are sold openly across internet platforms. The volume of trafficked archaeological material has increased exponentially. With this, the ethical crisis that threatens the preservation of archaeological knowledge has only compounded. Renfrew called for greater international recognition and action to combat illegal trade. A legal instrument is now available, the Council of Europe's Nicosia Convention (2017). However, only one of the G7 nations - Italy - has ratified and implemented Nicosia. The USA, Britain, Germany, France, Japan, and Canada have not. To have a chance of safeguarding the archaeological context, the Nicosia Convention requires the support of these 'consumer' nations, not just the 'source' nations. Renfrew's proposed solution to the "illegal" trade was to promote "legitimate ownership". This policy has proved naïve and weak; if anything, over the past 30 years, it exacerbated the problem. Institutions and collectors in democratic countries argue that the acquisition was legal enough at the time. In conflict zones around the world, the evidence of the archaeological and historical record is denied while absurd political claims of new national 'ownership' are made. We must now see that the only legitimate ownership of the heritage is public, not private ownership. The resolution of the ethical crisis must reside in Heritage professionals, institutions, and democratic governments fulfilling their responsibility to protect the heritage by respecting the archaeological record.

600. Motivations of Illicit Indigenous Human Remains Trade: Insights from Historic and Present-Day Case Studies

Authors: Constanze Schattke (Department of Anthropology, Natural History Museum Vienna) – Damien Huffer (Adelaide University)
Format: Oral

Between 1877 and 1889, Austrian collector Andreas Reischek travelled to Aotearoa/New Zealand to document and collect natural history specimens. He also plundered Indigenous human remains/kōiwi from graves, which were later restituted in 2022. During the more than ten years Reischek spent in Aotearoa/ New Zealand, he wrote a diary, which represents an important and rare window into collecting practices and attitudes at the time. In this paper, we present an overview of an ongoing project to digitize and use qualitative digital humanities tools to close-read these diaries. Attitudes Reischek expressed to justify his activities are here compared to case study examples of how the buying and selling of Indigenous human remains within today's global, mostly online, human remains trade is rationalized. In a preliminary analysis, we explore some of the criminogenic elements surrounding human remains, which are at least occasionally classified as cultural heritage under State-level legislation within source, transit and market countries. The acquisition and sale of human remains in the past and today also represents a particularly emotional category of heritage crime. We demonstrate how the rhetoric of today's collecting community draws heavily on the same colonial attitudes that Reischek upheld, revealing the persistent use of similar 'neutralisation techniques' (sensu Sykes and Matza 1957) to justify theft, resale and collection. In accordance with the Nicosia Convention's mandate to monitor online trade, we provide detailed evidence that the Indigenous human remains trade is not only unregulated and ongoing, but also use insight from the past to further illuminate the motivations of today's dealers and collectors, which remain deeply rooted in colonialist ideologies of otherness. These findings will inform better-drafted legislation and contribute to more targeted public outreach.

1073. From Archive, trough OSINT to Court File: Cross-jurisdiction Recovery Strategies for the Torun Numismatic Theft

Authors: Mariusz Wisniewski (Ministry of Culture and National Heritage, Poland)
Format: Oral

A major theft of nearly four hundred of numismatic objects from a District Museum in Torun (Poland) created a long-running, multi-jurisdiction search problem. The theft conducted by a long time employee of the museum remained undetected for years while stolen coins entered polish and international market. Identical types appear on popular platforms, while only a small subset are the stolen, uniquely identifiable specimens. This paper presents a case study of how Ministry of Culture and National Heritage as a competent, national authority can combine forensic numismatic identification with OSINT-style market monitoring and jurisdiction-specific legal pathways to locate and secure stolen coins in different countries (Poland, Germany, Austria, Italy, USA and Australia). While a high-profile recovery (the "Holey Dollar") has already demonstrated feasibility, the broader challenge lies in routine, repeatable work across many lower-profile objects and diverse legal contexts. The author attempts to outline a three-layer workflow. Continuous discovery using auction archives, collector platforms, and image-based search, followed by specimen-level identification and rigorous discrimination of questionable results using repeatable micro-features (edge nicks, flan cracks, corrosion patterns, die wear, and museum documentation) which then should be backed by legal triage that selects the most effective route per jurisdiction (criminal seizure, civil recovery, customs/administrative measures, and voluntary returns). All steps work when

supported by structured cooperation with LEAs, administrative bodies, academia, museums and private and organizational, international partners. The Polish framework based on the 2017 restitution law implementing EU mechanisms for return of cultural goods provides the mandate for coordinated action, but practical success depends on adapting evidence packages and requests to each legal environment. It is theorized that the Nicosia Convention, for those countries which ratified it, provides a useful common language for aligning standards of due diligence, documentation, and cross-border cooperation reducing significantly workload for those dealing with stolen portable heritage.

1407. From Looting to Law: Archaeological Evidence from Syria and the Implementation Challenges of the Nicosia Convention

Authors: Isber Sabrine (Milá y Fontanals Institution —Spanish National Research Council)
Format: Oral

This paper presents an ongoing research project analysing the looting and illicit trade of Syrian antiquities from the 1980s to the present, with particular focus on the period following the outbreak of the Syrian conflict in 2011. While the destruction and trafficking of Syrian cultural heritage are well documented, significant gaps remain in reliable data concerning the actors involved, trafficking routes, timing of looting activities, types of materials targeted, and the cumulative impact on archaeological sites. The project applies an interdisciplinary methodology combining satellite imagery analysis, archaeological datasets, archival sources, and documentation produced in collaboration with local civil society organisations. This approach enables a more precise, evidence-based reconstruction of looting dynamics. Preliminary results indicate that at least 14% of Syrian archaeological sites have been affected by looting, with Early and Middle Bronze Age sites and Roman and Late Roman contexts particularly targeted. The evidence further suggests that looting has been primarily driven by organised criminal networks and armed groups, including terrorist organisations, which have used antiquities trafficking as a source of financing. These findings are examined in relation to the Council of Europe's Nicosia Convention, the only international treaty specifically dedicated to the criminalisation of offences against cultural property. While the Convention provides an essential legal framework addressing theft, illegal excavation, trafficking, and market placement, this paper argues that current legal instruments remain limited in addressing the wider archaeological and social consequences of looting. In particular, non-material harm—such as the erosion of cultural identity, collective memory, and social trust—remains insufficiently reflected in criminal law approaches. The paper calls for closer integration between archaeological evidence, community-based documentation, and legal mechanisms to strengthen the effective implementation of the Nicosia Convention, and reflects on the relevance of these issues for post-conflict recovery in Syria and comparable contexts.

63 CONTINUITY, INNOVATION, AND THE MAKING OF THE MYCENAEAN WORLD: RETHINKING MIDDLE HELLADIC (POTTERY) TRADITIONS

Theme: 7. Interaction, connectivity and mobility
Organisers: Peter Pavuk (Institute of Classical Archaeology, Charles University, Prague) – Iro Mathioudaki (AEGIS Research Group, UCLouvain)
Keywords: Regional identities and resistance, Cultural continuity and change, Technological transmission and adaptation
Format: Regular session

SESSION ABSTRACT

The study of Middle Helladic (MH) wares, many of which continued into the Late Bronze Age (LBA), provides essential insights into the dynamics of pottery production and the balance between cultural conservatism and innovation. Yet defining local styles and establishing synchronisms on the Greek Mainland remain difficult due to pronounced regional variability. Recent work from sites such as Lerna, Ayia Irini (Keos), and Mitrou highlights the need to reconsider the late MH and early Mycenaean phases within broader regional and inter-regional frameworks of production. The persistence, transformation, or disappearance of particular wares raises wider questions: where MH traditions endured longer, what does this reveal about production and consumption patterns, local autonomy, and the formation of distinct cultural zones across the Mainland? The issue of pottery forming techniques is also revealing. It illustrates well that technological change was not a simple replacement of one tradition by another, but a complex process of adaptation within existing practices. This session seeks to advance discussion on the chronological and typological assessment of MH wares continuing into the LBA and to refine the definition of the final Middle Bronze Age in Mainland Greece. Beyond pottery, it welcomes papers exploring continuity and change in settlement, funerary practice, and the limited evidence for cult and ritual, aiming for a more integrated understanding of this crucial transitional period. A clearer grasp of the mechanisms behind continuity and change in MH traditions has implications beyond Central Greece. It contributes to broader debates on technological transmission, tradition and innovation, cultural resilience, and social reproduction across the Bronze Age Aegean and the eastern Mediterranean. Understanding these long-term processes also helps to illuminate the conditions that enabled the emergence and eventual expansion of the Mycenaean palatial culture once the palaces were established.

CONTRIBUTION ABSTRACTS

671. Rethinking Middle Helladic (Pottery) Traditions

Authors: Iro Mathioudaki (Catholic University of Louvain) – Peter Pavuk (Institute of Classical Archaeology, Charles University, Prague)
Format: Oral

This paper presents our collaborative attempt to reassess the variability of Middle Helladic wares and styles at Greek mainland sites in the early Late Bronze Age. Focusing primarily on Central Greece, and drawing on our complementary research backgrounds, we address broader questions of pottery production, cultural conservatism, and inter-regional interaction prior to the full establishment of Mycenaean-style pottery. Recent excavations have shown that the diversity observed in the early Mycenaean Grave Circles is also reflected in other contemporary contexts, where similar combinations of wares occur. This raises key interpretative questions: how should such variability be understood? Should analysis prioritise inter- and intra-regional patterns, or seek to define spheres of cultural influence shaping the circulation of material culture? How, in turn, does this affect our understanding of Mainland Greece as a cultural entity? While recent research has made important advances, fundamental choices remain regarding the future direction of pottery studies in this large region. We argue for a balanced approach that combines micro-regional perspectives with an appreciation of wider networks, in order to clarify the interconnected character of the early Mycenaean world and to develop a more integrated interpretative framework. Important question also is, how (and why) this changes with the rise of the Mycenaean palaces.

1262. Resisting the Lustre: Central Euboean "Grey Power" and the Entrenched Traditions of Middle Helladic Central Greece

Authors: Christopher Hale (Institute of Archaeology and Ethnology, Polish Academy of Sciences)
Format: Oral

The transition from the MBA to the LBA on the Greek mainland is often explored in relation to the expanding distribution of Mycenaean Lustrous-Decorated pottery as a proxy for intensifying influence of the northeast Peloponnese on other areas of the Aegean. Recent scholarship has traced the first appearance of this material in central Greece (in very small quantities) to a late stage of Late Helladic I (LH I), and emphasis is often placed on the persistence of central Greek Middle Helladic (MH) traditions, which can pose challenges for relative dating. However, MH central Greece itself is increasingly being recognized as a complicated ceramic landscape with diverse regionalisms, so what exactly persists (and why) is often poorly explored. Emerging evidence suggests that central Euboea may have hosted a particularly specialized, intensive, well-connected, and highly influential pottery production industry, spanning the MH through to LH I or LH IIA. Central Euboean products (mostly Fine Grey Burnished) were widely distributed in high numbers throughout central Greece and elsewhere, varyingly influencing local production. On the other hand, genuine imports, alongside both Aeginetan and northeast Peloponnesian influence on central Greek products, can be recognized in some decorated pottery types dating from the late MBA, suggesting a complex multi-directional dynamic. The appearance of Mycenaean Lustrous-Decorated pottery in late LH I may then have come via long established routes of connectivity, and begun as one additional component of a consumption strategy which challenged dominant and entrenched practices embodied by the central Euboean tradition with its associated consumption practices. The central Euboean tradition itself may have reacted conservatively to resist these new innovations, resulting in the persistence of late MH types into the early LBA.

1208. From Fingerprints to Orbits: Reassessing NAA Provenance in the MH–LH Northeast Peloponnese

Authors: Daniel Frank (Independent Researcher)
Format: Oral

Neutron activation analysis (NAA) has been a cornerstone of Aegean pottery research for decades, enabling the definition of chemical "fingerprints" that illuminate production practices and the structure of regional and supra-regional exchange. At the same time, the interpretive step from statistical groups to provenance varies in reliability. Group assignments can be strengthened through evidence such as wasters, clay-source sampling, and coherent distributional patterns; yet equifinality remains common, as similar signatures may derive from multiple clay sources, recipe choices, or overlapping workshop traditions. The historical value of NAA therefore lies not only in "pinning down origins", but also in comparing chemically defined groups and their distributions across sites, phases, and regions. This paper synthesises NAA results for the Middle and Late Bronze Age with a focus on the Northeast Peloponnese along the Argolid–Corinthia–Saronic interface (Lerna, Tiryns, Midea, Katsingri, Tsoungiza), contextualised through key "orbit" comparanda in the central Aegean (Mitrou, Aegina/Kolonna). Building on a multi-scalar connectivity framework, it re-codes NAA group attributions into a comparable set of orbit-level categories and juxtaposes recurring import signals and production patterns by site and phase. Particular attention is paid to MH-derived and proliferatatedearly Mycenaean ceramic classes and the shifting corridors of interaction that structured their movement, especially maritime routes and island hubs. By reintegrating NAA groupings into a wider archaeological and historical perspective, the paper offers a provenance-based way to discuss continuity, innovation, and the formation of regional zones of pottery production and exchange from the late Middle Bronze Age into the early Mycenaean period.

1832. Crafting Complexity: Middle Helladic Traditions, Mainland Agency, and the Making of Mycenaean

Lustrous Decorated Pottery

Authors: Salvatore Vitale (University of Pisa)
Format: Oral

In this paper, I reconsider the critical role that Middle Helladic (MH) and Minoan traditions had in the development of Mycenaean Lustrous Decorated pottery (MLDp), initially one of the many "Minoanizing" classes that appeared across the Aegean at the beginning of the Late Bronze Age (LBA). To do so, I first focus on technology and style (with the latter intended as the interrelation among morphology, decoration, and syntax), and then discuss the meaning of production, distribution, and consumption patterns. Theoretically, I take an eclectic approach, using mobility, cultural entanglement, and human agency to better understand the formation process of MLDp within broader Aegean socio-political developments during the early LBA. After reviewing the current dataset, I suggest that at its onset, in Late Helladic (LH) I-IIA, MLDp represents a fusion between Cretan technologies and styles and deeply rooted MH features. These mainland characteristics included the use of updraft kilns, giving MLDp vessels their distinctive texture; the occurrence of shapes such as small piriform jars, alabastra, jugs with cut-away necks, and goblets; and a remarkable preference for tectonic decoration. In the "new cultural environment" that characterized the early LBA Aegean, I argue that the appearance of MLDp reflects the growing demand for "Minoanizing" objects by mainland communities, as well as the economic and political agency of new, emerging mainland elites. By the second half of LH I, these factional groups and their leaders favored the establishment of specialized workshops and mobilized the lucrative distribution of MLDp across the Peloponnese, central Greece, and the wider Aegean. At the same time, these elite groups used MLDp as a prestigious commodity in feasting ceremonies and burial arenas and exploited the power of its impactful new style to increase their leadership and establish their status within their local communities.

1838. Something Old, Something Borrowed, Something New: Aeginetan-Mycenaean Interactions at Mitrou, Central Greece, during the Early Late Bronze Age

Authors: Francesca Nani (University of Pisa)
Format: Oral

According to established narratives, Aeginetan pottery was extremely popular in the Middle Helladic period and quite rapidly decreased after the beginning of the Late Helladic (LH) phase. While this view still holds true for the Argolid, the site of Mitrou in Central Greece provides a different picture, with Aeginetan pottery peaking in popularity in LH IIA and continuing to be present in decent quantities up until LH IIIA2 Early. During this time, Mitrou's Prepalatial elites incorporated in their local arena a wide range of different imports, vividly displaying in feasting events a "mixed" assemblage comprised of local, Mycenaean, and Aeginetan vessels. Mitrou's contexts show that during LH II, Aeginetan fine pottery was undergoing technological and stylistic changes sparked by interaction with Mycenaean ceramics. While most Aeginetan vessels found at this site remained conservative, a small fraction of Mitrou's LH IIA-IIIA2 Early Aeginetan fragments show a gradual incorporation of innovative elements. These included the incorporation of Mycenaean-type shapes and motifs; the use of lustrous paints; and the occurrence of wheel-finished specimens. This situation provides a privileged case study to examine both local and regional dynamics during a time when important economic and socio-political shifts were occurring on mainland Greece. At Mitrou, I argue that the continued demand for Aeginetan pottery and the contexts of use demonstrate the agency of the local community in selecting and manipulating whichever imported class best served their agenda. At a broader scale, these changes demonstrate the continued efforts of Aeginetan producers to remain relevant in the competitive Aegean arena, where consumers' tastes were shifting towards Mycenaean pottery. These trends also suggest a redirection of Aeginetan exports towards Central Greece, via Kiapha Thiti and/or Kea, beginning in LH IIA and continuing until the emergence of Palatial centers definitively shifted the balance of power in the Aegean.

2168. Between Mitrou and Pefkakia: End of MBA and the process to Mycenaeanization at the coastal site of Raches (Central Greece)

Authors: Tobias Krapf (Swiss School of Archaeology in Greece) – Maria-Foteini Papakonstantinou (Ephorate of Antiquities of Phthiotis and Evrytania)
Format: Oral

The sea route along the coasts of Euboea and Central Greece played a crucial role in the northward expansion of Mycenaean (material) culture at the beginning of the Late Bronze Age (Late Helladic period). This region is furthermore characterised by the relatively long persistence of older traditions, partly in parallel with new Mycenaean elements. Located on the northern shore of the Malian Gulf, the Bronze Age site of Raches (Phournoi) has the potential to link developments observed in central Euboea and at Mitrou in the south with those at Pefkakia in the north, as well as with the nearby Spercheios Valley. A rectangular early Late Helladic building overlying a Middle Helladic apsidal house has been excavated by the Ephorate of Antiquities responsible for Phthiotis and Evrytania. Mycenaean pottery indicates a period of use extending until at least LH IIIA1. From the Middle to Late Helladic transition, a substantial quantity of matt-painted pottery has been preserved, displaying a reduced range of shapes and decorative motifs in comparison with the well-known local tradition of the Middle Helladic period (Δ1β). The non-Mycenaean pottery shows many characteristics in common with assemblages from other sites in Phthiotis and Thessaly. This paper presents the stratigraphy and ceramic development of Raches and places them within the interregional context of sites along the Euboean Gulf, with particular emphasis on the relationship between the continuity of traditional ceramic production and the contemporaneous introduction of Mycenaean pottery. On a regional scale, Raches is compared with sites in the Spercheios Valley in order to assess whether the process of Mycenaeanization differed between coastal and inland areas.

2024. Evaluating the persistence of mainland-style consumption practices into the Late Bronze Age at Ayia Irini, Kea

Authors: Natalie Abell – David Roberson (University of Michigan)
Format: Oral

In the late Middle and early Late Bronze Age, tablewares and associated consumption practices at Ayia Irini on Kea changed dramatically as part of the so-called Minoanization phenomenon. Locally produced and imported Cretan-style cups, bowls, jugs, jars, and cooking pots became common. Evidence for commensality is obvious in the form of huge deposits of Cretan-style conical cups in local households. The importance of commensal activities is suggested also by other large deposits of tablewares and the existence of ritual spaces like the Temple and the nearby hilltop shrine of Troullos. During these periods, Middle Helladic- and mainland-style tablewares continued to be imported and locally produced, suggesting ongoing connections between Kea and the mainland. This paper explores the ceramic evidence for these connections during the early phases of the Minoanization phenomenon and evaluates how traditional mainland-style consumption and commensal practices may have persisted within the Keian community. It also considers evidence for shifts in tablewares and consumption practices on the mainland through the lens of novel, often Minoanizing mainland imports at Ayia Irini in these periods.

2358. Quantifying and qualifying Late Helladic (LH) I at Eleon

Authors: Trevor Van Damme (University of Warwick)
Format: Oral

The Eastern Boeotia Archaeological Project, a synergasia of the Canadian Institute in Greece and the Ephorate of Antiquities of Boeotia, has carried out excavations at the site of Eleon in Boeotia, Greece since 2011. The most significant early Mycenaean discovery at the site is the Blue Stone Structure (BSS), a monumental burial enclosure containing pit, cist, and built chamber tombs. Within the graves, most ceramic vessels are matt-painted, Minyan, undecorated, or bichrome wares leaving their precise relationship with the Late Helladic subphases of the Argolid uncertain. In this paper, all identifiable lustrous decorated ware pottery fragments contained within the tumulus that sealed off the burials are analyzed together for the first time. Beyond establishing the extreme infrequency of their presence within the overall assemblage, which remains dominated by Minyan and undecorated wares, this research demonstrates that all of the lustrous decorated ware fragments are imports, primarily from the Argolid. Ultimately, this study concludes by establishing a relative date for the construction of the tumulus and a terminus ante quem for all the burials contained within within the Argive sequence.

890. Pottery of non-Mycenaean traditions during the early Late Bronze Age at the site of Kastro-Palaia, Volos

Authors: Dimitris Agnousiotis (Ephorate of Antiquities of Magnesia, Hellenic Ministry of Culture)
Format: Oral

The site of "Kastro-Palaia" is situated in the western part of the modern city of Volos and occupies a commanding position at the innermost recess of the Pagasitic Gulf, controlling the natural route leading toward the Thessalian hinterland. Archaeological research on the site and its wider area has been particularly intense from the early 20th century to the present, providing valuable information for the occupation during prehistory. Middle Bronze Age proved to have been a notably flourishing period, as evidenced by thick deposits, as well as by the presence of multiple architectural phases and numerous finds. The end of the period coincides with the MHIII and LHI phases that were identified not only in the settlement but also in the cemetery of the site. Palaia continued to experience a phase of peak prosperity and archaeological data indicate rather a smooth and gradual transition into a new era, without abrupt cultural changes. Indeed, new buildings were founded directly upon the underlying Middle Bronze Age deposits. As for pottery production, there is no indication of a sharp break from the past, as pottery related to Middle Helladic traditions continued to be produced in large quantities. On the other hand, several changes can also be observed: craftsmen experimented, techniques evolved and new shapes and decorative motifs were introduced. In LH IIA imported Mycenaean pottery appeared in the site but initially does not seem to have been particularly popular, as Middle Helladic culture was deeply rooted and persisted for a long time. The major turning point in ceramic technology occurred at the end of LHII, when the local workshops gradually adapted to the new demands and started producing Mycenaean-style pots. This new pottery came to dominate during LHIIIA, marginalizing Middle Helladic traditions.

841. Communities in transition in the Eurotas Valley: a Middle Helladic III/Late Helladic I small tholos tomb from Sparta

Authors: George Tsiaggouris (Ephorate of Antiquities of Lakonia) – Maria Tsouli (Ephorate of Antiquities of Lakonia, Head

of D.P.C.A.M.)
Format: Oral

This paper aims at tracing the transitional MH III/LH I period in Laconia, through the data that emerged from the recent rescue excavation of a "small tholos" tomb on the eastern outskirts of Sparta, carried out by the Ephorate of Antiquities of Lakonia. The discovery of this tomb, one of the earliest examples of "small tholos", complements the important range of grave types of this period which have come to light in the Eurotas valley during the last twenty-five years. The tomb, with an external diameter of 3.46 m. and maximum preserved height of 0,99 m., was extremely carefully built of thin slate slabs resting on a foundation ring of roughly worked stones. The corbelling of the tholos began immediately above the foundation ring. The way the superstructure of the tholos was formed is not clear since the tomb collapsed. The stomion was entirely made of thin slate slabs and blocked with dry - stone, while a dromos was probably not shaped. The tomb contained primary extended burials as well as secondary burials, two of which were furnished by a kantharos and a small jug, respectively. The use of this combination of vessels as grave offerings, namely a small open drinking vessel and a small closed vessel, has been attested in other types of graves of the period found both in Laconia and in other areas of the Mainland Greece. However, the choice of grave offerings of MH tradition in a tholos tomb, the most emblematic tomb type of Mycenaean funerary architecture, reflects the diversity and receptivity of Laconia to influences from other areas, while preserving selective elements of local tradition and identity, in a period characterized by complex social and cultural changes, which led to new social structures.

166. Continuity and change in late Middle Helladic and early Late Helladic Boeotia: an update

Authors: Laetitia Phialon (University of Fribourg)
Format: Oral

Boeotia in Central Greece is part of the regions where Middle Helladic (MH) traditions were long lasting into the Late Helladic (LH) period. For instance, although a few Mycenaean chamber tombs were used from LH II onwards in Thebes, the discoveries of late MH-early LH pit and cist graves in the settlement suggest that MH funerary traditions also continued well into the Late Bronze Age. However, one major difficulty remains: in the absence of Mycenaean decorated pottery from the LH I or LH II phases, it is very difficult to date the layers and structures uncovered in various Boeotian sites. The matt-painted polychrome pottery reported in recent publications on the subject must now be systematically considered within the framework of LH I development. This paper aims to explore regional continuity and change in Boeotia during a crucial transitional period, from the late MH to the LH II period, by examining structures and pottery of these phases, with a focus on the sociocultural forms of the Mycenaean emergence in central Greece (Phialon 2011), while incorporating new reflections on the landscape of ancient Greece (e.g. Knodell 2021). The data drawn from the recent archaeological reports (the 9th Ephorate of Prehistoric and Classical Antiquities), available since my last update (2018) on the funerary landscapes in MH and early Mycenaean Central Greece, will certainly shed new light on long-term processes of continuity and change in the late MH and Early LH Boeotia.

1817. Innovation, representation and fortification in Aegina Kolonna. New thoughts on the representative function of fortifications in the Early Mycenaean period

Authors: Benjamin Huber (Department of Classics, University of Salzburg)
Format: Oral

The island of Aegina is located in the heart of the Saronic Gulf, a strategic location that was key to the development of the settlement of Kolonna on its north-western coast into a major centre during the Early and Middle Helladic periods. Kolonna's function as a commercial hub, and its dominant role in trade, is most evident in the distribution of Aeginetan pottery across the Greek mainland and the Aegean. This prosperity is also reflected in the architecture, particularly the massive fortifications of the settlement. From EH III onwards, comprehensive measures were taken to fortify Kolonna, and by the Late Bronze Age, it comprised three different parts: the 'Inner City', the 'Inner Suburb' and the 'Outer Suburb', each of which was enclosed by walls and bastions. The latter's fortifications were built in the Late Middle Helladic period and show further phases of reinforcement in the Early Mycenaean period that differ completely from earlier phases. The walls were massively strengthened and extended by a rectangular tower with masonry resembling the Cyclopean technique. This process of 'monumentalisation' of the 'Outer Suburb' and thus a relatively small area of the settlement raises the question of the reasons for these architectural changes and innovations. Was it merely a military necessity to reinforce the fortifications further, or should we also consider issues of representation and display reflected in architectural appearance? As the Early Mycenaean period marks a time of fundamental societal shifts, accompanied by the development of new fortified settlements, the second aspect deserves further investigation. Were fortifications a means of demonstrating power and wealth in a landscape of competing regional centres? In examining the functions of fortifications, this contribution discusses the interplay of representation and architecture at the transition from the Middle to the Late Helladic period.

64 COASTAL-INLAND INTERACTIONS DURING THE THIRD MILLENNIUM BCE IN THE SOUTHERN BALKANS

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Kyle Jazwa (Maastricht University) – Christopher Nuttall (Swedish Institute at Athens)
Keywords: Coastal-Inland Interactions, Southern Balkans, Third Millennium BCE, Early Bronze Age
Format: Regular session

SESSION ABSTRACT

More than a half-century ago, Colin Renfrew famously described the Aegean in the third millennium BCE as having an "international" character, a reflection of the substantial evidence for the movement of items, people and ideas across the region. Since Renfrew first coined this term, the "international" character of the era has only become more apparent, with demonstrable links among settlements and regions throughout the southern Balkans. It is therefore unsurprising that coastal sites have received considerable scholarly attention: they were key nodes mediating long- and short-distance contacts, functioning as stopping points or links in a chain that could funnel materials, ideas, and people inland. This focus has been reinforced by modern research biases, as coastal zones – often affected by tourist development – tend to be more extensively explored than their inland counterparts, which remain comparatively under-investigated. Yet such a model, in which inland settlements are vaguely characterised as agricultural, pastoral, or extractive, risks oversimplifying the complexity of coastal-inland dynamics, and indeed echoes interpretative patterns applicable to many periods beyond the third millennium BCE. This session seeks to probe more specifically the relationships between coastal and inland sites and regions in the southern Balkans during this transformative era, exploring how people, places and resources were interlinked and how these categories themselves were constructed and experienced. We invite papers engaging with this topic at multiple scales of analysis: from detailed comparisons of individual sites to regional syntheses, diachronic perspectives, and theoretical considerations. Contributions addressing the influence of natural resource distribution, socio-political and cultural organisation, and climatic factors (e.g., 4.2 ka event) are particularly welcome. Equally important are reflections on archaeological biases and how they have shaped our understanding of the third millennium southern Balkans.

CONTRIBUTION ABSTRACTS

1164. Settlements on the Edge: Wetland Occupation along the Bulgarian Black Sea Coast during the Late Copper and Early Bronze Age

Authors: Nadezhda Karastoyanova (National Museum of Natural History - Bulgarian Academy of Science | National Archaeological Institute with museum - Bulgarian Academy of Science) – Kalin Dimitrov (National Archaeological Institute with museum - Bulgarian Academy of Science)
Format: Oral

The Bulgarian Black Sea coast represents a key zone of human occupation within the western Black Sea littoral, where wetlands offered diverse and highly productive resources. This paper focuses on the Late Copper Age (Chalcolithic) and the Early Bronze Age, examining human adaptation to dynamic coastal landscapes shaped by river deltas, lagoons, and changing shorelines. Holocene sea-level rise and coastal dynamics have led to the partial or complete submergence of several settlements, preserving valuable archaeological evidence in underwater contexts. The study is based primarily on new archaeozoological data from recent underwater excavations at the ancient harbour area of Sozopol. The faunal assemblages are dominated by wild species and demonstrate intensive exploitation of both terrestrial and marine resources. Of particular significance is the presence of tuna, a species not native to the modern Black Sea ecosystem, as well as remains of species no longer present along the Bulgarian Black Sea coast, such as the Mediterranean monk seal (Monachus monachus). The occurrence of tuna may serve as an important indicator of palaeoenvironmental conditions, suggesting different sea connections, water temperatures, or ecological regimes during the Late Copper Age and Early Bronze Age. In addition, the presence of oysters further contributes to the reconstruction of coastal palaeoenvironments and marine habitats. Special attention is given to evidence for the intensive hunting of dolphins, highlighting the economic role of marine mammals in wetland subsistence strategies. Comparative analysis with analogous wetland and pile-dwelling settlements along the Bulgarian Black Sea coast demonstrates that these sites represent specialised communities, whose economy relied predominantly on hunting rather than on mixed farming practices. The results provide new insights into specialised wetland adaptations and human–environment interactions along the Bulgarian Black Sea coast during the Late Copper Age and Early Bronze Age.

2151. Synchronization and cultural relations between Southern Bulgaria and the adjacent areas in the Early Bronze Age

Authors: Masao Semmoto (The Ancient Orient Museum, Tokyo)
Format: Oral

Bronze Age societies in the Aegean Sea and mainland Greece, driven by the expansion of West Asian urbanization and maritime trade networks into Europe, fostered intensified interactions with the southern Balkans at the second millennium BCE. To understand the factors and mechanisms of these relationships, it is crucial to elucidate the specific roles played by Thrace and Rhodope

Mountains in southern Bulgaria – the immediate hinterland of the North Aegean coast – within the chronological framework of the third millennium BCE (Early Bronze Age). This presentation reviews the chronological synchronisms of Early Bronze Age sites in southern Bulgaria and its surrounding areas by examining the radiocarbon dates and diagnostic archaeological materials, with a primary focus on pottery. Based on synthesizing these synchronisms, the presentation evaluates the patterns of continuity and discontinuity across the stages of the Early Bronze Age and discusses the cultural elements connecting southern Bulgaria with its adjacent areas.

904. Connecting Shores and Plains: The Role of Thrace in Southern Balkan Interactions during the Third Millennium BC

Authors: Zheni Vasileva – Petar Minkov (National Archaeological Institute with Museum at the BAS)
Format: Oral

Cultural and trade contacts during the 3rd millennium BC were fundamental to the development of Early Bronze Age societies in Southeast Europe and the Eastern Mediterranean. These interactions took place against a background of profound transformations following the end of the Chalcolithic period in the Balkans, driven by environmental change, demographic shifts, and increased mobility. As a result, social, economic, and cultural structures were reconfigured, giving rise to new forms of connectivity between coastal and inland regions. This research aims to examine the role of Thrace within these dynamic processes. Positioned between the Aegean–Anatolian world, the Balkans, the North Pontic region, and Central Europe, Thrace occupied a strategic intermediary role that facilitated long-distance exchange and cultural transmission. Archaeological evidence – including imports, local imitations, prestige goods, and indications of specialised craft production – demonstrates the intensity and multidirectional nature of these contacts. Particular emphasis will be placed on the importance of river corridors, land routes, and maritime connections in structuring Early Bronze Age interaction networks. The research addresses questions concerning material culture, trade and exchange systems, mobility and migration, technological transfer, and social transformation during the Early Bronze Age. Jewellery and metallurgy, as well as the development of local craft traditions within broader Aegean–Anatolian and Balkan interaction spheres, constitute key themes of the study. The research also engages with traditional centre–periphery models and seeks to reassess Thrace as an active participant in supra-regional networks.

1802. Early Helladic Settlement in Central Greece and the Influence of Coastal Proximity

Authors: Kyle Jazwa (Maastricht University)
Format: Oral

Coasts have often been attractive settlement locations because they offer direct access to marine resources and "international" trade networks. However, that selfsame setting can also bring many risks, such as increased exposure to natural and seaborne threats. This paper seeks to more precisely define the value and role of coastal access in Early Helladic ("EH") Greece. As a case study, the eastern central Greek mainland (Boeotia, Phocis, Phthiotis, northern Euboea) was chosen because several different types of coastal landscapes are present – coasts facing the open sea (Aegean), a strait (Euripus Strait), a gulf (Corinthian Gulf), and three lakes; this provides a unique opportunity to examine the influence of each type. To do so, an up-to-date survey of EH settlement in the region is first presented. Included in that examination are coastal proximity measures for each site and the influence of other environmental factors on coastal access, such as intervening mountains and ravines. Then, evident patterns among different collections of sites with similar accessibility to one or more of the coasts are considered. We find that, while most EH settlements were positioned within one half-day's walk to a coast and with relatively few intervening geographic hindrances, a distinct preference to avoid being located directly on the coast, especially facing the Aegean Sea and Corinthian Gulf, is evident. Once distance to the coast exceeds one half-day's travel, however, settlement becomes significantly sparser. Altogether, the results show that access to the coast appears to have been attractive for many EH communities, but other factors (e.g., competition) meant that the greatest ease of access was not a priority.

2356. An Early Bronze Age mainland center in the Aegean: mobility, technological innovation and craft specialization at Koropi (east Attica)

Authors: Kerassia Douni (Ephorate of Antiquities of East Attica, Greek Ministry of Culture) – Maria Mexi (Ephorate of Antiquities of East Attica, Greek Ministry of Culture)
Format: Oral

The third millennium BC in the Aegean is widely characterized by an "international spirit" expressed through intensified mobility of people, ideas and materials, technological transfer, and expanding exchange networks across coastal and inland zones. Within this context, mainland settlements should not be viewed solely as agricultural background to coastal exchange, but as active participants in the formation of regional interaction systems. The Early Bronze Age settlement of Koropi, located in the fertile Mesogeia plain (east Attica), provides an important case study for exploring these dynamics. Archaeological evidence reveals a community deeply embedded in networks of production, technological innovation, and exchange. The analysis of pottery demonstrates specialized ceramic manufacture, the adoption of new technological practices, and strong links with both nearby Attic sites (Askitario, Rafina, Agios Kosmas) and more distant regions such as the Cyclades, the Peloponnese, and Crete. These patterns indicate multidirectional flows of goods and knowledge. Equally significant is the evidence from ground stone technology. The abundance of macrolithic

artefacts—predominantly made from igneous rocks—and patterns in raw material selection and resource management practices showed that Koropi had a major role in the circulation and redistribution of andesitic raw materials from the wider Argosaronic region in the mainland. Data derived from the study of pottery and macrolithics points to organized production, technical knowledge, and participation of the site in both local and wider networks of trade and exchange. All these characteristics indicate that Koropi was not merely a self-sufficient agropastoral community but a center of innovation and craft specialization integrated into wider regional networks. The EBA Koropi highlights how inland sites participated in and structured both coastal and inland relationships, acting as mediators of mobility, resources, craft production and technological practices, and contributing decisively to the interconnected socio-cultural and economic landscapes of the prehistoric Aegean.

1724. Across the Saronic: Interaction and Exchange in the Third Millennium BC. Evidence from the Little Islandscapes of the Saronic Project

Authors: Christopher Nuttall (Swedish Institute at Athens)
Format: Oral

The Saronic Gulf has long been recognised as a key zone of interaction within the Early Bronze Age (EBA) Aegean, yet its role in structuring regional exchange during the Third Millennium BC remains unevenly understood. This paper draws on evidence generated by the Little Islandscapes of the Saronic Project (LISP) to examine patterns of interaction across insular and mainland settings within the Gulf. By integrating data from multiple small-scale island contexts, the study explores how exchange operated across short and longer maritime distances and how these interactions articulated with broader regional networks. Particular attention is paid to variability in connectivity and circulation between predominantly coastal EBA communities occupying different ecological and spatial positions within the Gulf. Evidence for interaction is explored through patterns of access to key resources, including the circulation of andesite ground stone tools and obsidian, alongside shared ceramic traditions linking island and mainland contexts, particularly with Methana. Rather than functioning simply as a maritime corridor between major centres, the Saronic Gulf is argued to have operated as a densely interconnected micro-region, structured through frequent short-distance movements and overlapping exchange relationships. These patterns highlight the importance of coastal settlement configurations in shaping interaction and contribute to wider debates on mobility, regional integration, and the organisation of exchange in the EBA Aegean.

66 TIMELESS OR TRENDING? GEMSTONES AND THEIR CULTURAL VALUES FROM AN ARCHAEOLOGICAL AND SCIENTIFIC PERSPECTIVE

Theme: 1. Widening perspectives in material culture studies
Organisers: Magda Pieniazek – Susanne Greiff (Tübingen University) – Marion Weber (National University in Colombia)
Keywords: Gemstones, Value, Materiality, Provenance analyses, Chaine operatoire, Exchange
Format: Regular session

SESSION ABSTRACT

Cultural values of materials and objects were in constant flux throughout antiquity. They emerged from an interplay between various features such as objective physical properties and artefacts' agencies, men's sensory perceptions, local traditions, foreign influences, changes in religious and socio-political spheres, available production and procurement technologies. Although gemstones like carnelian, rock crystal, amethyst, lapis lazuli or garnet were always considered precious due to their extraordinary color, hardness, exoticism, over time they acquired symbolic meanings that defined their roles in past cultures. Gemstone objects served as markers of social status and were believed to have amuletic properties. Their significance triggered the development of sophisticated lapidary technologies, and transregional exchange networks connecting distant areas like for example the Indus Valley and the Aegean as early as the Bronze Age. Despite their obvious importance, gemstones are among the least studied archaeological finds. Although scientific analyses such as LA-ICP-MS or micro-RFA have advanced considerably in recent decades, contributing to our understanding of provenances and exchange networks, they require more scholarly attention. The materiality of gemstones and trends in the relationship between stone type, color, pattern, iconography and function also definitely need further studies. In this interdisciplinary session, we will explore the value of gemstones from a comparative diachronic perspective. We want to share information on both archaeological and science-based reconstructions, particularly those using new methodologies. Specialists working with material from Europe and Asia from the Bronze Age to the Early Medieval period are invited to participate. Contributions from other areas that present ethnoarchaeological analyses are also welcome, such as studies of the documented use and symbolism of gemstones within Middle and South American native populations. We are also interested in presentations based on written sources, including specific accounts like Assyrian texts describing the use of stones in the art of conjuring and healing practices.

CONTRIBUTION ABSTRACTS

662. Regional Variations in Carnelian Bead Production Technology and Sourcing: Defining Indus style carnelian beads in West Asia and the Mediterranean

Authors: Jonathan Kenoyer (University of Wisconsin) – Geoffrey Ludvik (University of Wisconsin, Madison | Holy Apostles

College and Seminary)
Format: Oral

Advances in bead documentation methodologies have made it possible to identify regional styles of carnelian bead production that are differentiated by specific aspects of bead shaping, perforation and finishing. This paper will present an overview of the methodologies and results from studies of beads from the Indus region of South Asia, the Levant and the eastern Mediterranean. In addition to metric documentation of basic bead morphology, analysis of bead drill holes and perforation techniques are documented using dental impression material. These impressions are examined using a digital microscope for basic morphology and high resolution Scanning Electron Microscopy to define and differentiate the specific types of drills that were used. Drilling techniques identified to date include percussion, various types of stone drills, and metal drills with coarse or fine abrasives. Geochemical sourcing of the carnelian itself has been done on some archaeological beads using Laser Ablation-Inductively Coupled Plasma- Mass Spectrometry (LA-ICP-MS). A summary of the recent results indicates major sources for carnelian from South Asia, Iran, various part of Arabia, Turkïye and Egypt. In addition to select beads from sites in the Indus Valley and Mesopotamia, examples will also include beads from sites in Arabia, Egypt, the Levant, Turkïye and Greece.

1280. Drilling Technologies of Carnelian Beads: A New Perspective on Connections Between Central China and the Mongolian Plateau

Authors: Tang Longhao (Guangxi Normal Univercity)
Format: Oral

As an important ornament in human society, carnelian beads first emerged in China during the early to mid-second millennium BC and became widely popular in central China during the Western Zhou Dynasty (1046-771BC). At that time, social elites generously used them, along with beads made of other materials, as part of their personal ornaments, which were buried with their deceased owners. In the past, carnelian beads were thought to have came from West Asia, but with advancements in archaeological analysis methods, this view has faced increasing skepticism. This article analyzes the production technologies of carnelian beads from the Liangdaicun cemetery—the site with the largest number of carnelian beads unearthed from the Western Zhou period. We found that the three drilling technologies (geode, pecking, and stone drilling) exhibited in these carnelian beads are completely consistent with the drilling technologies of carnelian beads popular in the late Bronze Age of Mongolia (1400-1000BC). This proves that the technological tradition of carnelian beads in central China can be directly traced back to the Mongolian Plateau, and population migration is the most likely form of connection between them. Based on the historical context, we believe that the popularity of carnelian beads in the Western Zhou Dynasty was a political strategy of the rulers at that time. This strategy aimed to create a ritual system by utilizing materials favored by different ethnic groups in order to gain a cohesive identity and consolidate the newly established regime.

782. Carnelian and Amber in the Aegean Bronze Age: Changing Values over Time

Authors: Magda Pieniazek (Tübingen University)
Format: Oral

The value and meaning of Bronze Age materials and objects depended on a variety of factors, such as indigenous traditions, fluctuating exchange networks, the evolving needs of local societies, religious beliefs, socio-political organizations and available technologies. The meaning of such precious substances as amber and carnelian was a sum of these different factors in relation to their physical properties and men's sensory perceptions. Amber and carnelian were among the most prominent gemstones of the Aegean Bronze Age. While their color can be very similar, their other properties are quite disparate. The consumption patterns of both materials developed along different trajectories. They began their career as exotica, arriving from distant areas such as the Indus Valley or southern England. After this initial stage came a period of experimentation, during which local artisans tried to adapt both materials to local needs and preferences. This experimental phase ended with different outcomes for the two gemstones. Carnelian exchange flourished across the Mediterranean and Aegean Seas, and it was fully appropriated as one of the most important materials used in the production of seals and jewelry. In the course of the Late Bronze Age, it became integrated into burial rites and other spheres of local culture. In contrast, it is clear that, after a relatively short period of fascination, the importance of amber diminished. However, certain contexts suggest that, in later phases, amber may have been valued primarily not as a gemstone, but for its "magical" and possibly "amuletic" attributes.

396. Late Bronze Age Gemstone Production at Tell Atchana, Alalakh (Hatay, Türkiye)

Authors: Murat Akar (Hatay Mustafa Kemal University) – Magda Pieniążek (University of Tübingen)
Format: Oral

Tell Atchana-Alalakh, located at the crossroads of Anatolia, Mesopotamia, and the Levant in the Amuq Valley of Hatay, is one of the very few sites in Western Asia to have yielded an uninterrupted stratigraphic sequence spanning the entire second millennium BC. As the capital of the Kingdom of Mukish, the site preserves extensive Middle and Late Bronze Age administrative palace complexes, residential quarters, workshops, and funerary contexts. These contexts are exceptionally rich in material culture, including large corpora of epigraphic material—cuneiform tablets, cylinder seals, and seal impressions. Of particular significance is the wide range of workshops identified at Tell Atchana, providing valuable insights into palace-controlled production systems alongside household-level craft specialization. Evidence of specialized activities includes among others, ivory and stone carving, carpentry, metalworking and glass production. Furthermore, the remarkable quantity of gemstone objects and associated production debris indicates that Alalakh functioned as a significant center for jewelry production within the region. The presentation will focus on gemstone jewelry from Alalakh from both local and transregional perspectives. The assemblage comprises objects manufactured from carnelian, agate, onyx, amber, and other stones, embedded within exchange networks extending from Central Asia to the Baltic region. These networks involved not only finished objects but also the circulation of raw materials. Evidence for local bead production includes gemstone chunks, chips, semi-finished objects, and broken beads, which collectively document key stages of the chaîne opératoire. The spatial concentration of debitage in specific areas of the site suggests the existence of specialized production spaces or workshops. This contributes to a more nuanced understanding of craft organization and resource procurement in diachronic perspective, as well as Alalakh's role within broader Bronze Age economic and exchange networks.

570. Symbolic meaning of Mesopotamian beads and necklaces in the 1st millenium BC

Authors: Dorottya Láng (Hungarian National Museum | Eötvös Loránd University)
Format: Oral

A more detailed study of beads and necklaces has been relatively neglected in Mesopotamian archaeology. Regarding bead materials, a clear distinction can be drawn between their scientifically determinable materials and the categories that likely existed within ancient conceptual frameworks. Closely related to material is appearance - particularly color, pattern, and luster - which not only characterizes objects visually but also carries symbolic significance. Interpreting colors allows objects to be grouped into broader categories that may reflect shared symbolic meanings in antiquity. To approach the symbolic role that individual beads may have held in the past, multiple interpretative dimensions must be considered together, including form, color, pattern, appearance, function, and origin. An important complementary source for this investigation is the corpus of amulet-necklace texts, which provide insight into the composition of the necklaces. A critical comparison between these textual descriptions and extant objects in museum collections may reveal meaningful correspondences, although reconstructions of surviving bead strings do not always reliably reflect original ancient arrangements. Nonetheless, recurring patterns in amulet texts may contribute to more historically accurate interpretations of bead compositions. The magical connotations evident in amulet-stone lists clearly support an approach grounded in symbolic analysis. This raises broader questions about ancient aesthetics: what was considered beautiful, and how were aesthetic and functional values balanced in personal adornment? My research explores the potential of integrating material evidence with written sources to better understand the cultural, symbolic, and aesthetic meanings of beads and bead necklaces in Mesopotamia.

1827. Identification and Geographic Origin of Gemstones from the Collections of the Archaeological Museum of Thessaloniki, Greece

Authors: Maria Nikopoulou (Aristotle University of Thessaloniki, School of Geology) – Stefanos Karampelas (Aristotle University of Thessaloniki, School of Geology | Laboratoire français de gemmologie-LFG) – Evangelia Tsangaraki (Archaeological Museum of Thessaloniki) – Lambrini Papadopoulou (Aristotle University of Thessaloniki, School of Geology) – Christos Katsifas – Ioannis Nazlis (Archaeological Museum of Thessaloniki) – Vasilios Melfos – Nikolaos Kantiranis (Aristotle University of Thessaloniki, School of Geology)
Format: Oral

This study aims to emphasise the significance of mineralogy in identifying gemstones used in Hellenistic and Roman jewellery from the collections of the Archaeological Museum of Thessaloniki (AMTh). Most of the examined artefacts derive from excavations in Northern Greece with well-documented archaeological contexts, while a small number originate from handovers or confiscations and are of uncertain provenance. The study aims on the following: (a) mineralogical characterisation to resolve terminology conflicts between geologists and archaeologists; (b) the geological - geographic origins to locate potential ancient sources; and (c) the correlations between specific gemstones and types of jewellery. The identification of the gemstones was carried out through microscopic observation of inclusions and the application of mobile, non-destructive advanced methods, such as Raman Spectroscopy, Photoluminescence, Visible–Near InfraRed Spectroscopy, and Micro–EDXRF analysis. The results revealed one corundum and a significant number of beryls, garnets, and varieties of quartz and chalcedony. The corundum was classified as a sapphire of metamorphic origin, with characteristic fingerprint inclusions, indicating Sri Lanka as its possible geographic origin. Based on spectroscopic and chemical data, the beryls are classified as emeralds, most likely originating from Egypt. The garnets belong to the pyralspite group, with pyrope and almandine members prevailing. They are classified into three subgroups, each one related to a specific geological environment. The quartz samples are divided into macrocrystalline (rock crystals and amethysts) and microcrystalline (chalcedonies, agates, jaspers) varieties. Among them, a chrome chalcedony was identified, probably originating from Asia Minor deposits. The diversity observed in the types of gemstones used, as well as in their possible sources of origin, can further contribute to a deeper understanding of the economic, aesthetic, and symbolic values attributed to these artefacts during the Hellenistic and Roman periods, as well as of the complex trade networks in which their societies participated.

598. Crafting Value: Goldsmithing Quality and the value of Garnet Jewellery in the Early Middle Ages

Authors: Susanne Greiff (Archaeometry Research Group, University of Tübingen) – Elke Nieveler (LVR-Landesmuseum

Bonn)
Format: Oral

Value and significance are difficult to grasp when it comes to archaeological ornaments as our modern materialistic attributions of value to gemstones cannot be transferred linearly to the past. In a multi-year project entitled 'Weltweites Zellwerk' (Worldwide Cellwork), cloisonné-style jewellery items decorated with garnet gemstones were examined across Europe. The aim was to understand the systematic changes in the use of garnet in the Merovingian period, which manifested themselves in the 7th century in a significant reduction in the number of objects decorated with garnet and a change in style away from lavish garnet settings towards the use of individual stone inlays. The early Middle Ages in the Rhineland (Germany) are characterised by many burial sites with rich grave goods. Despite a high degree of looting, an extensive inventory of material culture has been preserved, allowing us to draw conclusions about temporal and spatial developments, especially between the 6th and 7th centuries. From the Rhineland burial grounds alone, 250 objects with around 1,000 garnets were examined. In a closely interlinked research strategy, the origin of the garnets was determined, investigations into the quality of the stonework and goldsmithing techniques were carried out, and these were finally placed in the archaeological context. The focus was on the question of how QUALITY can be defined in these contexts. Are there systematic links between stone quality, stoneworking quality, the origin of the stones, the quality of the goldsmithing and the status of the buried individuals? What changes do we see over time? Only through this intergrated systematic approach can we clarify the importance attached to quality in the context of garnet-decorated objects and how this is to be interpreted in relation to value and worth. The results allow us to approach these questions in a manner strictly oriented towards the archaeological material.

2029. Pre-Hispanic gemstone artefacts from the Sierra Nevada de Santa Marta, Colombia: Agate and carnelian

Authors: Marion Weber – Natalia Acevedo (Universidad Nacional de Colombia, sede Medellín) – Daniel Rodríguez-Osorio (Universidad del Norte) – Susanne Greiff (Eberhard Karls Universität Tübingen)
Format: Oral

Archaeological studies of Museum Collections that contain material culture from Pre-Hispanic societies of the Sierra Nevada de Santa Marta, in the northern Colombian Caribbean region, have registered the use of a variety of gemstones with different colours, such as green nephrite, variscite, serpentinite, steatite, black nelsonite, white quartz, and red jasper, agate and carnelian. Provenance studies of some of these lithic artefacts have proven that their raw material sources are local, for example serpentinite and nelsonite, but can also be traced to distant origins within the northern Caribbean, such as variscite. Red agate and carnelian are particularly abundant within the collections. Ornaments and pendants made of this hard material are characterised by differently shaped beads, zoomorphic figures such as frogs and caterpillars, as well as anthropomorphic figures. Though the origin of the agate and carnelian raw material is still under investigation, the source is likely to be within the geological formations of the northern Andean region of Colombia. The high abundance of agate and carnelian artefacts indicates that they were highly valued and suggest that they had important symbolism within the Caribbean Pre-Hispanic cultures. This importance is also seen today and red stones from the Sierra Nevada de Santa Marta are highly sought after and attributed curative and protective powers by some native societies.

1207. Stone beads and pendants of the Kogi people (Colombia): preliminary findings from an ethnoarchaeological study

Authors: Alain Queffelec (UMR5199 PACEA, CNRS, Univ. Bordeaux, Ministère de la Culture) – Pierrick Fouéré (INRAP | UMR5608 TRACES, CNRS, Univ. Toulouse Jean Jaurès) – Eric Julien (Association Tchendukua)
Format: Oral

Stone beads and pendants are still used today by the Kogi people in the Sierra Nevada de Santa Marta, Colombia, for a variety of cultural and symbolic purposes. These artifacts, known as tumas, bear a striking visual resemblance to the lapidary works attributed to the Tairona culture, who are widely considered the direct ancestors of the Kogi. In this study, we analyzed a collection of Kogi beads and pendants using the same methodological approach applied to archaeological artifacts from the Caribbean islands' Ceramic Age. Our analysis involved typological classification, mineralogical identification, and a detailed examination of the production techniques. Although this research is still in its preliminary stages, it has already yielded interesting findings one may compare with archaeological artefacts from Colombia or the Antilles. By comparing these results with the contemporary use of tumas among the Kogi, we also aim to explore potential interpretations of similar artifacts in past societies, interpretations that remain particularly elusive for Western scientists due to the cultural and temporal distance involved. Despite the impossible direct transfer of symbolic interpretations between current and past societies, understanding the modern context of tumas may offer valuable clues to deciphering their roles in pre-Columbian societies.

67 MERC FORUM: APPROPRIATING MEDIEVAL HERITAGE IN THE CONTEMPORARY WORLD

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Maria Vargha (University of Vienna) – Saša Čaval (ZRC-SAZU) – Petar Parvanov (Bulgarian Academy of Sciences) – Pavla Tomanová (Institute of Archaeology, CAS)
Keywords: Medievalism, Heritage ethics, Identity and ideology
Format: Other
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

Across Europe and beyond, the Middle Ages continue to echo in public life, with medieval imagery and heritage being constantly reused, reimagined, and politicised. From ideological movements and heritage debates to films, video games, and digital reconstructions, medievalism is consistently utilised to shape identities and values in the present. This is resonant on another level: the streets, towns, and landscapes we often still inhabit are shaped by their medieval past, whose presence is thus familiar yet elusive. In this forum, we understand appropriation broadly — from creative reinterpretation to ideological instrumentalisation — reflecting both the vitality and the volatility of medieval heritage today. This session brings together scholars and heritage professionals to examine how medieval material culture, narratives, and symbols are appropriated in the contemporary world. We will discuss issues, such as how political movements, digital communities, and creative industries use the Middle Ages to support and legitimise their identities, ideologies, values or worldviews. Moreover, the forum interrogates how such appropriations reveal the ongoing entanglement of heritage, identity, and power in a globalised media landscape. The discussion aims to facilitate a shared framework for understanding and communicating medieval heritage through a more inclusive and reflexive dialogue with the public. Arguably, scholars and heritage professionals must become more comfortable in engaging critically and constructively with such uses of the past. Invited discussants from diverse disciplinary backgrounds will examine with the audience various examples from their own practice, addressing the ethical and methodological challenges posed by these "resonant pasts", while asking what responsibilities scholars of the Middle Ages hold in navigating the contested afterlives of medieval heritage in the present.

69 INTERACTION, CONNECTIVITY & MOBILITY IN THE BALKANS: DIACHRONIC PERSPECTIVES ON LAND USE AND HUMAN–LANDSCAPE RELATIONS

Theme: 7. Interaction, connectivity and mobility
Organisers: Samira Fischer (University of Erlangen-Nürnberg) – Gabriella Armstrong (Department of Anthropology, Stanford University) – Andrea Pambuku (Directorate of Archaeological Service, National Institute of Cultural Heritage) – Erina Baci (Department of Anthropology, University of Michigan)
Discussant: Tobias Krapf (Swiss School of Archaeology in Greece)
Keywords: Balkans, Landscape, Mobility, Interaction, Connectivity, Land Use
Format: Discussion session

SESSION ABSTRACT

Situated between the Adriatic, Aegean, and Black Seas, the Balkan Peninsula has been a nexus for interaction, connectivity, and mobility across time. Characterized by a plethora of diverse geographies, including mountain chains, fertile valleys, and strategic corridors, the Balkans preserve a complex record of human land use whose resulting social and material landscapes are equally rich and dynamic. Broadly defined, landscape archaeology is the study of how humans interacted with, perceived, and shaped the environments around them. It is then inherently interdisciplinary, drawing from a variety of disciplines in addition to being multiscalar—zooming out past the "site." Thus, landscape archaeology provides a comprehensive framework for understanding human-environmental relations in the past. This session aims to bring together and highlight the research being conducted by early-career scholars and archaeologists exploring land use, mobility, and human-landscape interaction across the Balkans from Prehistory through the Medieval period. By emphasizing landscape archaeology as both a theoretical and methodological bridge, this session aims to integrate diverse datasets and foster dialogue among scholars working across temporal, regional, and disciplinary boundaries. Despite its widespread adoption in other parts of the world, landscape approaches are still uncommon in the Balkans, where the cultural history paradigm remains the dominant theoretical approach. Therefore, one of the goals of this session is to transcend the "Balkanization" of research traditions and emphasise the Balkans as a unified, interconnected domain of long-term human–environment interaction, a pivotal stage for the study of landscape transformation and cultural connectivity across Eurasia.

CONTRIBUTION ABSTRACTS

1248. Corridors of Mobility and Connectivity: Human-Landscape Interaction in the Neolithic Strymon River Valley

Authors: Nena Chatzitheodoridou (University of Thessaly)
Format: Oral

Situated between the Aegean and the interior of Southeastern Europe, the Strymon River Valley has long functioned as a strategic corridor of interaction, connectivity and mobility within the Balkan Peninsula. This paper examines the Strymon River Valley as a diachronic landscape of movement, analyzing how Neolithic communities inhabited, engaged with and transformed this environmentally dynamic region and how patterns of mobility and land use developed through sustained human-landscape relations. Adopting a landscape archaeological framework, mobility is approached not as episodic or large-scale migration, but as a socially embedded practice expressed through riverine corridors, floodplains, mountain passages and environmentally contingent terrains. By integrating geomorphological, hydrological and palaeoenvironmental datasets with settlement distribution, the analysis moves beyond site-based perspectives to conceptualize the Strymon River Valley as a multiscalar landscape shaped through the interaction of environmental affordances, constraints and human agency. The study highlights the valley's multifunctional character as a locus of habitation, a conduit of circulation and a landscape continually reconfigured through reciprocal interactions between environmental processes and human activity. Diachronic patterns indicate that mobility strategies were not environmentally determined but actively shaped through interregional interactions across the Balkans. By framing the Strymon River Valley as an interconnected, transboundary Balkan landscape rather than a collection of culturally bounded regions, this paper contributes to ongoing efforts to move beyond culture-historical paradigms in Balkan archaeology. It argues that corridor-based landscape approaches offer a robust analytical framework for understanding long-term connectivity, land use practices and human-landscape relations across the Balkans from Prehistory onward.

2536. Rise over run: Spatial modelling of Neolithic and Copper Age copper artefact distribution according to the 'least-cost corridor' method

Authors: Norbert Faragó – Zsuzsanna Siklósi (Eötvös Loránd University)
Format: Oral

The spread of metallurgical products across Europe has remained a central focus of Prehistoric research for a century. Building upon the Neolithic roots of Balkan metallurgy and relying on the exploitation of local copper ore deposits, communities in present-day Serbia and Bulgaria produced significant quantities of copper artefacts. Lead isotope and chemical composition analyses demonstrate that these artefacts gradually reached distant regions. While the dynamics, mechanisms, scale, and socio-economic significance of this diffusion have long been subjects of archaeological debate, less attention has been paid to the precise routes utilised by the agents. Consequently, this study investigates the potential transport routes connecting mining districts to final deposition sites, spanning from the initial appearance of copper artefacts in the Late Neolithic Carpathian Basin (4700 cal BCE) to the Middle Copper Age (3900–3650 cal BCE). Specifically, we aim to identify the least-cost corridors (LCCs) based on energy expenditure and time allocation. Several scholars have drawn attention to the key role of waterways since the spread of Neolithization. The research takes this circumstance for granted, but little attention has been paid to the practical know-how of maintaining such networks in the catchment area of the River Danube. Although water transport surpasses walking in terms of speed, it requires higher social energy investment. Moreover, the possible role of water as a hindrance must be taken into account equally. Is it possible to identify a moment or period in the distribution of Copper Age artefacts when such a highly organised social network manifests itself? What kind of influential role can be attributed to watercourses and waterlogged areas in communities that maintain such intensive networks of relationships? By reconstructing potential transport corridors, we seek to contribute to a more granular understanding of the dissemination of metallurgical products and technologies across Europe.

2709. Examining Geological Affordances and Prehistoric Settlement in Kosova

Authors: Gabriella Armstrong (Stanford University) – Erina Baci (University of Michigan)
Format: Oral

This paper presents ongoing research examining the environmental factors influencing settlement patterns across Kosova from the Neolithic to the Iron Age (6500-500 BC). Inspired by Galaty et al.'s (2022) analysis of environmental factors in driving broad settlement shifts in Dukagjin over time, this research applies a similar framework but at a broader scale. The data used in this analysis are from the Atlas of Archaeological Sites in Kosova (AASK) a database of nearly 1000 archaeological sites compiled from published archaeological data in the Archaeological Maps of Kosova Volumes I–III (2006, 2012, 2017). The analyses presented here evaluate whether patterns in prehistoric site distributions, observed from previous clustering and distance analyses, such as nearest neighbor, and Ripley's K, were influenced by geological features, particularly soil and bedrock types, and slope. Here, the assessment of how landscape features may impact long-term settlement strategies allows for a more nuanced understanding of larger human-environment interaction and land use trends in the region. By linking archaeological and geological datasets, this study contributes to discussions in Balkan landscape archaeology, offering insights into the drivers of prehistoric mobility, land use, and settlement choice. These results also refine ongoing research questions and methodologies demonstrating the value of interdisciplinary, multi-scalar landscape approaches in a region where such analyses remain relatively underutilized. Furthermore, these types of regional approaches are useful for integrating local data, at the country level, into broader Balkan and European frameworks regarding settlements and landscapes in prehistory.

2612. Halfway There – Life Between Rivers, Sea, and Mountain Peaks

Authors: Morana Vukovic (Archaeological Museum Zadar)
Format: Oral

The Velebit mountain, extending over more than 100 kilometres along the eastern Adriatic coast, was long regarded as an archaeologically marginal area. Systematic research conducted over the past two decades has challenged this view, demonstrating continuous human engagement with this rugged karst landscape from the earliest prehistory to the present. This paper focuses on the southern sector of Velebit, where the mountain slopes are structured by the deeply incised canyons of the Zrmanja and Krupa rivers and bordered by the Adriatic Sea. Although largely depopulated today, archaeological evidence indicates that this area played a crucial role in prehistoric lifeways. Multiple ecological zones provided access to freshwater and fertile river valleys, marine resources along the coastal foothills, extensive pastures suitable for year-round grazing, and diverse mountain resources. Fortified hillforts (gradine) reflect the strategic organisation of space, including territorial control, surveillance of movement, and the regulation of communication and exchange networks. Numerous tumuli, widely distributed across the landscape and often associated with hillforts and communication routes, further articulate the structured use of space. Their continued reuse in recent pastoral contexts highlights the long-term persistence of spatial practices. Settlement and mobility patterns display a strong degree of continuity. Many Bronze and Iron Age routes remain embedded in the contemporary landscape as local paths, pastoral tracks, and formal hiking trails. Modern hamlets frequently occupy the foothills of prehistoric hillforts, while oral traditions preserve knowledge of the landscape's deep past. Prehistoric monumental features, particularly large tumuli positioned at key topographic and strategic nodes, continue to function as persistent landmarks, marking routes, passes, boundaries, and symbolically charged places. Drawing on results of systematic archaeological field survey conducted since 2018 by the Archaeological Museum Zadar, this paper examines the Velebit massif as a dynamic cultural landscape shaped by mobility, connectivity, and long-term spatial continuity.

223. Beyond Marginality: Landscape Archaeology of the Rhodope Mountains in the Balkan Context

Authors: Vassilis Evangelidis – Despoina Tsiafaki – Melpomeni Karta – Varvara Ioannidou (Athena RC)
Format: Oral

Mountain landscapes in the Balkans have long been framed as peripheral or marginal zones, culturally conservative and situated beyond the effective reach of political and economic centers. Rooted in culture-historical paradigms, this view has obscured the dynamic roles of upland environments as spaces of interaction, mobility, and sustained human–environment engagement. This paper challenges such narratives through an archaeological study of the Rhodope Mountains as dynamic landscapes shaped and/or redefined from the 7th century B.C. until the Roman period. Drawing on data produced by the THRACE-CONNECT project—an H.F.R.I.-funded project mapping mountainous landscapes and movement networks in Aegean Thrace from the Greek colonization to the Imperial Era —the study examines patterns of land use, mobility, and settlement organization across the upland Rhodope. Employing a multiscalar methodology that integrates GIS-based spatial analysis, route modeling, and site-distribution data, it reconstructs how mountainous terrain actively mediated connections between the Aegean coast and the interior rather than functioning as a barrier. The analysis highlights both transformations associated with new social and economic structures and strong continuities rooted in earlier Thracian landscape practices. These findings suggest that external influence was negotiated and adjusted through pre-existing movement corridors and local spatial logics. By situating the Rhodope mountains within broader Balkan networks, this paper reconceptualizes mountain zones as active agents of regional connectivity and long-term landscape transformation, illustrating how landscape archaeology can move beyond narratives of marginality to reveal the dynamic role of upland environments in shaping human–environment interactions across the peninsula.

1719. Burials Betwixt and Between: The Liminal Deathscape of Phaleron

Authors: Angelica Caraballo-Santiago (University of California Santa Barbara) – Katrina Kuxhausen-Derose (University of California Los Angeles)
Format: Oral

A deathscape presents the intertwined spatial, material, and social dimensions through which death is experienced, managed, and memorialized in a landscape over time. This paper argues that the coastal cemetery of Phaleron served as a liminal deathscape through which the emerging Athenian polis could manage a wide spectrum of deaths, including infants, non-elites, travelers, criminals, and more. Phaleron was not a distant, isolated burial ground, but a mortuary landscape situated within a corridor of movement between urban and rural, land and sea, and inclusion and exclusion. Phaleron's placement in a marshy, coastal zone meant that the boundaries between land and water repeatedly blurred and reasserted themselves. Such a landscape resisted clear demarcation and lacked economic use-value, operating as a wasteland that gained meaning from its fluidity. The sandy, mutable soils allowed for reuse, ambiguity, and partial erasure, making Phaleron uniquely suitable for the management of socially diverse populations. It stands in stark contrast to the performative monumentality, civic identity, and political ideology found in the Kerameikos on the Sacred Way into Athens. Phaleron's long-term use, shifting shoreline, and repeated depositions reveal the transient nature of the deathscape as a dynamic spatial process. Recent bioarchaeological research demonstrates how mobility, bodily treatment, and burial variability were materially embedded into the deathscape of Phaleron. The proximity of infant pot burials to violent adult inhumations, the range of ages represented, and the contrast of grave goods show how the deathscape accommodated multiple identities in a single, shared space. Phaleron is distinct from the insular deathscape of the Kylindra infant cemetery, where age specifications and ritual repetition anchor and restrict community practice. This comparative study foregrounds death as a driver of land use, positioning the deathscape of Phaleron as an active component within a wider landscape of interaction, connectivity, and movement in the Aegean.

2693. Landscapes of Connectivity: Settlement, Cult, and Mobility in the Berat Region (Albania) from Late

Antiquity to the Middle Ages

Authors: Andrea Pambuku (Directorate of Archaeological Service, National Institute of Cultural Heritage)
Format: Oral

This paper examines long-term patterns of human–landscape interaction in the Berat region of central Albania from the 3rd to the 14th centuries AD, adopting a landscape archaeology and settlement pattern approach. Situated along the Osum River valley, the Berat region constitutes a well-defined micro-region that historically functioned as a major corridor linking the Adriatic lowlands with the mountainous interior of the Balkans. Its strategic geography fostered mobility, communication, and cultural exchange, shaping settlement organization, religious topographies, and systems of territorial control across Late Antiquity and the Middle Ages. Rather than treating archaeological sites as isolated entities, the study conceptualizes Late Antique basilicas, medieval churches and monasteries, fortifications, and associated settlements as components of an interconnected cultural landscape structured by connectivity and movement. The research is grounded in a geospatial archaeological dataset compiled through the integration of published scholarship, archival sources, and field-based documentation. Using GIS, archaeological evidence is analyzed in relation to environmental variables such as topography, hydrology, slope, and ancient communication routes, particularly Roman roads that continued to influence movement patterns into the medieval period. A central focus of the paper is the role of religious architecture as a spatial anchor within this landscape. Cult monuments frequently cluster near roads, river crossings, fortified centers, and productive zones, indicating their active role in organizing territory and facilitating mobility. The diachronic perspective reveals patterns of continuity and adaptation rather than rupture, highlighting the resilience of inherited infrastructures and the enduring influence of Late Antique spatial frameworks on medieval landscapes in the Berat region.

999. Living well and long-living: the case of Orlovets-Papaz cheshma, a multiperiod site in the Lower Danube basin

Authors: Vanya Petrova (National Archaeological Institute with Museum) – Nadezhda Todorova (Sofia University St. Kliment Ohridski)
Format: Poster

Multiperiod open-air sites provide long-term and diachronic evidence of how human communities adapted to, modified and interacted with their environment over time. This paper presents ongoing research into the multiperiod site of Orlovets-Papaz Cheshma (meaning 'Priest's Fountain' in Turkish), located in the central part of the Lower Danube plain in northern Bulgaria. The site has yielded evidence of recurrent, non-continuous occupation spanning several millennia, from the beginning of the 5th millennium BC to the 5th century BC, covering the Early Chalcolithic, Final Chalcolithic, Late Bronze Age, the Early and beginning of Late Iron Ages. Integrating data from plant macro-remains, anthracology, zooarchaeology, clay provenance analysis and high-resolution artefact studies enables us to investigate continuity and change in settlement patterns, resource exploitation and land use, as well as subsistence strategies, in response to varied cultural choices and traditions, and/or climatic and environmental dynamics. The rich collections of plant macro-remains and faunal assemblages testify to the varied roles played by agriculture and animal husbandry in each period, while hunting and gathering strategies seem to have retained their importance over time. Nevertheless, the availability and proximity of water sources seem to be a critical factor in the long-term occupation of the same spot.

71 COMMUNITY IN CONTEXT: INTEGRATING ARCHAEOLOGICAL AND BIOMOLECULAR EVIDENCE FROM MEDIEVAL CEMETERIES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Guido Alberto Gnecchi Ruscone – Maria Spyrou – Maxime Poulain (University of Tübingen) – Ksenija Djukic (University of Belgrade)
Keywords: aDNA, isotopes, cemeteries, community, Middle Ages
Format: Regular session
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

Advances in biomolecular methods, such as stable isotope analysis and, more recently, ancient DNA, have enabled the generation of extensive biomolecular data from medieval cemeteries. These approaches have often been used to address broad-scale questions, for example, long-term human diffusion processes and their impacts on ancestry, diet and infectious disease burden across wide geographical expanses. Recently, an increasing number of biomolecular studies are shifting the focus to investigate the lived experiences of local communities, bringing insights into mobility and kinship practices, amongst other things. The medieval period, with its rich archaeological, historical, and art-historical sources and its large and diverse cemeteries, offers a unique opportunity for such integrated, multi-scalar studies. By combining biomolecular and contextual evidence, researchers can now address and provide answers to more complex social questions. The goal of this session is to foster knowledge exchange and discussion between archeologists, historians and geneticists who study medieval communities (early to late Middle Ages) through biomolecular methods (isotopes, ancient DNA), combined with anthropological, archaeological or historical perspectives on cemeteries, their material culture and the socio-economic and -political systems in which they were embedded. We welcome the submission of research projects and case studies that connect global processes (migration, trade, pathogen spread) with local experiences (diet, health, mobility, identity) and which further enhance cross-disciplinary collaboration between archaeological and biomolecular approaches. Possible themes fitting the focus of this session include: impact of migration on local communities; social structure and identity through spatial organization and kinship patterns in cemeteries; local responses to global epidemics through pathogen DNA and skeletal analyses; within community infectious disease burden for elucidating the timing and dynamics of pathogen transmission; dietary and health inequalities between social groups, or in marginalised communities, via isotopes and ancient DNA.

CONTRIBUTION ABSTRACTS

2646. 'Ways of Being Related' in migration period Britain, an investigation of kinship, cemetery and material culture

Authors: Duncan Sayer (University of Lancashire)
Format: Oral

Recent ancient DNA evidence points to migration as a significant factor in social change in early Medieval Britain. 75% of the ancestry within a population of the 278 individuals we published in Gretzinger et al 2022 had Continental Northern European ancestry. But we should not overlook the 25% which remain as a sizable influential population - not a isolated outpost of separate Roman Briton's but a amalgamation of relationships and lifeways. This 25% includes 'other's', West Africans, Romano British in different combinations of ancestries that define diversity and immortality relatedness. In this paper I will look at aDNA, migration and kinship. Early Medieval communities were making new and diverse ways of being related and marking these in material culture and mortuary proximity, as much as in their genes. In this paper I will explore different manifestations of kinship present in migration period cemeteries and will focus on sites like Oakington, West Heslerton, Dover Buckland, Updown and Worth Matravers. I will argue that it social change was as much a mixing up of kinship rules as a result of migration, gene flows or cultural change. I will also introduce new a new project that bring together DNA Isotopes and excavation to explore the idea of relatedness in the early middle ages in different ways.

2074. Biological Relatedness and Community Organization in the Moravian Principality

Authors: Denisa Zlámalová – Renáta Přichystalová (Department of Archaeology and Museology, Masaryk University) – Šárka Krupičková (Institute of Archaeology, Czech Academy of Sciences) – Sylva Drtikolová Kaupová (Department of Anthropology, National Museum, Prague | Institute of Archaeology CAS, Prague) – Bendeguz Tobias (Institute of Medieval Research, Austrian Academy of Sciences, Vienna) – Lumír Poláček (Institute of Archaeology, Czech Academy of Sciences) – Matej Ruttkay (Institute of Archaeology, Slovak Academy of Sciences, Nitra) – Jiří Macháček (Department of Archaeology and Museology, Masaryk University) – Johannes Krause (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Zuzana Hofmanová (Max Planck Institute for Evolutionary Anthropology, Leipzig | Department of Archaeology and Museology, Masaryk University)
Format: Oral

A recurring challenge in studying Medieval cemeteries is their long-term use, which often disturbs earlier contexts. To investigate the emergence of Early Medieval societies—especially in regions lacking contemporary written sources—we focused on the 9th-century Moravian principality (also referred to as Great Moravia), one of Central Europe's earliest polities. Its cemeteries ceased functioning soon after the polity collapsed, offering a rare snapshot of a society existing for roughly 85 years. Our study includes over 600 samples from individuals from eight cemeteries across present-day Czechia, Slovakia, and Austria. The newly forming society was evidenced to be shaped by ongoing integration rather than descent from a single founding population, as revealed by its mostly shared ancestry background with genetic outliers suggesting social permeability. Distant relatedness links revealed that various sites were connected within the principality despite their geographical distance and that the individuals themselves were only weakly clustered by their burial site. Though the burial communities were composed of related individuals, the society was not only centered on relatedness (like Avar-period and rural cemeteries) nor mostly composed of unrelated individuals (like the 5th-6th century Eastern Germany). Elite burial spaces were often shared by multiple kin groups, and several high-status individuals lacked close relatives at their site. Nonetheless, elite markers tended to cluster within certain pedigrees and among individuals with higher overall relatedness connectivity. This indicates that elite status was not restricted to biological lineages, yet kinship still played a meaningful role in elite formation, alongside the integration of outsiders and possibly Christian practices such as godparenthood. Overall, Early Medieval communities in the Moravian principality were neither biologically closed nor organized solely around kinship. Instead, community belonging was socially produced through the incorporation of newcomers, negotiated access to elite status and burial spaces, and marital strategies that crossed local boundaries.

938. Shared ancestry across religious boundaries in medieval Córdoba, Spain

Authors: Diego Esteve-Gómez (University of the Basque Country EHU) – Enrique Hiedra Rodríguez (Universidad de Córdoba) – Carles Lalueza-Fox (Institute of Evolutionary Biology, CSIC-Universitat Pompeu Fabra | Natural Sciences Museum of Barcelona, MCNB) – David Reich (Department of Human Evolutionary Biology, Harvard

University | Department of Genetics, Harvard Medical School | Howard Hughes Medical Institute, Harvard Medical School | Broad Institute of MIT and Harvard) – Iñigo Olalde (University of the Basque Country EHU | Department of Human Evolutionary Biology, Harvard University | Ikerbasque–Basque Foundation of Science)
Format: Oral

The Islamic conquest of the Iberian Peninsula in the eighth century marked a turning point that profoundly shaped the social, cultural, and demographic landscape of the region for the following seven centuries. During the period of the Emirate (711–929) and the subsequent Caliphate of Córdoba (929–1031), the city of Córdoba emerged as the political and administrative capital of al-Andalus, attracting populations of Arab, Berber, and broader Mediterranean origin, while a substantial part of the local population remained in place. Processes of conversion, Arabization, and sustained interaction among these groups have long been the subject of extensive debate from historical, philological, and archaeological perspectives. In this context, archaeogenetics offers a novel approach, providing direct biological evidence that allows us to reassess these socio-demographic dynamics from a comparative perspective. With its rich funerary record, the city of Córdoba offers an exceptional context to directly compare communities associated with different religious traditions within the same urban setting. In this work, we recover and analyse genome-wide data from 42 individuals from two contemporaneous medieval cemeteries excavated in Córdoba: a Christian necropolis located in Ronda del Marrubial and an Islamic necropolis from the Zumbacón area (SC-3 Zum). The two sites are separated by approximately 500 metres and date to the Emiral and Caliphate periods. Preliminary results indicate that, despite adhering to different religions, most individuals from both cemeteries share the same ancestral origin in the pre-Islamic populations of southern Iberia. Overall, our results point to a largely local origin of Córdoba's Muslim population during the Emiral and Caliphate periods and suggest that religious conversion, rather than large-scale mobility, played a central role in shaping the religious landscape of Al-Andalus. Future archaeogenetic analyses of additional cemeteries will be necessary to assess whether these patterns are consistent across the wider urban population of medieval Córdoba.

2000. Archaeological and Biomolecular evidence from Fara Olivana (Bergamo): migration, social structure, dietary and material culture of the "Lombards" in Italy

Authors: Caterina Giostra (Catholic University of the Sacred Heart - Milan) – Maria Fortunati (former Archaeological Superintendency of Lombardy) – Guido Gnecchi Ruscone (Senckenberg Centre for Human Evolution - University of Tübingen) – Cosimo Posth (University of Tübingen) – Daniel Winger (University of Rostock) – Maurizio Marinato (University of Padua) – Alessandra Mazzucchi (Osteoarc APS ETS) – Emanuela Cristiani (Sapienza University of Rome)
Format: Oral

A project funded by the Italian Ministry of University and Research focused on migration, biological composition, social structure, diet and occupational activities, cultural interactions, and dynamics of integration within allochthonous communities that arrived in Italy at the end of the 6th century. The written sources identify these groups as the Lombards, who came from Pannonia (modern-day Hungary) together with other minority groups and were founders of the Lombard Kingdom (568-774 AD). These are central themes in Early Medieval history and archaeology and have long been debated in the specialist literature from a theoretical and methodological perspective. The interdisciplinary approach adopted involved the integration of archaeological data, ancient DNA analysis, multi-isotopic analyses for mobility (Sr, O) and diet (C, N, together with dental calculus analysis), and anthropological study. Moreover, for the first time, data derived from archaeometric analyses of typical artefacts - considered type fossils of allochthonous material culture - were also combined. The case study presented is the recently discovered necropolis of Fara Olivana (northern Italy). The 113 graves brought to light can be dated between the last three decades of the 6th century and the second half of the 7th century. Archaeological factors such as chronology, spatial organization, and the nature of the finds (including laboratory analyses) are integrated with genetic ancestry, kinship, mobility, status, and the circulation of material culture. All individuals uncovered were taken into consideration. The result is a community rich in experiences emblematic of the period, which can be compared with other Italian contexts and, above all, with Hungarian sites already investigated using a similar interdisciplinary approach and the application of genetics.

2233. Paired Lives and Shared Environments? Biomolecular Insights from Double Burials in Medieval Wallachia

Authors: Franceska Ştirbu ("Vasile Pârvan" Institute of Archaeology) – Sterling Wright (College of Health Solutions, Arizona State University) – Laura Weyrich (Department of Anthropology, Pennsylvania State University) – Ana García-Vázquez (Research Institute of the University of Bucharest) – Estelle Herrscher – Guy André (Aix Marseille Univ, CNRS, Minist Culture, LAMPEA) – Adrian Bălăşescu ("Vasile Pârvan" Institute of Archaeology) – Valentin Radu (National History Museum of Romania | Research Institute of the University of Bucharest) – Gabriel Vasile ("Vasile Pârvan" Institute of Archaeology)
Format: Oral

Recent advances in biomolecular archaeology enable the integration of multiple lines of evidence to produce highly detailed reconstructions of past communities. This study combines ancient DNA analyses of dental calculus with isotopic data on diet and mobility to investigate skeletal remains from the largest cemetery in medieval Wallachia, located in Buftea, Romania. Dating from the 14th to the 17th centuries, the site includes 10 double burials, one of which also features a reburial, offering a unique perspective on the

social and biological aspects of this population. Bioanthropological and paleopathological analyses revealed a high prevalence of mortality among subadults, as well as non-specific infectious disease markers, including periostitis and osteomyelitis, likely intensified by nutritional deficiencies and potential calamity events. Stable isotope analyses of carbon (δ13C), nitrogen (δ15N), sulphur (δ34S), oxygen (δ18O) and strontium (87Sr/86Sr) were used to reconstruct paleodiets, asses nutritional stress and identify mobility patterns among 21 individuals, both adults and subadults. Dental calculus samples from 18 of these individuals were further examined using aDNA metagenomic approaches to characterize the oral microbiome and explore indicators of oral health and diet. These biomolecular results were integrated with archaeological evidence and historical sources to situate dietary practices and population movement within a broader social and environmental context. By combining microbial, isotopic, and archaeological data, this study highlights variation in individual lifeways and demonstrates how biomolecular approaches can illuminate medieval burial populations as socially and biologically dynamic communities. This research represents the first fully integrated biomolecular investigations of a medieval cemetery in Romania and underscores the value of combining oral microbiome and isotopic analyses to reconstruct community structure, health, and mobility in southeastern Europe. This work was supported by a grant of the Ministry of Education and Research, CCCDI - UEFISCDI, project number PN-IV-P6-6.1-CoEx-2024-0042, within PNCDI IV.

2561. Life and death in the medieval rural community: a case study from southeastern Estonia

Authors: Marie Anna Blehner (University of Tartu)
Format: Oral

While much of Europe had entered the Middle Ages during the first millennium, this transition in the territory of present-day Estonia occurred primarily in the 13th century, following the Northern Crusades and the consolidation of Christianity. This period was marked by profound societal, religious, and cultural transformation, including the establishment of urban centers, the construction of churches, and changes in mortuary practices. Despite the spread of Christian norms, certain local traditions persisted, leading to the development of rural village cemeteries that were not directly associated with churches. The Loosi cemetery represents one such burial site and provides a valuable case study for examining the coexistence of Christian and local burial traditions in a rural medieval context. The study focuses on six burials distinguished by rich grave goods or unusual characteristics in the context of rural village cemeteries. Using an interdisciplinary bioarcheological approach, it integrates osteological analysis, ancient DNA, and stable isotope data to reconstruct aspects of health, diet, mobility, ancestry, and kinship within a rural medieval community. Osteological analysis provides evidence of age at the time of death, the sex of the individual, health, diet, and pathological conditions. Ancient DNA data offers insights into genetic ancestry and kinship relationships, while stable isotope analyses of carbon, nitrogen, sulfur, and strontium illuminate dietary practices and mobility. By combining multiple lines of evidence, this study – based on the author's Master's thesis – demonstrates the potential of interdisciplinary methods to reconstruct individual life histories and broader community dynamics. The findings contribute to a more nuanced understanding of rural life in southeastern Estonia during the Late Middle Ages and underscore the methodological value of integrated bioarcheological research.

1868. A multifaceted isotopic ($\delta^{13}C$ and $\delta^{15}N$) approach to diet and social identity in monastic and secular medieval Barcelona

Authors: Victor Morcillo (Géosciences Environnement Toulouse, CNRS, Observatoire Midi-Pyrénées | Department of Anthropology, McMaster University) – Benjamin T. Fuller (Géosciences Environnement Toulouse, CNRS, Observatoire Midi-Pyrénées) – Carme Rissech (Departament de Ciències Mèdiques Bàsiques, University Rovira i Virgili) – Klervia Jaouen (Géosciences Environnement Toulouse, CNRS, Observatoire Midi-Pyrénées) – Lluís Lloveras (Departament d'Història i Arqueologia, University of Barcelona)
Format: Oral

This paper presents a multifaceted study of dietary practices and social differentiation in medieval and post medieval Barcelona (13^{th}–16^{th} centuries), combining contextual archaeological analysis, anthropological study of human remains, and stable isotope analysis ($\delta^{13}C$, $\delta^{15}N$) of both humans and animals. This research focuses on individuals recovered from the monastic contexts of Santa Caterina and Sant Agustí, two important religious institutions with distinct historical trajectories and social connections within the city. Santa Caterina, founded in 1219 by the Dominican Order, was one of Barcelona's most influential monastic houses, closely linked to political and ecclesiastical elites. Sant Agustí, established in 1349 and associated with the Augustinian Order, developed strong ties with the urban craft community, particularly the Guild of Tanners. Archaeological excavations conducted between 1993 and 2007 uncovered numerous burials distributed across different funerary spaces, including cloisters, cloister corridors, and external areas of the churches. These spatial patterns provide key contextual information related to status, privilege, and social identity. Isotopic data were obtained from 49 humans and a comparative assemblage of associated fauna (including domestic animals and fish), allowing for a interpretation of dietary practices. Results reveal clear dietary differences in animal protein consumption not only between monastic and secular individuals, but also within the religious community itself, highlighting distinctions between friars, privileged lay individuals, and non privileged secular populations. These differences are expressed both in burial location and isotopic signatures, suggesting a close relationship between food access, social position, and funerary treatment. Finally, this study constitutes a pilot phase of a larger ongoing project, which will expand the number of human and faunal samples and further integrate material culture, funerary context, and isotopic evidence to refine interpretations of diet and social identity.

1988. Through teeth and text: introducing an interdisciplinary study of human mobility in the Medieval

Low Countries

Authors: Lieke Bes (AMGC, Vrije Universiteit Brussel | SHOC, Vrije Universiteit Brussel | Ghent University) – Isabelle De Groote (Ghent University) – Christophe Snoeck (AMGC, Vrije Universiteit Brussel) – Bart Lambert (SHOC, Vrije Universiteit Brussel)
Format: Oral

Our knowledge of human mobility in the Low Countries during the medieval period (500-1500 CE) is still fragmented. This topic is worth studying, as the ways in which people moved played a major role in population growth during the Early and High Middle Ages as well as urbanization during the 11th to 13th centuries, after which the newly formed cities facilitated movement further by serving as connected hubs. The Low Countries were urbanized early on and more extensively when compared to the rest of Europe. A diachronic analysis of human mobility in this area during the entire Middle Ages will therefore be necessary to shed light on what facilitated these processes. For this doctoral research project, human mobility will therefore be studied at sites from the Early, High, and Late Middle Ages. A combination of biomolecular and physical anthropological methods, as well as historical sources will be used. Isotope analysis (O, Sr) and analysis of dental non-metric traits will be applied to several collections of human remains from cemeteries across the Low Countries. These analyses are supplemented with isotope data for diet reconstruction (C, N). For urban sites from the 14th and 15th centuries, the isotopic and dental non-metric data will be confronted with historical records in the form of poorterboeken. While these registers of newly incoming citizens contain crucial information on the movement of people toward the cities, they also suffer from great social and gender biases. By applying an interdisciplinary approach, the movement of people can be studied within the historical context of rising urbanization, while testing the possibilities and limitations of different types of data for this kind of research. In this paper, the project will be introduced and preliminary results from the first High Medieval site of Sint-Pietersplein (Ghent), will be presented.

839. Resting places of plague victims (541-750 CE). Archaeogenetic study in isolation and integration from the Black Sea to the Atlantic

Authors: Solenn Troadec (Institute of Archaeology of the Czech Academy of Sciences Prague | MHAAM) – Mathieu Ott (Inrap Midi-Méditerranée | UMR5140 Archéologie des Sociétés Méditerranéennes) – Alina Hiβ (Max Planck Institute for Evolutionary Anthropology, Leipzig) – Valérie Delattre (Inrap | UMR 6298 CNRS ARTeHIS)
Format: Oral

In 2020, the world rediscovered the meaning of pandemics. The impact of COVID-19 on modern populations and the treatment of their dead echoed health crises faced by ancient societies. In the early Middle Ages, however, these events remain imperfectly documented in written sources. The project developed by the Max Planck-Harvard Research Center for the Archaeoscience of the Ancient Mediterranean (MHAAM) aims to adduce new evidence to the Justinianic Pandemic through an interdisciplinary approach. This paper presents the first results of this interdisciplinary endeavor in France. Through collaborations with the Institut National de Recherches Archéologiques Préventives (Inrap), the CNRS and other French institutions, our team created a geodatabase of atypical burials in early medieval France (c. 500-1000 CE). This inventory served as the basis for the selection of individuals for aDNA genetic analyses. The identification of atypical burials is based on a flexible definition, designed to adapt to the diversity of burial practices observed at different scales in this period. By comparing results from these individuals to the rest of their communities treated in more traditional ways, and with other victims identified throughout Europe, this project provides the necessary geographical and chronological coverage to understand various reactions to pandemics from different communities. This paper brings archaeology back to the center of genetic studies. It depicts a more nuanced and humane perspective on early medieval European communities experiencing epidemic events, and their associated funerary practices . On a wider scale, this project follows the historical roads of infection and aims to develop a truly European archaeology of plague, its influence on the continent, and the resilience of past societies.

1196. Biturica Pestilentia. Interdisciplinary Perspectives on the Justinian Plague from the Burial Site of Le Pressoir (Central France)

Authors: Raphaël Durand (Service Archéologie Bourges Plus | UMR 5199 PACEA) – Dominque Castex – Sacha Kacki (UMR 5199 PACEA)
Format: Oral

Excavated in 2009, the site of Le Pressoir in Saint-Doulchard, near Bourges (France), uncovered part of the medieval cemetery associated with the local church. Previously thought to date back to the 10th century, the cemetery now appears to originate from the 6th–7th centuries, as suggested by archaeological excavations. On the immediate outskirts of this burial ground, a boundary ditch revealed an unusually high number of graves—some containing multiple burials—indicating one or more episodes of exceptionally high mortality. Initial post-excavation analyses quickly confirmed a mortality pattern typical of an epidemic. Paleogenetic research, conducted in collaboration with the Max Planck Institute, further revealed remarkably well-preserved pathogen traces, with a significant number of individuals infected by Yersinia pestis. Since 2021, these findings have been supplemented by isotopic studies aimed at exploring potential links between diet and infection, as well as determining the geographic origins of the buried population. While the latter question remains under investigation, preliminary dietary results highlight notable differences between infected individuals buried on the margins of the cemetery and the rest of the deceased. In addition, recent cementochronology

research revealed specificities of the plague's demographic impact on adults. Combining hagiography, archaeology, and biological anthropology, the Le Pressoir site provides an exceptional case study for understanding the final repercussions of the Justinian Plague within the Frankish kingdom.

1749. Venice's Lazzaretto Vecchio: A Biomolecular Archive of the Second Plague Pandemic

Authors: Emily Gaul (Microbial Archaeogenomics, University of Tübingen) – Antonino Vazzana – Carla Figus – Matteo Romandini – Vittoria Bianchi (Department of Cultural Heritage, University of Bologna) – Philip Slavin (Division of History, Heritage and Politics, University of Stirling) – Stefano Benazzi (Department of Cultural Heritage, University of Bologna) – Cosimo Posth (Archaeo- and Palaeogenetics, University of Tübingen | Senckenberg Centre for Human Evolution and Palaeoenvironment, Tübingen | Archaeogenetics, Max Planck Institute for Evolutionary Anthropology) – Maria Spyrou (Microbial Archaeogenomics, University of Tübingen | Senckenberg Centre for Human Evolution and Palaeoenvironment, Tübingen | Archaeogenetics, Max Planck Institute for Evolutionary Anthropology)
Format: Oral

Within recent years, ancient DNA has emerged as a tool radically advancing our understanding of the evolutionary history of the bacterium Yersinia pestis, the aetiological agent of plague. The lineage responsible for the Black Death is now known to have originated in central Eurasia, from where it spread to Europe undergoing frequent resurgences over a period of approximately five centuries. Despite the publication of over 100 Y. pestis genomes from the Second Plague Pandemic, imprecise dating of lineages and sporadic sampling through time and space impede the synthesis of genetic data with evidence from other disciplinary approaches. Here, we present the case study of the Lazzaretto Vecchio, which functioned as a site of treatment and quarantine for those afflicted with plague in Venice from 1423 until the mid-17th century CE. A total of 170 individuals recovered from tomb and mass burials at the site underwent multiple bioarchaeological analyses, yielding detailed insights into the disease's victims spanning two centuries. Genome-wide Y. pestis data generated for 37 individuals, show that the recovered strains fall into four distinct genetic clusters, consistent with successive waves of plague affecting the city. Furthermore, observed patterns in the spatial distribution of Y. pestis diversity across the mass graves enabled the assessment of demographic differences among victims associated with distinct outbreaks, including age, sex, genetic ancestry and detected co-infections. Our findings underscore the value of high-resolution approaches in facilitating novel, multidisciplinary perspectives on Y. pestis evolution and its interplay with host population dynamics during past plague pandemics.

1273. First Bioarchaeological and Molecular Evidence of Leprosy (Mycobacterium leprae) in 13th-Century Serbia: A Study from Čačak

Authors: Ksenija Djukic – Željka Matić – Ana Vučurević Petreski – Veda Mikašinović (University of Belgrade, Faculty of Biology) – Vujadin Vujadinović – Aleksandra Gojgić (National Museum of Čačak, Serbia) – Milica Keckarević Marković – Dušan Keckarević (University of Belgrade, Faculty of Biology)
Format: Oral

Leprosy remains one of the most socially and biologically significant diseases of the medieval period, yet its presence in the territory of modern-day Serbia have long relied solely on historical testimony. This study presents the first combined osteological and molecular confirmation of leprosy from a medieval context in Serbia. Skeletal remains derive from a 13th-century necropolis excavated in 2023 at the Bate Janković Street site in Čačak (central Serbia), where 16 graves were investigated. Bioanthropological analysis identified 16 individuals (two adult females, two males, seven adults of indeterminate biological sex, and five non-adults). After skeletal changes compatible with leprosy were noted in one individual, ancient DNA analysis targeting M. leprae was performed on affected bones (palate, tibia and fibula) and an upper molar. Subsequently, all individuals from the cemetery were screened for molecular evidence of infection. The results indicated that one individual (grave 17), a young female aged 20-25 years, displayed a consistent pattern of craniofacial and postcranial lesions. Observed pathological features included active cribra orbitalia, porous and newly formed bone on the palatine, marked resorption of the anterior alveolar bone with loss of the maxillary incisors, new bone formation in the left paranasal sinus, and severe osteomyelitis of the tibia and fibula. This set of skeletal changes is consistent with leprosy. Molecular methods including specific PCR amplification followed with sequencing confirmed the presence of M. leprae. In addition, a second molecularly positive case was identified (Grave 10), a male aged 35 – 45 years, despite the absence of skeletal lesions specific for leprosy. This study provides the first direct physical evidence of leprosy in medieval Serbia and demonstrates the value of integrating routine bioanthropological with bimolecular detection of M. leprae for reconstructing the paleoepidemiological and historical distribution of leprosy in medieval Europe.

1998. Strontium and oxygen isotope analysis of human remains at the North Sea emporia: Dorestad in comparison

Authors: Lieke Bes (AMGC, Vrije Universiteit Brussel | SHOC, Vrije Universiteit Brussel | Ghent University) – Julie Luyt – Petrus Le Roux (University of Cape Town) – Letty Ten Harkel (Leiden University)
Format: Poster

Isotopic (O, Sr) investigations into the people buried at Early Medieval (7th – 9th c.) emporia sites around the North Sea and the Baltic

area have produced results that give insight into mobility among the populations of these trading hubs. Previous studies by various researchers include the sites of Ribe (Denmark), Birka (Sweden), Domburg (Netherlands) and Dorestad (Netherlands). Current research has yielded 87Sr/86Sr and δ18O data from 20 additional Dorestad individuals from De Geer II. Based on the strontium data, at least one individual has an origin outside of the current-day borders of the Netherlands. Another three spent part of their childhood outside the immediate surroundings of Dorestad. The oxygen data suggests two individuals may have moved in childhood, but the shift in δ18O could also be caused by changes in diet or local climate. In this poster presentation, these results are compared to those from previous studies on the aforementioned other emporia sites, including the previously published data from Dorestad site Veilingterrein. While at each site, non-local individuals could be detected based on δ18O and/or 87Sr/86Sr values, the numbers are likely underestimated due to overlapping baseline ranges around the North Sea. Dorestad, Domburg and Ribe are almost isotopically indistinguishable. This obscures investigations into mobility between these settlements. This is an issue, considering the emporia were closely connected to each other. Analyses of different burial practices and material culture of the individuals for whom isotopic data is available at Ribe and Birka have provided additional information, but this is difficult for Dorestad where all burials have been interpreted as Christian and contain little to no grave goods, and Domburg which is extremely poorly preserved. Additional methods like aDNA analysis or a proxy thereof, such as dental non-metric trait analysis, might shed more light on mobility between the North Sea emporia.

72 HIGHLAND LIVES, HIDDEN LANDSCAPES: ARCHAEOLOGICAL RESEARCH IN THE MOUNTAINS OF GREVENA

Theme: 7. Interaction, connectivity and mobility
Organisers: Nikolas Dimakis (National and Kapodistrian University of Athens) – Sonia Dimaki (Hellenic Ministry of Culture/ Ephorate of Antiquities of Grevena) – Mercourios Georgiadis (University of Crete) – Chrysanthi Kallini (Aristotle University of Thessaloniki) – Arnau Garcia-Molsosa (Catalan Institute of Classical Archaeology)
Keywords: Mountain archaeology, Landscape archaeology, Pindus, Grevena
Format: Regular session

SESSION ABSTRACT

The Grevena region, situated in the rugged Pindus highlands of Western Macedonia, Greece, remains one of the least archaeologically explored areas in the southern Balkans. Yet its mountainous terrain preserves a rich and multi-layered cultural landscape, shaped by millennia of human presence - from Paleolithic foragers and transhumant pastoralists to Hellenistic fortified communities and Byzantine outposts. This session invites contributions that explore the archaeological record of the Grevena mountains and its broader cultural, historical, and environmental context. We are especially interested in research grounded in the methods and theoretical frameworks of mountain archaeology and landscape archaeology, including - but not limited to - survey and excavation projects, remote sensing and LiDAR applications, geoarchaeological and bioarchaeological studies, and heritage management strategies. We aim to initiate a dialogue among researchers working in Grevena and the wider Pindus range, highlighting both the challenges and opportunities of archaeological practice in highland zones. Special attention will be given to interdisciplinary approaches that consider the mountains not merely as marginal spaces or natural boundaries, but as dynamic arenas of interaction, connectivity, and resilience. By bringing together recent and ongoing archaeological work in the region, this session seeks to place Grevena on the scholarly map of highland archaeology in southeastern Europe, and to reflect on how mountainous environments shape, and are shaped by, human activity across time.

CONTRIBUTION ABSTRACTS

2563. Fortified Sites and Spatial Organisation in the Uplands of Grevena

Authors: Gerasimos Trasanis (National and Kapodistrian University of Athens)
Format: Oral

This paper examines fortified sites in the Regional Unit of Grevena from the Iron Age to the Late Roman period. Adapted to the extensive forests and the rugged terrain the ongoing research is based on a field survey combining conventional archaeological recording with GIS and drone documentation. To date, more than twenty-five naturally and/or artificially fortified sites have already been identified and relocated. Focusing on construction techniques, building materials, size, construction investment, and topographic location, the paper identifies local architectural patterns in the Grevena fortifications. These show close affinities with neighboring Upper Macedonian areas, yet remain distinct from the larger and more complex fortification systems of Lower Macedonia and southern Greece. By analyzing their features along with their dispersion on the landscape, the paper reassesses their function within changing social, political, and economic conditions. Finally, it highlights their role in shaping both local territorial organization and the long-term 'mountain' identity of communities in Grevena.

2173. The site of Kastri in Polyneri Grevena. The ancient acropolis between Macedonia and Epirus

Authors: Chrysanthi Kallini – Stella Drougou (Aristotle University of Thessaloniki) – Nikolaos Chatzidakis (Freelance)
Format: Oral

The ancient acropolis at Kastri, the rocky peak at a height of 1,100 m, which located between the villages of Polyneri and Alatopetra in the northeastern Pindos, occupies two natural plateaus. Access is relatively smooth from the southeast, while in the northwest the hill turns into a steep and inaccessible rock. On the first slope from the top of the hill a large building complex was uncovered, and it was confirmed that the acropolis was fortified with a strong enclosure over most of its area. The building complex on the large plateau includes three main structures: a temple, a large Doric stoa, and another large building, which together form a square open towards the top of the hill. According to the excavation findings, this complex must have been created at the end of the 4th century BC and survived until the middle of the 2nd century BC. The comparison of the acropolis at Kastri with similar sites in ancient Epirus like Gitana, Elea, Kassopi, shows that the urbanization of ancient Upper Macedonia and Epirus took place in the 4th and 3rd centuries BC. These cities developed in mountainous areas, naturally protected, and these citadels were the political and administrative centres of the regions. The spatial organization of these spaces was part of a broader building program, which included the construction of strong fortifications and various religious, political, and administrative buildings. The role of the ancient site at Kastri appears to be significant, as it contributes to our understanding of the importance of mountainous regions at the crossroads of the two neighboring kingdoms in terms of political and economic developments, as well as cultural exchanges during the Hellenstic period.

163. Mapping the Invisible: The Philippaioi Project (Phili.P)

Authors: Nikolas Dimakis (National and Kapodistrian University of Athens)
Format: Oral

The Philippaioi Project (Phili.P) is a five-year interdisciplinary research programme (2024-2028) jointly conducted by the National and Kapodistrian University of Athens and the Ephorate of Antiquities of Grevena, aiming to reassess the archaeological potential of the mountainous landscapes of Upper Macedonia through a systematic study of the fortified hill at Philippaioi, in the Grevena region. Situated at an altitude of approximately 1,150 m and extending over c. 9 ha, the site preserves substantial architectural remains, funerary features and dense surface material, yet has remained largely unexplored owing to the geomorphological complexity, dense vegetation and long-standing research bias towards lowland contexts. Phili.P introduces an integrated methodological framework that combines intensive surface survey, architectural documentation and targeted test excavations with advanced non-invasive techniques, including drone-borne LiDAR, multispectral photogrammetry, geophysical prospection and GIS-based landscape analysis. These approaches allow high-resolution mapping beneath forest cover and facilitate the reconstruction of settlement organisation, defensive systems and activity zones within a highly structured upland environment. Complementary bioarchaeological, geoarchaeological and micromorphological analyses provide insight into subsistence strategies, resource exploitation and site formation processes, while an ethnographic component documents local perceptions and memory practices connected to the archaeological landscape. Preliminary results from the first field season demonstrate the presence of a fortified acropolis-like nucleus, extensive terracing systems and a long sequence of occupation from the Early Iron Age to the Hellenistic and Roman periods, challenging the traditional view of the Macedonian highlands as marginal or transient spaces. By foregrounding both habitation and mortuary evidence, the project seeks to reconstruct patterns of everyday life, mobility and social organisation in upland settings. Phili.P contributes to current debates on mountain archaeology by demonstrating the centrality of highland communities in regional networks and by offering a transferable methodological model for the investigation of complex, low-visibility landscapes in the eastern Mediterranean.

802. Tymphaia-Upper Macedonia. Highland Lives and Deaths in Monachiti-Megali Petra

Authors: Georgia Karamitrou-Mentessidi (Greek ministry of culture) – Eleni Mentesidou (International Hellenic University)
Format: Oral

The archaeological site of Megali Petra at Monachiti, in the Grevena Prefecture, provides new evidence for highland settlement organization and funerary landscapes in Tymphaia, a region of ancient Upper Macedonia. Situated on a steep rocky hill at an altitude of approximately 1,100 m, the site forms part of a wider network of fortified upland communities, reflecting adaptive strategies shaped by environmental constraints and the defensive potential of mountain terrain. Rescue archaeological investigation has substantially enhanced our understanding of the spatial articulation and long-term use of this highland landscape. Fieldwork documented two extensive plateaus on the hill functioning as burial areas, where tombs with associated grave assemblages indicate intensive funerary activity during the Roman period. This funerary evidence is associated with architectural structures on the same hilltop, demonstrating the close integration of habitation and mortuary zones within a single upland settlement complex. At the same time, the confiscation of bronze finds belonging to the group of the "Macedonian bronzes," reportedly originating from the site, suggests an earlier phase of activity and occupation. Together, these data point to a diachronic pattern of landscape use in which settlement and burial practices were continuously embedded within the same topographic framework. By approaching Megali Petra as a dynamic highland cultural landscape, this study contributes to current debates in mountain archaeology, highlighting mountainous environments not as marginal peripheries but as active arenas of social organization, connectivity, and long-term resilience.

The Monachiti case study thus refines our understanding of human adaptation to upland environments and advances the archaeological mapping of the Grevena highlands.

1461. Prionia of Grevena. Evidence of Settlement and Early Cult Practices in the Mountains of Tymphaia

Authors: Aikaterini Anagnostopoulou (Greek Ministry of Culture | University of Ioannina) – Georgia Karamitrou-Mentessidi – Dimitra Theodorou (Greek Ministry of Culture)
Format: Oral

Within the framework of the construction of the Egnatia Odos (Grevena–Panagia section), rescue excavations were conducted at the sites of Paliomonastiro and Ivani at Prionia in Grevena Prefecture in ancient Tymphaia, a region of Upper Macedonia. At the first site, a section of a Hellenistic settlement was uncovered, featuring two kilns and seven burials, while at the second site, a settlement of the Hellenistic period was revealed, accompanied by artifacts from the Archaic-Classical period and the Late Bronze Age. The Late Helladic III period (LBA) is attested by the presence of Mycenaean pottery and handmade Macedonian matt-painted pottery, as well as 18 pithoi, stone tools, clay spindles, and loom weights, indicating a range of productive and domestic activities. The Archaic funerary assemblages include two pit burials of young girls with rich grave goods, such as bronze and silver pins and fibulae, bracelets, silver earrings, a silver ring, necklaces and amulets, along with scattered small finds. Of particular interest is a bronze ring with the inscription ΧΑΙΡΕ ΚΑΙ ΣΥ. Additionally, the remains of eight animals (three sheep/goats and five dogs) were identified, together with fragmentary bones of cattle, pigs, and deer. Interpretation of the archaeological evidence suggests that the site likely functioned as a sanctuary with a semi-out door character, possibly dedicated to the worship of Artemis as Kynigetis and Agrotera, adapted to the mountainous and forested environment. The findings provide the first evidence of Mycenaean presence in the Grevena area and attest to the circulation of Macedonian matt-painted pottery. The Archaic burials and the scattered artefacts indicate settlements with a strong economy and extensive trade as well as cultural connections, demonstrating that Upper Macedonia from the 6th -5th centuries BCE was integrated into the broader Greek cultural sphere, characterized by a high standard of living and cultural development.

225. The archaeological site of Agios Konstantinos: a transition area from the highlands of Grevena to the Thessalian and Macedonian plain.

Authors: Peli Plika (International Hellenic University)
Format: Oral

The archaeological site at Agios Konstantinos in the village of Dimitra, SE Grevena, offers an opportunity to reassess the role of upland–lowland interfaces in western Macedonia as zones of mobility, resource negotiation, and interregional connectivity. This paper argues that the site functioned diachronically as a nodal point within a geographically and culturally transitional zone linking the Grevena highlands with the Thessalian and Macedonian plains. The archaeological record, spanning from the Hellenistic to the Byzantine period, includes a Hellenistic farmhouse with associated workshop areas and a multi-phase basilica accompanied by an extensive cemetery and a kiln associated with workshop activity. Rather than representing isolated occupation phases, these remains indicate recurrent investment in settlement, production, and ritual activity at the same strategic location, suggesting sustained engagement with movement corridors and local resources. The continuity and changing character of use indicate that Agios Konstantinos operated as a point of communication, economic mediation, and cultural interaction across ecological and regional boundaries. The site thus provides material evidence for understanding transitional landscapes not as peripheral margins, but as active mediating environments shaping long-term settlement and economic strategies.

227. Built for the Dead: Monumental Funerary Architecture in Roman Grevena (2nd–4th c. AD)

Authors: Vasileios Vlachos (National and Kapodistrian University of Athens)
Format: Oral

This paper addresses the monumental funerary architecture of the Roman period in the region of Grevena, focusing on the complete set of funerary monuments identified and studied to date at the sites of Megalo Seirini, Leipsokouki, and Kivotos. The material forms a distinct architectural corpus of underground vaulted tombs, displaying a degree of typological coherence both within the local unit of Tymphaia and the wider region of Upper Macedonia, as well as in comparison with examples from other parts of the Roman Empire. The study aims at the typological classification and chronological assessment of the monuments, combined with their comparative analysis. By synthesizing the architectural evidence, the paper examines the broader contexts in which architectural choices were shaped and considers their relationship to local building traditions and wider Roman models. Beyond typology, the material is placed within a broader architectural and geographical framework, exploring how common architectural types and forms appear, are adapted, and acquire local inflections. In this perspective, the funerary monuments of Grevena are approached as part of the diversity that characterizes funerary architecture across the Roman provinces.

198. Bioarchaeological Insights from Grevena: A Diachronic Osteological Analysis of Hellenistic to Ottoman Rural Populations

Authors: Maria-Eleni Chovalopoulou – Nikolaos Dimakis – Samuel James Cockerill – Maria Aikaterini Kourmpatsou – Stavroula Tzampouri – Theofania Mantzorou (National and Kapodistrian University of Athens)
Format: Oral

This paper presents a diachronic bioarchaeological study of human remains from four excavations in the region of Grevena, northern Greece, spanning the Late Hellenistic, Roman, and Ottoman periods. The assemblages derive from the sites of Tsigodentro, Leipsokouki, Sirini, and Pefkakia and offer a rare opportunity to explore long-term patterns of health, activity, and demography in rural populations of the region, which remains comparatively understudied in bioarchaeological terms within the wider region of Macedonia, Greece. Despite variable preservation and, in some cases, extensive commingling due to post-depositional disturbances, osteological analysis allowed the reconstruction of key aspects of the biological profile and the assessment of living conditions. The Late Hellenistic assemblage from Tsigodentro includes four individuals, while the Roman-period contexts of Leipsokouki and Sirini yielded a minimum of five and at least eighteen individuals respectively. The Ottoman cemetery at Pefkakia is represented by five individuals, three of whom are non-adults. Indicators of physiological stress, including enamel hypoplasia and evidence of infectious lesions, are particularly evident among non-adults, pointing to challenging living conditions during early life. The Roman assemblage from Leipsokouki is characterized by marked skeletal robusticity, suggesting sustained engagement in physically demanding activities. The material from Sirini, although fragmentary, exhibits a range of pathological and activity-related stress indicators, including dental calculus, carious lesions and enamel hypoplasia, as well as multiple fractures, collectively pointing to both chronic oral health stress and intense physical activity. Taken together, these assemblages provide insight into both continuity and variability in health status and activity patterns among rural communities in Grevena across more than a millennium, significantly contributing to the existing knowledge on human lifeways in historical-period Macedonia. Finally, the recovery of well-preserved petrous portions highlights the potential for future aDNA analyses, which may further elucidate biological relationships and population dynamics in the region.

866. The Early Neolithic Vrastero in southern Grevena

Authors: Sonia Dimaki (Hellenic Ministry of Culture) – Merkourios Georgiadis (University of Crete)
Format: Oral

The identification of the Early Neolithic site at site at Vrastero in 2022 led to a systematic study of this site. The widespread pottery remains along with several recognizable stone tools in the surface led to a systematic survey of the area. Four trenches were also opened to trace the stratigraphy and cultural remains that belonged to this site. The preliminary results from Vrastero provide the image of a significant site that acted as a production centre for various types of objects and tools. Some were made for local consumption like pottery, most of the flaked tools and stone objects. Others like stone tools, especially grindstones, were massively produced on site and most probably they were exported to other contemporary settlements. The local pottery is a very important group that provided the opportunity for understanding the character of ceramic production and consumption in this part of western Macedonia, between north-western Thessaly and the area of Kozani. Furthermore, the structural remains allowed an assessment of the building materials employed and the local architectural tradition in comparison to the surrounding regions. Overall, a preliminary assessment will elucidate the conditions and economy of an EN settlement in a part of Greece that is known to a limited extent.

643. Animal Husbandry Mobility and Mountain Landscapes in the Grevena Region (Northern Pindus): Ethnographic and Folklore Perspectives

Authors: Evangelos Karamanes (Academy of Athens)
Format: Oral

Focusing on the mountainous region of Grevena in the Northern Pindus, this paper explores forms of mobility related to animal husbandry through the perspectives of Greek ethnography and folklore studies. For centuries, the Pindus highlands have constituted a privileged space for nomadic and semi-nomadic pastoral groups, whose seasonal movements shaped economic practices, social organization, and cultural perceptions of mountain landscapes. The contribution draws on a critical review of classic and later ethnographic research conducted among pastoral populations in mainland Greece, including emblematic studies by Alan Wace and Maurice Thompson on the Pindus Vlachs, as well as later approaches to agropastoralism of Koupatsarei and the Voio area communities of builders (masons, master masons, folk architects-experts). Emphasis is placed on the comparatively lesser-known work of Greek scholars associated with the Folklore Archives / Hellenic Folklore Research Centre of the Academy of Athens, following the foundational studies of Demetrios Loukopoulos on pastoral life in Roumeli in the interwar period. Within this scholarly framework, Grevena is examined as part of wider networks of transhumant mobility linking the Northern Pindus to lowland winter pastures in Thessaly and Macedonia. The geomorphology of the region—combining high-altitude summer grazing with accessible plains—favoured forms of transitional livestock farming that enabled the long-term exploitation of mountain environments. The paper addresses key issues debated in the literature: the specialization of specific cultural groups in animal husbandry and the regulation of access to pastures; the coexistence and interaction of pastoral and agricultural activities; diachronic transformations of pastoral mobility in relation to socio-political change; and the relationship between mobility, gender, and other mobile professional groups. By foregrounding ethnographic and folkloric evidence, the paper highlights Grevena as a key case study for understanding mountain landscapes as dynamic spaces of interaction, connectivity, and resilience.

2535. The Mountain as a Stage: Towards a "Poetic" Landscape Archaeology in Grevena

Authors: Sofia Baltzoi (Independent Researcher)
Format: Oral

This paper proposes a "poetic" and participatory approach to landscape archaeology in the mountainous environments of the Pindus, through the case study "Place, Space and Memory", developed during the NKUA excavation at Agios Georgios (Grevena). Student participation provided the starting point for methodological experimentation, in which repetitive walking, rhythmic modulation, silence, listening, and collective attention transformed a routine route into a reflective research practice. Movement and walking are treated not as mere transit, but as sensory protocols that activate place awareness and embodied knowledge. Rhythm, effort, and environmental conditions reshape perceptions of distance, slope, stratified terrain, soundscape, and temporality. The ritual dimension and performativity of these practices are used not to reconstruct the past, but as analytical lenses through which to examine body, place and time relations in contemporary archaeological practice. These methods complement conventional field techniques, particularly in relation to scale, visibility, and lived engagement with mountain terrain. By emphasizing collective memory and local community involvement, the paper frames archaeological knowledge as a dialogical process that links scientific interpretation with lived experience, intergenerational storytelling, and community heritage awareness. Bringing these strands together, the contribution frames the mountain not as a marginal boundary, but as a dynamic arena of connectivity, resilience, and the long-term co-shaping of people and landscape.

1098. Geophysical Survey at Philippaioi in Grevena: preliminary results from a highland settlement

Authors: Nikolas Dimakis (National and Kapodistrian University of Athens) – Grigoris Tsokas – Konstantinos Polydoropoulos (Aristotle University of Thessaloniki) – Nikolas Kordatos (Independent researcher) – Dimitris Tsokas (Aristotle University of Thessaloniki)
Format: Poster

Recent geophysical prospection was conducted for the Philippaioi Project (Phili.P) of the NKUA at the archaeological site of Philippaioi, focusing on an approximately 14 sqkm riverside area located at the foot of the hill that dominates the site. The survey aimed to assess the subsurface archaeological potential of this sector prior to excavation and to refine hypotheses concerning the spatial organization of the settlement within a highland landscape. The applied geophysical methods revealed a series of distinct anomalies consistent with anthropogenic features, including linear and rectilinear patterns, localized high-response zones, and clustered signals indicative of built structures or activity areas. The spatial distribution of these anomalies suggests organized use of space rather than sporadic or ephemeral occupation, pointing to zones of particular archaeological significance within the surveyed area. These results provide a critical framework for the planning of forthcoming systematic excavations of the Philippaioi Project, allowing for targeted investigation of key areas and more efficient allocation of research resources. Beyond their immediate practical value, the geophysical data contribute to broader discussions on settlement planning, land use, and the articulation of habitation space in mountainous regions of western Macedonia. The Philippaioi case study highlights the importance of non-invasive methods for revealing hidden archaeological landscapes and advancing our understanding of highland communities that remain underrepresented in regional archaeological narratives.

2509. Arsalia-Agios Georgios (Grevena): preliminary economic data from a late Roman rural site

Authors: Noe Conejo (University of Carlos III of Madrid) – Simona Perna (University of Barcelona) – Irene Liesk (Birkbeck University of London) – Sonia Dimaki (Hellenic Ministry of Culture/Ephorate of Antiquities of Grevena)
Format: Poster

Excavations carried out to date have revealed evidence of a Roman rural settlement consistent with a Roman villa at the site of Arsalia-Agios Georgios (Grevenà). During the 2025 campaign, three large trenches were dug, allowing for the documentation of a wealth of material culture related to the site's most recent occupations, which date back to late antiquity. This poster presents, first, the current state of knowledge of the site; second, an analysis of the numismatic and ceramic evidence documented in recent campaigns; and third, a list of all known materials found in the vicinity. The aim is to present preliminary data from an interdisciplinary perspective on the economic behavior of Arsalia-Agios Georgios. Fundamentally, it reflects on the identification of possible consumption patterns through the study of ceramic evidence and the inclusion of the site in monetary supply networks through documented coins, in terms of its occupation levels in late antiquity. In this way, it provides new data for in-depth and future reflection on the functioning of the rural world of the region in a complex and constantly changing period.

74 THE FUTURES OF COMMUNICATING ARCHAEOLOGY

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Robin Skeates (Durham University) – Sofia Fonseca (ICArEHB, Algarve University | German Archaeological Institute, DAI) – Laura Coltofean (Research Cluster 5: History of Archaeology, Römisch-Germanische Kommission)
Keywords: Archaeological communication, Digital archaeology, Open access, Public engagement, Ethics, Diversity, equality and inclusion
Format: Regular session
Affiliation: Community on Archaeology and Tourism, Community on Teaching and Training of Archaeologists - CTTA

SESSION ABSTRACT

It is easier than ever for archaeologists to access information and exchange ideas using a variety of communication forms. But rapidly developing technologies and changing behaviours present opportunities and threats to the future of archaeological discourse. These raise fundamental questions, which speak directly to the conference theme of 'Crossing the divide'. This session, organized in the centenary year of Antiquity journal, seeks to explore how archaeologists will communicate knowledge in an open, interconnected, and increasingly digital world. It asks how emerging tools such as artificial intelligence, virtual and augmented reality, and participatory platforms may reshape the ways we research, publish, and engage publics. We also invite reflection on questions including: • Will the proliferation of scholarly communications render the peer review system unsustainable? • What will it cost to produce and access scholarly publications; who will pay and who will profit? • Will access to publicly funded archaeological research products become more open and equitable? • Will authors lose copyright control over their intellectual assets? • How will the rhetoric of archaeology change? In what languages will archaeology be communicated? • What impact will archaeological communications have, academically and societally? • Will archaeological information and interpretations become more politicised and polarized? Who will speak for archaeology? • Will archaeologists become more attuned to the diversity of their publics and reach previously marginalized groups? • Will bad science and misinformation erode public trust in archaeology? We welcome contributions from archaeologists, heritage professionals, educators, communicators, museum curators, and publishers who are experimenting with new forms of communication or critically analysing their impacts. Case studies, creative experiments, and theoretical reflections are equally encouraged. Ultimately, this session aims to identify the values and practices that will sustain archaeology's dialogue with society — bridging divides between specialists and audiences, print and digital, past and future.

CONTRIBUTION ABSTRACTS

1996. Communicating Archaeology in a Digital World: Training, Participation, and the Ethics of Open Knowledge

Authors: Sofia Fonseca (ICArEHB, Algarve University | German Archaeological Institute, DAI) – Jörg Linstädter (German Archaeological Institute, DAI)
Format: Oral

Archaeological communication is undergoing rapid transformation as digital platforms, online education, and participatory media reshape how knowledge is produced, shared, and debated. While these developments expand access and visibility, they also challenge established models of authority, peer review, and intellectual ownership. This paper reflects on the opportunities and tensions emerging from this shift through the lens of recent initiatives in digital training, open educational resources, and public engagement in archaeology. Drawing on experiences from international online learning programmes, webinars, and collaborative heritage projects, the contribution examines how new communication formats influence who participates in archaeological discourse, in what languages knowledge circulates, and how expertise is negotiated between professionals and wider audiences. Particular attention is given to questions of equity and access, including the role of open platforms in supporting underrepresented regions and communities, and the risks of misinformation, digital inequalities, and platform dependency. The paper argues that the future of communicating archaeology will depend not only on technological innovation but also on ethical frameworks and inclusive practices that prioritise transparency, accessibility, and dialogue. By analysing current experiments in digital and participatory communication, it seeks to identify principles that can sustain meaningful engagement between archaeology and society, bridging divides between academic and public knowledge, global and local perspectives, and analogue and digital modes of communication.

230. The Quiet Majority: How Development-led Archaeology is Leading the Way

Authors: Emilia Zelewicz (Arcadis UK Consulting LTD)
Format: Oral

The field of archaeology is undergoing rapid transformation as development-led archaeology is expanding exponentially. Today, 88% of investigations are conducted by commercial teams (CIfA 2025), positioning consultancies and commercial archaeologists as the primary leaders in this evolving sector. Social Value legislation (Social Value Act 2010) obliges heritage professionals to communicate their findings to the public —fostering well-being, belonging, and equal access to archaeological knowledge. This paper examines how development-led archaeology is adapting to these shifts, leveraging emerging technologies to enhance assessments and increase public engagement. For nearly a decade, Arcadis has been at the forefront of innovation, integrating AI, VR, and advanced digital platforms into our projects—from 3D barrow reconstructions and interactive story maps to tactile workshops with overlooked groups. These technologies are now central to Arcadis's strategy to improve quality of life with every project we deliver. Looking ahead, emerging technologies are set to democratise access and understanding, while collaboration between heritage professionals, communities, and developers is making meaningful engagement a priority, from project design to completion. This paper will

show how Arcadis' adoption and development of these tools have strengthened site assessments and empowered communities to connect with their heritage in more meaningful ways.

1412. Evolutionary "Cheesecake" and the Midpoint: Why Structural Storytelling is a Powerful Tool for Archaeological Communication

Authors: Tera Pruitt (Cambridge School of Art, Anglia Ruskin University)
Format: Oral

As archaeology enters an increasingly digital and interconnected era, the discipline faces intense competition from pseudoarchaeological narratives that often leverage powerful, "page-turning" story structures to engage the public. While academic communication often relies on a "flat" delivery of facts, multidisciplinary research in neuroscience and psychology suggests that human brains are neurochemically hardwired to respond to specific storytelling frameworks. This paper argues that archaeologists can bridge the divide between specialists and the public by adopting evidence-based storytelling practices—specifically the Midpoint. Drawn from study of the Hegelian Dialectic and its relationship with the neurochemistry of the brain, the Midpoint is defined as a focal point of high tension or a significant plot turn located in the conceptual middle of a narrative. The Midpoint serves as a vital cognitive waypoint that maintains audience attention and prevents "tuning out." Drawing on a comparative analysis of structural successes and failures in museum exhibits and commercial fiction, this presentation explores how the lack of a defined midpoint can lead to untethered interpretations and a loss of audience trust. Furthermore, it examines how pseudoarchaeological stories, such as the Bosnian Pyramids, utilise engaging structures to create a "rush of insight" and "aesthetic relief" that academic archaeology frequently lacks. By mastering the "science of storytelling," archaeologists can produce more memorable, impactful, and competitive factual narratives that sustain a meaningful dialogue with society in the 21st century.

2474. Illustration and Imagined Narratives as Method: A Case Study from Late Iron Age Mallorca

Authors: Margalida Coll Sabater (Pompeu Fabra University)
Format: Oral

This paper proposes archaeological illustration and imagined narratives as forms of artistic making that can function simultaneously as a research method and as a durable bridge between specialist knowledge and society. Using a case study of Late Iron Age burial practices in Mallorca (Balearic Islands), I show how "making"—archaeological drawing and sequential images alongside constrained first- and third-person imagined narratives—can be used not only to communicate results, but also as a methodological tool that actively generates new research questions during analysis. Grounded in sensory archaeology, the approach responds to the limits of conventional descriptive and typological writing, which often sidelines dimensions of lived experience. By treating narrative and illustration as structured interpretive experiments explicitly bounded by the archaeological record, the method foregrounds issues that remain underexplored in mortuary studies: senses and atmospheres, emotion, gendered practice, childhood, disability, and ageing. Iterative image–text production makes interpretive assumptions visible (what must be inferred, what remains unknowable), prompting alternative hypotheses and more reflexive argumentation. The paper reflects on the academic and societal impacts of sharing these outputs as combined visual–narrative research results rather than as uncontextualized reconstructions. These materials are currently disseminated through peer-reviewed academic publications, public outreach articles, and a project website dedicated to archaeological dissemination. Because they are legible beyond specialist audiences and can be co-read, critiqued, and discussed with diverse publics, they support more inclusive dialogue while remaining grounded in archaeological evidence.

845. The future of Antiquity

Authors: Robin Skeates (Durham University)
Format: Oral

As Antiquity nears its centenary, it is appropriate to look—contextually and critically—back at how archaeology has been published in this prominent journal, and forward to assess the opportunities and challenges posed to academic journals by the rapidly changing world of publishing. Established journals are having to respond to a range of interconnected pressures: the move toward open-access publishing models, the unsustainable growth in new submissions, the rise of predatory journals, growing use of AI by researchers, and increasing geo-political tensions. This paper will reflect on these dynamics, focussing on four questions of ethical significance. First, how can global academic publishers and journals respond to the decolonial critique of their perpetuation of power structures that marginalize non-Western perspectives and researchers? Second, what can journal editors and authors do to sustain linguistic diversity in the face of the growing dominance of English as the lingua franca of science? Third, what can we all do about the peer review crisis facing scientific publishing? Fourth, as solo authors are replaced by science teams, how should contributions to research be credited?

2337. Trade and Crossover Publishing as Pathways for Communicating Archaeology Beyond Academia

Authors: Laura Coltofean (Research Cluster 5: History of Archaeology, German Archaeological Institute)
Format: Oral

This paper explores the potential of archaeologically themed trade and crossover books as means of communicating archaeological knowledge to audiences beyond academia. Drawing on a series of interviews with scholars trained in archaeology, Egyptology, and the history of science who have expanded their academic publishing to include trade and crossover books, it examines how these authors navigate the balance between scholarly rigor and accessibility, how effectively they convey complex archaeological and historical narratives, and how diverse readerships engage with and respond to their books. The paper also discusses the authors' motivations behind the shift to trade and crossover publications, as well as whether these publishing formats offer specific professional advantages and opportunities over traditional forms of scholarly communication. Finally, it evaluates the extent to which trade and crossover publications contribute to expanding the relevance of archaeology in society and support a more nuanced and accurate public understanding of the human past.

1374. Learned Societies and the Challenges (and Opportunities) of Communicating with Diverse Audiences through Traditional and Non-traditional Means

Authors: Ben Thomas (Society of Architectural Historians)
Format: Oral

Academic writing, as seen in the multitude of professional journals and monographs published each year, presents and elucidates complex ideas objectively and thoroughly through well-supported arguments. But even great academic writing often struggles to find broad audiences and cannot compete with the sheer volume of people who access information via the internet, social media, and television and video sources. Furthermore, technological innovations that access global communication networks mean that anyone with a computer and access to the internet can present their ideas to a global audience without having to undergo any sort of professional review or vetting. Consequently, we are flooded with bad science and misinformation and finding credible writing from reliable sources is difficult even for academic experts. In this presentation the author examines how learned societies are responding to the challenge of communicating with a variety of audiences through traditional and non-traditional means. How do these organizations evaluate the effectiveness of their communication? Also, in addition to supporting the creation and dissemination of sound academic knowledge, do these organizations highlight and amplify credible writing and direct people towards reliable, fact-based information?

338. Slow Knowledge in a Fast Media World: Communicating the Past in an Age of AI

Authors: Sarah Mcclure (University of California, Santa Barbara)
Format: Oral

Digital platforms, artificial intelligence applications, and short-form communication are reshaping how people learn, expertise is judged or ascribed, and trust in knowledge is created. In this evolving landscape, archaeology may play an important role in the development of new approaches. Our discipline is grounded in material evidence, careful documentation, considered and nuanced interpretations, and an acceptance of uncertainty. It is precisely these aspects that are increasingly recognized as important domains for honing critical thinking as people navigate algorithm-driven information systems. Rather than treating new technologies only as threats, archaeologists are well positioned to contribute to conversations about ethical AI use and enhancing educational curricula. Archaeologists also need to engage with this new educational and media landscape to highlight the importance of our discipline, foster public support, and promote archaeology for future generations. Current political, social, and cultural turmoil in the United States provides a timely case study for these challenges. Archaeology in the U.S. is currently under threat, with severe cuts in research and heritage funding, and legal and policy changes that are undermining long-standing practices of heritage management. Archaeological heritage and our ability to train future archaeologists is at risk, yet public interest in archaeology remains strong. In this paper I suggest that the future of archaeology both in the US and elsewhere depends on how effectively we engage with and communicate within this changing educational and media environment. Drawing on my experiences writing op-eds while teaching large undergraduate classes, I highlight communication strategies that can effect change, sometimes in surprising ways. By engaging audiences on topics they already care about, rather than trying to "sell" our work, and disseminating our research in ways that are accessible, archaeologists can build trust, counter misinformation, and help bridge political and cultural divides between experts, technologies, and the public.

582. When digital is not enough: experiencing slowness in archaeological communication

Authors: Marco Paladini (Ca' Foscari, University of Venice)
Format: Oral

In contemporary debates on archaeological communication, effectiveness is often associated with the ability to make content increasingly attractive through digital tools and multimedia solutions. This contribution challenges this assumption, arguing that, in certain contexts, an increase in technological mediation does not necessarily lead to a deeper understanding of the archaeological setting and may, at times, hinder it. The paper is based on the observation of guided visit experiences conducted in the northern lagoon of Venice, characterized by a slow engagement with space through navigation on traditional low-speed boats. In this context, slowness of movement and direct immersion in the lagoon environment are not merely logistical conditions, but function as a communicative device in their own right. The extended duration of the experience encourages attention to the landscape, spatial relationships, and environmental transformations, creating the conditions for an understanding of context that precedes explicit archaeological

interpretation. Archaeological narration thus builds upon an experience already developed through movement, time, and direct perception of the environment, organizing and interpreting elements previously observed by participants. Within this process, the emotional dimension acts as a factor of attention and engagement, without replacing or overshadowing cognitive content. These dynamics emerge across different audiences, from school groups to adult visitors, suggesting that communicative practices based on simplicity and slowness can be both effective and inclusive. Rather than opposing digital and non-digital approaches, the contribution proposes a critical reflection on the limits of technological mediation and on the need to calibrate tools and languages in relation to context and modes of experience. From this perspective, slowness does not represent a rejection of innovation, but a conscious choice that foregrounds material reality, storytelling, and direct experience as central components of archaeological communication, while also suggesting the potential applicability of similar slow-experience approaches in other contexts.

1566. Communicating Archaeology in Pisidia (Turkey): Landscape-based engagement and public practice

Authors: Isilay Gürsu (British Institute at Ankara)
Format: Oral

This paper examines how archaeological knowledge produced through long-term research in Pisidia (Southwest Turkey) has been translated into contemporary public engagement through the British Institute at Ankara's (BIAA) cultural heritage initiative. Building on decades of archaeological work in the region, it focuses on the Pisidia Heritage Trail as a methodological framework for communicating archaeology beyond conventional site-based or museum-centred formats. The trail—a 350 km walking route linking twelve archaeological sites and their associated villages—is analysed not simply as a public-facing outcome, but as an infrastructure for engagement that foregrounds movement, scale, and embodied experience. By situating archaeological remains within lived rural landscapes, the trail enables forms of understanding that emerge through walking, encounter, and duration, rather than through didactic interpretation alone. Drawing on approaches from public archaeology, anthropology, and heritage studies, the paper argues that heritage communication in Pisidia operates as a relational and context-specific practice, shaped by long-term presence and everyday interactions between people, places, and material remains. It further considers the role of digital mediation—particularly three-dimensional reconstruction—as a complementary communicative tool. Rather than aiming to resolve absence or uncertainty, these digital interventions are used to make fragmentary archaeological features intelligible while preserving ambiguity and interpretive openness. Together, these approaches demonstrate how public archaeology can operate across bodily, spatial, and visual registers, mediating connections between past and present in a region where archaeological remains are deeply embedded in contemporary rural life. The paper contributes to wider debates on how archaeological knowledge can be communicated in ways that are situated, experiential, and responsive to local contexts.

2710. Communicating Archaeology by Making It Useful: Veterans, Mental Health, and Public Value

Authors: Christina Seehusen – Thomas Mikkelsen – Andres Dobat (Aarhus University dept. of Archaeology and Cultural Heritage Studies)
Format: Oral

How can archaeology engage publics who are rarely reached through conventional forms of heritage communication, and what societal impacts might such engagement generate? This presentation responds directly to the session's focus on diversity, equity, and impact by presenting Veterans in Archaeology, a Danish community archaeology initiative that reframes both archaeological communication and archaeological purpose. Museum professionals demonstrate remarkable creativity in ways of communicating archaeology, e.g. experimenting with digital platforms, immersive technologies and innovative narrative forms. While such approaches are vital, we argue that an often-overlooked modality lies in shifting the central question from "how do we attract (new) audiences?" to "what can archaeology do for specific audiences?" This perspective foregrounds public needs and benefits, positioning archaeology as an active social resource rather than a communicative product. Veterans in Archaeology engages military veterans suffering from psychological injuries; a group frequently marginalised or dissociated from cultural institutions. Participation is structured around amateur metal detecting as an entry point, attracting individuals who are not necessarily primarily interested in archaeology to begin with but drawn by community, outdoor activity, the modality of detecting and the opportunity to contribute meaningfully to shared histories through detector surveys. The programme operates through an intervention track connecting veterans with a nationwide network of experienced volunteer mentors, and a research track using qualitative ethnographic methods to investigate participants' lived experiences. By opening access to archaeological practice and research in participatory and equitable ways, the project addresses questions of who archaeology serves and who benefits from publicly funded knowledge production. We argue that archaeology can play a constructive role in supporting mental health, offering relief, purpose, and connectedness beyond formal support systems. In doing so, it proposes an expanded understanding of archaeological impact—one that bridges communication, care, and knowledge, and situates archaeology as a meaningful contributor to societal wellbeing.

1642. Communicating Archaeology in Greek Vocational Education: Challenges and Futures

Authors: Styliani Kaltsogianni (Aristotle University of Thessaloniki - Independent Researcher)
Format: Poster

The concept of "The Futures of Communicating Archaeology" addresses the need for adaptive and innovative approaches to the transmission of archaeological knowledge in response to contemporary educational and institutional changes. In Greek Higher

Vocational Training Schools (SAEK), the teaching of art history and cultural heritage is primarily connected to vocational programs such as "Museum and Archaeological Site Guards" and "Conservators of Works of Art", where archaeology constitutes essential professional knowledge rather than a purely academic discipline. Recent reforms of the SAEK study guides have reshaped the way art history and cultural content are delivered. In the program for museum and archaeological site guards, teaching hours dedicated to art history and cultural heritage have been significantly reduced, while within conservation programs, art history and archaeology have been fragmented into smaller, specialized modules. While this modular structure enhances the connection between theory and practice, it also risks weakening a holistic understanding of cultural and historical contexts. These changes highlight the growing importance of future-oriented strategies for communicating archaeology. With fewer teaching hours and fragmented curricula, emphasis must shift toward interpretive skills, critical engagement and effective communication of cultural significance. For museum guards, this involves developing the ability to mediate between archaeological sites and diverse audiences. For conservators, it requires the capacity to contextualize material culture within broader historical, artistic and ethical frameworks. Digital technologies, experiential learning and collaborations with museums and archaeological institutions offer valuable tools to maximize educational impact under these constraints. Ultimately, the future of communicating archaeology in SAEK education depends on flexible, practice-based and digitally enhanced pedagogical models that safeguard the quality and relevance of cultural heritage education.

75 REVIVING THE PRESENT PAST: CURRENT PERSPECTIVES ON ETHNOARCHAEOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Alexander Gramsch (Römisch-Germanische Kommission) – Esmeralda Agolli (Department of Archaeology and Culture Heritage, University of Tirana)
Keywords: Analogy, Postcolonialism, Community, (Ritual) Practice, Bioarchaeology, Heritage
Format: Regular session

SESSION ABSTRACT

There is broad consensus in archaeology that understanding finds and findings requires reference to external sources. But which sources, which types of knowledge help us out of the box of our culturally shaped experiences, queries and expectations? One of these sources is the empirical observation and recording of behaviour, practices, attitudes etc. in current contexts – ethnoarchaeology in a very wide sense. Ethnological or anthropological research conducted by archaeologists is able to integrate archaeological questions and theoretical principles with contextual evidence that is less about filling the gaps, but is of a different quality and allows us to 'read' the incomplete archaeological evidence differently. The aim of this session is threefold: (1) We invite case studies, e.g. on ritual practices, beliefs, thanatology, technological choices, or social dynamics. We especially encourage approaches based on postcolonial discourses that include indigenous perspectives and deconstruct the exoticizing of the 'other'. (2) Building on this, we propose to explore the relationship with community archaeology, asking how members of the communities can be involved, not only to provide data, but to develop questions and discuss results and how they can contribute to explore venues for effective documentation, protection, and promotion of the living heritage, both tangible and intangible. To what extend does globalisation impact the integrity of the living heritage that could perish in no time? (3) We also want to discuss premises, possibilities, and limitations of a postcolonial, multi-perspective ethnoarchaeology in the context of an increasingly scientific archaeology. Against the backdrop of the so-called 'third science revolution', the question arises as to how ethnoarchaeology can contribute to broadening the scope of our research questions, our interpretations, and the safeguarding of indigenous knowledge and heritage and to making archaeology a politically engaged, ethically aware discipline.

CONTRIBUTION ABSTRACTS

1824. Setting the scene: The present past reconsidered

Authors: Alexander Gramsch (Independent) – Esmeralda Agolli (Tirana University)
Format: Oral

In this keynote-style introduction we want to set the scene for the stories and accounts that are about to unfold in this session. Following a very brief overview over history and development of ethnoarchaeology as a field – or rather sub-field? – we will highlight some of the possibilities, pitfalls and powers ethnoarchaeology has. We will briefly look at how ethnoarchaeology was involved in practices of 'othering,' in constructing 'the other' and at how earlier approaches perceived these other societies as "lands of the living past". We will consider possible relation between ethnoarchaeology and community archaeology, asking how members of the communities can be involved to develop research questions and discuss results and how they can contribute to explore venues for effective documentation, protection, and promotion of the living heritage. We also want to discuss premises, possibilities, and limitations of a postcolonial, multi-perspective ethnoarchaeology, one that goes beyond the study of the exotic merely to fill the gaps of prehistory. We will address the question, how ethnoarchaeology can contribute to broadening the scope of our research questions, our interpretations, and the safeguarding of indigenous knowledge and heritage and to making archaeology a politically engaged, ethically aware discipline.

2663. Ethnoarchaeology as modern archaeology of living systems: the ethno- prefix moving aside, and unavoidable reflections

Authors: Alessandro Vanzetti (University of Rome "La Sapienza") – Makarius Itambu (University of Dar-es-Salaam) – Marina Gallinaro (University of Rome "la Sapienza")
Format: Oral

Ethnoarchaeology has been one of the most relevant fields in which archaeologists have redefined their tools, procedures, goals, and place in cultural anthropology, since the New Archaeology and through Post-processualism. It has often been widely discussed that "traditional societies" are disappearing, and we do know that in modernity there does not exist almost any place on Earth that is remote enough from connectivity and capitalist impact. The allure of ethnoarchaeology as observing another structural dimension of societies, whose inner systemic organization would represent some analogue for archaeological contexts, is fading away, more seriously than in the past. In fact, archaeology of "processes under high-level control" (including in this dimension both experimental archaeology, ethnoarchaeology, modern archaeology and some historical archaeology) has been de facto emerging, particularly under the impact of the Schiffer perspective. In our view, this is a partially alternative view to long established ethnoarchaeology, because the behavioral characteristics are more appreciated than the similarity of the living contexts with possible archaeological contexts: in a certain sense, this was a move away from "analogy" toward "behavioral cross-cultural regularities", and is certainly important in modern research. Building upon the traditional concept of ethnoarchaeology and these behavioral views, we can propose to highlight community and individual knowledge as relevant awareness also in a reflexive sense: it would mirror the involvement of the observed actors in a world impacted by modernity, as well as their self-perception of these transformations, facing the reducing strength of traditional practices. This evaluation and self-evaluation of changing cultural systems is one of the impacts of ethnoarchaeology as a proper discipline, aside its archaeological significance. We will discuss these theoretical (and practical) issues, by referring to real situations encountered in our current ethnoarchaeological project on the pottery traditions in Central Tanzania (Singida region).

1762. The Value and Legitimacy of Ethnographic Analogy: Evolutionary-Cognitive Perspectives in Palaeolithic Archaeology

Authors: Rimtautas Dapschauskas (University of Heidelberg)
Format: Oral

The use of ethnographic analogy has a long and productive history in Palaeolithic archaeology, yet it remains one of the discipline's most contested methods. Since the 1970s, under the influence of postmodern relativism, the interpretive turn, and post-processual archaeology, deep scepticism towards cross-cultural generalizations and evolved human universals has gained prominence. This shift increasingly framed culture as a "superorganic" domain decoupled from biology, thereby marginalizing empirical-quantitative approaches and confining inquiry to hermeneutics and semiotics. Against this background, analogies between Palaeolithic and contemporary hunter-gatherer societies—particularly when extending beyond technology to social institutions, cognition, and emotion—were frequently dismissed as epistemically flawed and implicitly derogatory to the latter. This presentation argues for the value and legitimacy of ethnographic analogy from an evolutionary-cognitive perspective. Unlike the normative and teleological evolutionism of the nineteenth century, contemporary evolutionary approaches explicitly reject value judgements concerning cultural superiority or inferiority. Instead, they are grounded in the assumption that all humans share an evolved cognitive architecture shaped by millions of years of natural and sexual selection. Ethnographic analogy is not employed to identify one-to-one correspondences with the past, nor does it treat recent hunter-gatherers as "frozen time capsules" of the Stone Age. Rather, ethnographic data serve to delineate the constrained possibility space of human behaviour in non-state societies, to identify patterns plausibly rooted in evolved psychological mechanisms, and to highlight divergences between past and present that themselves require evolutionary explanation. Without such reference points, archaeological interpretation risks being anchored primarily in the narrow experiential horizon of WEIRD academic observers. Methodologically, ethnographic analogy today constitutes one among many elements in complex nomological networks of cumulative evidence. These networks integrate findings from a wide range of disciplines and methodologies, enabling robust triangulation of long-term behavioural trajectories across deep time, as illustrated in this talk by research on the evolution of ritual.

108. Braiding Knowledge Systems: Ethnoarchaeology as Indigenous Food Sovereignty Praxis

Authors: Anna Antoniou (University of Massachusetts, Amherst | US NSF Center for Braiding Indigenous Knowledges and Science)
Format: Oral

Ethnoarchaeology has traditionally focused on empirical observations of living peoples as data to interpret the archaeological record. But how can ethnoarchaeological approaches move beyond data extraction to become a tool for Indigenous self-determination? Drawing on a North American case study, this presentation explores how community-led ethnoarchaeology can serve Indigenous food sovereignty while simultaneously deepening our understanding of past foodways. I present research conducted with, for, and by the Shoalwater Bay Indian Tribe and Chinook Indian Nation in Willapa Bay, Washington and demonstrate how ethnoarchaeological research can be retooled to meet contemporary community priorities. Our project utilizes a braided methodology, the

process of bringing western science and Indigenous knowledge into right relationship, to document and map ancestral fish and shellfish procurement practices and sites. This evidence then informs the reconstruction and use of fish weirs and smokehouses. These structures advance insights into past foodways while address contemporary community needs through economic resources, cultural revitalization, and climate adaptation strategies. Our approach creates a dynamic loop where archaeological findings inform present-day food sovereignty efforts while contemporary revitalization practices provide new interpretive frameworks for understanding the material record. This case study responds to calls for postcolonial, multi-perspective ethnoarchaeology in three ways: First, it centers Indigenous epistemologies and research questions rather than treating communities as data sources. Second, it demonstrates how community members drive question development, methodology, and knowledge production. Third, it illustrates ethnoarchaeology's potential to safeguard living heritage while contributing to archaeology as a politically engaged, ethically aware discipline. Ultimately, this braided approach shows how ethnoarchaeological research can support Indigenous resistance to colonial erasure while expanding interpretive possibilities beyond culturally-bounded Western frameworks.

527. Heritage and archaeology: a new view from South East Australia

Authors: Kevan Edinborough (Bournemouth University)
Format: Oral

This talk presents a cautionary case study from Melbourne, Victoria, Australia, which is undergoing a very rapid transformation due to an unprecedented program of urban and regional development. Following on from the author's work in the Pacific Northwest, a novel multiperiod case-study combines ethnograhic, historical, archaeological and radiometric evidence. On one hand these results shed new light on mid to late Holocene settlement in South East Australia. On the other hand, they suggest an alarming bias exists in the archaeological record that directly relates to European colonization. Recent ethnographic and oral history research suggests that the effect of massacres and disease on indigenous populations during colonisation by Europeans are underestimated in Australia. As part of a British Academy funded Visiting Fellowship, ethnography, archaeology and radiocarbon dates have been statistically analysed to reexamine the tempo and likely underestimated fatal outcomes of colonisation in Southeast Australia. It is anticipated that new and ongoing collaborations between archaeologists and communities will empower First Nations effectively silenced by colonisation and who still suffer the consequences.

1300. Living heritage? Ethnoarchaeology of Swahili limestone architecture on the East African Coast

Authors: Monika Baumanova (University of West Bohemia in Pilsen)
Format: Oral

The architectural heritage of the East African coast is defined by a tradition of coral limestone and lime mortar construction. Historically, the temporal coincidence of the rise of this tradition with the spread of Islam (8th–10th centuries) led 20th-century scholars to highlight potential links with the Islamic world beyond Africa and even attribute these techniques to Middle Eastern origins, effectively sidelining the indigenous Swahili agency. This paper presents ongoing ethnoarchaeological research that aims to identify continuity and local development in limestone construction practices by bridging the gap between research on the standing ruins of medieval deserted towns and the living urban fabric of coastal Swahili towns like Lamu, Kenya. By engaging with contemporary Swahili masons and families who have inhabited and maintained these structures for centuries, this study documents the evolution of construction techniques and material choices. The research utilises living heritage to understand how technological choices were adapted or maintained from the medieval period to the present. In doing so, it centres on local expertise. Furthermore, the paper discusses how documenting these living technologies serves as a vital tool for heritage protection. It demonstrates that ethnoarchaeology may help us to move beyond the two pervasive views of Swahili building traditions known from archaeological sites that present it as either irrecoverably lost, having disappeared with the colonial era, or, at the other extreme, as a static millennium-old toolkit that is going to be lost with modern technologies and materials. The paper shows how, in this case, ethnoarchaeological research helps in recognising the evolving character of the practice and the logic behind choices made over generations, and may lead us to explain the form and character of building remains on archaeological sites.

1062. Ethnoarchaeological research in a rapidly changing society: Methodological and interpretive considerations

Authors: Esmeralda Agolli (Tirana University)
Format: Oral

Over the past four decades, Albanian society has undergone an exceptionally rapid and profound process of transformation. The collapse of the communist regime in the early 1990s and the subsequent dissolution of nearly half a century of political and cultural isolation initiated a dynamic period of socio-cultural reconfiguration. These changes have been manifested in shifting perceptions, evolving modes of everyday life, and redefined social expectations. Within this context, particularly from an ethnoarchaeological perspective, such circumstances generate a compelling framework for investigating cultural traits that are currently subject to transformation or are at risk of disappearance. Based on a long-term research project carried out in rural Albania, this paper discusses the potential of ethnoarchaeological research on mortuary rites and practices. In particular, it focuses on the research methodology involved in the process of data collection, including the formulation of interviews, the selection of interviewees, and the systematic documentation of cemeteries. It examines how actions embodied in materiality may inform archaeological interpretation. The

study further addresses regional variability in rites and practices and explores how such variability contributes to a more nuanced understanding of social dynamics related to age, gender, social status, and religion. Furthermore, it seeks to investigate how an ethnoarchaeological research perspective oriented toward a society in transition contributes to the interpretation of cultural change and continuity, and to what extent comprehensive documentation and analysis of mortuary rites and practices enhance the understanding of a living social context characterized by constant change and transformation.

1497. Past in the Present- Preserving the sacred and ritual landscape of Saptasthanams, Tiruvaiyaru, India through the interaction of contemporary People

Authors: S Darsana (Holy Cross College AutonomousTiruchirappalli)
Format: Oral

The present paper intends to study the seven temples in the central part of Tamil Nadu built in the Chola period (around thousand years back) popularized in late medieval period and preserved in the modern times that throw some interesting light on the nature of visitors' behaviour during the temple festival times. The research documents the architectural features of all the seven temples with information gathered from the inscriptional and literary sources. It discusses the ritual of Nandi's (the Bull God, the Vehicle of Lord Shiva) birth, Nandi's marriage and ezhur pallakku (Seven Palanquin festival where the gods of seven temples are taken in procession around the seven temple towns). It has been noticed that tradition never dies in India. Even in the modern day, many young people who work outside their hometown, come for the festival and act as palanquin bearers. They do not do this for monetary gains as the money they get is very meagre. Out of passion and devotion to their gods and villages, they participate in the temple festivities. An interaction with the local population and the observation of various rituals associated with these festivals revealed the preservation of continuity of thousand-year traditions and legacy. The sacred landscape created by the location of temples on either side of the rivers still plays a crucial role in the modern period. This paper would act as an apt example for the reviving the past in the present context with inputs from contemporary population.

1077. Chullpas, Churches and Calvaries in Tarapacá: Rituals, Cosmopolítics and Andean Itinerancies

Authors: Francisca Urrutia-Lorenzini (Universidad de Tarapacá)
Format: Oral

Through archaeological and ethnographic research in the Tarapacá region for more than fifteen years, several exchanges and collaborative experiences have been conducted with the Aymara Community of Nama. There is a shared commitment to foster dialogues and joint initiatives between academic scientific knowledge and ancestral wisdom. Interactions between these different ways of thinking and living must be carried out through symmetrical and reciprocal relationships. But, it is important to keep in mind that the approaches of each are not equivalent and that both have their own particular practices, narratives, methodologies and conceptualizations. These experiences situate us within the contemporaneity of Andean worlds, where we are keen to nurture diversity and diplomacy at its edges. The Andean people of Nama define their territory through a set of relationships and itineraries linked by different footpaths that have the village as their radial centre. They are marked by calvaries associated to two churches and their respective dedications. In the past, during the patronal festivities, these footpaths became pilgrimages that ritually performed and actualised the relations established with other territories and communities. The calvaries were arranged around chullpas or ancestral towers, erected in pre-Hispanic times and remaining in use until colonial times. Today, chullpas and gentiles draw on stories of a humanity that predates the arrival of the sun, but which still maintains its influence in this world and displays its own forms of connection. Borders of any kind are fluid, emphasise interaction and require constant articulation through cyclical renewals of the ritual calendar. Ancestry does not refer to closed traditions, but rather as a vital and transformative force. The Nameños offer their own cultural and historical interpretations, they enact multiple ways of being with the environment that challenge dominant ways of living and thinking.

2486. Water!

Authors: Cornelia Kleinitz (Humboldt-Universität zu Berlin) – Alfatih Mohamed Ali Saeed (University of Khartoum) – Hassan Ebeid-Allah (Musawwarat Community Council)
Format: Oral

Collaborative research on materialities of pastoralist lifeways at Musawwarat es-Sufra, Sudan, left decisions on the topics of research and research priorities in the hands of partners from local pastoralist communities. This meant that a significant part of our work was dedicated to the most fundamental problem that pastoralist communities in drylands face: The provision and storage of water. The initial focus on 'Water!' became key to our learning about present pastoralist 'logic' as well as our reflections on past mobile lifeways and their (few) material traces. Our joint studies have shown, for example, how durable water infrastructures – in the recent past mechanical wells constructed and used during the past two centuries – can be understood as 'lasting markers of communal practice' that not only served as economic hubs in the landscape but also acted as mnemonic devices due to their centrality to pastoralist lifeways. In the deeper past, monumental artificial water reservoirs were collectively dug to harvest and store water from temporary river beds for several months. This formed the basis of sustained use of the land by mobile, pastoralist populations long after the end of the rainy season. Our collaborative study explored how their functioning relied on precise knowledge of seasonal weather phenomena and drainage patterns in the landscape, and a set of engineering skills that ensured the accurate excavation of

the reservoir and placement of its walls. Our joint research endeavour proved to be enriching not only for the archaeologists but also for the local pastoralist communities as it valued, centred and affirmed their specialist knowledge.

1193. The Man Who Spun: Cultural Constraint or Economic Pragmatism? Ethnoarchaeology and Interpretive Archaeology

Authors: Patrycja Godlewska (Nicolaus Copernicus University in Toruń)
Format: Oral

In the archaeological record of the Oder and Vistula river basins, spindle whorls and needles constitute a relatively common component of female grave assemblages, particularly in prehistoric contexts. This pattern changes during the Early Middle Ages, when textile tools become less frequent in funerary contexts. These transformations coincide with profound socio-cultural shifts, linked both to processes of early industrialisation and to the symbolic reconfiguration introduced by Christian doctrine. The symbolism of spinning and weaving extends well beyond utilitarian practice, encompassing cosmological, ritual, and social meanings. Notably, men were also implicated in this symbolic sphere. Although rare, spindle whorls occasionally appear in male burials, sometimes as the sole grave good. Within gendered interpretative frameworks, the figure of the man who spun has traditionally been perceived as feminised, with his martial competence and social status implicitly questioned. This perception reflects the ambiguous symbolic role of spinning itself—an ambiguity still traceable in ethnographic sources rooted in traditional belief systems. In Slavic folklore, the spinner is contrasted with the weaver, who is associated with Demiurge-like creator figures and whose masculinity is never challenged. Nevertheless, in traditional culture, both weavers and shepherds—linked to the ambivalent archetype of the Golden Fleece—occupied liminal and non-normative social positions. They were simultaneously feared and admired, often living at the margins of their communities. Drawing on Slavic folkloric sources, cognitive archaeology, and symbolic readings of grave assemblages, this paper explores male burials containing spindle whorls as a lens through which to reconsider gendered labour, identity, and social ambiguity in past societies. By integrating interpretive archaeology with ethnoarchaeological perspectives, the contribution highlights alternative frameworks for understanding these atypical funerary contexts and argues for a more nuanced approach to gender representations in archaeological interpretation.

2517. On the interpretation of objects with unclear practical functions: modern and ancient anthropomorphic representations

Authors: Liudmyla Shatilo (Institute of Archaeology of the National Academy of Science of Ukraine) – Robert Hofmann (Kiel University)
Format: Oral

Our case study examines the possible significance and functions of anthropomorphic figurines in prehistory, in particular of the Chalcolithic Trypillian complex (4700 - 3000 BCE). In order to find alternative explanations for the use of such objects and to test archaeological theories, modern wooden anthropomorphic sculptures, so-called 'angels' from the Ore Mountains, Saxony (1820/30-today), were considered alongside the Trypillian representations in a structural comparison. The selected material categories, despite the great differences between them (visual, material, production process, historical context, etc.) and the insurmountable time barrier of six thousand years, have certain structural similarities in a number of characteristics. However modern realities were in no way directly transferred to the archaeological context; we believe that the work conducted only provided ideas and new perspectives for the interpretation of prehistoric art objects. In order to study the use and meaning of the figurines, we turned to the topics of the content (what is depicted) and style (how it is depicted) of these objects and considered the following topics: typological variability of representations, gender differentiation, size classes, styles of figurines and their stylistic development/evolution, production and distribution. From the methodological point of view the study of modern figurines from the Ore Mountains included on the one hand long-term observations and a series of interviews with producers, users and specialists and on the other on documenting the sculptures using archaeological methods. The observations on the Trypillian material are based on the revision and supplementation of previous typological approaches using statistical methods and quantification approach.

107. Reconstructing Roman ointments and incense production practices: An ethnoarchaeological perspective

Authors: Alice Capobianco (Università di Genova | Universität zu Köln)
Format: Oral

The production of scented ointments and incense in the Roman world was a complex and highly specialised craft, documented by literary sources, archaeological contexts, and material culture. Nevertheless, many technical and practical aspects of this production remain poorly understood, particularly those related to raw material processing, artisanal gestures, and small-scale manufacturing practices. This paper adopts an ethnoarchaeological approach to address these gaps, using contemporary traditional practices as a heuristic tool to interpret archaeological evidence. The study is based on comparative fieldwork carried out in several regions where artisanal production of oils, perfumes, resins, and incense-related substances is still practiced today, including Morocco (Essaouira), Turkey, Tunisia, Saudi Arabia, and Iraq. These observations are complemented by comparative case studies from areas such as India (Kannauj), Oman, and the Horn of Africa, which are discussed through published ethnographic and archaeological literature. Although not all of these regions have been directly investigated through fieldwork, they provide valuable comparative

frameworks due to their long-standing association with perfume and incense production. By integrating these ethnoarchaeological data with Roman literary sources (e.g. Pliny the Elder) and archaeological evidence from sites such as Pompeii, Paestum, and En Boqeq, this contribution aims to reconstruct key phases of the production cycle, from raw material acquisition to processing and aromatisation. The paper highlights both continuities and transformations in artisanal knowledge, emphasising the role of embodied practices and technical choices that leave only subtle traces in the archaeological record. This approach demonstrates the potential of ethnoarchaeology to refine the interpretation of ancient production processes and to bridge the gap between textual sources and material evidence.

348. An Ethnoarchaeological Approach to Rock Art Studies

Authors: Roxanne Tsang (School of Archaeology, University of Oxford)
Format: Oral

Many archaeological sites across the globe do not come with ethnography. However, in Papua New Guinea (PNG), we can inform the archaeology through ethnography thereby bringing multiple perspectives on the interpretation of any objects under examination. In particular, rock art which refers to any man-made markings on rock shelters' and caves' walls or ceilings, require multiple perspectives. This paper draws on ethnoarchaeology to further understand the nature of rock art production near Auwim village in East Sepik Province of PNG. Here, the ethnoarchaeological approach relates to the integration of local or community knowledge with the archaeology of artwork itself. The paper demonstrates how rock art can utilise ethnoarchaeology to build a model about the nature of rock art production. This nature of mark-making themes include; ritual, menarche, enemy raids, seasonal hunting and gathering, and communal history and memory which are in fact functional elements of the rock shelters. It concludes with a framework and implications for rock art analysis through ethnoarchaeology.

2524. Traces of the Katyn Massacre: An Ethnoarchaeological Perspective

Authors: Olgierd Lawrynowicz – Magdalena Majorek-Lipowicz (Institute of Archaeology, University of Lodz) – Aleksandra Krupa-Lawrynowicz – Sebastian Latocha (Institute of Ethnology and Cultural Anthropology, University of Lodz)
Format: Oral

This paper addresses the use of ethnoarchaeological methods, techniques, and tools in the study of the archaeology of crime, with particular reference to the Katyn Massacre. The Katyn Massacre occurred in 1940, when NKVD officers, acting on orders from Joseph Stalin, executed Polish prisoners of war in Russia, Ukraine and Belarus. Research on mass violence and political crimes confronts archaeology with material evidence whose meanings are shaped by practices of memory, experiences of trauma, and contemporary social and political conditions. Such contexts challenge the sufficiency of exclusively monodisciplinary scientific approaches and call for reflexive and interdisciplinary methodologies. Within the project Lexicon of Katyn Archaeology (1990–2015), ethnographic research was conducted with archaeologists and participants of fieldwork in Katyn, Mednoye, Kharkiv, and Bykivnia, as well as with individuals whose biographies, experiences, and memories are connected to the Katyn Massacre – members of Katyn Families. Adopting a broad understanding of ethnoarchaeology as the empirical study of contemporary practices, narratives, and attitudes toward material remains, the paper demonstrates how ethnographic observation, narrative interviews, and documentation of commemorative practices can enrich the interpretation of archaeological data. In the case of the Katyn massacre, such approaches allow material traces of violence to be situated within the contexts of family memory, local knowledge, institutional frameworks, and grassroots forms of commemoration, offering alternative ways of "reading" incomplete and fragmentary evidence. Multi-perspective and reflexive ethnoarchaeology expands the scope of archaeological research beyond reconstruction and identification, supports more responsible and transparent interpretations, and contributes to the safeguarding of intangible heritage related to experiences of violence, loss, and memory. The application of ethnoarchaeology not only allows for a better understanding of the material evidence of the Katyn crime but also enables research to be conducted in a socially responsible and ethically informed manner, as illustrated through selected case studies.

76 ARTISTS AND CRAFTSMEN IN ANCIENT GREECE: TECHNOLOGY, STATUS, AND PRODUCTION DYNAMICS

Theme: 1. Widening perspectives in material culture studies
Organisers: Eléonore Favier (École française d'Athènes) – Laureline Pop (Université de Genève | Fond national suisse)
Keywords: artists, craftsmen, Ancient Greece, Technology, Status, Production
Format: Discussion session

SESSION ABSTRACT

Through a multidisciplinary approach combining archaeological, epigraphic, and literary evidence, this session aims to explore the complex place and identities of artists and craftsmen in Archaic, Classical, Hellenistic, and Roman Greece. By focusing on production processes, the organisation of labour, and the social dimension of technology, the session seeks to offer a nuanced professional and social characterisation of ancient craftsmen. The traditional opposition between "artist" and "artisan", although rooted in both ancient and modern discourse, fails to reflect the complexity and diversity of specialisation, skill transmission, and perceptions of manual work in antiquity. To move beyond this opposition, particular attention will be given to techniques and contexts of production — notably sanctuaries, but also urban workshops, domestic spaces, and settings linked to public or private commissions. This broader perspective will allow participants to examine how artistic and craft practices were embedded within social, economic, and religious frameworks throughout Greek history. Through case studies and comparative approaches, the session invites discussion on how the material and social conditions of craftsmanship shaped creation and professional identity from the Archaic to the Imperial period. Contributions addressing theoretical, methodological, or contextual aspects of ancient craft production are welcome, especially those that cross disciplinary boundaries or integrate textual, material, and technological data. Papers adopting comparative or regional perspectives (including from the wider Mediterranean) and studies using technical or archaeometric analyses are particularly encouraged.

CONTRIBUTION ABSTRACTS

588. Making Kouroi in Boeotia: Artists, Technology, and Patronage at the Sanctuary of the Ptoion.

Authors: Lucrezia Mastropietro (Scuola Superiore Meridionale)
Format: Oral

Boeotia has yielded the largest number of kouroi in the Greek world, almost all from the Sanctuary of Apollo Ptoios. There is no evidence that the region was artistically isolated during the VII and VI centuries BCE; rather, the corpus demonstrates a strong capacity to rapidly assimilate technical and stylistic innovations in quarrying, carving, proportions, and surface treatment. This paper examines the kouroi from the Sanctuary of the Ptoion as a case study of the relationship between technique, production, and patronage: the concentration of kouroi in this single ritual and archaeological context provides a coherent framework for analysing local sculptural practices. The analysis focuses on the most representative and best-preserved examples from the corpus. Close examination of material selection, tool marks, proportional systems, and stylistic evolution reveals both workshop continuity and controlled experimentation. Features such as the rendering of musculature and hair, together with the gradual shift from schematic to more volumetric modelling, indicate selective engagement with broader Greek sculptural developments rather than passive imitation. The kouroi thus function as material expressions of civic and personal identity. This study challenges the traditional distinction between "artist" and "artisan", proposing instead that the technical sophistication of the Ptoion sculptures indicates makers who operated as skilled technicians and creative agents simultaneously. Sculptors at the Ptoion mediated between material constraints, workshop traditions, and patronal expectations, contributing to the construction of Boeotian identity within a shared sacred landscape shaped by both sculptural production and patronage.

903. New Perspectives on the Workshop Problem of Lycian Classical Period Sculpture

Authors: Hava Keskin (Akdeniz University) – Tijen Yücel Bahçetepe (Independent Researcher)
Format: Oral

Since their discovery in the eighteenth century, the Classical-period sculptural monuments of Lycia have attracted sustained scholarly attention. Research has focused predominantly on material from Xanthos, with particular emphasis on iconography, typology, and stylistic dating. While a degree of consensus has emerged in these areas, the organization of production—specifically the identification of sculptors and workshops—has remained comparatively underexplored, despite being equally central to the interpretation of these works. This study revisits the question of workshop organization in Classical Lycia and adopts a critical stance toward established historiographical categories. It asks whether monuments that display strong endogenous features were produced by Lycian sculptors themselves or commissioned from Greek craftsmen. The prevailing view attributes much of this production to "Ionian masters," understood as Greek sculptors combining Persian, Greek, and Lycian iconographic elements. However, the term "master" itself requires critical scrutiny rather than being taken as a self-evident analytical category, as it often carries anachronistic and hierarchical assumptions. Moreover, the approximately two centuries of sustained sculptural production in the region, largely in local stone, suggests that this dominant interpretation should be treated with caution. The paper focuses in particular on the sculptural corpora from Xanthos and the more recently studied material from Tlos. Within this framework, the study evaluates the criteria commonly employed to identify workshops in antiquity and examines the extent to which they can be meaningfully applied in the Lycian context. Through close analysis of a defined corpus characterized by distinctive local iconography and locally sourced materials, the paper aims to contribute to moving beyond the artist/artisan dichotomy and to foreground the likely role of local workshops and practitioners in the production of Lycian sculpture.

359. Family Trajectories and Professional Identities of Sculptors in Rhodes: Transmission, Mobility and Integration in the Hellenistic World

Authors: Melanie Joffrain (University of Lyon/University of Athens)
Format: Oral

This paper investigates the professional dynamics of sculptors in Hellenistic Rhodes through a multidisciplinary approach combining epigraphic and archaeological evidence. With nearly 270 sculptors' signatures preserved from the Hellenistic to the Imperial period, Rhodes offers an exceptional corpus for examining how artistic production was shaped by mobility, family transmission

and processes of civic integration. The paper focuses on two families of foreign sculptors active on the island in the late Hellenistic period. The first case study examines Artemidoros of Tyre and his sons Charmolas and Menodotos (2nd-1st c. BCE). Their signatures reveal a workshop structured around family collaboration and intergenerational transmission : the father signed works with each son separately, while the two brothers later signed together. Yet these shared practices conceal divergent strategies of integration. While Menodotos appears to have retained his Tyrian citizenship, Charmolas obtained Rhodian citizenship – later transmitted to his own son – and is attested collaborating with other sculptors, suggesting broader professional networks. A comparative perspective is offered through the contemporary family of Epicharmos of Soloi and his homonymous son. Their inscriptions document a gradual process of integration, while also revealing technical collaboration with bronze workers (ἐποίησε/ ἐχαλκούργησε), shedding light on the specialization and division of labor. By examining these two families, the paper argues that sculptural production in Rhodes was structured by flexible professional networks shaped by mobility, civic status and technical collaboration. More broadly, this evidence challenges the traditional opposition between "artist" and "craftsman", highlighting instead the complex and evolving professional identities of sculptors in the Hellenistic Greek world.

578. Organization and specifications of a Neo-Attic workshop under the Empire: the example of the Piraeus workshop.

Authors: Méganne Moulon (Université Bordeaux Montaigne, Ausonius)
Format: Oral

Neo-Attic art appears among Greek sculptors at the end of the Hellenistic period and immediately becomes very popular with the Romans. It is likely that Attic workshops of Greek sculptors specialized in the production of Neo-Attic reliefs to meet the demand of a Roman clientele. Although evidence of sculpture workshops is very scarce, due to the minimal infrastructure required for this craft and the mobility of artisans, it is through their surviving sculptural production that we attempt to understand their know-how and techniques. An archaeological testimony that allows us to better understand the organization of this type of workshop is the corpus of Neo-Attic reliefs from the Piraeus, which includes more than a hundred fragments recovered from a shipwreck that ran aground in the port of Athens. While the Neo-Attic character of these reliefs is confirmed by their iconography, which is inspired by Greek sculpture of the Classical period, their style varies from panel to panel. By studying tool marks and the style of the reliefs, an initial observation shows that although the technique is homogeneous, the style varies according to the sculptor. Having a large number of blocks that were certainly produced by the same workshop would make it possible to better understand the distribution of roles among artisans within the workshop. Moreover, another characteristic of this corpus is the notion of serial production: the reliefs are all of the same dimensions, in the same marble, and some present identical iconographic subjects executed multiple times. This serial production, applied to Neo-Attic workshops, also raises questions about the organization and functioning of this type of workshop and about how they adapt to the demands of their clientele.

287. Crafting Iron in Eretria: From Technical Insights to a Social Approach

Authors: Julien Gravier (Ausonius Institute UMR 5607, UBM | Malcolm H. Wiener Laboratory, ASCSA)
Format: Oral

Although ironworking rarely fits within traditional categories of artistic creation, it operated at the interface of multiple domains and under strong constraints. As such, it provides a fruitful perspective for exploring the relationship between technology, labor organization, and the social position of craftsmen. This paper draws on research on iron metallurgy in Eretria, where secondary smithing activities are attested within the urban area over a long chronological span. The evidence sheds new light on craft organization and local technical know-how. Combining archaeological, archaeometric, and historical data within the framework of the iron chaîne opératoire, this paper moves beyond purely technical analysis to characterize the local technical culture and its impact on production and status. Rather than assuming a strictly segregated organization of craft production, the Eretrian evidence indicates that ironworking activities were not spatially isolated from civic and religious contexts. On the contrary, the presence of smithing wastes within structured urban areas at different periods, combined with archaeometric indicators of on-site activity, points to a craft practice both displaying recurring technical patterns and well embedded in everyday urban life. This spatial and technical configuration provides a concrete basis for discussing the social positioning and professional identity of the Eretrian ironworkers. Focusing on well-contextualized Eretrian remains, this paper argues that technical practices provide a pathway to reassessing ironworking in its social and cultural environment. Rather than treating technology as a purely material domain, it demonstrates how production processes themselves shaped the visibility, integration, and status of ironworkers within the civic and religious fabric of the city. This case study therefore invites a broader reconsideration of how material practices can refine our understanding of artisan identities beyond the traditional opposition between "artist" and "artisan."

1298. Beyond Careless Workmanship: Craftsmanship and Technique in Greek Commercial Weights

Authors: Thomas Leblanc (UCLouvain)
Format: Oral

Greek commercial weights are everyday objects used in marketplaces for weighing goods. While some examples were made of stone, the majority were produced in copper alloy and, above all, in lead, which was by far the most common material. A significant proportion of these weights is decorated with iconographic symbols, sometimes described as having been executed « in a schematic way

[because of the] rather careless workmanship of the lead weights ». Such assessments highlight two recurring assumptions in the study of this material. The first assumes that, because these are small utilitarian objects, they did not require a high degree of aesthetic refinement. This perspective, however, overlooks the role of the craftsman, who « had the love of his craft and the desire to create something beautiful ». The second assumption is based on the idea that, since most weights were made of lead, they were produced using simple and largely undifferentiated manufacturing techniques. A detailed analysis of the chaînes opératoires, however, reveals a wide range of technical processes involved in the manufacture of weights, including casting in disposable moulds, the striking of small weights, and lost-wax casting. Furthermore, these weights had to be calibrated to a specific standard, requiring deliberate post-production adjustment of their mass. This paper focuses primarily on the weights from Cyzicus (Asia Minor) to demonstrate that this seemingly modest category of material culture embodies a genuine artistic intention on the part of the craftsmen, while also highlighting the diversity of techniques employed in their manufacture.

1155. Organisation of Bone and Antler Working in Olbia Pontica: Archaeological Evidence and Interpretative Issues

Authors: Alisa Semenova (The Institute of Archaeology of the National Academy of Science of Ukraine)
Format: Oral

Bone and antler working was an important yet archaeologically less visible sector of craft production in Olbia Pontica. Unlike pottery production or metallurgy, this activity did not require fixed infrastructure, which complicates the identification of workshops and the reconstruction of production organisation. So far, no production area in Olbia can be securely identified as a bone- or antler-working workshop. However, bone-working waste has been recorded in both urban and cult contexts. The cultic contexts are particularly informative: in a bothros (a pit with so-called "sacred refuse") a series of worked deer antlers representing successive stages of processing was discovered. The assemblage includes remains of primary antler segmentation, production waste, blanks, and semi-finished pieces, reflecting manufacture from raw material to nearly finished decorative plates. These finds provide indirect evidence for antler working within the temenos, probably connected with the production of fittings for wooden boxes or furniture. Finished plates are attested both inside the temenos and in urban contexts, while remains representing successive stages of antler working — from primary waste to semi-finished elements — are recorded across the settlement. Although these finds do not form large concentrations, taken together they point to antler working involving successive stages of processing despite the absence of identifiable workshops. In archaeology, craft specialisation is often linked to fixed workshops and large-scale production. The situation in Olbia suggests a different model. This paper discusses the possibility of small-scale, mobile or multifunctional production units connected with the manufacture of composite objects, where organic materials formed only one part of the technological process. Comparative evidence from Greek and non-Greek sites of the same chronological horizon provides a broader framework for reassessing craft organisation and archaeological criteria for identifying production.

861. Material Properties of Mudbricks from the Late Archaic Wall of Eleusis and Investigation of Their Production Procedure

Authors: Eleni-Eva Toumbakari (Hellenic Ministry of Culture) – Michail Bardanis – Georgios Dounias (Edafos Engineering Consultants SA)
Format: Oral

The Archaic fortification wall of Eleusis, commonly known as the Peisistratean Wall, is one of the few surviving examples of mudbrick fortification architecture in Greece. Excavated by Dimitrios Philios in the 1880s, part of its superstructure was exceptionally preserved due to deliberate backfilling undertaken during the expansion of the Sacred Court around the Telesterion. Between 2018 and 2023, a comprehensive conservation program created the framework for the first systematic investigation of its mudbrick superstructure. The project integrates archaeological context, epigraphic testimony from Eleusis, material and geotechnical characterization, and experimental replication to reconstruct the production sequence and assess its implications for Archaic construction practices. The analytical program comprised soil classification tests, mineralogical analyses of the fine fraction, unconfined compression tests, and suction measurements. Results indicate that the bricks were produced from silty sand to sandy silt with low clay content and marginally plastic to non-plastic fines, suggesting deliberate raw material selection. Mechanical characterization was combined with experimental replication: new mudbricks were manufactured from comparable raw earth with varying straw contents, and compaction energy was calibrated to achieve densities equivalent to the ancient specimens. The drying process was monitored through embedded sensors to evaluate performance parameters under controlled conditions. This integrated methodology enables a systematic reconstruction of the production sequence. Experimental results also allow estimation of production rates for small, organized work teams. When correlated with the total number of bricks required and the logistical demands of supply, preparation space, drying, and transport—assuming a construction span of 10–15 years—the findings indicate sustained, coordinated labor and structured construction management. The study therefore concludes by offering a preliminary reconstruction of the workforce organization And management requirements.

738. Dyeing and dyeing workshops: the study of craftsmanship and production through the Hellenistic workshop of Helike

Authors: Marie Frey (University of Rouen Normandy)
Format: Poster

Color was a central element in ancient Greece; wearing it could be seen as a sign of social distinction. Purple was associated with royalty before becoming an indicator of wealth. Dye works were therefore essential craft spaces in cities. The preparation of dyes and their application were long and meticulous processes, requiring a lot of space and, above all, special expertise. It was necessary to have scientific skills and knowledge in order to prepare dyes correctly, for example. This study forms part of recent studies on the archaeology of techniques. However, the historiography on this subject remains limited. There are a few scattered studies that address this topic, but few explore the theme of dyeing in detail. The case of Helike, dating from the Hellenistic period, allows us to imagine and visualize what a dyeing workshop might have looked like at that time and what the profession of dyer (bapheus) entailed. This artisanal space is well preserved and documented (recent studies), shedding light on la chaîne opératoire of this potential Hellenistic dyeing workshop. The different sizes and shapes of the eight vats that comprise it (rectangular, apsidal, wide, shallow, etc.) allow us to hypothesize about their specific uses (wool preparation, mordanting, dyeing, etc.). Traces of dyes reveal the organisms used for dyeing and the colors produced. Finally, the artifacts found provide us with information on dyeing methods and show us how techniques have evolved (tiles for recovering excess dyes, etc.). We can highlight developments and innovations thanks to archaeology, ancient texts and recent studies on dyeing and dyeing workshops.

1882. From workshop to consumer: Greek vase painters and the social and cultural dynamics of demand in the western mediterranean

Authors: Daniela Ferreira (CITCEM; Faculty of Arts and Humanities, University of Porto)
Format: Poster

This paper examines a specific and well-documented corpus of red-figure bell-kraters attributed to workshops associated with the Telos Group and recovered in archaeological contexts within present-day Portugal. Moving beyond approaches centred on trade routes and redistribution systems, the study foregrounds the relationship between producers and consumers, analysing how production strategies responded to demand in the western Mediterranean during the 4th century BCE. In this region, red-figure bell-kraters are documented in settlement contexts as well as in funerary assemblages. In the latter, they were used as cinerary urns, a purpose distinct from the function for which they were originally conceived. As already documented in the south of the Iberian Peninsula, their dimensions and morphological proportions diverge from those of comparable vessels produced for other markets, indicating deliberate adaptation in size and format to meet local requirements. Such formal adjustments suggest that these workshops were not merely exporting surplus goods, but calibrating production to peripheral consumer expectations. Iconographic evidence reinforces this interpretation. The imported vessels exhibit marked uniformity in their decorative programmes, with a clear predominance of Dionysiac and symposium imagery. Scenes repeatedly depict music, food, and drink, alongside male and female figures engaged in convivial interaction, the latter often occupying visually prominent positions. This selective and standardised repertoire reflects both workshop organisation and a stable horizon of demand among western consumers. Frequently characterised in scholarship as stylistically "mediocre", these painters are here reconsidered as pragmatic and highly adaptive craftsmen operating under specific economic constraints during a period of contraction in the figured pottery market. By integrating formal analysis, iconography, and archaeological context, this case study demonstrates how technical standardisation, adapted vessel morphology, and thematic choices articulate a dynamic interplay between workshop organisation and consumer agency, thereby nuancing the professional and social identities of Classical Greek vase painters.

77 ENGAGEMENTS WITH STONE WORLDS IN THE AMERICAS

Theme: 1. Widening perspectives in material culture studies
Organisers: Marie Kolbenstetter (Leiden University | Université Paris Nanterre) – Kim Ruf (University of Oxford) – Alejandra Roche Recinos (Leiden University)
Keywords: Ontologies, Lithics, Materiality, Stone monuments, Sacred landscapes, Americas
Format: Regular session

SESSION ABSTRACT

Worked stone is ubiquitous across the diverse landscapes of the American continent. From monumental architecture and rock art to groundstone tools and sculpted effigies, stone has long been a medium through which human and non-human relations are articulated, maintained, and transformed. Scholarship has long recognised the central role of lithic materials in Indigenous ontologies, cosmologies, and territorial practices across the Americas, a perspective that has gained renewed attention in recent years. Echoing broader archaeological debates on lithic animacy and mineral ontologies, this session seeks to foreground the diverse ways in which stones participate in social, ritual, and ecological worlds. We invite contributions that explore the multiple agencies of stone – its affordances, transformations, and relational capacities – through material, visual, and ethnographic evidence. How have different communities perceived, engaged with, and cared for stony substances? What can the study of material engagements—through archaeological, ethnohistorical, and Indigenous perspectives—reveal about the intertwined lives of people and stones in shaping places, identities, and cosmologies? By bringing together case studies from across the Americas, this session aims to foster a comparative and cross-temporal dialogue on "stone worlds." In doing so, it seeks to widen current perspectives in material culture studies by integrating Indigenous epistemologies, ontological approaches, and material sensibilities into archaeological inquiry.

We welcome papers addressing lithic technologies, sculptural traditions, rock art, ritual landscapes, and theoretical reflections on material animacy and relationality.

CONTRIBUTION ABSTRACTS

1669. The ontology of architectural stone at two ancient Oaxacan cities

Authors: Arthur Joyce (University of Colorado Boulder)
Format: Oral

This paper explores the ontology of architectural stone in ancient Oaxaca, Mexico, by reading Indigenous Mesoamerican perspectives through new materialism. I focus on two ancient cities: Monte Albán in the Oaxaca Valley, and Río Viejo in the lower Río Verde Valley. I consider the physical and semiotic properties of stone to examine the ways in which stone afforded and constrained human projects in both regions. The monumental center of Monte Albán was its Main Plaza complex, which was built on a mountaintop in the center of the valley. From its founding, if not before, evidence indicates that the Main Plaza was a powerful Mountain of Creation connected in Mesoamerican cosmology to rain, agricultural fertility, sacrifice, creation, and the divine. The monumental center was largely built from stone quarried from the mountain itself, thereby merging sacred mountain and monument, while the undulations of the mountaintop afforded the architectural verticality that dominates the plaza. In addition, the sedimentary bedrock from which building materials were quarried afforded the manufacture of stone masonry. In contrast, the monumental center at Río Viejo was located on its massive acropolis built in the floodplain of the Río Verde. Although two hills on the eastern end of the site provided stone, the hardness and density of the granitic rock made the quarrying, transportation, and working of stone more challenging than at Monte Albán. Instead, the people of Río Viejo relied primarily on earth from the floodplain to construct their ceremonial center. Rather than a sacred mountain, the acropolis was closely connected to the river and its fertile floodplain through its construction materials and because it was largely surrounded by the floodwaters of the Verde during the rainy season. The materiality of both monumental centers therefore converged in different ways on fundamental aspects of Mesoamerican cosmology.

1702. Growing Stone: Learning and Caring for Stone in Contemporary Maya Artisanal Practices

Authors: Celine Gillot (University of Montreal) – Guadalupe Tamay Camal (Independent artisan-researcher)
Format: Oral

Archaeological and ethnographic scholarship has long approached materials as entities whose properties can be identified, measured, and used for classification. While such analytical approaches remain central to the study of crafted objects and technical traditions, they offer limited insight into how materials are learned, perceived, and engaged. This contribution examines how stone, in certain contexts, can be understood not as a material defined by fixed properties, but as one that undergoes transformation through processes, temporalities, and forms of attention often associated with living entities. Informed by the perspective of a Yucatec Maya stone artisan, the paper focuses on ways of knowing stone shaped through experiential and analogical learning rather than formal apprenticeship. It shows how sustained experimentation with stone, coupled with analogies drawn from agricultural practices and close observation of the surrounding environment, produces a regime of knowledge in which stone properties become perceptible, workable, and transformable. Within this regime, stone is not merely extracted or worked; it is also cared for and placed within conditions that allow it to change over time and, in some cases, to grow. Foregrounding the situated and relational nature of stone knowledge, this paper illustrates how what might be described as a lithic ontology emerges through practice rather than through an explicitly articulated belief system. Without projecting this case onto the past, it invites reflection on how some stone-related practices may have involved forms of attention and care prior to extraction, shaping, or use. More broadly, it asks how taking such modes of engagement seriously might expand archaeological ways of thinking about the relational processes through which lithic materials became known.

750. Stone Producers and Stone Ontologies in the Maya World: Investigating the Role of Animacy on Flaked Stone Tool Production

Authors: Rachel Horowitz (Washington State University) – M. Kathryn Brown – Jason Yaeger (University of Texas at San Antonio) – Bernadette Cap (San Antonio Colleges)
Format: Oral

Among the Classic period Maya stone was considered animate and to have personhood. While the personhood of stone is widely understood by scholars, the impact that this personhood and animacy had on flaked stone tool producers is less well understood and less studied. Here we draw on data from excavation at multiple lithic production workshops in the Mopan Valley, Belize, to investigate the role of animacy in how lithic producers made and lived with this material. In the case studies discussed here, lithic producers lived literally on top of the production spaces, meaning that they had a unique interaction with the toolstone. We draw on evidence of ritual practice in household workshops, including caches and burials, as well as ethnographic and ethnohistoric documentation of stone tool producers relationship with stone, to discuss the impact that the animate nature of lithic toolstone had on flaked stone tool producers. We focus particularly on the relational aspect of animacy and how flaked stone tool producers may have had unique relationships with toolstone.

251. Mineral life: reconsidering the boundaries of the lithic in ancestral Honduras

Authors: Rosemary Joyce (University of California, Berkeley)
Format: Oral

In recent work grounded in new materialist ontological thinking and engagement with indigenous Lenca perspectives, I moved to reconsider the inanimacy that modern archaeology attributes to stony materials, specifically obsidian and marble. This exploration was intended to question arbitrary boundaries imposed between the inanimate and the animate, showing that mineral matter engages in activity often at a pace that may seem imperceptible to the fleeting human observer. At the same time, the more I delved into the long-term and slow temporalities of geological emergence, alteration, and weathering that affected these entities, the more boundaries blurred, with mineral matter showing its capacity to act abruptly, in highly visible ways, in intra-action with assemblages of other entities that often resulted in mixtures of what today would be considered inorganic and organic matter. This paper returns to two of the more evocative and somewhat unexpected examples of this kind of inorganic activity, copper and lime, to again try to follow a truly monist ontology of becoming in ancient Lenca thought and action.

117. When sculptures are absent. Notes on substitution and process ecology in the context of central Nicaragua

Authors: Alexander Geurds (Leiden University | University of Oxford)
Format: Oral

This paper analyzes 'worlds of stone', specifically in the Chontales region of central Nicaragua, through the theoretical lens of P-Arch, which explores how stones can function as active participants within ritual landscapes as opposed to being passive substrates for representation. Connecting with the key concepts of ontology, materiality, stone monuments, and ritual landscapes, I propose to see "sculpture" and "rock art" as similar processual stabilizations within an ecology of marked and worked stone. Empirically this argument is supported through contexts around the city of Juigalpa, and the Aguas Buenas site, where extensive mound building and petroglyph production occurred on exposed bedrock, also including examples of carved stone incorporated into mound construction materials. As opposed to viewing variability in media (e.g., free standing sculpture, carved outcrops, petroglyph bearing construction stones) as a typological problem, I view it as a relational distribution of lithic agency: stones, through their affordances, visibilities, portabilities, and placements, enable diverse forms of care, encounters, and territorial practices, possibly consistent with Indigenous ontological emphases discussed in this symposium. Instead of considering "absence of sculpture" as an absence, I am viewing this as a positive process indicator; where the bedrock is rich in marks and near the surface, lithic affordances can possibly shift the place of figuration from portable/erected monolithic objects to in situ surfaces and thereby reconfigure how stones are involved in identity, memory and ritual landscape formations.

170. Working Stone, Shaping Place: Petroglyphs and Other Lithic Engagements in Southern Costa Rica

Authors: Kim Ruf (University of Oxford)
Format: Oral

Southern Costa Rica is home to several hundred petroglyphs carved into a diverse range of stone forms, including shaped barrels or seats, spheres, pillars, and minimally modified boulders. These stones bear anthropomorphic, zoomorphic, and geometric motifs that have traditionally been approached through stylistic classification and iconographic interpretation. While such studies have generated important insights, they often treat stone primarily as a passive surface for imagery rather than as an active participant in social and ritual life. This paper presents an ongoing, multi-year research project that approaches petroglyphs as engagements with stone worlds, focusing on the selection, working, and emplacement of lithic materials within pre-Columbian archaeological landscapes of Costa Rica's southern zone. Drawing on initial fieldwork, the study examines how particular stones were chosen for carving, how degrees of modification varied, and how petroglyph-bearing stones relate to topography, movement, visibility, and other material features. Rather than privileging motif meaning alone, the project considers stoneworking as a situated practice through which human-stone relations were enacted and sustained. This contribution outlines the project's conceptual framework and methodological approach. It frames petroglyphs not simply as carved images but as outcomes of sustained engagements with stones and places. Focusing on locally situated stoneworking practices, the paper offers a material-centred perspective on lithic engagements. It examines how carved rocks contributed to the creation of places and the relationships between human and other-than-human agents in southern Costa Rica.

253. Life history of jade lapidaries: involvement in society, rituals, and ecological worlds in pre-Columbian Costa Rica

Authors: Waka Kuboyama-Haraikawa (Tohoku University)
Format: Oral

Pre-Columbian Costa Rica developed a jade lapidary tradition between 500 BCE and 900 CE, which is considered evidence for the rise of social inequality and specialization in the region. Celtiform pendants are among the most recurrent motifs in Costa Rican jade lapidary production and are characterized by skillfully decorated human or animal figures carved on the poll of a celt. This presentation focuses on the human–object–human communication that developed between the craftspeople and the owners of celtiform pendants and highlights the social significance of acquiring jade lapidary objects. The material evidence suggests that these pendants played important roles in ancient society as symbols of status and as objects involved in ritual activities. The life history of celtiform pendants reflects distinctive human behaviors such as intentional fragmentation, imitation, reuse, and reworking, through which knowledge, skills, and materials were applied to meet social demands and shape the object. Furthermore, raw material procurement and pendant production processes were strongly influenced by the ecological environment. The quality of the finished product, the techniques required, and the quantity of objects that could be produced depended on the availability of raw materials. Celtiform pendants have often been interpreted as prestige objects; however, this paper argues that not all celtiform pendants should be classified within a single category. Rather, each pendant embodied different social values and roles. It can be proposed that the widely shared material culture represented by celtiform pendants contributed to maintaining social cohesion among different cultural groups in pre-Columbian Costa Rica.

78 DECORATIVE PRACTICES IN THE ROMAN WORLD: NEW PERSPECTIVES ON MATERIALITY, FUNCTION, AND MEANING

Theme: 1. Widening perspectives in material culture studies
Organisers: Daniela Martins (University of Algarve | University of Murcia) – Gonzalo Castillo Alcántara (University of Valencia) – Gil Vilarinho (University of Évora) – Alberto Villarejo De Torres (University of Sevilla)
Keywords: Architecture, Roman Period, Archaeometry, Decorative Techniques, Aesthetics, Virtual archaeology
Format: Regular session

SESSION ABSTRACT

Decoration comprised a key aspect of how the Romans shaped, perceived, and inhabited their environments. From the painted walls to the patterned floors of domestic and public buildings, decorative systems structured visual experience, mediated social interactions, and materialised cultural values. Yet despite its ubiquity, Roman decoration has often been treated as an aesthetic backdrop rather than as an active participant in the making of meaning. Bringing together archaeology, art history and particularly an interdisciplinary approach to material culture, and by foregrounding the active role of materials – plaster, pigment, marble, glass, and metal – in the creation and transformation of decorated surfaces, this session aims to address how decorative practices articulated relationships between form and function, surface and structure, and ornament and object. We are particularly interested in research that explores diverse contexts – from domestic interiors and urban façades to ritual settings and reused architectural fragments – to examine how decoration mediated relationships between people, things, and spaces. This session thus reexamines decoration as a complex field of practice in which materials, techniques, and contexts intersect to produce social and aesthetic effects, aiming to address topics such as the sensory perception of decorated spaces, the material and technical choices of artisans, and the shifting roles of decoration in processes of reuse and recontextualization. Collectively, these studies highlight decoration as a dynamic medium through which Romans negotiated identity, value, and experience across different regions, inviting new theoretical and methodological approaches to one of the most pervasive yet understudied aspects of the Roman world.

CONTRIBUTION ABSTRACTS

749. The use of preparatory traces in Roman wall painting: Examples from Lusitania

Authors: Daniela Martins (University of Algarve | University of Murcia) – Gonzalo Alcántara (University of Valencia) – Débora Rodríguez (University of Coimbra)
Format: Oral

Roman wall paintings, like architecture and other artistic expressions of the same period, were executed according to well-defined rules and aesthetic canons. The techniques behind the production of such works are extensively described by classical authors, and their material expressions can still be recognized today through macroscopic and microscopic analysis of the archaeological evidence. These investigations continue to reveal both the precision and the variability inherent in the application of ancient decorative practices. The use of preparatory traces, whether incised, painted, or scratched, represents a fundamental step in the planning and execution of roman wall decoration. While this aspect has been increasingly documented in various contexts of the Roman world, its study within Lusitania remains comparatively limited. This paper aims to present a synthesis of the known evidence for preparatory traces in Lusitanian wall paintings, focusing on various examples from Mérida, Évora, Faro, and Conimbriga. By examining the nature, frequency, and distribution of these traces, the study seeks to identify possible technical patterns, regional divergences, and shared practices that may reflect the circulation of workshop traditions and/or the influence of regionalist models. Ultimately, this analysis contributes to a broader understanding of the organization of painting workshops in the western provinces and their relationship to the artistic and cultural networks of the Roman Empire.

285. Textiles and furs in Roman wall painting: evolution and transmission of a decorative fashion

Authors: Gonzalo Castillo Alcántara (University of Valencia) – Daniela Santos Martins (University of Algarve | University of Murcia)
Format: Oral

The representation of elements of luxury and prestige in Roman pictorial ornamentation remained a constant feature from the emergence of decorative styles and, in many cases, continued in use until the end of the Empire. However, certain motifs and decorative elements that we can include in this group, such as marble imitation or metallic objects, have attracted more attention from researchers than other ornamental resources. This proposal aims to analyze a specific type of representation, as textile and stretched fur motifs, to delve into the appearance and evolution of these elements in Roman painting. The objective is to assess how they adapted and transformed over time and whether these models are influenced by the decorative fashions of their period. Although their use is attested in classical sources, such motifs are not equally represented in the archaeological record, making this a topic that still lacks a coherent synthetic study. This search therefore seeks to compile the extant evidence in order to analyze its technical, archaeo-architectural, and chronological implications.

741. Wall painting in the roman houses of Italica

Authors: Maria Teresa Velazquez Guerrero (Universidad Pablo de Olavide de Sevilla) – Gonzalo Castillo Alcántara (Universidad de Valencia) – Pedro López Vázquez (Universidad Pablo de Olavide de Sevilla)
Format: Oral

Recent advances in the study of domestic architecture in Italica have provided numerous new insights into the understanding of these buildings. Among them is the documentation of previously unpublished examples of wall painting associated with private houses. Some of these derive from recent fieldwork, as in the case of the Casa de la Cañada Honda and the Casa de la Exedra. Others come from the archival holdings of the Archaeological Ensemble of Italica and from private collections, including wall painting fragments from the Casa de los Pájaros, the Casa de las Tabernas, and other domestic buildings. The analysis of the available evidence allows for a reassessment of what was previously known about Roman wall painting in Italica, expanding the number of documented examples and enriching the study of domus decoration. Consequently, based on the results obtained, this paper offers an evaluation of the pictorial decoration of the houses of Italica within the broader context of residential architecture in the Roman Empire during the second century AD.

23. On clipei and caryatids in Colonia Patricia (Córdoba). Evidence from the collections of the Archaeological Museum of Córdoba

Authors: Álvaro Castillo Arteche (Universidad de Córdoba)
Format: Oral

The attic story, generally composed of a series of clipei and caryatids, is a decorative element that gained great popularity from the Augustan period onwards, particularly as decoration for porticoes in public plazas or precincts linked to imperial power. In the capital, Rome, there are two paradigmatic examples of this decoration: the Forum Augustum and, according to recent studies, the Templum Pacis. This model was exported to the provinces, undergoing significant development in the provincial capitals of Lusitania and Tarraconensis, Augusta Emerita (Mérida) and Tarraco (Tarragona), where some of the best-preserved examples of this architectural typology can be found. To date, the only evidence of clipei in the city of Colonia Patricia (Córdoba) was a small, little-studied marble fragment of unknown provenance and location. Thanks to an exhaustive search in the storerooms of the Archaeological Museum of Córdoba, we present three marble fragments, one of them unpublished, that attest to the existence of at least two different Flavian-era attics decorated with clipei and caryatids. In essence, the study presented here has allowed us to reassess and redefine the architectural decoration of two different settings in the city of Colonia Patricia based on the analysis of fragmentary materials, which are frequently overlooked by traditional scholarship.

164. Mosaic decoration in Colonia Patricia Corduba. A descriptive analysis, parallels and functionality

Authors: Alberto De Torres (Universidad de Sevilla)
Format: Oral

The mosaic wealth of the capital of the Roman province of Baetica, Colonia Patricia Corduba, is evident in the abundant number of mosaics recovered in archaeological excavations, which, over the last sixty years, have contributed decisively to the knowledge and development of Cordoba's archaeology. These floors, documented mainly in domestic contexts, are an essential source for the study of the architecture, decoration and spatial organisation of Roman Cordoba. This work, which forms part of our doctoral thesis, aims to present some of the results of the most recent studies on Roman mosaics in Colonia Patricia Corduba, integrating new archaeological interpretations and methodological revisions. To this end, it addresses the formal reconstruction of the preserved pavements, as well as the hypothetical restoration of the lost areas, based on the analysis of parallels and compositional schemes. Likewise, a detailed study of the geometric and iconographic composition of the mosaics is carried out, taking into account their

spatial arrangement and their relationship with the architectural areas to which they belong. All of this allows us to advance in the functional interpretation of these pavements and in the identification of decorative influences from other territories of the Roman Empire, thus contributing to a better understanding of the mosaic phenomenon in southern Hispania.

2154. The Hypogeum of San Salvatore, Cabras (OR), Sardinia, Italy

Authors: Nicoletta Camedda – Ilaria Orri (Fondazione Mont'e Prama) – Paola Derudas – Nicolò Dell'Unto – Danilo Campanaro (Lund University) – Anna Galli (Università degli studi di Milano-Bicocca) – Michele Caccia (Institute of Bioimaging and Complex Biological Systems, IBSBC-CNR) – Luca Cheri – Anthony Muroni (Fondazione Mont'e Prama)
Format: Oral

The mission of the Mont'e Prama Foundation is to preserve and foster the archaeological sites in the Archaeological Nature Park of the Sinis Peninsula, on the central-western coast of Sardinia. One of the archaeological sites managed by the Foundation in this area is the Hypogeum of San Salvatore, which is the subject of the present discussion. The Hypogeum is a subterranean structure built in the 4th century CE, consisting of five rooms: two overlook an entrance corridor, while the other three are arranged around a circular space, at the center of which is a well. The centrality of water, which has always been seen as an element of worship, invites to reflect on its importance. The importance and originality of the structure are closely linked to the presence of charcoal drawings on the walls, dating from the 4th century AD onwards. The depictions, executed with varying characteristics and levels of quality, sometimes display a remarkable refinement, suggesting that they may have formed part of a deliberately planned decorative scheme; in other cases, they appear cruder and represent a wider range of subjects. Among the highest-quality images, two scenes stand out: the marriage of Mars and Venus, and the struggle between Hercules and the Nemean Lion. The simpler representations, arranged in a disorderly manner and often overlapping, are instead interpreted as ex-votos left by visitors to these spaces. The aim of this discussion is to gather attention on the iconographic elements of the Hypogeum, namely on the connection between water and the characters depicted on the walls. Although this topic has been addressed occasionally and discontinuously in recent years, current research now benefits from advanced technologies that have enabled detailed photographic mapping of the walls, thus providing new interpretations and stimulating further reflections on the figurative apparatus and its meaning.

1447. Tabula Picta and Roman Decoration: From Painted Panels to Decorated Architecture and Writing Surfaces

Authors: Fangfang Tian (Sapienza Università di Roma)
Format: Oral

From writing to painted panels and architectural decoration, Romans treated materials and surfaces in very different ways: some marks could simply be erased, while other images and decorative work were treated as part of the building. Choices of material and technique were not only matters for craftsmen, they also shaped how the law decided which part would be regarded as the principal. The painted panel (tabula picta) reflects central Roman ideas about decoration and value. Some jurists, like Paul, said that the wooden board was the main thing. Others said that if the painting was a real masterpiece, then the painting should be the main thing and the board only secondary. Justinian finally took the side of the image, saying it was absurd to treat a painting by Apelles or Parrhasius as a mere accessory to a cheap wooden board. This marked a clear shift: a decorative image could override its support and become the object itself. For the situation of buildings, jurists discussed fixed decoration such as wall-paintings, marble facings and house statues. Pomponius and Labeo treated these as accessories, but Papinian argued that once art is fixed to the wall it is part of the house itself, not an accessory. The garden frescoes from the Villa of Livia at Prima Porta, show this clearly: they were inseparable from the room and seen as part of the architecture. On writing, Gaius sums up the view: letters, even if written in gold, were thought to follow the papyrus or parchment. The reason might be considered cost and value - writing itself was relatively cheap, while the material support was more expensive. Taken together, writing, painting and architectural decoration show that Roman decoration could be absorbed into buildings, become the main object, or remain a functional surface.

2694. Advertising In Ancient Pompeii: Visual Marketing in Food and Drink Outlets

Authors: Massimo Betello – Mencia Casas Neo – Sebastian Terrazas – Emma So (John Cabot University)
Format: Oral

The visual presentation of food outlets in the Roman world has been subject to limited research, with publications mostly providing general descriptions of their shop signs and decorations. This evidence is often presented in simplistic ways, assuming that marketing strategies and visual messages functioned in antiquity as they do today. This paper focuses on shops selling ready-to-eat food in Pompeii. These businesses targeted customers from the streets, placing their service counters by their entrance(s) to allow for easier access and better visibility. The high volume and density of these establishments suggest an elevated degree of competition among them. Through the study of the decorations and images placed on these businesses' frontages, it is possible to inquire whether visual methods were used to attract customers, functioning as early forms of advertisement. Semiotic analysis helps understand the signs and symbols activated by the viewers, while a spatial evaluation of the display allows to identify how they functioned to attract prospective customers. External factors such as street infrastructure and pedestrian traffic flows are also considered. Furthermore, this study applies modern marketing theory and psychology to classify these displays as advertisements. This variety of methods

enables a nuanced analysis of several popinae. The results reveal instances of deliberate use of visual devices to maximize profit by attracting pedestrians, but also a lack of decoration in streets with higher density of foot-traffic - that is, potential customers. These conclusions align with modernizing approaches to Pompeiian economy, suggesting that bars did not operate on a simple subsistence level. Furthermore, it seems that these practices were heuristic, created and reproposed through trial and error, without formal study of the best advertising methods. Finally, this study shows how interdisciplinary approaches to decorative practices help understand ancient systems such as the Pompeian economy, society, and behavioral codes.

583. Gold on silver. Decoration in Roman mail and scale armour

Authors: Martijn Wijnhoven (Institute of Archaeology of the Czech Academy of Sciences, Brno)
Format: Oral

This contribution provides an overview of the decorative techniques used in Roman body armour, with a focus on mail and scale armour, which often exhibits structural similarities to contemporary clothing. Although functionality was paramount in Roman military equipment, decoration also played a significant, yet frequently overlooked, role, even in armour designed for combat. Mail armour, composed of interlinked iron rings, often incorporated copper alloy rings to create patterned effects ranging from simple borders to complex geometric designs. Likewise, scale armour, consisting of metal or bone scales attached to a textile backing, exploited material contrast. While mixtures of iron and copper alloy scales are attested, a more common technique was the selective tinning of copper alloy elements to produce striking contrasts between silvery and golden hues. Decoration reached its zenith in the 2nd and 3rd century AD with the integration of front-opening chest plates into mail and scale shirts. These plates were often embossed, engraved and selectively tinned to concentrate visual impact at focal points on the body. By focussing on materials, techniques and surface treatments, this paper argues that Roman mail and scale armour were part of broader decorative practices that blurred the distinction between clothing, ornaments and military equipment.

377. Roman Wall Painting in Jordan: Past Research and New Directions for a Unique Case in the Mediterranean Oikoumene

Authors: Elena Cantero Ros (University of Groningen)
Format: Oral

In recent decades, the corpus of painted plaster evidence coming from the Hashemite Kingdom of Jordan has significantly increased. Located at the edge of the Limes Arabicus, wall paintings from the Roman period have appeared in contexts ranging from the funerary to the domestic sphere, and from the Nabatean South to the profoundly Hellenised North. Despite the unique cultural interplay and its importance for the understanding of visual culture in antiquity, a consistent overview of the toichographological research to date is still missing. Moreover, the emergence of novel analytical approaches in archaeological science is being slowly implemented, decentering images and allowing for new research into craft organisation, trade and resource management. Therefore, this work aims to provide an overview of the current state of the art on painted plaster in the Jordanian territory. The iconographical evolution of the craft will be evaluated, highlighting the diversity of archaeological contexts as well as the impact of cultural influences native to the Transjordan. Finally, this work will introduce new archaeometrical research pioneered by the University of Groningen in collaboration with the German Protestant Institute of Archaeology in Amman and the Cultural Heritage Agency of the Netherlands.

1434. Adornment and Elite Display in Late Antique Sagalassos: Glass Beads in Urban Mansion

Authors: Eylül Oral (İhsan Doğramacı Bilkent University | Sagalassos Archaeological Research Project)
Format: Poster

Located in the Taurus Mountains of Western Anatolia, the ancient city of Sagalassos, was an important urban centre of the ancient Pisidia region from the Hellenistic period to the Late Antique period. The assemblage of glass beads from the Urban Mansion, elite residential building, of the city shows new findings for the elite identity display through personal adornment, that challenge the narrative of elite identity display and the use of precious metals, particularly gold. This study, based on the material, typological, and production technique classification of 55 beads found in the domestic area of the ancient city, questions the relationship between the display of elite identity and precious materials in the conventional archaeological literature. Preliminary analysis, considering the display of elite identity in the ancient city of Sagalassos together with the sociological and economic conditions of the Late Antique period, suggest that the elites residing in the Urban Maison may have used glass beads, made using a special technique, as a substitute for precious materials such as gold or pearls.

1644. Marble decorative elements in Aquincum (Budapest): provenance and use/usage

Authors: Anita Polgár-Nyerges (Budapest History Museum) – Judit Zöldföldi (University of Stuttgart | Miss Marble) – Bernadett Bajnóczi (HUN-REN Research Centre for Astronomy and Earth Sciences)
Format: Poster

Aquincum, the provincial capital of Pannonia Inferior (from AD 106), was situated at the most important crossing point of the Pannonian Danube frontier. Aquincum flourished until around the middle of the 3rd century AD; several richly decorated public and private buildings are known from the 2nd and 3rd centuries. In addition to the use of mosaic floors to decorate buildings, expensive marble slabs were also used to enhance the splendour of the interiors. Imitations of this decoration often appear on the plinths of wall paintings. The studied fragments of marble used to decorate buildings can be found in the collection of the Aquincum Museum (Budapest). The finds show a varied picture, with fragments of different shapes and colours. We were able to separate fragments of large slabs, small and coloured framing fragments, and fragments of profiled door and window frames. The aim of the research was to identify the possible provenance of the raw materials and to compare the results with those of previous investigations conducted in Aquincum and Pannonia. The research has been provided valuable data and additional information on the study of Roman marble quarrying, processing and transportation. Some of the white marbles came from the eastern Alps in the direction of Noricum. There is also a large presence of white (e.g. Proconnessos, Thassos) and polychrome marbles (e.g. cipollino verde, verde antico, breccia corallina, pavonazetto, greco scritto) from the Mediterranean region, which clearly shows that Aquincum had access to the main marble trade networks of the 2nd–3rd centuries AD. To determine the exact sources of the raw materials, in addition to non-destructive in situ measurements (MGS /Maximum Grain Size/, Raman spectroscopy, XRF /X-ray fluorescence spectroscopy/), thin section petrographic and stable isotope analyses were carried out.

2729. Decorative stone and architectural display at the Late Roman site of Santa Vitória do Ameixial (Estremoz, Portugal)

Authors: Gil Vilarinho (University of Évora)
Format: Poster

This paper presents a study of decorative stone employed within the architectural programme of the Roman villa of Santa Vitória do Ameixial, examining how ornamental stone materials contributed to visual display and the articulation of domestic space in a high-status rural residence. The villa, which has been the subject of over a century of archaeological excavations and is situated in proximity to one of the most significant marble quarrying areas of the region in antiquity, provides an important case study for understanding the material construction of elite environments in Late Roman provincial contexts. The analysis is based on stone fragments from wall revetment, pavements and architectural detailing recovered from archaeological contexts. These materials are examined to assess their provenance and aesthetic properties—colour, veining and carving—which were fundamental to their decorative function. Although the majority of the assemblage consists of white marble, the notable presence of painted polychrome elements indicates a more complex and visually developed decorative scheme. Contrasting the archaeological contexts and architectural associations of these materials permits an assessment of their spatial distribution and functional deployment within the villa. The evidence demonstrates that decorative stone was not applied uniformly throughout the site but was instead concentrated in architecturally and socially significant areas. Through the deliberate manipulation of material diversity and colour contrasts, stone decoration contributed to the creation of hierarchised and visually differentiated settings, reinforcing distinctions between more private and more public zones within the complex. Ultimately, the use decorative stones at Santa Vitória do Ameixial reflects sustained investment in the aesthetic elaboration of the built environment and illustrates how material resources were mobilised to convey cultural refinement and social standing within the framework of Late Roman rural elite architecture.

79 BURIALS OF PROMINENT WOMEN IN PREHISTORIC SOCIETIES: THE ARCHAEOLOGY OF SOCIAL INEQUALITY AND THE FEMALE WORLD

Theme: 1. Widening perspectives in material culture studies
Organisers: Jan Turek (Center for Theoretical Study, Charles University, Prague) – Agnieszka Przybyl (Institute of Archaeology, University of Wroclaw) – Petr Krištuf (Department of Archaeology, Umiversity of West Bohemia in Pilsen)
Keywords: Elite female burials, Gender archaeology, Mortuary symbolism, Social inequality, Multi-proxy contextual analysis
Format: Regular session
Affiliation: Archaeology and Gender in Europe - AGE

SESSION ABSTRACT

Burials of prominent women occur in many prehistoric cultures worldwide. Over recent decades, the debate about the social significance of this phenomenon has undergone substantial change. Elaborate funerary constructions and monuments, as well as exceptional and richly furnished burial assemblages, are increasingly interpreted as expressions of individual identity rather than merely manifestations of established power structures and social hierarchy. In contemporary gender archaeology, exceptional female burials are no longer viewed solely as appendages or reflections of male power. In some societies, social power associated with notable women was conveyed through traditionally male warfare prestige objects; in others, a woman's social standing in the funerary ritual was signified by specifically feminine artefacts, distinguished by their quantity and high social value. Recent research favours multi-evidence, contextualised and theoretically informed readings that permit a range of roles for elite women as political actors, ritual specialists, lineage agents, or symbols of social reproduction. The mortuary material of many forms can be used in order to approach a more nuanced past, including how gender may have interacted with other social determinants to create identities. Recent feminist and gender theory have shifted interpretations away from binary, essentialist readings towards models that regard gender as relational, performative and entangled with age, kinship, ideology and political economy. This session invites discussion of the variability of funerary symbolism in exceptional female burials across a broad temporal and geographic framework.

542. Burials in Bytes – Exploring Early Neolithic Gender Identities Through Quantitative Methods

Authors: Yanik Hahnekamp (University of Vienna, Department of Prehistoric and Historical Archaeology)
Format: Oral

Recent investigations of Early Neolithic grave fields in Central Europe and beyond reveal dynamic and complex mortuary practices, suggesting non-synchronous social and funerary developments across the Linear Pottery Culture (LPC) distribution area. Gender identities and relations receive particular attention, including questions of female mobility, sexual differentiation, and whether systems disadvantaging women can be identified in burial evidence. This presentation addresses these issues through key results from a doctoral thesis titled "Burials in Bytes: A Quantitative Study of Linear Pottery Culture (LPC) Cemeteries." The study applies a range of theoretical models of social identity and social structure to the quantitative analysis of selected LPC grave fields. The dataset comprises approximately 1,550 archaeological features and their associated contents, systematically categorized according to pit types, anthropological data, body position, grave goods, elements of dress, and other attributes. These data were examined using multiple methods, including correspondence analysis, seriation, and spatial distribution mapping, to identify patterns in the funerary treatment of individuals and relationships between graves. The results support previous interpretations by demonstrating marked differences in funerary practices across and within regions, while also highlighting variation and supraregional trends in the treatment of the sexes. A series of case studies presents exceptional female graves and illustrates how LPC communities across Europe may have enacted diverse versions of lifeways, gender identities, and social organization.

2016. Did Princesses Live in the Copper Age? Rethinking Elite Female Burials from the Present-Day Poland

Authors: Stanislaw Wilk (The Karkonosze Museum in Jelenia Góra) – Marek Nowak (Jagiellonian University in Kraków, Institute of Archaeology)
Format: Oral

The Early Copper Age (Eneolithic) in south-eastern and central Europe is widely associated with accelerating social and ideological transformations, including the emergence of new forms of inequality that are often inferred from mortuary evidence. While discussions of "elite" status have long focused on male graves richly furnished with weapons and metalwork - often treated as straightforward evidence of hierarchy - prominent female burials, marked by abundant ornaments of copper, gold, shell, and stone, invite more nuanced interpretations that foreground identity, gendered symbolism, and the relational construction of status. Building on recent debates in gender archaeology, this presentation offers a contextualised, multi-proxy study of richly equipped female graves from the territories of present-day Poland (notably Lesser Poland, Lower Silesia, and Kuyavia). These territories have often been framed as peripheral to the metallurgical "core" of the Carpathian Basin and the Balkans; however, evidence points to close interactions, i.a. through the circulation of copper objects and other prestige goods. We combine cultural and chronological contextualisation with bioarchaeological observations and a comparative mortuary approach to evaluate how exceptionally rich female graves relate to other burials, including richly equipped male and child graves within the same communities. Particular attention is paid to the typological and chronological placement of copper artefacts, as well as to available provenance data for the metal. Our aim is to test (i) whether female "wealth" reliably indexes elite social rank, or whether some assemblages instead materialise specific roles (e.g., lineage agents, ritual specialists, or symbols of social reproduction), and (ii) whether female prominence was expressed through gendered forms of value rather than merely reflecting male power structures. The study is conducted within the Mysterium Magnum – The Origins of Metallurgy in Central Europe project, funded by the International Visegrad Fund.

2516. A Corded Ware Female Burial with Arrowheads: Gender, Memory and Engagement within a Monumental Landscape

Authors: Agnieszka Przybyl (Institute of Archaeology, University of Wrocław) – Agata Hałuszko (Institute of Archaeology, Maria Curie-Skłodowska University) – Marzena Cendrowska (University of Bergen)
Format: Oral

Archaeological excavation can sometimes lead to surprising results: what appears obvious initially may prove less straightforward upon closer inspection. This presentation describes a case of precisely this kind: a surprising discovery of a female burial of the Corded Ware culture (CWC) inserted into the monumental mound of a Funnel Beaker culture (FBC) long barrow, recorded at site Muszkowice 18 (Lower Silesia, Poland). It illustrates how the earlier long barrow mound functioned as a pre-existing monumental landscape, whose prestige, memory effects, and authority were reactivated by the intrusive CWC burial. Crucial to the presented example is a female individual interred with arrowheads. This is the opposite of the usual male-coded patterns seen in CWC funerary symbolism. This unusual pairing of sex and artefacts may be interpreted as a statement crafted to perform status, affiliation, or role in a highly visible mortuary context. The presentation examines how gendered identities could be assembled in death, and how this assemblage made the woman materially "prominent": clearly recognisable and socially empowered within the ritual landscape. By setting this burial within the context of regional instances of CWC engagements with earlier barrows, the presentation argues that the case illustrates a gendered form of interaction with a monumental topography. In this mode, the visibility and prominence of this woman were negotiated not only through her body and artefacts, but also through her strategic placement in a sacred space. In doing so, it contributes to the debate on prominent women, as well as commemorative practices within a monumental landscape and strategies of social remembrance in the Late Neolithic. This research was supported by the National Science Centre, Poland (NCN), projects No. 2017/25/B/HS3/01442 and 2024/06/Y/HS3/00071.

827. More teeth, more power? Elite burials of Corded Ware women and their social significance

Authors: Petr Kristuf (University of West Bohemia in Pilsen) – Jan Turek (Charles University)
Format: Oral

A highly distinctive marker of high social status in female burials of the Corded Ware period in Bohemia (specifically) is the presence of rich decorative jewellery assemblages. These include necklaces made from perforated shell beads, pectorals, and garment and accessory adornments composed of perforated animal canines. One of the richest female burials of this period in Bohemia is the Prague-Čimice burial. Its wealth derived from a suite of necklaces comprising 1,435 pearl rings. The rings measured approximately 6–13 mm in diameter and were manufactured from freshwater shell. Additional necklaces consisted of 194 perforated animal teeth, principally dog canines, but also from domestic pig and sheep or goat, as well as from small carnivores such as foxes and wild cats. This assemblage was further supplemented by 36 bone imitations of dog canines. Similar finds occur at Sulejovice (258 teeth, Litoměřice District), Prague-Březiněves (595 teeth), and more recently in a ring-ditch grave with a palisade surrounding a barrow at Račiněves (ca. 30 teeth, Litoměřice District). Such graves may also contain rare copper-wire ornaments and shell discs decorated with solar motifs of concentric circles and a cross. These are unequivocally graves of the social elite of the period. The monumental funerary architecture likewise suggest the exceptional status of the deceased woman, since the central positions within circular ditches were predominantly reserved for men assembled with battle-axes. It should be emphasised that elite female Corded Ware burials were typically accompanied by distinctly female funerary assemblages, whereas gendered mixing occurs only after the mid-3rd millennium BC, evident in some Bell Beaker female burials that include elements of archery equipment and copper daggers. Important women of the Corded Ware horizon were thus represented by artefacts with unequivocally feminine gendered connotations, and the opulence of their shell and canine pendants confirmed their high social status.

2025. Beyond brides: women's role in shaping the third millennium BCE

Authors: Louise Olerud (Faculty of Archaeology, Leiden University)
Format: Oral

Current scholarship about Northwestern Europe in the third millennium BCE strongly emphasises male agency. This period is considered a time in which much cultural and social change takes place: ancient DNA studies suggest that male migrants from Eastern Europe brought in Indo-European language and culture, as well as a 'male-dominant', patriarchal society. Even though stable isotope studies show that particularly women were highly mobile in this period, this mobility is typically interpreted as a passive form of female exogamy in which women were imported as brides by men (fathers, husbands) to uphold alliances. The active agency of the women themselves, or even the knowledge that these women would have brought from faraway places, is typically not acknowledged. Through network analysis of female graves and their – sometimes quite rich – assemblages, associated with the Corded Ware and Bell Beaker phenomena throughout Europe, this paper investigates the role of women as active and powerful agents in the cultural changes taking place in this period.

447. Mothers at the Centre: spatial politics of kinship at Early Bronze Age Cemeteries in Lower Austria

Authors: Katharina Rebay-Salisbury (University of Vienna | Austrian Academy of Sciences)
Format: Oral

Early Bronze Age cemeteries in Lower Austria were structured according to kinship and time of death, resulting in clustered burials that correspond closely to multi-generational lineages. Drawing on the findings of an ancient DNA study of 129 individuals from Drasenenhofen, Franzhausen, Pottenbrunn, Ulrichskirchen, Unterhautzenthal and Schleinbach (Furtwängler et al. 2025), this paper examines the spatial positioning of women's graves in relation to social status and family ties. Within kinship clusters, women—especially mothers—occupy central spatial positions and are frequently interred in immediate proximity to their offspring. Notably, several centrally located graves of women contain distinctive dress ornaments and status-linked artefacts, highlighting their roles as facilitators of economic activity, knowledge transmission, and social representation. The mothers of sons appear to be particularly highly valued and central to kinship networks. This highlights the social salience of motherhood within predominantly patrilineal and likely patrilocal frameworks, in which alliances were organized through female lines. The aDNA data reveal high diversity of mitochondrial lineages across family clusters, consistent with exogamous marriage practices that brought nonlocal women into communities. Isotopic evidence from the wider region indicates higher female mobility than male, corroborating the genetic evidence. Our study reinterprets prominent women's burials as nodal points in the organisation of families, alliances and status, shedding light on the gendered dimensions of social inequality in the Bronze Age world.

1378. The Burials of Powerful Women of the Northern Black Sea Steppe in the 4th Millennium BCE

Authors: Sofiia Svyryd – Alexey Nikitin (Grand Valley State University)
Format: Oral

The Northern Black Sea (North Pontic) steppe was a major center of cultural and genetic transformation during the 4th millennium BCE, particularly among Eneolithic populations ancestral to the Yamna culture. These groups constructed kurgans (burial mounds) traditionally interpreted as elite, male-centered monuments. However, recent ancient DNA evidence reveals that of seven Pontic Eneolithic kurgans, five (approximately 70%) belong to women. If Proto-Indo-European ideology emphasized male-centered cosmic and social order, why were foundational kurgan burials so frequently female? This presentation explores primary burials in three Eneolithic kurgans in the Odesa region of Ukraine, Katarzhyno Kurgans 1 and 2, and Mayaky Kurgan 1. The Katarzhyno 1 burial contained an unusually tall woman interred with an askos-type vessel interpreted as a symbol of female divinity. Katarzhyno 2 held an adolescent female, possibly sacrificial, buried with a mortar and pestle, items often associated with sacrifice, eternity, and transformation in Indo-European traditions. The Mayaky 1 burial consisted of disarticulated remains of a middle aged woman with a cranial deformation and perimortem cranial trauma, suggesting ritualized violence and physical liminality. Drawing on mortuary archaeology, aDNA, osteology, and Indo-European mythological parallels from Slavic and Vedic traditions, this study argues that powerful and liminal female figures played a foundational role in the ideology and ritual practice of early Kurgan people in the North Pontic.

504. Mariupol-type burial mounds. Gender paradoxes

Authors: Nataliia Mykhailova (Institute of archaeology of National Academy of Sciences of Ukraine)
Format: Oral

There are more than three dozen known mass graves of the so-called Mariupol type in Ukraine. A smaller part of them dates back to the Mesolithic period, while the majority dates back to the Neolithic period. The earliest burial complexes were located, mainly, on the Dnipro Rapids and Low Dnipro; some later cemeteries were found on the territories to the West and to the East, from Dniester to Don rivers. The Mariupol-type burial inventory differs from other Neolithic burial complexes in Europe due to the quantity and uniqueness of the jewellery, some of which is entirely one-of-a-kind. Graves of the early period were either individual, double or collective. Many of the deceased's had few adornments with them in the grave: decorations made from shells, bone, stone, pearls, carp fish teeth and deer canines. In the early stages, women's jewellery is scarce and inferior in quality compared to men's and children's jewellery. The later phase of the Mariupol type cemeteries, stretching from the Dniester to the Don river, are distinguished by a remarkable assortment and abundance of grave goods. A wide variety of beads and pendants were on display, crafted from a range of materials including shells, bone, marble and jet. The most impressive personal ornaments are the perforated boar tusks and plates, made from tusks, which are a testament to the craftsmanship and artistry of the artisans who crafted them. These ornaments are exclusively abundant at the Mariupol cemetery and are inherent to male, female and children's burials. In the burial grounds of the late period, numerous female burials are as rich as male burials. However, some of them had atypical features, for instance, symbols of power, weapons. These phenomena are probably evidence of either a special social status for the buried persons or a gender transformation.

817. Invisible No More: Women in Yamna Mortuary Practices at the Western End of the Steppe

Authors: Bianca Preda-Balanica (University of Helsinki)
Format: Oral

The prevailing understanding of Yamna groups migrating from the Pontic–Caspian steppe into Southeastern Europe in the 3rd millennium BC remains deeply influenced by stereotypes of violent steppe men wiping out local male populations and abducting or marrying local women. Unsurprisingly, research has overwhelmingly focused on men, examining their graves, bodies, and the successful spread of their genes, often with little or no reference to other social categories such as women and children. Yamna graves span roughly half a millennium at the western end of the Great Steppe, in what are today Romania, Bulgaria, Serbia, and Hungary. Yet women remain largely invisible in the literature addressing both the initial migration process and the enduring Yamna presence in the region. This invisibility does not reflect their absence from the archaeological record but rather stems from long-standing androcentric research biases, gender stereotypes, and double standards in interpretation. Starting from the observation that women received burials comparable to those of men, this presentation advances the hypothesis that they played crucial roles in shaping social complexity within Yamna communities. Focusing on burial practices associated with women – including funerary structures, body treatment and positioning, grave goods – and bioanthropological data on health and activity patterns, this study investigates the multidimensional social identities women held during life and those enacted through mortuary practices.

203. Burials of elite women in Koban culture

Authors: Sergey Makhortykh – Nadja Kotova (Institute of Arcaheology Ukrainian Academy of Sciences)
Format: Oral

Gender studies have become a vital component of contemporary archaeology because they challenge long-standing assumptions about past societies and offer more accurate, inclusive interpretations of human history. Koban culture is recognised as one of the most significant archaeological phenomena of the Early Iron Age in the Caucasus, with absolute dates ranging from 900–400 BCE. The prevailing understanding of Koban society is derived from studies of necropolises, some of which contain hundreds of graves (Tli; Koban, Klin-Yar 3, etc.). The aim of our contribution is to analyze the burials of the high-status women from the Koban culture, focusing on the Northern and Central Caucasus. In the context of funeral rituals, a group of women with sceptres and specifically

feminine artefacts (e.g., various bronze amulets) is distinguished, which allows us to identify them as priestesses. A separate cluster comprises burials of women accompanied by medical instruments, which may be associated with healers. The high social status of women in Koban society is also supported by evidence from the Nart epic, the oldest parts of which date back to the first millennium BCE. Elite female burials were a distinctive feature of the "golden age" of Koban culture (900-650 BCE). The majority of these burials are located in the mountainous Central Caucasus region, which indicates a high level of prosperity in society. This is primarily due to the advanced development of bronze metalworking and close cultural and trade contacts with populations of the South Caucasus and the Near East. The specific characteristics and varying levels of development of various Koban culture communities, as well as the evolving political landscape, were key factors in shaping the past gender systems in this region of the Caucasus.

333. Prominent Women in Andronovo Burial Rites (based on the Lisakovsk complex of the Bronze Age , Kazakhstan)

Authors: Emma Usmanova (Saryarka Archaeological Institute Karaganda Buketov University) – Alicia Ventresca-Miller (Department of Anthropology, University of Michigan)
Format: Oral

The Lisakovsk burial complex dates to the Bronze Age (~ 1950 to 1500 BCE) and is part of the Andronovo cultural horizon. Over 200 burials have been unearthed in over 35 years of excavation, with burials associated with Petrovka, Alakul, Fyodorovo archaeological cultures. Radiocarbon and chronological data suggest that the formation of the barrows in the Lisakovsk burial complex began in the period associated with Petrovka and Alakul cultures (~1950 to 1750 BC). Within the excavated burials, some individuals have been estimated to be female based on anthropological data (for a total of 25 burials). An analysis of grave goods and ritual features of deceased women, indicate evidence for a symbolic pattern of burial rites. Our findings suggest that there were differences based on age, profession, and leadership existed between women in the Lisakovsk society during the Bronze Age. The main element of buried with prominent women was a headdress with a 'nakosnik', a plait decoration or braid ornament. In one burial, there were weaving tools and ritual features that indicate the burial of a professional weaver. The deceased women's leadership was represented by a knife-dagger as well as the placement of her grave in the central barrow, with a surrounding ditch containing children burials. A collective memory contributed to the preservation of behavioral stereotypes and the regulation of social relations. Signs of women prominent status were found in the funeral rite and included in this social phenomena. The Lisakovsk burial complex included a category of female burials which were protected against looting. Perhaps, due to their life status, they ensured and facilitated the dissemination and preservation of a collective memory in this preliterate society. Incursions into these burials would signify a violation of the status quo of a female social group.

2235. Contextual Identity of Individuals in a Matrilineal Society: Chaco Canyon

Authors: Zhuohan Yu (University of Chinese Academy of Social Sciences)
Format: Oral

During the transitional period between small-scale societies and fully developed states, complex societies took a variety of forms. Despite the diversity, individual identity was often shaped through landscape, material culture, and broader contextual frameworks. As a complex, highly organized society, Chaco Canyon is a place where the Puebloan culture flourished with interaction between surrounding areas. While it is considered as a matrilineal society, the buildings, rooms, and burials discovered in various archaeological sites, such as Pueblo Bonito, together formed a new space and context for illustrating the identity of women. Under this circumstance, the identity of women can be embedded in buildings, rooms, and burial practices, which was attached with geneological continuity and spatial permanence. Compared to the patrilineal society, it is clearer to examine how the identity of women herself was shaped, transmitted, and maintained without being mediated by male relatives. This paper explores how the women's identity was shaped, voiced, contextualized, and can be visible under a matrilineal society like Chaco Canyon, and how its interpretation differs from that in the patrilineal societies. Through the multi-dimensional and combined perspective of what had been discovered in Chaco Canyon, this study hopes to offer a new aspect to understanding the identity expression and visibility of prominent women in prehistoric complex societies.

2047. Beyond Kinship: The Prominent Woman of Montanissell Cave and the Symbolic Construction of Female Status in the Bronze Age

Authors: Cristina Santos – Maria Rosa Campoy-Caballero – Daniel R. Cuesta-Aguirre – Xavier Jordana (Universitat Autònoma de Barcelona) – Núria Armentano (Museu d'Arqueologia de Catalunya | Universitat Autònoma de Barcelona) – Assumpció Malgosa (Universitat Autònoma de Barcelona)
Format: Oral

Recent archaeological and anthropological research challenges traditional narratives portraying the Bronze Age as a male-dominated world structured around long-distance male mobility and patrilineal exchange networks. Increasingly, female agency is emerging as a key driver of cultural transmission. The burial from Montanisell Cave (Catalan Pyrenees, Spain) provides an exceptional case study. The cave contained eight individuals dated to the Bronze Age: an adult woman -La Senyora de les Muntanyes- centrally placed and richly adorned with a unique assemblage, unparalleled in northeastern Iberia, one young adult woman, one adult man, one adolescent, and five children under 12. Previous bioanthropological analyses suggested patrilocality and female exogamy based

on high mitochondrial diversity and demographic structure, although genetic resolution had been insufficient to verify biological relatedness. We now present complete paleogenomic data from all individuals, revealing a structured kinship network: two minors (IDs 9 and 11) are full siblings, both related at second degree to infant ID5; infant ID2 and the adult male show first-degree kinship. Crucially, the central woman shows no relatedness up to the second degree with any individual and does not share a mitochondrial haplogroup with them. Her prominent placement and exceptional ornamentation therefore probably reflecting socially constructed status, not kinship. This case invites renewed reflection on gender, prestige, and inequality in prehistoric Europe, positioning the Montanisell woman as one of the most compelling examples of a prominent Bronze Age female whose authority was socially – not biologically – grounded.

1826. Tracing Life, Health and Identity: A Multi-Proxy Study of an Early Bronze Age Woman from the Barrow in Szczepankowice, Poland

Authors: Agata Haluszko (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin | Archeolodzy.org Foundation, Świdnica) – Krystyna Jarysz – Radosław Jarysz (Archaeological Museum in Wroclaw) – Stefan Tangl (Karl Donath Laboratory, Medical University of Vienna | Austrian Cluster for Tissue Regeneration, Vienna)
Format: Poster

Reconstructing individual life histories in prehistory requires understanding how biological processes intersected with social realities. This study investigates a mature woman from a barrow burial at Szczepankowice, southwestern Poland. Her interment, associated with the Únětice culture, forms part of a broader pattern of female graves that challenge established interpretations of gender, status, and community in Early Bronze Age societies. To explore the biological dimensions of this individual's life, both osteological and molecular evidence were considered. Published ancient DNA data confirmed the presence of an extinct Hepatitis B virus (HBV) lineage phylogenetically close to chimpanzee strains. Although the infection was likely chronic, no pathognomonic skeletal lesions attributable to HBV were identified. This finding highlights the value of integrating molecular and histological perspectives to distinguish between systemic disease, ageing, and physiological stress in archaeological remains and to better understand long-term health trajectories in the past. The analysed material comprised compact bone fragments derived from the shafts of two long bones, previously sampled for isotopic analyses. Compact bone microstructure was well preserved, showing minor non-pathognomonic alterations within the tissue but no macroscopic evidence of trauma or diagnostic pathology. Histological observations revealed well-organised secondary osteons and mild remodelling activity, with occasional resorption lacunae and empty osteocyte spaces consistent with low-grade physiological stress typical of later adulthood. These features indicate normal age-related bone turnover and nonspecific metabolic changes, reflecting overall biological stability and resilience throughout life. The study forms part of the MOUND project, funded by the National Science Centre, Poland (grant no. 2023/48/C/HS3/00020). By combining osteological, histological, and molecular evidence, it explores how physiological traces preserved in bone illuminate the lives, health, and social identities of prominent women in the Early Bronze Age, contributing to broader discussions on gendered personhood, health, and inequality in prehistoric Europe.

2236. Searching for Gendered Patterns in the Burial Mounds of the Kalenderberg Culture

Authors: Mária Lepiš Valigová (Institute of Archaeology of the Slovak Academy of Sciences)
Format: Poster

The main aim of this poster is to explore gendered patterns in the burial mounds of the Kalenderberg culture through a comparative analysis of ceramic grave inventories from burial mounds and flat cemeteries in the northeastern Hallstatt cultural area. The study is based on the observation that flat cremation graves occasionally contain artefacts traditionally interpreted as female-associated, such as spindle whorls or iron knives, whereas grave goods in burial mounds are often poor and in many cases limited to ceramic vessels. The research draws on published data and a revision of archaeological material from museum collections. The analysis focuses on the composition, quantity, combinations, and decorations of ceramic vessels in selected burial mounds and compares them with ceramic assemblages from flat graves of the same period and region. Non-ceramic artefacts are primarily considered as contextual indicators for gendered associations observed in flat burial grounds. Rather than assigning biological sex, the poster examines whether ceramic inventories alone may reflect gendered practices, and whether burial mounds differ from flat graves in the ways gender was materially expressed or obscured. The results contribute to discussions on gender visibility, funerary practice, and social differentiation within the Kalenderberg cultural group.

80 BRICK BUILDING IN THE MEDIEVAL NORTH – TECHNIQUES AND TRADITIONS

Theme: 1. Widening perspectives in material culture studies
Organisers: Joakim Kjellberg (The Museum of Medieval Stockholm) – Tanja Ratilainen (Aalto University | University of Turku | Turku City Museum) – Villu Kadakas (Talinn University) – Regin Meyer (NIKU)
Keywords: Medieval, Northern Europe, Brickbuilding, Architecture, Brickproducrion
Format: Regular session
Affiliation: Medieval Europe Research Community - MERC

SESSION ABSTRACT

Answering the call of EAA 2026 theme 1 on style, function and meaning of material culture, this session address questions regarding the introduction and spread of techniques used in early brick buildings and medieval traditions in brick production and architecture in Scandinavia and along the coasts of the Baltic and North seas. Medieval brick architecture has been referred to as emblematic of the Hanseatic period of step-gabled urban houses and gothic churches throughout northern Europe. The technique of brick building and associated styles was first introduced in the area during the Middle Ages. Still the associated producers, consumers and trade networks remain understudied, with arthistorians tending to focus on style. Its wide but seemingly simultaneous appearance in eastern Baltic and in western Scandinavia, in places such as Bergen, Stockholm, Tartu and even in Turku and Novgorod have been associated with Hanseatic merchant activities. When it comes to churches the urban mendicant orders have been traditionally seen as primary drivers of the style and form. Still standing examples in these regions show local adaptions versus imported established solutions and international reference. Recent projects in Sweden, Finland and Norway, utilising modern techniques of dating and trace element analysis, such as XRF and ICP, show that import and export of bricks from far distances were much more common than previously recognised already in the medieval period but also, as in the case of Oslo, that local production could be in place from the earliest introduction stage This field of research is under strong development and a larger comparative body of knowledge needs to be established. We invite contributions exploring and mapping the dating and introduction, techniques of production and use of brick buildings throughout Medieval Europe with the aim of establishing connections and networks between researchers interested in future development of this subject.

CONTRIBUTION ABSTRACTS

180. Brick, Mobility, and Networks: Provenance Studies from Medieval Scandinavia to the Atlantic World

Authors: Torbjörn Brorsson (Ceramic Studies, Sweden)
Format: Oral

Medieval and early modern brick production is often interpreted as a predominantly local phenomenon, closely linked to nearby clay sources and short-distance supply networks. This paper demonstrates how Inductively Coupled Plasma (ICP) analyses fundamentally challenge this assumption by revealing complex patterns of production, circulation, and material mobility. Drawing on case studies from Kökars monastery on Åland, the medieval fortress Kärnan in Helsingborg, and contexts related to transatlantic trade during the eighteenth and nineteenth centuries, the paper highlights the wide geographic reach of brick and ceramic materials. ICP-based geochemical fingerprinting shows that visually similar bricks may originate from multiple production centres, including supra-regional and overseas sources. The results underline brick as an active component in long-distance economic, religious, and political networks rather than a purely local building material. The paper argues that systematic ICP analyses are essential for advancing our understanding of medieval brick production, monastic and urban construction practices, and later global exchange networks.

2158. Akershus castle and palace: OSL- and ICP-analysis

Authors: Lars Jacob Hvinden-Haug – Regin Meyer (Norwegian Institute for Cultural Heritage Research NIKU)
Format: Oral

Akershus – a Medieval castle, a Renaissance palace and an 18th century fortress, situated at a rocky peninsula next to both old and "new" Oslo. Today this majestic complex is regarded as a national monument and a symbol of Norway's capital, going back to 1300. It shows an extensive use of bricks, with changing dimensions, types and course intervals over the centuries. Our knowledge of Akershus' architectural development was mainly established by historians and architects over a century ago. However, new archaeological finds challenge this traditional view about the early origins and later medieval development. With the additional results from OSL- and ICP-analysis, this paper not only raise questions concerning the dating of the castle, but also the role of the Norwegian and the later Union monarchs, and how the production and use of bricks was organized.The paper also emphasizes the importance of interpretation within a building archaeological context and interdisciplinary approach.

206. Brick production and brick building in Lund during the Middle Ages

Authors: Gunilla Gardelin (Kulturen)
Format: Oral

In Denmark, brick construction began in the mid-12th century. Lund, located in eastern Denmark, was an important ecclesiastical town with an archbishopric, monasteries, convents and several parish churches. The first examples of brick construction in the city date from around 1200. This paper examines brick production based on three brick kilns found in Lund, in relation to contemporary brick buildings in the city. A brick kiln was found in 1934 near a Benedictine monastery for nuns. The abbey church was built in the mid-14th century. A thermoluminescence dating of the kiln's last use was estimated to be 1590 +/- 40 years, which suggests a period of use of about 200 years. Another brick kiln was discovered during investigations in 1987 and had been situated next to the Dominican convent in Lund. The kiln construction was dated through finds and thermoluminescence dating to the mid-14th century and could have been in use for 20-100 years. Recently a brick kiln has been discovered at the Benedictine monastery for monks and will be luminescence dated in 2026. The brick kilns were built near two monasteries and a convent, and obviously

produced bricks for these buildings. The brick kilns could have been used for firing bricks for several months a year and for several years, and may have supplied bricks to several buildings in the city. The presentation will address the size of the brick production in the three kilns and how it corresponds to contemporary brick buildings in Lund.

149. Bricks in medieval Stockholm: local products or imported goods?

Authors: Anna Bergman (Museum of Medieval Stockholm)
Format: Oral

Stockholm's earliest known brick building dates from the mid-13th century. Brick architecture in the region was then in its infancy and only a few brick buildings date from this period. Several brickworks were located in the Stockholm area from the late 13th century onwards, and medieval written sources mention only locally made bricks. We know that bricks were imported to Stockholm from areas along the south coast of the Baltic Sea from the late 16th century onwards, but were they imported even earlier? Recent maritime archaeological finds from Sweden have shown that bricks were sometimes a long-distance commodity in the Middle Ages. To ascertain where the bricks for Stockholm's buildings were made, the Museum of Medieval Stockholm commissioned ICP analysis on some sixty brick samples. These derive from religious houses, the Tre Kronor fortress, secular buildings, defensive walls and brickworks. The results were then compared with a clay-composition database that covers much of northern Europe. The study found that the majority of bricks were made locally, although others were imported. These results pose new questions about brick trade networks in northern Europe.

2113. The harbourarea of the Dominican Convent in Turku – the use of bricks from the 2023-24 excavations.

Authors: Kari Uotila (Muuritutkimus | University of Turku)
Format: Oral

The following paper presents the results of new dating techniques which were used to ascertain the period of use of bricks from the 2023-24 excavations at the primitive harbour area of the Dominican Convent in Turku. Archaeological research undertaken in 2023–24 revealed the harbour area and soil layers of the Dominican Convent in Turku, as well as wooden and brick structures dating back to the 14th century. Furthermore, the soil layers contained building materials, most notably bricks in the lowest archaeological layers, which can be dated to the early 14th century based on stratigraphic data, artifact dating, and natural science dating. In addition to the Dominican convent's beach area, the presentation will examine other new dating results for the use of bricks in the Turku area in the 2020s, as well as the lowest soil layers and building sites in archaeological excavations. In the context of excavation sites, the presence of bricks is predominantly in the form of fragments or brick dust. However, these remains serve as indicative evidence of the utilisation of bricks within the designated area. In the case of edifices such as Turku Castle, the bricks are incorporated into brick-mortar masonry structures.

2403. Holy shit! A 15th-century latrine and other brick structures found in the tower of the Cathedral in Turku, Finland

Authors: Tanja Ratilainen (Aalto University | University of Turku | Turku City Museum)
Format: Oral

La cathédrale engloutie project, which is funded by the Academy of Finland and runs from 2024 to 2028, made surprising discoveries in the cathedral tower in autumn 2025. Inside the north wall of the tower, in spaces previously interpreted as loopholes, a latrine room with a waste disposal shoot and an oven with a chimney were found, with a small room between them. The waste shoot was filled with post-medieval building waste, but some dried organic matter, likely human coprolites, was found on the edges of the structure. While osteological, archaeobotanical and ancient DNA analyses are underway, the presence of parts, probably of European lobster (Homarus gammarus), as well as the brick structures, suggests that the first floor of the cathedral tower was not built for defence, but rather for living quarters and perhaps even for hosting banquets for distinguished guests of the church. This paper focuses on the function of the tower and its brick structures.

1970. Beyond Style: Material Knowledge and Brick Production in Medieval Church Architecture of Tartu, Estonia

Authors: Eero Kotli (Freelance)
Format: Oral

Art-historical research on medieval architecture in Estonia has prioritized stylistic analysis and spatial composition, supplemented by historical context and, more recently, cultural landscape studies. Individual masters and architecturally prominent monuments have been central, while building materials and construction processes have received comparatively little attention. This imbalance complicates chronological interpretation, as construction durations and technological constraints remain insufficiently understood, particularly in medieval brick architecture, where stylistic readings may conflict with concealed production realities. A notable exception is Tartu St John's Church, where the study and conservation of terracotta sculptures has included analysis of production.

This paper adopts a material-centered perspective on medieval brick architecture in Estonia, focusing on the surviving churches of Tartu, examining underexplored aspects of brick and terracotta production and construction technology, drawing partly on the author's professional experience as a ceramicist. Topics include regional clay resources, material homogeneity, additives and mixing methods, forming conditions, drying regimes, shrinkage during drying and firing, seasonal constraints, defects, material loss, and risks within firing. From a technical standpoint, freshly quarried sedimentary stone and leather-hard clay exhibit comparable workability, suggesting overlapping skills between stone carvers and terracotta makers. Ceramic production, however, involves extended and risk-intensive drying and firing stages, placing primary responsibility on the brick-master. While master-builders and stonemasons could be recruited from abroad, likely common in 13th-14th century Estonia – brick production depended on detailed knowledge of local clay and technological aspects. Knowledge of medieval brick production in Estonia remains limited. Some written sources survive from Tallinn and several kilns have been excavated in Tartu. Approximate estimates can be made of brick quantities required for Tartu's churches. Archaeomagnetic and optically stimulated luminescence dating may further refine chronologies; preliminary studies have been conducted at Tartu University. Overall, medieval brick architecture relied on specialized local empirical know-how, whose significance warrants reassessment within architectural history.

853. The introduction of brick buildings in the district of Uppland, Sweden

Authors: Joakim Kjellberg (The Museum of Medieval Stockholm)
Format: Poster

This paper presents an ongoing study of the early adoption of brick architecture in eastern Scandinavia and examines how new building technologies were embedded within changing cultural, social, and institutional frameworks during the High Middle Ages. The focus is on renewed data collection in Uppland, Sweden, a region where brick construction emerged in a landscape traditionally dominated by stone and timber architecture. The introduction of brick in the late 13th and early 14th centuries coincides with processes of urbanisation, ecclesiastical expansion, and intensified interaction with continental Europe. In towns, brick manufacture appears closely connected to civic and royal building initiatives, whereas in rural settings brick construction is predominantly associated with monastic foundations and monastic estates. Monastic orders, operating within transregional networks, are traditionally interpreted as key agents in the transmission of technical knowledge, craft practices, and architectural concept, why particular attention is given to differences between urban and rural contexts of brick production and use. The study builds on earlier work at the Museum of Medival Stockholm demonstrating that early brick architecture in Stockholm relied on both locally produced and imported materials. By integrating evidence from standing buildings, archaeological excavations, and known production sites, this project reconstructs patterns of material supply, technological choice, and knowledge transfer. Chemical analyses of brick samples are employed to distinguish local production from imported materials and to explore how brick-building traditions were organised and adapted in different social environments. The paper contributes to broader archaeological discussions on craft mobility, institutional agency, and the role of building materials in shaping medieval urban and rural landscapes in northern Europe.

2683. Bricks in the limestone areas of medieval Estonia

Authors: Villu Kadakas (Tallinn University)
Format: Poster

When one speaks of medieval brick use in buildings, one usually refers to brick buildings. However, areas where natural stone was abundant and dominated as the material, still small quantities of bricks can be found. While in Southern Estonia buildings were normally made of bricks, in the northern and western parts of Estonia mostly various types of limestone were used. However, regular masonry bricks can be found in the hypocaust ovens in the houses of Tallinn, as well as in castles and monasteries, probably because better resistance to heat. The roofs of the stone buildings in Tallinn, castles and monasteries, as well as some rural parish churches, were of various types of ceramic tiles. Sets of glazed ceramic tiles have existed in floors of some churches and rural houses. Some limestone churches had vaults made of bricks. All these are rather easy to explain with special qualities of tile material, which cannot be provided in limestone. However, in some of the rural churches sometimes brick elements can be found, which could have been easily made of limestone, as the rest of the building. A plinth moulding (Karuse), a set of decorative niches on a gable (Valjala), extensive use of brick in various mouldings (Pöide) can be mentioned for example. Existence of mostly specific types of brick material in limestone areas brings forth a question, if it was made locally or imported. Knowledge about medieval brick production is rather limited. According to written sources, from at least the 14th century there was a brick kiln working in the outskirts of Tallinn, but it is difficult to establish, what types of bricks were made there, which part of the material in surviving buildings or excavation finds can be brought to connection with this production centre.

82 BEYOND BOND 4: CLIMATE PULSES AND SOCIETAL DYNAMICS ACROSS THE MEDITERRANEAN AND EURASIA (7000–5200 CAL BP)

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Catalin Alexandru Lazar (ArchaeoSciences Platform, ICUB, University of Bucharest) – Enikő Magyari (Eötvös Loránd University – ELTE, Budapest)
Keywords: Holocene, Bond 4, Mediterranean Basin, Eurasia, Archaeology & ArchaeoSciences, Paleoenvironmental &

Paleoclimatic data

Format: Session with keynote presentation

SESSION ABSTRACT

The Bond 4 event—initiated ~7000 cal BP and peaking ~5300 cal BP—marks the most extensive Holocene surge of drifting sea-ice in the subpolar North Atlantic (Bond et al., 2001), broadly aligning with Neoglacial cooling. Across the Mediterranean Basin and adjacent Eurasian regions, this interval coincides with profound cultural reconfigurations: i) the rise and fragmentation of complex, stratified communities; ii) intensification and rerouting of exchange; iii) innovations in metallurgy and agropastoral practices; iv) and rapid relocations of settlement foci. These are all doubled by several regional climatic pulses (ca. 6200, 5800, and 5200 cal BP), which are associated with shifts in settlement patterns and abrupt cultural downturns. This session rethinks the end of the Neolithic/Chalcolithic by integrating archaeobiological, socioecological and palaeoclimatic evidence to test the mechanisms linking climate variability, ecosystems, and human trajectories. We welcome studies that mobilise multi-proxy datasets—palaeodemography, stable isotope-based diet and mobility, palaeoenvironmental reconstructions, modelling, a/sedaDNA, material culture changes and high-resolution chronologies—to move beyond correlation, quantify uncertainty, and evaluate competing causal pathways of the Bond 4 event.

CONTRIBUTION ABSTRACTS

1012. Neoglacial cooling, Bond Event 4 and societal reorganisation in East-central Europe: possible links

Authors: Eniko Magyari (Eötvös Loránd University, Budapest | HUN-REN-MTM-ELTE Research group for Paleontology) – Aneta Formáčková (Czech Geological Survey) – Ilona Pál (Eötvös Loránd University, Budapest) – Heiki Seppä (University of Helsinki) – Jon Camuera (Andalusian Earth Sciences Institute, Armilla) – Gabriella Darabos (Eötvös Loránd University, Budapest) – Cindy De Jonge (Geological Institute, ETH Zürich, 8092 Zürich, Switzerland) – Pál Raczky (Eötvös Loránd University, Budapest) – Catalin Lazăr (Research Institute of the University of Bucharest)

Format: Oral

The rise of Neolithic and Chalcolithic cultures in the Carpathian Basin and the Lower Danube during the 5th millennium BCE was marked by well-defined settlement structures, labour limited agriculture and broadly egalitarian social systems. The first signs of societal stress appeared between 4200-4000 BCE in this region. Settlements were destroyed, and the populations retreated into small villages or hilly refugia. At the same time, new groups entered the region from the Pontic steppe. Similar processes unfolded in the eastern Carpathian Basin, culminating between 4500 and 4200 BCE with the disappearance of the Tisza Culture. Eastern influences intensified throughout the Chalcolithic and the period concluded with the Yamnaya expansion around 2900–2800 BCE. This cultural transformation coincided with the neoglacial cooling phase of the mid-Holocene, characterised by gradually declining summer temperatures, rising winter temperatures, and century-scale fluctuations in precipitation that differed between the eastern and western parts of the region. Bond Event 4 (the 5.9 ka rapid climate change event) is embedded within this interval of pronounced climatic variability. Here we present new palaeoclimate results from pollen, chironomid, diatom and lipid-biomarker based climate reconstructions, and compare them with mid-Holocene vegetation changes inferred from pollen and sedaDNA. Our findings indicate that the settlement abandonments between 4500 and 4200 BCE coincided with a rapid reorganisation of the North Atlantic storm track, producing cooler and wetter summers, enhanced river discharge, and major changes in lowland hydrology. Thereafter, alternating centuries of wet and dry summers reflect the emergence of a NAO-like circulation regime. These environmental shifts promoted forest-steppe expansion on the Pontic steppe and favoured the rise of mobile pastoralist groups. The impact of Bond Event 4 is particularly evident in the abandonment of Gumelnița settlements along the Lower Danube. Only limited palaeoclimate archives indicate drying; cooling and hydroclimatic instability is the more consistent signal.

1922. From Expansion to Abandonment: Climate Variability and the Decline of Chalcolithic Cultures in the Lower Danube

Authors: Alfred Vespremeanu-Stroe – Cristina Covataru – Diana Hanganu (University of Bucharest) – Adrian Bălășescu (Vasile Pârvan Institute of Archaeology, Bucharest) – Luminița Preoteasa – Adrian Cîrjan (University of Bucharest) – Daniel Garvăn (Buzău County Museum of History) – Kamen Boyadziev (National Archaeological Institute with Museum, Sofia) – Cătălin Lazăr (University of Bucharest)

Format: Oral

The causes behind the decline of the Chalcolithic societies in southeastern Europe remain strongly debated, ranging from migration of nomadic groups from the Pontic steppes and long-term infiltration processes to climate-driven stress, social conflict or ideological change. We reassess these competing hypotheses through an integrated spatial and palaeoenvironmental study that examines major Chalcolithic cultures in the Lower Danube region (Boian, Hamangia and Cucuteni–Trypillia: C-T) maintaining the focus on the Kodjadermen–Gumelnița–Karanovo VI (KGK VI) in relation to mid-Holocene climate. GIS-based analysis of settlement distribution examines transformations during early and peak phases of KGK VI (Gumelnița A1–A2; c. 4700–4250 cal BCE) and the late phase (Gumelnița B1; c. 4250–3900 cal BCE), highlighting shifts in site density and landscape positioning. .These spatial patterns are evaluated alongside palaeoecological evidence, including pollen-based reconstructions and zooarchaeological datasets spanning early/middle and late KGK VI phases. In parallel, regional palaeoclimatic records and palaeoclimate databases from southeastern

Europe are synthesised to evaluate the potential role of increased aridity episodes around 4250–4150 cal BCE and during the 5.9 ka RCC, which may have contributed to the widespread abandonment of settlements and the disappearance of the KGK VI cultural complex around 3900 cal BCE. Recent geoarchaeological research conducted in the Mostiștea Valley suggests that this interval was characterised not only by a trend toward increasing dryness, but by higher hydrological instability. Preliminary results suggest a two-stage process rather than a sudden collapse: a contraction of settlement systems beginning around 4250 cal BCE, followed by socio-ecological reorganisation during the B phase and culminating in widespread abandonment at 3950–3900 cal BCE, broadly aligned with the 5.9 ka RCC. Integrating spatial modelling and environmental proxies, the study evaluates whether climatic stress was a primary driver or interacted with wider cultural dynamics shaping the KGK VI landscape.

1122. Holocene land use in the Moldavian forest-steppe: Eneolithic pastoralism and Bronze Age farming

Authors: Ilona Pál (Eötvös Loránd University) – Enikő Magyari (Eötvös Loránd University | HUN-REN-MTM-ELTE Research Group for Paleontology) – János Korponai (Eötvös Loránd University | University of Public Service | Sapientia Hungarian University of Transylvania) – Darabos Gabriella (Eötvös Loránd University) – Laurentiu Țuțuianu (ICUB Research Institute of the University of Bucharest) – Cristian Manailescu (Horia Hulubei National Institute for R&D in Physics and Nuclear Engineering) – Andrei Asăndulesei ('Alexandru Ioan Cuza' University of Iași) – Daniel Veres ('Emil Racovita' Institute of Speleology)

Format: Oral

We present a high-resolution, multi-proxy Holocene palaeoecological record from Iezerul Dumbrăvița, a sinkhole lake on the Suceava Plateau (NE Romania), situated at the western margin of the Eastern European forest-steppe. The study evaluates long-term vegetation, land-cover and land-use dynamics and assesses human-environment interactions with a particular focus on the Cucuteni–Trypillia cultural complex (CTCC), within the context of Mid-Holocene climatic variability associated with the Bond 4 interval. Pollen, non-pollen palynomorphs, microcharcoal, loss-on-ignition and magnetic susceptibility analyses are integrated with 26 radiocarbon dates, REVEALS-based land-cover reconstruction and agricultural land-use probability (LUP) modelling. During Cucuteni lakeshore occupation (~5.9–5.65 ka cal BP), grazing-indicator fungi increase sharply, and episodic burning is indicated by microcharcoal, while cereal pollen remains consistently low and regional woodland cover does not decline further. These results contrast with strong archaeobotanical cereal evidence from other Moldavian Cucuteni sites and imply a specialised role for the Dumbrăvița settlement, oriented toward pastoralism, while crop cultivation likely occurring away from the lake. Site abandonment at ~5.65 ka cal BP coincides with rapid hornbeam-dominated afforestation, indicating a shift toward more humid conditions and reduced availability of open forest-steppe habitats. This environmental transition follows the ~5.8 ka climatic pulse within the Bond 4 event and parallels regional evidence for Eneolithic population decline, suggesting that climate-driven ecosystem change contributed to cultural reorganisation rather than abrupt collapse. Human impact intensifies during the Bronze Age (when grasslands expand, cereal pollen reaches ~15%, and LUP values peak around 3.3 ka cal BP), consistent with the regional expansion of Noua group. These results provide the first clear evidence for lakeshore wheat and barley cultivation by Noua communities in the region, despite the absence of identified contemporary settlements. Overall, the record highlights non-linear, culture-specific land-use responses to Mid-Holocene climate variability across the forest–steppe ecotone.

1879. Trial-and-error proxies: ceramic pot form & volume shifts across Gumelnița A2–B1 at Sultana-Malu Roșu tell site within Bond 4 dynamics

Authors: Catalin Alexandru Lazar – Gabriel Popescu – Sebastian Dumitrescu (University of Bucharest) – Theodor Ignat (University of Bucharest | Bucharest Municipality Museum)

Format: Oral

Bond 4 includes a cluster of abrupt hydroclimatic perturbations, among which the 5.9 ka pulse is frequently invoked when discussing the late fifth-millennium BC reconfiguration of tell-based societies in the Lower Danube. To move beyond simple correlation, we test whether ceramic forms and vessel volumes at the Sultana-Malu Roșu tell site (c. 4600-3900 cal. BC) can serve as a behavioural proxy that is both measurable and explicitly uncertainty-aware. Our dataset comprises whole or reconstructable vessels assigned to the KGK VI/Gumelnița A2-B1 phases, recorded in a standardized relational database, including paste, surface treatment, typology, weight, fragmentation, and volumetry (measured by filling or computed from complete profiles). Phase attribution combines archival/stratigraphic controls with radiocarbon data. Interestingly, the A2-B1 pottery transition corresponds with the KGK VI demographic trajectory modelled from radiocarbon summed probability distributions: a growth/plateau culminating c. 4500–4400 cal BC, followed by a sustained decline beginning c. 4400/4350 cal BC and continuing towards c. 3800/3750 cal BC. The results suggest that B1 phase is different than A2 phase in three analytical dimensions: (1) changes in assemblage composition and surface treatment, (2) a shift in vessel form toward more open shapes, and (3) a reduction and tighter clustering of vessel volumes, noting that the compressed volume range may partly reflect collection or survival biases rather than production patterns alone. Treating volumetry as a direct climate signal could be an important proxy for past population behaviors in response to climate change. Our study presents a "trial-and-error" approach that could shed light on unknown aspects of European prehistory. Finally, our paper compares these ceramic signals to independently documented Bond 4–related phenomena in the same micro-region, including a decline in local human pressure, changes in land-use intensity in the Mostiștea/Danube floodplain record, and isotopic evidence for changing crop water management at Sultana/Gumelnița sites.

1121. Neolithic to Bronze Age forest-steppe compositional change in East-Central Europe: the role of

climate

Authors: Gabriella Darabos (Eötvös Loránd University, Department of Environmental and Landscape Geography) – Enikő Magyari (Eötvös Loránd University, Department of Environmental and Landscape Geography | HUN-REN-MTM-ELTE Research Group for Paleontology) – Cătălin Lazăr (ArchaeoSciences Platform, Research Institute of the University of Bucharest,ICUB) – Ana Ilie ("Curtea Domnească" National Museum Complex in Târgoviște) – Laurențiu Grigoraș (Buzău County Museum) – Katia Vulcan (National History Museum of Romania) – Valentin Parnic (Lower Danube Museum in Călărași) – Diana Hanganu (ArchaeoSciences Platform, Research Institute of the University of Bucharest | GEODAR, Research Institute of the University of Bucharest)
Format: Poster

Reconstructing Middle Holocene vegetation in the Pannonian and Extra-Carpathian Lowlands has traditionally relied on pollen records, while wood-charcoal (archaeo-anthracological) evidence has remained limited. As a result, the use of woody resources by Neolithic and Eneolithic communities, especially the contrasts between ecological zones, has been only partly understood. This study reconstructs the principal forest types and vegetation composition of the southeastern Great Hungarian Plain (GHP) and the Lower Danube region by integrating charcoal assemblages, pollen data, and potential vegetation maps. Taxonomic analyses of large-volume charcoal samples from multiple archaeological sites reveal that *Quercus* was the dominant tree taxon in both regions and the preferred material for construction. In the southeastern GHP, charcoal spectra show a characteristic *Ulmus–Quercus* dominance, whereas along the Lower Danube the prevailing pattern is *Quercus–Fraxinus* or, at some sites, near-exclusive oak use. The Lower Danube lowlands and piedmont areas further exhibit thermophilous taxa such as *Ostrya carpinifolia* and *Carpinus orientalis*. In the floodplain and forest-steppe environments of the southeastern GHP, *Ulmus* played a major ecological and economic role. In contrast, in the Lower Danube lowlands elm became subordinate, while *Fraxinus* gained importance, a trend also observed in the Sub-Carpathian foothills with their species-rich deciduous forests. A marked decline of *Ulmus* during the Early Copper Age in the southeastern GHP may reflect climatic deterioration or elm disease. Romanian pollen records document the rise of *Carpinus* (*C. betulus*, *C. orientalis*) during the Gumelnița and Cernavodă periods, a pattern mirrored in charcoal assemblages from piedmont sites. Whereas southeastern GHP vegetation comprised mainly floodplain and forest-steppe woodlands, the Extra-Carpathian Lowlands also supported thermophilous mixed oak forests embedded within a predominantly forest-steppe landscape. Overall, the data indicate that prehistoric communities selectively exploited locally available wood resources and adapted their subsistence strategies to distinct ecological settings.

2011. Geoarchaeological evidence on prehistoric inhabitation of the lower Danube Valley: a case study from Jijila Lake (NW Dobrogea, Romania)

Authors: Mihaela Dobre – Diana Hanganu – Laurentiu Tutuianu – Luminita Preoteasa (Research Institute of the University of Bucharest) – Sorin Ailincai (Faculty of History, University of Bucharest) – Alfred Vespremeanu Stroe (Research Institute of the University of Bucharest)
Format: Poster

Floodplain stratigraphy preserves key proxies for reconstructing environmental–human interactions. This study is based on a 19-m-long sediment core retrieved from the Lower Danube floodplain in north-western Dobrogea. The core was multiproxy analyzed (sedimentology, pollen, charcoal and radiocarbon dating) to reconstruct paleoenvironmental changes and human activities. The integrated results from the Jijila core, recovered from a floodplain lake formed within a former delta plain system, provide new insights into mid- and late-Holocene floodplain environmental dynamics and offer a new perspective on the timing and nature of early human settlement in the study area. Human inhabitation in the Brăila–Jijila region remains debated, with archaeological evidence indicating Neolithic settlement while earlier radiocarbon dates suggest a possible Mesolithic–Neolithic presence (Brăiliţa). Unfortunately, the basal section of the core does not cover the Mesolithic period. However, newly generated charcoal and pollen records from the Jijila core indicate the onset or resumption of human activity around 5200 BCE, during the Chalcolithic (Late Neolithic), corresponding to two successive cultural phases (Boian and Gumelnița). This activity is reflected by low-intensity deforestation, increased fire incidence, and early crop cultivation. The transition to the Bronze Age is also well recorded, particularly through macro-charcoal profiles, and can be associated with the Cernavodă and Yamnaya cultures. Human impact intensified during the Late Bronze Age (ca. 1250 cal BCE), likely linked to the development of pastoral practices, and increased further during the Early and Late Iron Age, as evidenced by widespread fire-induced deforestation around 450 cal BCE, followed by the expansion of animal husbandry and crop cultivation. A peak in human presence in the Brăila–Jijila region is recorded during the Roman period (ca. 100–400 CE), as indicated by cereal cultivation and elevated charcoal concentrations, reflecting intensified land use linked to Roman frontier dynamics along the Lower Danube.

83 EXPLORING PUBLIC ARCHAEOLOGY: METHODS, TRENDS AND SOCIETAL IMPACT

Theme: 2. Crossing the divide. Archaeology and the open world
Organisers: Viviane Diederich (University of Bamberg) – Jessica Irwin (University of Edinburgh) – Patrick Cassitti (Archäologischer Dienst Graubünden / Amt für Kultur) – Natalie De La Torre Salas (Florida Public Archaeology Network)
Speakers: Ellen Thiermann (Swiss Archaeology) – Carenza Lewis (University of Lincoln) – Jens Notroff (German Archaeological Institute) – Pascal Ratier (Institut national de recherches archéologiques préventives INRAP)
Keywords: Public Archaeology, Knowledge Transfer, Citizen Science, Digital Tools, Societal Perception of Archaeology, Misinformation
Format: Workshop
Affiliation: Deutsche Gesellschaft für Ur- und Frühgeschichte e.V. (DGUF), Public Archaeology Community

SESSION ABSTRACT

In an era where digital transformation is reshaping scientific communication and influencing public engagement with archaeology, this session aims to explore the implementation of Public Archaeology across Europe, highlighting various methods employed to facilitate knowledge transfer. Public archaeology often aligns with citizen science and utilizes social media, which significantly aids in disseminating archaeological knowledge. However, pseudoarchaeology and misinformation reaches an alarmingly wide audience which must be recognized and adressed. Moreover, archaeology is connected to the public and society in many fields, and in some of these areas, engagement and interaction are not even fully recognized as such. These interactions vary in rules and dynamics, influencing societal perceptions of archaeology, which, in turn, affects the discipline itself. Historically, archaeological knowledge has often been manipulated to advance political and ideological agendas. Therefore, a deliberate approach to public archaeology and its narratives is essential, alongside a strong understanding of media and other interactions between archaeologists and the public. While research on public archaeology is increasing at a national level, it remains underrepresented in written professional discourse. Thus, fostering connections on a European level is still crucial. This session aims to link national initiatives and explore interaction areas between archaeology and society, focusing on social media, urban development, cultural heritage protection, and the climate-humanity nexus. Methodologically, key topics will include: a) identifying effective (digital) tools for public communication, b) understanding the societal structures that connect archaeology and the public, c) sharing best practices and real-life examples from successful implementations. Essentially, we will address common challenges and strategize overcoming them, with the goal of collaborativley drafting a position paper post-session. Conducted as an interactive 90-minute workshop, the session will begin with brief presentations to outline key concepts, followed by group discussions where participants will reflect on critical public archaeology areas needing empirical research.

85 POTTERY FUNCTION AND PAST SOCIETIES: A MULTI-DISCIPLINARY PERSPECTIVE

Theme: 1. Widening perspectives in material culture studies
Organisers: Pauline Coat (Paris 1 Panthéon-Sorbonne University, UMR 8096 ArchAm) – Pauline Debels (UMR 8215 Trajectoires, CNRS and Laboratory ARCAN, Genève University) – Vanessa Forte (Department of Science of Antiquities, Sapienza University of Rome) – Annelou Van Gijn (Faculty of Archaeology, Leiden University) – Julien Vieugué (CNRS UMR 8068 TEMPS Technology and Ethnology of Prehistoric Worlds)
Keywords: functional analysis of pottery, use-wear analysis, integrated approach, residue
Format: Regular session

SESSION ABSTRACT

Archaeological pots are often examined for their technological and stylistic characteristics, yet their functional roles remain comparatively underexplored. Functional analysis of pottery can provide valuable insights into food habits, ritual and craft activities of past societies, which are strong identity markers that help define cultural groups and understand their change through time and space. Such studies can shed light on the different stages of food and drink processing, from the storage of foodstuffs to the consumption of prepared meals and beverages, as well as the production of non-food substances. Identifying the actual function of archaeological pottery vessels, nevertheless, represents a real challenge insofar as it requires the integrated study of morphometry (shape, size and capacity), technological aspects (ceramic paste, surface treatment), use-wear (outer soot deposit and inner charred residue, abrasions, attritions, etc.), and content analysis such as microbotany (phytolith, starch analysis, charred macroremains identifications) and organic chemistry (GC-MS, isotopes…). This session invites contributions that employ multi-proxy approaches to investigate pottery function and demonstrate its potential to address broader cultural questions. By bringing together specialists in use-wear analysis, organic chemistry, archaebotany and related fields, we aim to foster dialogue across disciplines, addressing various cultural and social issues through the function of archaeological pottery in any time periods and geographical areas.

CONTRIBUTION ABSTRACTS

2084. Can salt be identified in pottery? Insights from the use-wear analysis of experimental and recent-past archaeological collections

Authors: Pauline Debels (UMR 8215 Trajectoires, CNRS, France | ARCAN Laboratory, University of Geneva) – Anne Mayor

(ARCAN Laboratory, University of Geneva | Global Studies Institute, Geneva) – Amadou Beye – Moustapha Sall (Université Cheikh Anta Diop) – Caroline Hamon (UMR 8215 Trajectoires, CNRS, France)
Format: Oral

While organic residue and microbotanical analysis provide key information on vessel contents, use-wear analysis offers a complementary perspective by inferring functions and activities through patterns of surface alteration. More rarely, however, has use-wear analysis been able to infer specific contents, such as acidic liquids (Van Gijn et al. 2020, Debels et al. 2023) or fermented products (Arthur 2002; Debels et al. 2024). This paper presents a contribution to the identification of a content that has so far remained largely invisible to archaeological proxies: salt. Because salt does not preserve archaeologically, its identification has been limited to exceptional contexts, primarily through chlorine detection via XRF analysis on briquetage ceramics used in salt production (Cassen and Weller, 2013; Weller and Ard, 2024). As a result, discreet salt production techniques and everyday culinary or craft uses of salt have remained poorly understood. Through controlled experimental research, we demonstrate that salt can be identified through distinctive use-wear patterns. Three ceramic vessels produced by potters in Lower Casamance (Senegal) were used to store saline solutions of varying saturation over a two-month period. The experiments produced highly diagnostic wear patterns, characterised by their location on the vessel surface and by specific modes of surface attrition. We present the key diagnostic criteria for identifying salt-related use-wear and apply this methodology to a ceramic assemblage from a 20th-century refuse area excavated in the same Senegalese village. The identification of matching wear patterns suggests local salt production and/or use, in agreement with ethnohistoric sources. This method opens new perspectives for documenting salt, a strategically vital resource at the centre of economic and social systems from prehistory to the recent past, through ceramic use-wear analysis with a high transcultural applicability.

75. Pottery and Salt in Neolithic China: the Jiandiping Amphorae as Brine Purification Devices

Authors: Linlin Song (Independent researcher) – Marcella Festa (Northwest University, Xi'an)
Format: Oral

The jiandiping amphora, a distinctive ceramic type of the Yangshao culture (c. 5000–3000 BC), is primarily distributed across the middle Yellow River region, with notable concentrations in the Wei River valley. Despite its widespread presence, the function of this vessel has long remained unclear in scholarly discussions. This study approaches the function of the jiandiping amphora through spatial patterns, vessel morphology, and experimental observations. Spatial analysis reveals a recurrent association between Yangshao sites with discovery of amphorae and natural salt resources, indicating access to brine-rich environments. Morphological characteristics, particularly the pointed base and elongated body, are well suited to sedimentation and the separation of impurities. Experimental tests focusing on vessel shape, fabric, permeability, and crystallization processes further indicate that these amphorae were unsuitable for long-term liquid storage or sustained exposure to high temperatures, yet effective in brine purification. Evidence from oracle bone inscriptions and ethnoarchaeological studies complements these observations, supporting a reinterpretation of the jiandiping amphora as a potential tool involved in salt processing, specifically as a brine purification device. This perspective on the functional use of jiandiping amphorae encourages a reassessment of Neolithic cultural and technological practices in China and highlights the complex roles of ceramic vessels within the Yangshao tradition.

208. Food practices in the Middle Neolithic: An integrated use-wear and residue approach

Authors: Lone Claudi-Hansen (Museum Vestsjælland | University of Copenhagen)
Format: Oral

Ceramic vessels are among the most abundant artefacts in the Middle Neolithic Funnel Beaker Culture of southern Scandinavia (c. 3300–2800 BC), yet little is known about how food was prepared and consumed in everyday and ritual contexts. Use-wear traces demonstrate that most vessels were used prior to deposition, indicating that ceramics placed in ritual contexts were not made exclusively for ceremonial purposes but also participated in everyday practices of cooking and handling. This raises questions about how pottery moved between domestic and ritual spheres, and how vessels acquired new meanings through use, reuse and deposition. This study combines ceramic use-wear analysis with lipid residue analysis across different depositional contexts to explore food practices and vessel use within Funnel Beaker communities in southern Scandinavia. The primary dataset comprises 329 ceramic vessels from western Zealand, Denmark, deriving from settlements, wetland deposits and passage tombs, supplemented by comparative material from nearly 500 Neolithic vessels and experimentally generated reference data. Two case studies illustrate the interpretive potential of this integrated approach. Vessels containing dairy lipids consistently display use-wear patterns associated with heating, supporting the interpretation of early cheese-making as a culinary practice. In contrast, interior erosion linked experimentally to fermented or acidic liquids occurs almost exclusively on fine-ware vessels deposited within passage tomb chambers, suggesting that fermented foods or drinks held particular ritual value in mortuary contexts.

740. A Telltale of Residues. An analysis of pottery types and functions through organic residues from a Bronze Age tell settlement

Authors: Magdolna Vicze (Hungarian National Museum Public Collections, National Institute of Archaeology) – Petra Jones (British Museum) – Zsuzsanna Czegeny (HUN-REN Research Centre for Natural Sciences, Budapest)
Format: Oral

An analysis of pottery types and functions through organic residues from the Bronze Age tell settlement of Százhalombatta-Földvár, Hungary. The Bronze Age tell settlement of Százhalombatta-Földvár has been extensively investigated for nearly three decades by an international research team within the framework of the SAX Project. The project applies a strongly multidisciplinary approach to the wide range of archaeological materials and datasets, such as archaeobotany, archaeozoology, soil micromorphology, ceramic petrology, and related fields. Its primary aim is to achieve a fine-grained understanding of the routines, practices, and challenges of daily life in a Bronze Age community that resonates through the archaeological find material. To this end, a household archaeology perspective is employed. Individual households are first studied independently and subsequently compared using multi-proxy approaches. This paper presents the integrated analysis of complete pottery assemblages from two households (House 4240 and House 6506) selected from a total of thirty excavated houses. The composition of organic residues preserved in the pores of ceramic vessels were investigated using Pyrolysis Gas Chromatography–Mass Spectrometry (Py-GC/MS) and compared with the range of pottery types present in each household. By integrating vessel form, typology, and residue composition, this study aims to provide new insights into the actual use—and thus the function—of specific pottery types. Furthermore, by contrasting two complete household assemblages supplemented with extensive Py-GC/MS analysis, the paper seeks to address broader questions related to household practices and/or social differentiation within the settlement and also contributing to a more nuanced understanding of pottery use in Bronze Age tell communities.

1047. Functional analysis of pottery, a multi-proxy approach to reconstructing mochica's culinary traditions (north coast of Peru 4th-9th century AD)

Authors: Pauline Coat (Paris 1 Panthéon-Sorbonne University, UMR 8096 Archaeology of the Americas) – Julien Vieugué (CNRS UMR 8068 TEMPS Technology and Ethnology of Prehistoric Worlds) – Martine Regert – Arnaud Mazuy (CNRS UMR 7264 Cultures – Environments. Prehistory, Antiquity, Middle Ages) – Belkys Gutiérrez (BGL Arqueología & contratistas generales S.A.C.) – Gabriel Prieto (University of Florida, Department of Anthropology) – Elena Vega (National University of Trujillo, department of Archaeology and Anthropology) – Edgar Bracamonte (Tumbas Reales of Sipán Museum) – Nicolas Goepfert (CNRS UMR 8096 Archaeology of the Americas)
Format: Oral

Between the 4th and 9th centuries AD, social groups now collectively known as the Mochica culture developed in the northern coastal valleys of Peru. Long considered as a unified and homogeneous cultural group, the various Mochica groups actually maintained complex socio-cultural relationships and developed distinct cultural traits. Thus, a question that is still debated is whether the occupants of the various Mochica centres were part of a single cultural group or were different ethnic entities. The study of culinary traditions (the type foods consumed and how they were procured, stored, prepared, and consumed) appears to be a privileged means of addressing this topic, in that they constitute strong markers of identity that can indicate socio-cultural boundaries. To reconstruct Mochica culinary traditions, a functional analysis of pottery, combining the shape of ceramic vessels, their use-wear (including lipid residue analysis of some samples), has been carried out on more than 1000 potteries from various Mochica sites. Such an integrated approach allowed us to make first assumptions about the ingredients consumed and the ways they were processed and stored - hypothesis that were refined through ethnographic surveys and experiments conducted among Peru communities that still use pottery for various food activities. This multi-proxy approach, which is unprecedented in South America, stands at the crossroads of typometry, traceology and organic chemistry to exploit the combined power of these disciplines to document Mochica identity through the reconstruction of their culinary traditions.

1240. Morphology, Technology and Use-wear analysis in Cogotas I Pottery: Ceramics form the Middle and Late Bronze Age in Inland Iberia

Authors: Áurea García-Fernández (University of Salamanca)
Format: Oral

The second millenium BC in central Iberia was characterized by the presence of the Cogotas I culture. Traditionally, this archaeological group has been defined through ceramic typology, which has also been used to establish an internal chronological sequence (Fernández-Posse 1986). However, Cogotas I pottery holds far greater potential as an archaeological source. The aim of this paper is to explore how identity can be studied through ceramic assemblages. To this end, we analyze pottery dated to the Middle and Late Bronze Age from a series of archaeological sites on the Northern Iberian Plateau. This study adopts three complementary analytical approaches: morphometry, technological analysis and use-wear analysis. Morphometric data indicate that most vessels associated with food consumption exhibit large diameters, suggesting their involvement in feasting practices (Dietler, 2006), as such dimensions are well suited to communal food-sharing contexts. In contrast, storage vessels have received only anecdotal attention in previous research, and to date no comprehensive studies have examined this category of pottery in detail. This paper seeks to address that gap by combining morphometric and technological analyses in order to identify differences in the chaîne opératoire —understood as a process that culminates not at production, but when the object enters the archaeological record—. Finally, use-wear analysis allows us to assess the possible functions of the vessels studied. Together, these approaches enable us to infer patterns of pottery production, shared practices within Cogotas I communities, and the implications of these practices for the construction of their identities.

1261. Cooking animal and plant substances among the Late Neolithic societies in the Southern Levant:

an insight from pottery residues

Authors: Julien Vieugue (CNRS - Technology and Ethnology of Prehistoric Worlds) – Martine Regert (CNRS - Cultures and environments, Prehistory, Antiquity, Middle Age) – Louise Martignac (CNRS - Archéorient) – Monica Ramsey (University of Toronto - Department of Anthropology) – Lindsay Ducan (University of Cambridge - McDonald Institute for Archaeological Research) – Yosef Garfinkel (Hebrew University of Jerusalem - Institute of Archaeology)
Format: Oral

It is now well known that the Early Pottery Neolithic societies in the Levant used some pottery to cook part of their food. Nevertheless, many questions remain unanswered about the cuisine of these Neolithic communities who lived during the late 7th/early 6th millennium cal. BC: What type(s) of food preparations were cooked in the ceramic vessels? Which cooking technique(s) were used? To answer these questions, we undertook the thorough analysis of 153 cooking pots coming from the major Early Pottery Neolithic sites of Sha'ar Hagolan and Muntaha located in the Upper Jordan Valley. Our multidisciplinary study method, developed at the interface between traceology, chemistry and botany, is based on the combined macro-, microscopic, molecular and isotopic characterization of the inner charred residues mainly trapped into the porous wall of the Neolithic pots. The visual aspects of the food crusts and their distribution alongside the profile of the ceramic vessels, as well as the starch spherulites found inside, suggest that all the pots were used to boil foodstuffs by being placed in the center of stone hearths. The integrated analysis of lipids, phytoliths and starches trapped in the inner charred residues of these ceramic vessels revealed that they had contained various animal products (such as subcutaneous ruminant fats and dairy products) and plant substances (such as cereals). These results open new perspectives to characterize the different recipes prepared by the Neolithic communities of the Levant and, beyond, highlight their food habits that are strongly linked to their socio-cultural identities.

1355. Cooking traces on medieval pottery: combining use-wear, starch grain analysis and chemistry

Authors: Aurélie Chantran (UMR 7041- ArScAn) – Cagnato Clarissa (UMR 8096 - ArchAm)
Format: Oral

Despite the extensive use of archaeological pottery in the study of food-related activities, the specific cooking practices involving vessels — including preparation sequences, heat exposure, and combinations of techniques — remain challenging to identify archaeologically. This paper presents a multi-proxy methodological approach developed to identify cooking techniques through the combined analysis of ceramic use-wear, starch grain alteration, and chemical residues, grounded in experimental archaeology. The method is based on a reference collection produced through controlled experiments replicating specific cooking techniques (e.g., boiling, frying, roasting and mixed preparations), allowing the characterization of diagnostic surface traces on ceramics (e.g., soot distribution, internal residues, fill lines) depending on the heat mediator used. We also document the transformations of experimentally obtained starch grains and chemical signatures. These experimental markers are then compared to archaeological material. The methodological framework was first tested on ceramic assemblages from Couzan Castle (France), allowing for the identification of diagnostic cooking-related traces across diverse contexts and ceramic fabrics, the association of specific preparation modes with certain plant taxa through the observation of starch alterations, and the assessment of the complementarity of these approaches. The study was then applied to a well-dated culinary refuse context from Orville Castle (France), dating to the early 15th century. The integration of use-wear analysis, starch grain studies, and chemical data reveals a clear predominance of wet cooking Methods, while also highlighting more complex, individualized preparations that combine multiple cooking stages or different modes of heat transmission. In addition, the analysis of meat butchery patterns in conjunction with ceramic vessel capacities offers supplementary insights into food preparation practices. Beyond the identification of vessel function, this study emphasizes the value of considering ceramic assemblages as material evidence of cooking gestures and proposes a transferable methodological framework for reconstructing food preparation practices in archaeological contexts.

1938. Re-enacting Ceramic Assemblages: A Dynamic Approach from Gestures to Function in Archaeological Interpretation

Authors: Melania Zingarello (CEPAM UMR 7264 - CNRS & Université Côte d'Azur)
Format: Oral

The functional analysis of archaeological pottery often relies on direct evidence such as residue analysis or use-wear studies. Yet, in contexts where sampling or close observation is not feasible – due to fragmentation, inaccessibility, or conservation restrictions – alternative frameworks are needed to reconstruct vessel use. This paper introduces re-enacting as a method for investigating the functional role of ceramic assemblages through the dynamic reconstruction of technical acts: the gestures, interactions, and material constraints that define how vessels operate within operational sequences. Developed through the study of functional ceramic sets from 3rd millennium BCE Mesopotamia, this approach shifts the analytical focus from individual artifacts to micro-assemblages, considering how groups of vessels interact spatially, ergonomically, and functionally. Experimental archaeology and embodied practice are employed as empirical tools to test hypotheses about operational processes, offering a systematic and replicable framework for contexts where established analytical methods are limited or impossible. This approach adds a further line of evidence to existing functional studies and provides insights into the gestural and ergonomic dimensions of vessel use, thereby broadening the methodological toolkit for understanding pottery function in diverse archaeological settings.

2051. Reassembling cooking practices in Neolithic Dispilio, NW Greece

Authors: Evangelia Voulgari (Aristotle University of Thessaloniki) – Marina Sofronidou (Ephorate of Antiquities of Drama)
Format: Oral

This paper examines cooking vessels from Neolithic Dispilio, a lakeside waterlogged settlement on the southern shores of Lake Orestias, near Kastoria in northwestern Greece. The site has been systematically investigated since the 1990s by the Aristotle University of Thessaloniki. The study is based on a corpus of 1,765 whole vessels and diagnostic profiles that we restored and analysed. This dataset provides a robust framework for identifying and characterising a wide range of cooking vessels, including wide-mouthed biconical or spherical jars, four-legged vessels, basins, pans, bowls, and oval-shaped containers described as boat-shaped vessels. Some vessel types are more prevalent than others, with certain forms exhibiting diachronic continuity, while others are restricted to specific phases of the settlement's development from the mid-6th to the early 5th millennium BCE. By analysing their morphological and technological characteristics, use-wear, secondary uses, and spatial distribution, we show that the apparent simplicity of Neolithic dwellings contradicts the complex shades of the daily lives performed inside and outside the domestic sphere.

2083. Material Matters: Raw Material and Function in Neolithic Vessels

Authors: Bonnie Nilhamn (Helsinki University)
Format: Oral

Archaeological interpretations of vessel function have traditionally prioritised form, style, and shape, yet functional roles often remain difficult to establish without a broader, integrated perspective. This paper argues that materiality, understood here through raw material properties, should be treated as a central component of functional analysis, as material choice fundamentally enables and constrains vessel use, shaping what activities are possible, practical, or improbable. The importance of material is well acknowledged in discussions of porous, plant-tempered ceramics versus denser mineral wares, where properties such as permeability, durability, and thermal performance directly affect function. However, material considerations are less consistently foregrounded in multi-proxy functional studies. This paper demonstrates how material characteristics influence not only vessel use but also analytical outcomes in organic residue analysis, use-wear studies, and fabric or fraction analysis. Practical aspects such as weight, portability, and the likelihood of repair are likewise materially determined and directly affect our interpretations of vessel function. The paper is based on material from the Neolithic site of Tell Sabi Abyad in Upper Mesopotamia (present-day Syria), dating to c. 7000–5900 BC, and compares ceramic vessels with contemporaneous non-ceramic plaster ware. In the case of plaster vessels, material properties strongly dictated functional roles, sometimes more decisively than vessel morphology. At the same time, experimental evidence cautions against rigid assumptions about material limitations, demonstrating that relatively simple manipulations can extend functional possibilities. Focusing on materiality and material properties alongside established analytical methods allows for a clearer interpretation of vessel function, particularly with regard to storage, food processing, craft practices, and technological choices in the Neolithic.

2137. Between consistency and diversification – pottery vessel use in the Lower Rhine region, Germany, during the 6th–5th mill. BCE

Authors: Elisabeth Krewer Von Wulfen (Institute of Geology and Mineralogy, University of Cologne | Institute of Prehistoric Archaeology, University of Cologne) – Helge Mißbach-Karmrodt (Institute of Geology and Mineralogy, University of Cologne) – Silviane Scharl (Institute of Prehistoric Archaeology, University of Cologne) – Christine Heim (Institute of Geology and Mineralogy, University of Cologne)
Format: Oral

The early Neolithic period in the Lower Rhine Region (ca. 5300–4400 BCE) is characterised by significant changes in settlement patterns and agricultural practices, which is also reflected in the pottery as a major part of the material culture. By performing biomarker analyses and compound-specific isotope analyses on fatty acids from early Neolithic pottery, it is possible to obtain information about diet and animal husbandry and in particular, comprehensive insights into the use of ceramic vessels during the Early and Middle Neolithic periods. Therefore, our aim was to collect a sample as representative as possible, including ceramic vessels of different shapes, volumes, decorations, applications, and further vessel morphological characteristics. The vessels originated from sites of different sizes and locations, dating from the oldest to the youngest LBK and the Middle Neolithic periods, including the Großgartach Culture, Planig-Friedberg Group and Rössen Culture. Our research shows that, there are consistent patterns in the use of specific vessel shapes for food preparation, handling and storage between the LBK and the Middle Neolithic alongside changes in the composition of prepared foods over time. Although handling patterns in the use of ceramic vessels were already emerging in the LBK, a more specific use of vessels with certain morphological characteristics, indicates an increasing significance of animal products, during the Middle Neolithic period. Furthermore, the results point to a more frequent dairy product processing in ceramic vessels, which consequently occurred across a wider range of shapes.

2308. Understanding Copper Age pottery use in the Carpathian Basin through morphometric and organic

residue analyses

Authors: Rebeka Solti (Institute of Archaeological Sciences, Eötvös Loránd University) – Isabel Wiltshire – Izzy Davis – Lilly Olet – Melanie Roffet-Salque (School of Chemistry, University of Bristol) – Lucy Cramp (Department of Anthropology and Archaeology, University of Bristol) – Zsuzsanna Siklósi (Institute of Archaeological Sciences, Eötvös Loránd University)
Format: Oral

This study investigates the everyday lives of Early and Middle Copper Age (4500-3700 BCE) communities through combined morphometric and organic residue analysis of pottery assemblages from 13 settlements across present-day Hungary. The frequencies of communal and individual vessels for preparation or consumption, as well as different-sized storage vessels can inform about economic, culinary and dining practices. This includes food processing methods, group size, drinking practices and storage capacity. Potteries from Early Copper Age cemeteries and grave groups are also included, making it possible to compare settlement and burial contexts, in order to study how grave goods relate to everyday pottery use. Organic residue analysis was performed on selected sherds to provide direct evidence of the significance of animal-derived products in the diet and to confirm the increase in dairy consumption in the discussed time period. The presence of certain ingredients can also narrow down possible uses indicated by morphometry. The combination of these methods can thus provide a comprehensive picture of the economy, subsistence strategies, and cultural practices. Results indicated the overall importance of communal aspects in food preparation and consumption. Notably, the frequency of drinking vessels indicated an emerging drinking culture toward the end of the Middle Copper Age. Individual consumption and preparation vessels, as well as small storage vessels were overrepresented in burials, suggesting intentional selection from a range of domestic vessels. The results of organic residue analysis did not show clear correlation between vessel form and the type of content, and they confirmed that pottery was mainly used for processing animal carcass products throughout the investigated period. At the same time, dairy processing became common only at the end of the Middle Copper Age.

2579. Food and Pottery: Culinary Practices of the Northern Neolithic around 3rd millennium BC through Organic Residue and Vessel Microwear Analysis

Authors: Lucy Kubiak-Martens (BIAX Biological Archaeology & Environmental Reconstruction) – Jonica Doliente (BioArCh, Department of Archaeology, University of York) – Tania Oudemans (Kenaz Consult & Laboratory, Berlin) – Wiebke Kirleis (Institute for Prehistoric and Protohistoric Archaeology, Kiel University) – Annelou Van Gijn (Faculty of Archaeology, Leiden University) – Oliver Craig (BioArCh, Department of Archaeology, University of York)
Format: Oral

Food residues preserved on the surface of ceramic vessels (also referred to as 'food crusts') provide an exceptional insights into past food preparation practices. The study of these residues, however, is complex and requires an integrated, multidisciplinary approach combining high-power microscopy and chemical analysis. This study presents a comparative analysis of charred organic residues from Middle–Late Neolithic pottery assemblages in northern Germany (Oldenburg LA77 and Hunte 1; c. 3270–2920 BC) and the western Netherlands (Steynhof, Vlaardingen, and Hekelingen; c. 2900–2450 BC). We applied a combined analytical framework including scanning electron microscopy (SEM), lipid residue analysis (GC-MS and GC-C-IRMS), and direct temperature-resolved mass spectrometry (DTMS). SEM was used to identify cereal remains, herbaceous plant tissues, and non-plant components preserved after cooking. Lipid residue analysis was used to differentiate fats from ruminant, non-ruminant, aquatic and dairy products. In addition, application of a recently developed University of York method revealed cereal-specific lipid biomarkers in numerous residues. Integrating these methods reveals both shared and regionally distinct patterns in food components and food processing techniques. For some of the Vlaardingen vessels microwear analysis added more details on culinary practices. We discuss how the similarities and differences inform interpretations of daily culinary practices and cultural connections among Middle–Late Neolithic communities in northwestern Germany and the western Netherlands.

821. The role of ceramics in storage strategies and household resilience in Pryssgården outside the modern city of Norrköping, southern Sweden

Authors: Fredrik Larsson – Marita Sjölin (National Historical Museums) – Katarina Botwid (Keramikarkeologi)
Format: Oral

Archaeological excavations at Pryssgården in Norrköping, conducted in the early 1990s and again between 2022 and 2024, have revealed an extensive settlement containing 210 well-preserved post-built buildings dated from roughly 2000 BC to AD 1200. These structures, together with numerous activity areas tied to food preparation and craft production, represent several farmsteads that occupied the area over time. During the Bronze Age, the settlement comprised multiple contemporaneous farms characterized by large numbers of pits located both inside and outside buildings. Their distribution suggests a sophisticated and well-organized storage system. The pits contained substantial ceramic assemblages with wide variation in form, manufacturing technique and function. Chemical and craft-focused analyses have identified specialized pottery-producing farmsteads and provided insights into the organization of ceramic production and everyday vessel use. Integrating these data with farmstead analyses offers a holistic understanding of storage strategies, household resilience and the role of ceramics in these systems. A cellar associated with one of the houses offers a rare glimpse into Bronze Age household interiors. The seven vessels recovered from this context form a highly selective subset, allowing detailed examination of technological choices and practical use. Their characteristics indicate adaptation to heat exposure and daily tasks. The functional composition—focused on cooking and storage—shows the cellar served as an active household space. This demonstrates how artisanal analysis can illuminate spatial practices and everyday life even within very small archaeological features.

2117. A biomarker obsession? The role of methylxanthines in reconstructing cacao-based recipes in Mesoamerica

Authors: Estelle Praet (British Museum) – Katie Sampeck (University of Reading) – Rebecca Stacey – Danny Zborover (British Museum)
Format: Oral

Nowadays a mass-produced global commodity, cacao was deemed a divine food at the heart of ritual, social, and economic life in ancient Mesoamerica. Its identification in the archaeological record mostly relies on the presence of theobromine in absorbed residues of ceramic vessels. Theobromine has, alongside theophylline and caffeine, been widely used as a chocolate biomarker and has contributed to understanding cacao consumption through time via absorbed residues in vessels from South to North America. Interpretations and discourses soon relied on this tiny biomolecule, considering that its presence suggests chocolate consumption. In this journey towards reconstructing the complex and diverse culinary history of cacao, this paper will present the results of an in-depth testing of an ethnographic vessel from Oaxaca alongside serving and storage vessels from Rio Ceniza (El Salvador) and Isla de Sacrificios (Mexico). These vessels were tested for the presence of methylxanthines (theobromine, caffeine and theophylline) via targeted liquid chromatography mass spectrometry (LC-MS) and their more general lipid profile via gas chromatography mass spectrometry (GC-MS). This paper will shed light on how reference vessels can help shape ORA extraction and analytical methods, as well as data interpretation by emphasizing sample variability. It will also reveal cacao lipid profile(s) and identify the addition of other ingredients, paving the way for reconstructing the diversity of cacao-based recipes across Mesoamerica.

1451. Cooking Pot Roles in Social Practices: A Multidimensional Analysis of Ordinary Vessels from Late and Inka Periods, Hualfín Valley, Argentina

Authors: María Iucci – Federico Wynveldt – Juana Fuertes (Laboratorio de Análisis Cerámico, Universidad Nacional de La Plata - CONICET)
Format: Oral

During the expansion of the inkas into the valley region of Northwestern Argentina (Southern Andes, 15th century), local pottery production was centered on the manufacture of two main sets of containers: "fine" or painted ceramics—Belén, Santa María, and Sanagasta styles—which had clear regional boundaries, and "ordinary", "coarse" or "culinary" ceramics, characterized by a broader geographical distribution and distinct material and symbolic characteristics. In the Hualfín Valley (central-western Catamarca Province), ordinary vessels are found in association with Belén pottery, including dwellings, areas of productive activity and burial sites, and are characterized by clear evidence of fire exposure and sooting. This study explores a wide range of social practices in which ordinary pottery was involved. To this end, we present the results of our analysis of production technology and define the performance characteristics—the mechanical and thermal properties for which these vessels were particularly suited. In addition, we examine use-wear traces on the ceramic bodies, including both soot deposits and attrition marks, which allow for the identification of the specific and repetitive activities to which the vessels were subjected. Finally, we review the depositional contexts and the presence of modeled imagery to define specific use-situations and identify representational practices that incorporate symbolic references into the production of these containers. The body of evidence suggests that these vessels were made in a production cycle distinct from that of fine ceramics, using a manufacturing technology that balanced efficient production with thermal shock resistance and rapid heating. The social practices in which they were involved transcend mechanical and thermal properties, integrating these containers into the broader worldviews of the societies that produced them.

594. Everyday Vessels, Enduring Practices: The Simple Hemispherical Bowl and Its Users at Neolithic Halai, Central Greece

Authors: Effimia Angeli (Maria Curie-Skłodowska University)
Format: Oral

Even the most ordinary objects can illuminate the intricacies of human life, revealing how everyday practices, habitual decisions, and material interactions structured the experiences of past communities. In the Neolithic settlement of Halai (ca. 6000–5300 BC), the simple hemispherical bowl—mostly with flaring walls but also vertical or slightly restricted profiles—provides a window into the daily routines, decisions, and bodily engagement of its users, reflecting both habitual and multifunctional use over time. Adopting a user-centred and contextual approach, the study integrates spatial distribution across household and open-air contexts, use-wear traces, and decorative evidence. At Halai, hemispherical bowls appear both indoors and outdoors, showing repeated handling, multifunctional use, and occasional repair. Decoration is occasional and situational, reflecting practical and social priorities. The simplicity of the form aligns with strategies of adaptability, efficiency, and routine utility. Foregrounding the relationship between users and vessels, this case study demonstrates how even everyday ceramics illuminate daily life, social interaction, and cultural priorities. The simple hemispherical bowl thus serves as a lens for understanding the stability and flexibility of Neolithic practices at Halai.

332. Use-wear traces and thermal food processing: A peculiar abrasion marks on the vessels from the site of Viškovci, Eastern Croatia

Authors: Jasna Vukovic (University of Belgrade, Faculty of Philosophy, Department of Archaeology) – Ina Miloglav (University of Zagreb, Faculty of Humanities and Social Sciences) – Jacqueline Balen (Archaeological Musem in Zagreb) – Miroslav Vuković – Mia Marijan (University of Zagreb, Faculty of Humanities and Social Sciences)
Format: Poster

The poster will consider a distinct group of finds from the Late Copper-Early Bronze Age (2570-2340 cal BC) site of Viškovci, a hill-fort settlement near the town of Đakovo in Slavonia, Eastern Croatia. Pottery assemblage originates from features which contained vessels related to food-preparation and long-term storage. A distinct group of finds stands out: it consists of bases belonging to the medium-sized and large vessels for thermal food processing. Their most striking feature is a use-wear pattern on their external surfaces, where two zones can be distinguished. Outer zone is in the form of a regular ring, smooth, even burnished. Inside this ring is a heavily abraded zone, characterized by the complete removal of the original surface, indicating a pressure caused by applying some strong force. The surface-alterations were examined macroscopically, microscopically, and using 3D models to detect use-wear traces in the microrelief of the pottery fragment's surface. The possible explanations of the activities in which this kind of mechanical damage originated will be considered.

2189. Technological choices for building Early Neolithic ceramics and their external mud coats for salt production in Añana (Basque country, Spain)

Authors: Olivier Weller (CNRS - Lab Trajectoires) – Javier Camara Manzaneda (Universidad de La Laguna) – Alberto Plata Montero (Fundación Valle Salado de Añana) – Cristina Camarero (Qark) – José Manuel Martínez Torrecilla (Qark Arqueología SL) – Louise Gomart – Laurent Aubry (CNRS - Lab Trajectoires)
Format: Poster

The Salt Valley of Añana has emerged as new representative site for understanding the development of the neolithisation process in the north of the Iberian Peninsula (Upper Ebro valley), and for gaining a better understanding of the economic strategies of these first farming communities around one of the oldest salt exploitations in the European continent. The NéoSal research project, launched by a French Spanish team, has revealed an exceptional stratigraphic sequence linked with the salt exploitation and processing dating back to at least 5200 cal. BCE, which has yielded a large quantity of potsherds associated with several Early and Middle Neolithic layers (more than 500kg). The analysis of the pottery assemblage of Valle Salado de Añana have provided a macroscopic and mesoscopic characterisation of the ceramic manufacturing phases that were performed in this site along the Early Neolithic: among which, the prevalence of the forming tradition of the patchwork technology, revealing the distribution of this Mediterranean tradition in the north Iberian Peninsula. In parallel, another key element from this Early Neolithic site corresponds to the mud coating sherds applied on the surfaces of those vessels that were used to process the brine coming from the natural springs by evaporation. This poster provides new insights into the technologies used for building the ceramic vessels and the mud coating sherds recovered in the Neolithic sequence of the Salt Valley of Añana by integrating the analysis of technological traces and the 3D scanning techniques. The aim is to address (1) what were the technological choices that were employed for forming, adding and using these mud coating sherds and (2) whether the community of practice that was producing the vessels followed the same operational scheme for building these clayey elements, shedding new light on their equal participation both in ceramic manufacture and salt production.

2193. Manufacturing and Storing the Pharmakon - Cookware and Vessels Used to Produce, Hold, and Serve Compounds for Group Ritual Use

Authors: David Anderson (Independent Researcher)
Format: Poster

Speculation continues on the precise nature of the Pharmakon used during the Greater Mysteries of Eleusis. My research has led me to believe the compound was most likely Lysergic Acid Amide (LSA), an ergot-derived compound that synthesizes at a lower temperature than the better-known Lysergic Acid Diethylamide (LSD). Hierophant families almost certainly had equipment used for the collection, storage, and processing of ergotized grain into a form that could be reconstituted for use during group rituals. The scandal of Alcibiades' theft and profane abuse of the Pharmakon preceded the disastrous Siracusan Expedition for Athens. How would such a substance be stored and consumed by non-Hierophants? I would like to create a poster that will illustrate current archaeological findings from hearth structures inside the Telesterion of Eleusis and around the wider grounds. The poster can include information on what reputable sources suggest to be plausible manufacturing processes to turn ergotamine extractions into something like LSA that is safe to consume. Heating an ergotamine - ash mixture is a plausible process for LSA synthesis. My poster will review the literature and illustrate findings on the type of pottery that could have been used in the manufacturing process. My 'Pottery of Eleusis' poster will also include examples of storage vessels found onsite, and speculate on how pottery used for storage and transportation of the Pharmakon may have appeared. Manufacturing processes will be considered if there is room on the poster. I plan to include historically-accurate Pottery and other objects to my Eleusinia Temple Complex world on Meta Horizons. My poster will review the pottery suggested in the Eleusis literature and offer artistic interpretations of what the cookware and vessels used to produce, hold, and serve the Pharmakon of Eleusis may have appeared.

86 FROM DECAY TO DATA: INTEGRATING TAPHONOMY, FORENSIC ARCHAEOLOGY, AND DIGITAL TECHNOLOGIES IN HUMAN DECOMPOSITION RESEARCH

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Pier Matteo Barone (The American University of Rome | Forensic Geoscience Italy - Geoscienze Forensic italia | ENFSI SoC WG Forensic Archaeology) – Lucia Elgerud (Uppsala University) – William Cawley (Arizona State University) – Patrick Randolph-Quinney (Uppsala University)
Keywords: Forensic Archaeology, Taphonomy, CSI, Archaeothanatology, Human taphonomic facilities, 3D/4D digital tools
Format: Regular session

SESSION ABSTRACT

This session explores how taphonomy, archaeology, and forensic archaeology intersect to advance the understanding, documentation, and interpretation of human decomposition in diverse environmental and cultural contexts across both deep and recent timescales, including medico-legal and investigative settings. Within mainstream archaeology there has been a rush to adopt inductive archaeothanatological approaches to understand burial practices, whilst not fully engaging with the immense datasets—and operational insights from crime-scene and mass-fatality investigations—generated by human forensic taphonomic facilities over the last five decades. As such, we invite contributions that address cross-disciplinary, experimental, field, forensic-archaeological, and humanitarian approaches to taphonomy and thanatology, including work on clandestine burials, mass graves, search and recovery protocols, context recording, and evidentiary reconstruction. We also invite contributions on the establishment, operation, and ethical management of human taphonomic facilities—both proposed and already existing—as crucial infrastructures for advancing this field and for training to investigative standards (e.g., chain-of-custody, data governance, and courtroom communication). Emphasis will be given to innovative 3D and 4D digital toolkits for analyzing taphonomic processes, reconstructing contexts, and improving training and evidentiary communication. By bringing together taphonomy and thanatology, forensic archaeology, forensic science, and digital specialisms, the session aims to stimulate dialogue on new methodologies, harmonized investigative protocols, and the future of taphonomic research and practice in Europe and beyond.

CONTRIBUTION ABSTRACTS

100. From Search to Context: Integrated Forensic Archaeology Workflows for Decomposition Evidence

Authors: Pier Matteo Barone (The American University of Rome | Forensic Geoscience Italy)
Format: Oral

Locating clandestine burials and recovering the missing increasingly requires that "search and recovery" be framed as a disciplined, data-producing pathway for taphonomic and investigative interpretation. Building on operational experience across humanitarian and judicial contexts, this paper presents an integrated forensic-archaeology workflow that connects: (i) remote-sensing triage (satellite time-series, UAV survey, historical cartography and imagery); (ii) scenario-adapted near-surface geophysics for complex environments (including outdoor, indoor, and submerged settings); (iii) GIS-based modeling that integrates environmental and anthropogenic indicators with testimonial and intelligence inputs; and (iv) phased verification through archaeological ground-truthing and standardized recovery protocols. To support the session's "decay to data" perspective, the workflow embeds digital documentation at each stage—interoperable geodatabases, structured context recording, and 3D/4D capture of grave architecture, depositional sequences, and decomposition-related proxies—so that taphonomic signals can be compared across cases and, where relevant, training and research infrastructures. Anchored in the ENFSI Scene of Crime Forensic Archaeology Best Practice Manual, the approach reduces uncertainty, minimizes unnecessary disturbance, and strengthens chain-of-custody and courtroom communication. The result is a flexible yet harmonizable framework that improves efficiency and evidential robustness while advancing the comparability of decomposition datasets across jurisdictions.

1956. Beyond the Body: A Reassessment on the Utility of Body Farms

Authors: William Cawley (Arizona State University)
Format: Oral

Outdoor research laboratories specialized in examining the postmortem decomposition processes of humans and animals, or human taphonomy research facilities (HTF)/ "body farms", have facilitated research in multiple fields since their inception in 1981. The necessity of such facilities and the value of research produced by these institutions, though, continues to be debated by scholars of anthropology, bioarchaeology, osteology, and related fields. However, conversations on the utility of body farms for solely decomposition research ignore the exceptional opportunities and broader benefits such facilities can provide. In this paper, the author reviews the broad utility of outdoor postmortem research laboratories by examining their ongoing activities and contributions to ethically minded science, education, professionalization, and science communication in an international context across several such institutions. Data for this project are derived from semi-structured interviews, questionnaires, and primary research of these facilities to better represent the scope of their respective activities. I argue that body farms succeed not only in contributing to academic

literature across multiple scholarly fields, but also in providing spaces for experimentation, training, and the ethical study of human remains. By further exploring the utility of such facilities, this paper sheds new light on the often neglected, but equally compelling, benefits of both existing and prospective outdoor postmortem research laboratories.

1689. The challenges of operating a human taphonomy research facility: from ethics to research

Authors: Giovanna Vidoli – Mary Davis (Forensic Anthropology Center, University of Tennessee) – Joanne Devlin – Dawnie Steadman (University of Tennessee)
Format: Oral

The Anthropology Research Facility (ARF) in Knoxville, Tennessee, established in 1981, is the original "Body Farm." The associated body donation program has grown from three body donations in the first year to the current yearly average acceptance of 75 donors, with more than three times this number declined. As the field of forensic anthropology has expanded over the last 45 years, so has the ethical standards in body donation, research, and data sharing. This presentation will delve into some of the lesser discussed challenges in managing a human taphonomy research facility, including why we accept or decline a body donor, what research is acceptable, how to ethically manage skeletal remains from 2000+ individuals, how to fund the daily operations and infrastructure of a decomposition facility, and what data should be collected and shared. In addition, we will share the breadth of possible research from body farms by highlighting forensic archaeological research from the ARF, including 3D documentation and grave detection methods. The juxtaposition of challenges and research will demonstrate the high risk and high reward of establishing and managing a human taphonomy research facility.

2111. Research after Death: The Feasibility of Establishing a Swedish Human Taphonomy Research Facility

Authors: Lucia Elgerud (Uppsala University)
Format: Oral

The establishment of human taphonomy research facilities (HTFs) has been a central focus in forensic archaeology and anthropology since the founding of the first such institute at the University of Tennessee, Knoxville in 1981. HTFs offer unprecedented opportunities for research and training in these and related fields. However, while a dozen HTFs have been established across the world most are within the continental USA and only four facilities exist elsewhere, half of which are located in Europe. Taphonomic facilities, especially those concerned with human remains, have to abide by complex local and regional policies surrounding environmental impacts, human tissue research and storage, and biomedical safety. Local perceptions also need to be taken into consideration including potential opposition amongst local communities and incorrect or sensationalised rumours about activities conducted at HTFs. Some researchers, including those based in the UK, have been unsuccessful in establishing an HTF despite concerted efforts to do so, begging the question of how other countries can best realise the establishment of such a facility. This paper presents an ongoing Marie Skłodowska Curie postdoctoral project funded by the Swedish Research Council to investigate the possibility of establishing an HTF in Sweden. The study includes an analysis of views amongst the general Swedish population on body donation practices as well as current organ and full body donor motivations. By combining this ethnographic data with a textual analysis of Swedish laws and policy, this study seeks to establish a "roadmap to an HTF in Sweden". Only by understanding local parameters, institutions, and policy can new human taphonomy research facilities be realised. This paper accounts for the ongoing analysis of one such context, which may inform similar efforts in other countries across Europe and beyond.

2147. Decomposition Facilities as Sites of Interdisciplinarity: Bridging the Gap Between Experimental Ecology and Forensic Casework

Authors: Hayden Mckee-Zech (Northern Michigan University) – Kelly Sauerwein (National Institute of Standards and Technology) – Angela Dautartas (Western Carolina University) – Erin Patrick (University of Tennessee - Knoxville) – Derek Boyd (University of Nevada, Las Vegas)
Format: Oral

Decomposition is a chaotic and dynamic ecological process, not a linear sequence of stages as traditionally understood. To have utility in forensic investigations, taphonomic changes to the body should be described and understood through an ecological systems framework that emphasizes interactions among microbes, insects, vertebrate scavengers, soils, and the environment as coupled drivers of decomposition trajectory. Such an approach is necessarily interdisciplinary and requires both lab- and field- based experimentation, which is currently an uncommon practice in the field. Integrating traditional lab-based experimentation with observational data derived from decomposition research facilities allows for iterative testing, refining, and translation of hypotheses into investigative protocols for more nuanced and advanced research and experimentation. This synthesis is essential for producing defensible, courtroom-relevant interpretations grounded in reproducible and reliable empirical data. The foundations of such a synthesis, however, require standardization - consistent study designs, sufficient sample sizes, universally measured variables, and clear and concise reporting. We therefore argue that taphonomic research needs new infrastructure supporting standardized data collection, cross-site comparability, and interdisciplinary training. Such integration is necessary to transform fragmented observations into scalable knowledge capable of informing forensic recovery, humanitarian investigation, and archaeological interpretation across contexts.

2434. Applying Archaeothanatology to Mass Graves: Implications for Humanitarian Forensic Archaeology

Authors: Shubham Thakur – Jagmahender Sehrawat (Panjab University)
Format: Oral

From the Humanitarian forensic archaeology standpoint, mass graves often present as a herculean challenge from a technical and ethical purview. These graves often entail commingled, secondary transfers, disturbed and variably decomposed human remains that ultimately hamper the identification process and the credibility associated with undertaking-controlled excavation and documentation processes. This is where archaeothanatology helps strengthen humanitarian forensic archaeology through its formal reasoning, associated with anatomical connections, decomposition space, etc., by providing a standardised framework that offers insight into evidentiary reconstruction and identification processes in mass grave contexts. This study explores the archaeothanatological principles and their systematic integration in the investigation of mass graves, offering deep insights into body deposition, burial timing, and post-depositional disturbances. Besides, it also attempts to understand the role played by key indicators towards assisting in differentiating per-mortem violence from post-mortem alterations, if any. Also, to determine whether the bodies were buried individually, in groups or as episodic deposits. Thus, by drawing on forensic archaeological casework and experimental taphonomic research, the study aims to give due consideration to contextual recording and stratigraphic excavation to preserve critical spatial information from mass graves. The inclusion of archaeothanatological approaches helps by enlisting digital documentation and advanced imaging methods that may further support visual analysis and courtroom communication in the context of buried remains recovered from mass graves. Thus, the amalgamation of archaeothanatology with a humanitarian forensic approach enables a more holistic and standardised approach for undertaking forensic investigation of the mass graves. It has great potential to strengthen evidentiary interpretation and identification processes, and to uphold the dignity of the dead. Thus, this study aims to demonstrate that archaeothanatology is not only a tool for burial interpretation but also acts as a vital component of contemporary humanitarian forensic practices.

2413. Experimental histological analysis of porcine bone; Advancing understanding of microtaphonomy in aquatic environments

Authors: Alexander Cook – Richard Madgwick (Cardiff University)
Format: Oral

The process of Wedl tunnelling's potential and global applications have yet to be fully tapped in the forensic field and little experimental work has been undertaken linking the presence with specific environments and timescales. The analysis of these cyanobacterial attacks on the cortical edges and haversian canals of bone has led to questions on how they can be utilized for understanding deposition timescales, as well as the environmental conditions required for such attacks. Through the lens of a Bermudian case study, this paper aims to understand how cyanobacteria within different aquatic environments interacted with fleshed/excarnated porcine bone within five separate sites over an eight-month period. This study revealed that reef environments produced the deepest and most abundant type 1 tunnelling, likely due to constant sunlit conditions and relentless predation by marine life. Brackish ponds produced the least, with attacks seemingly disabled due to the lack of both sunlight beyond the surface as well as absence of cyanobacteria in water samples. It also confirmed that fleshed samples take longer to develop tunnelling in comparison to excarnated samples, and that putrification bacteria does not play a role in the intensity of the attack unless presented with a model environment allowing for necrotization. Whilst further targeted experimental work is required, these finding provide key new insights into the timing, condition and severity of microstructural modifications in diverse aquatic environments and have ramifications for our understanding of depositional practice in both archaeological and forensic contexts.

123. The traumatic, pathological and taphonomic signatures of identity of Ajnala skeletal remains: A forensic archaeological investigation

Authors: Jagmahender Sehrawat (Panjab University, Chandigarh)
Format: Poster

Innumerable crimes against humanity have been reported throughout human history and human hard tissues of bones and teeth remain witnesses to such brutalities. The traumatic, pathological and taphonomic marks of osseous tissues help forensic anthropologists in interpreting the cause and manner of death as they play crucial role in reconstructing past events. Thousands of unknown human remains were excavated non-scientifically from an abandoned well at Ajnala (Amritsar, India) by amateur archaeologists in 2014. In present study, teeth (982), cranial and jaw fragments (452), femur (204), clavicle (19), vertebrae (29), hand and foot bones (987) retrieved from Ajnala skeletal assemblage were examined for such features. These skeletal elements reportedly belong to 282 soldiers killed in 1857, whose cadavers were dumped in an abandoned well nearby to the site of massacre (Cooper, 1858, Bates and Carter, 2017). The human skeletal remains dumped since more than last 160 years remain unattended for months in harsh environmental conditions before the same were handed over to this author for their biological profiling purposes. The spatial positioning of the remains in well sediments and the pattern of peri-mortem bone fractures indicated that the cadavers were thrown from top of the well. The post-mortem injuries on the frontal and temporal portions of crania were suggestive of their non-scientific excavation. The stone bullets found entangled inside the examined intact crania (revealed from their CT scans) and, their morphological examination were indicative of brutal killing using the musketry firings. Many, if not most of the teeth, had a thin layer of dust and

debris and color changes (grey, pink, tan to brownish), owing to prolonged burial, fungal actions and interaction with their burial environment (Brown et al 2014). Comparatively lesser dental pathologies (caries, wear and hypoplasia) signified that the deceased had sound dental health, endorsing their possible army affiliations.

1710. Taphonomy of Epidemic and Conflict Burials: The "Archem" Project

Authors: Jovita Kadikinaite (Faculty of History, Vilnius University) – Matas Vaitkus (Faculty of Chemistry and Geociences, Vilnius University) – Angela Mollica Nardo (Life Sciences Center, Vilnius University) – Dovydas Karoblis (Faculty of Chemistry and Geociences, Vilnius University)
Format: Poster

In recent years, numerous 19th–20th-century burial sites have been uncovered, many of which exhibit evidence of chemical substances applied to human remains. During decomposition, these materials interacted with soft tissues, bone, and surrounding sediments, influencing postmortem processes and skeletal preservation. Such alterations challenge archaeological and forensic interpretation while also offering insights into historical burial practices. A pilot study conducted in 2022, focused on SEM analysis of sediments from 20th-century conflict burials, revealed a complex and context-dependent nature of this phenomena. The results demonstrated that similar taphonomic outcomes may derive from different causes, prompting the development of the Archem project, funded by the VU Science Promotion Fund. The Archem project applies an interdisciplinary framework that integrates forensic archaeology, anthropology, history, chemistry, geology, and microbiology. Its primary aim is to investigate the use of chemical substances in the burial of human remains during 19th–20th-century war and epidemic episodes, to identify motivations behind their application, and to assess their impact on the preservation of human remains. The project also examines the broader decomposition environment, including seasonality, soil composition, and burial context. Methodologically, the project expands sediment and soil investigation approaches by incorporating additional chemical and geological analyses, including XRD, XRF, pH measurements, and stratigraphic analysis. It also focuses on a wider range of archaeological contexts, including burials associated with cholera and typhus epidemics as well as conflict-related sites. These contexts include both respectful burials and disrespectful disposals of participants of Lithuanian and Polish uprisings, in addition to mass graves of 20th-century soldiers. Preliminary findings suggest that certain soil types are particularly conducive to sediment formation, sometimes producing deposits in the absence of added chemicals due to naturally alkaline conditions. Such environments can act as taphonomic "capsules," preserving crucial information about postmortem processes, underscoring the importance of environmental context in interpreting chemically altered burials.

2733. Using Pig Teeth as a Proxy for Understanding Heat Related Effects to Human Teeth with Transferable Methods for Forensic Investigation

Authors: Grace Holmes (University of Manitoba)
Format: Poster

Teeth are an extremely durable element of the human skeletal system and are likely to survive heat alteration events; however, burnt teeth are understudied in heat related decomposition in forensic contexts such as cremation, body disposal, or car fires. This research used pig teeth (n=296) as a proxy for human dentition to model and identify target experimental conditions for heat exposure ranging from 100°C to 1000°C for 30 to 360 minutes. Three-dimensional scans were collected before and after heat exposure to be uploaded to an open-access site as dental comparisons, which expands available visual representations for forensic experts. Metric analysis, macroscopic analysis, high-resolution photography, and 3D scans were collected before and after heat exposure to document visual, structural, and dimensional changes. This research refines foundational knowledge regarding how teeth change under specific thermal conditions; creating a more comprehensive scientific understanding of known visual changes of heat altered teeth. This will allow forensic investigators to have better visual assessment methods to recognize heat exposure parameters at forensic sites. Preliminary results from 100°C-500°C demonstrate mass shrinkage rates of 1.87% to 30.82% for deciduous teeth and 2.52% to 27.94% for permanent teeth, providing an important baseline for comparison to human dental studies by refining empirical standards for heat-induced changes. This research is foundational in identifying and testing experimental conditions that will be replicated on human teeth, which supports improved forensic heat exposure assessment, more reliable odonatological comparison for identification, and clearer fracture pattern differentiation. Changes within the results from metric and macroscopic analyses help identify target conditions to be replicated on human teeth, which is valuable for improved heat exposure condition assessments for forensic examination by providing reproducible and experimentally derived benchmarks for estimating heat exposure conditions and evaluating thermally altered evidence.

88 MAKING ARCHAEOLOGY ACCESSIBLE: EDUCATION, OUTREACH, AND ENGAGEMENT IN THE FIELD AND THE MUSEUM

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Io Viktoratou (American School of Classical Studies at Athens) – Christina Pagoni (Swiss School of Archaeology in Greece) – Kyriaki Katsarelia (University of Fribourg | University of Lille | Swiss School of Archeology in Greece)
Keywords: Outreach, Education, Museums, Learning, Community, Heritage
Format: Regular session

SESSION ABSTRACT

The American School of Classical Studies at Athens - the Agora Excavations, and the Swiss School of Archaeology in Greece organize this session to explore methods for developing educational and outreach programs, based on archaeological research. These initiatives aim to promote learning, storytelling, engagement and enjoyment in contemporary society. We will present case studies of educational and outreach initiatives, alongside our new joint program. These free programs provide spaces for critical engagement, active learning, and hands-on experience. The session invites presentations that explore the design of online and on-site educational programs that incorporate object-based learning, copies of artifact handling, thematic storytelling, and new technologies such as 3D scanning and printing. We will also consider strategies for initiating and maintaining public support. By integrating primary and secondary sources, dialogue with professionals in the field, and interaction with archaeological and archival material, educational programs cultivate curiosity, critical thinking, and a deeper understanding of archaeology as a living, evolving process that connects past and present. In an era defined by political, environmental, and social instability, collaborative approaches highlight the role of educational outreach in building empathy, and a shared sense of heritage. Outreach programs have the power to strengthen local connections to archaeological sites and encourage identity-building and cultural heritage preservation. Museums and excavations can act as community builders and spaces for healing, reflection, and adaptation. In doing so, we contribute to the broader conversation on how societies inherit, interpret, and protect the ancient world. We welcome contributions that share methodologies and case studies from educational and outreach programs linked to museums, archaeological sites, excavations, and artifacts. We particularly encourage presentations addressing inclusivity, accessibility, digital engagement, and community participation.

CONTRIBUTION ABSTRACTS

233. reCLAYm – Re-connecting citizen scientists with material culture research in archaeology

Authors: Jakob Maurer – Julia Längauer (Univ. for Continuing Education Krems, Center for Museum Collections Management) – Doris Jetzinger (University of Vienna) – Lukas Kerbler (Krahuletz-Museum Eggenburg) – Caroline Posch (Natural History Museum Vienna) – Andreas Thinschmidt (Krahuletz-Museum Eggenburg) – Franz Pieler (State Collections of Lower Austria) – Michaela Schauer (Natural History Museum Vienna)
Format: Oral

Joint work of archaeologists and citizen scientists (CS) represents a particularly intensive form of dialogue between science and society. Beyond its direct academic value for archaeological research, CS-integration can generate multiple additional benefits, ranging from the personal level (e.g., mutual learning, increase of interests, education, skills, self-confidence, well-being) to broader impacts on archaeology (e.g., enhanced public support, visibility, funding) and society at large (e.g., reduced scepticism towards science, sense of appreciation within local communities). In this contribution, we introduce our reCLAYm project (newly funded by GFF NÖ) as part of the ongoing discourse on the integration of CS in archaeology, with a particular focus on the still underexplored field of material culture research. The project centres on the extensive pottery assemblage from the Early Neolithic Linearbandkeramik site of Asparn/Schletz in Lower Austria, whose material volume of >3.000 boxes represents a major challenge for comprehensive analysis. We argue that a deep integration of CS into a transdisciplinary research framework, with a standardized methodological approach, offers a viable way to address a corpus of this magnitude, which exceeds what even teams of professionally trained researchers can realistically process on their own. Focusing on Neolithic pottery, the project combines typology, experimental archaeology, and portable X-ray fluorescence (pXRF) to investigate prehistoric pottery production, raw material sourcing, cultural development, and social interaction. Through CS-involvement in all research stages, from proposal design, data collection, interpretation to dissemination, reCLAYm explores their integration as co-researchers in complex analytical workflows. The project also addresses methodological challenges such as user bias, data standards, and legal boundaries of CS-integration in archaeometry, aiming to develop scalable, inclusive models for participatory research. We will also draw on results from our "United by Crisis?"-project, in which we conducted field surveys and isotope analyses together with schoolchildren, collectors and CS without prior archaeological experience.

1008. Bridging Science and Society: A Multi-Scale Participatory Research and Outreach Strategy within the "Wood for Limoges (FR)" Collective Research Programme

Authors: Anne-Claire Misme (Éveha) – Sandrine Paradis (Éveha, Geolab)
Format: Oral

Since 2020, the Collective Research Programme (PCR) 'Wood for the City of Limoges' has examined the historical relationship between the city of Limoges and its forest resources over the past five centuries. The project has examined the timber species used in existing timber-framed structures, the supply chain logistics (via the river and roads) and the subsequent impact on the surrounding forest landscapes. This research is conducted by a multidisciplinary consortium including universities, the CNRS, regional and municipal heritage services, and private stakeholders. While four primary axes focus on wood as fuel, construction timber, supply networks, and landscape evolution, a strategic fifth axis dedicated to participatory research and outreach was integrated from the project's inception. Driven by the conviction that data should transcend the academic sphere, the team structured this outreach axis around three core missions: assessing public attachment to timber-framed architecture and to the historical areas under study; documenting local knowledge and collective memory linked to the role of wood within the city; and disseminating our scientific results (e.g. building studies and dating) to schools and the local community. Methodologies included urban street surveys, interactive

events on the riverbanks, pedagogical workshops focusing on dendrochronology and building archaeology, etc. This paper explores the various outreach activities that enabled this research project to engage with the local community and create opportunities for further research, particularly in the fields of building archaeology and dendrochronological dating.

294. Board games for international scientific dissemination: breaking cultural barriers through play in disseminating research on past energy use

Authors: Andrea Alias Sotos (Institut Català de Paleoecologia Humana i Evolució Social / IPHES-CERCA | Universitat Rovira i Virgili) – Daniel Gallego Morales – Aina Martí Peñas (MUCBO | Fundació Jardí Botànic de Sóller-Museu Balear de Ciències Naturals) – Piyumi Embuldeniya – Uditha Jindasa – P. Narmada Hansani – Theekshana Athukorala (University of Peradeniya) – Natacha Filippi (Els Corremarges SCCL, Cooperativa de trabajo asociado) – Prabath Ekanayake – R.M.M. Chandraratne (University of Peradeniya)
Format: Oral

Relevant aspects from our past and present are related to plants and are key to how we organize our daily lives and face global challenges. For this reason, understanding plants and their relationships with societies, from ancient times to the present, is crucial for enhancing environmental awareness. However, plants and their uses are often omitted from the historical record. To overcome this, we are developing educational resources that will be useful for teaching the value of plants in both the past and the present. Our dissemination strategy focuses on game-based learning (ABJ). We recognize that play is a universal language, inherent in all cultures and civilizations, with formats that transcend barriers, which makes it a key element for integration and social cohesion in an international context. Its inherently playful format facilitates the introduction of complex topics, such as archaeobotany, traditional plant uses, and past energy use of plants, in a relaxed and fun way, overcoming potential learning barriers. This game has been developed based on the results of our archaeological studies in Sri Lanka, France, Catalonia, and Majorca. We have adapted the game to be used at the different locations of our project, and for different educational levels, to provide a knowledge-based resource for museum curators in an informal learning setting, as well as an educational resource for teachers. We have tested the game in several schools in Sri Lanka and are in the process of implementing the necessary changes to improve its educational value. We are also adapting the game for SEN schools, following the advice of teachers from the blind school of Kandy and SEN educators from Sri Lanka.

219. Artemis Amarysia: School Classes and Public in Greece Educational and Outreach Programs of the Swiss School of Archaeology in Greece

Authors: Christina Pagoni (Swiss School of Archaeology in Greece)
Format: Oral

Thanks to the support of the Stavros Niarchos Foundation, the Swiss National Science Foundation «Agora» project was adapted for school classes in Euboea. The activities carried out so far include information workshops for teachers about the Agora platform (esag.swiss/el), presentation of archaeological finds to students through school visits, and guided tours of the Eretria Museum and the archaeological site of Amarynthos. In just six months, more than 650 students from primary and secondary schools in Euboea participated in the activities, as well as numerous students from international schools. Until now, approximately 2,000 students have visited the sanctuary of Artemis in Amarynthos and taken part in our educational programs in Greece. In addition, the ESAG guides groups from associations, Universities, and Archaeological Schools to Amarynthos and Eretria weekly. During the summer, two "Open Excavation Days" were also held, attracting several hundreds of visitors. The annual "Junior Archaeologists" event, taking place every summer, is particularly popular. Each year, more than 80 children and their parents receive an exclusive tour of the excavation in the sanctuary of Artemis in Amarynthos, while the children then take part in a simulated excavation on the nearby beach. Additionally, last year an artificial excavation site was created next to the sanctuary, where school classes can acquire their first archaeological experiences. The data so far show the strong interest of Euboean schools in the educational activities of the ESAG, reflected in the steadily increasing participation of students each year. In October 2025, the ESAG also participated in the Athens Archaeology Festival organized by the British School at Athens with an educational activity/game created for families and children, while during the ongoing school year we are implementing a new educational program for middle/high school students, in collaboration with the American School of Classical Studies at Athens.

2297. The Archäomobil – Archaeology on Wheels. The archaeomobile of Eastern Switzerland takes archaeological education to every destination

Authors: Christina Lolos – Kilian Graf (Archäomobil Ostschweiz)
Format: Oral

Every day Swiss archaeologists investigate new archaeological sites. Much of this work takes place behind closed doors at the regional department offices (Kantonsarchäologien). To provide the public with insight into their work, five eastern cantons – Appenzell AR, St. Gallen, Schaffhausen, Thurgau, and Zurich – are conducting an innovative educational project. Since January 2021, the Archäomobil Ostschweiz has been offering expert access to archaeological topics and artifacts. As a mobile information center, it visits school classes in their schoolyards and raises awareness of the specialist departments' work among the local population at public events. The Archäomobil is a converted VW van equipped with teaching materials for archaeological education. It carries original finds ranging from the Stone Age to the Middle Ages from all participating cantons, as well as illustrative material and

interactive educational modules. Specifically, it provides an insight into the various aspects of archaeological work, including excavation, find and site management, dating methods, bioarchaeology, anthropology, underwater archaeology and UNESCO World Heritage. Thus, the Archäomobil performs educational work that extends beyond archaeology, promoting an interdisciplinary approach to various areas of the humanities and natural sciences. The focus is on direct interaction between experts and the general public. Unlike conventional archaeological museums, it emphasizes the working methods and scientific methodology of archaeologists rather than findings and content relating to archaeological eras. Thus, the Archäomobil complements the museum-based presentation of archaeological collections without competing with them directly. The Archäomobil aims to spark the public's curiosity about science and strengthen their connection to the region's cultural heritage. Great importance is attached to striking a good balance between scientific content and experience-oriented cultural mediation.

606. From Replicas to Resilience: Care and Cooperation in Early Years Prehistory

Authors: Clara Masriera-Esquerra (Universitat de Barcelona)
Format: Oral

Over the past decade, the Department of Prehistory at the Universitat Autònoma de Barcelona (UAB) has developed and delivered a programme of prehistory outreach for early childhood (ages 5–6) and early primary (ages 6–8) classrooms in Catalonia. Designed by an interdisciplinary team combining archaeological research and educational expertise, and implemented in partnership with the Museu de Sant Cugat del Vallès within the Sant Cugat del Vallès City Council's Programa Educatiu d'Entorn (PEE) for municipal schools, the programme translates current academic knowledge into age-appropriate, hands-on learning experiences that respond to teachers' curricular aims and to children's interests. Recent school requests have foregrounded climate change, bodily diversity (human and animal), and environmental adaptation, offering a bridge between past lifeways and present concerns. Each workshop follows a consistent structure: (1) eliciting prior conceptions through guided dialogue and image-based prompts, introducing key concepts through thematic storytelling; (2) rotating through four stations that prioritise object-based learning and accessibility: a mobile "museum" with replica artefact handling; rock-art making using real pigments; prehistoric fauna (including Ice Age narratives such as the woolly mammoth); and a critical "materials and media" station using contemporary plastic toys to surface and discuss stereotypes and misconceptions. Programme refinement is supported through structured pre-workshop teacher consultation and immediate post-workshop reflective audio notes focused on engagement, misconceptions addressed, and inclusion measures (e.g., sensory needs, attention, neurodiversity). Across contexts, workshops consistently generate high motivation and sustained curiosity, while helping children move beyond "survival of the strongest" and big-game clichés toward evidence-based, empathetic understandings that foreground diversity, care, cooperation, and everyday collective work as fundamental to group resilience and survival.

1588. An Interdisciplinary "Artaeology" School Lab: Bridging Prehistoric Greek Rock Art with Contemporary Artistic Practice

Authors: Dimitrios Trakosas (University of Ioannina) – Vicky Papagianni (University of York)
Format: Oral

This paper presents the outcomes of an interdisciplinary archaeology-art education program developed for secondary school students (ages12-15), exploring how prehistoric Greek rock engravings (particularly those from Philippi, Mount Pangaio, the Angitis region in Eastern Macedonia, and the Asphendou Cave in Crete) can function simultaneously as archaeological evidence, pedagogical tools, and contemporary artistic expression. Created through scratching and chiselling onto stone surfaces from the Last Ice Age and Late Neolithic through the Early Iron Age, these engravings constitute early systems of visual communication and expression, featuring linear depictions of humans, animals, celestial symbols, and everyday practices. Through experimental studio workshops, students approached these engravings as "the first tools of thought", examining their communicative, ritual, and emotional roles. Art historical frameworks contextualized the influence of prehistoric imagery on modern and contemporary art, referencing artists such as Picasso, Miró, Giacometti and Dubuffet. Participants produced their own symbolic compositions, translating their personal concerns (e.g. identity, relationships, anxiety) into simplified visual vocabularies inspired by prehistoric mark-making. These works were exhibited as a collective "future archive", in which young students intentionally addressed viewers of their own generation across time. The project demonstrates how engagement with prehistoric visual culture enables students to reconstruct early human perspectives while generating new artistic directions. By bridging archaeological knowledge, art historical interpretation, and studio practice, this scholar-lab proposes an interdisciplinary model that repositions rock art as a living pedagogical framework, connecting humanity's earliest expressions with future-oriented artistic inquiry.

259. Reconstructing Locality without Travel: Archaeology, VR Exhibitions, and Area Studies Education in South Korea

Authors: Hyejin Kim (Hankuk University of Foreign Studies | Department of Greek Studies and Bulgarian Studies)
Format: Oral

In the context of Greek area studies education in South Korea, archaeology occupies a distinctive pedagogical position. For students engaging with the ancient Greek world from a geographically distant location, archaeological materials often serve as the most tangible means of accessing locality, cultural practices, and historical depth. This paper examines a course-based project that integrates archaeological data and VR-based exhibition design—implemented through ZEPETO, a metaverse platform developed by a South

Korean company—in order to reconstruct local experience without physical travel. The project was developed for undergraduate students specializing in Greek area studies, many of whom have limited opportunities for on-site fieldwork. Rather than treating VR as a substitute for direct field experience, the course framed virtual exhibitions as a structured engagement with archaeological ways of seeing, emphasizing spatial organization, object context, ritual practice, and material relationships. Students curated VR exhibitions based on selected Greek cultural heritage sites, translating excavation reports, site plans, and visual documentation into immersive environments. This approach positions archaeology not merely as a supplementary field within area studies, but as an epistemological bridge linking historical knowledge, spatial imagination, and material culture. By combining archaeological methodology with digital visualization, the project also addresses educational inequality caused by geographic distance and encourages interdisciplinary collaboration. The paper argues that VR-based archaeological pedagogy provides a critically grounded model for area studies education beyond immediate geographic accessibility.

402. `The city beneath the city beneath the city´ – Teaching through archaeology in a shared workspace

Authors: Mia Toftdal – Marie Andersson – Cecilie Hansen (Museum of Copenhagen)
Format: Oral

In the Archaeological Workshop at the Museum of Copenhagen, students get to experience history firsthand when they participate in sorting, washing and examining finds from archaeological excavations alongside museums professionals. Students gain insight into the working processes of archaeology and learn how archaeology supplements and challenges our knowledge of the Danish capital. The Archaeological Workshop is a shared workspace; besides the everyday archaeological work, the location functions as a reliable teaching environment that aims, via inclusive, participatory and people-centered outreach, to increase access to archaeological material and hence our common cultural heritage. Here archaeologists work with the processing of finds alongside student in elementary school, who are being educated in an authentic workplace setting, and where they are actively participating in object-based learning activities. Here the students are interacting with archaeology hands-on with the purpose of encouraging curiosity, critical thinking, society engagement and identity-building. With this paper we will present one or two case studies from our multible educational initiatives in the Archaeological Workshop and elaborate on how we interact in a shared workspace. Through interdisciplinary collaborations between archaeology and education, we have gained considerable knowledge as to how encounters between children and archaeology can contribute to the development of learning abilities and general formation, in not only learning about archaeology but learning through archaeology.

1919. Teaching the Polis Across the Ages: Education and Outreach in the Athenian Agora

Authors: Io Viktoratou (American School of Classical Studies at Athens)
Format: Oral

For more than 5,000 years, the Athenian Agora has evidence of continuous habitation. Widely known as the birthplace of democracy and the heart of public life in ancient Athens, the Agora is also a dynamic and constantly transforming urban landscape, shaped by archaeological excavation, urban interventions, and heritage management practices from 1931 to the present. Grounded in the archaeological material of the Athenian Agora, these outreach programs seek to connect formal education with place-based experiences of the site. This paper presents educational and outreach programs developed and implemented by the American School of Classical Studies at Athens, under the auspices of the Ephorate of Antiquities of the City of Athens. These initiatives aim to offer accessible, inclusive, hands-on, and experiential learning opportunities for students aged 6 to 18, while also providing engaging and innovative perspectives for the general public. The paper focuses on four educational programs designed for different age groups: “Dogs in the Athenian Agora”; “The Trial of Theramenes and the Overthrow of Democracy”; “Vrysaki: The Revival of a Neighborhood;” and the most recent addition, developed in collaboration with the Swiss School of Archaeology in Greece, “From the Ancient Agora of Athens to the Ancient Agora of Eretria (AthEre Agora Project)”. Spanning from antiquity to the twentieth and twenty-first centuries, these programs illustrate the Agora as a site of continuity, rupture, and reinterpretation. Additionally, the paper provides an overview of outreach initiatives, with emphasis on the videocast series “Agora Scholars Speak” as a further tool for engagement and education. The programs draw on school curricula to deepen students’ existing classroom knowledge while fostering direct encounters with monuments and artifacts already familiar through formal education. All initiatives share a common goal: to cultivate a sense of shared heritage, participation, and collective responsibility toward cultural heritage among people of all ages.

2588. When Public Outreach is Part of the Mission

Authors: Meredith Langlitz (Archaeological Institute of America)
Format: Oral

The Archaeological Institute of America has had a dual mission to serve scholars and the general public since the organization was founded in 1879. Early on, this took the form of lectures and local societies that carry on to this day, but was joined by initiatives such as ARCHAEOLOGY magazine, the AIA Site Preservation Program, International Archaeology Day, and more. While the AIA does not operate a museum or excavation projects, we are able to extend this mission to the field through several avenues. Through partnerships, programming, and promotional efforts, we can share stories of archaeological research straight from the field to public audiences that we have built up over decades. Through our network of professionals, we can promote the public mission through funding opportunities, sharing best practices, and challenging our professionals and emerging professionals to view their work through a wider lens. This paper will cover strategies and tactics used to share archaeology with local communities and international audiences as well as case studies for best practices for inclusion, accessibility, online engagement, and community participation through the AIA’s outreach, professional, and site preservation programs.

427. Could the popularisation of archaeology have supra-regional effects? The Prapuszcza Project – Science and Education in Eastern Masuria, Poland

Authors: Iwona Lewoc (Terra Desolata Foundation)
Format: Oral

Since 2023, the Terra Desolata Foundation has been conducting excavations in the Borecka Forest, in north-eastern Poland. Alongside our scientific activities, we also carry out a range of educational activities tailored to diverse audiences. The presentation will showcase original solutions for promoting archaeological heritage beyond museums and academic institutions, including: - educational activities in local primary schools based on original large-format board games presenting the history of the region, - thematic walks combining outdoor activities with storytelling, - field games for participants of all ages, - open days at excavation sites, - publications addressed to different groups of people: comic book for younger children, popular science book for teenagers and adults, - open-access popular science lectures, - temporary exhibitions of archaeological artifacts discovered in the region, - educational stands at various local ope-nair events held in the region, - training courses for metal detectos users focused on lawful practices. During the above-mentioned activities reconstructions of archaeological artefacts, mock-ups, board games, consumable materials, as well as virtual data, such as 3D models are used. A variety of actions form a coherent educational program, creating a bridge between the past and the present. The knowledge we promote complements the core school curriculum, which devotes little attention to local history. After two years of intensive educational engagement, we have observed that our audience has become more sensitive to the need for protecting local archaeological heritage and is showing growing interest in and pride in the region’s past. Another result of our educational efforts is a noticeable increase in the number of reports of accidentally discovered archaeological artefcts. All our activities are free of charge for recipients, as they are funded from the state budget, granted by the Minister of Science and Higher Education in Poland under the “Science for Society II” Programme.

2060. “Understand-Remember-Care”: Educational Experiences from Archaeological Research of the Scythian Cultural Circle Hillfort in Chotyniec (SE Poland)

Authors: Katarzyna Trybała-Zawiślak (University of Rzeszów, Institute of Archaeology)
Format: Oral

The presentation discusses the public outreach and popularization aspects of the archaeological research conducted at the Scythian cultural circle hillfort in Chotyniec (SE Poland). Years of excavations at this exceptional site have enabled the development of an educational program tailored to local communities – ranging from schools (education for children and youth, including those with special educational needs) to adults who have completed formal schooling (the concept of lifelong learning and continuous skill development). The educational offer for schools includes theoretical sessions focusing on the protection of archaeological heritage, as well as practical workshops featuring games and activities. Specifically for children on the autism spectrum, a dedicated archaeological board game was developed. Furthermore, science picnics are organized for the local population. Importantly, this program reaches residents of small towns in southeastern Poland, located directly on the Polish-Ukrainian border. Through long-standing cooperation with the Lviv University, excavation internships were also organized for female archaeology students from Ukraine, providing them with a unique opportunity to participate in fieldwork during the full-scale war. In line with the principles of community archaeology, a project dedicated to the conservation and protection of the hillfort was launched, engaging local museums and governments as key partners in this endeavor. The presentation addresses the issue of the future of archaeological sites after the completion of fieldwork (‘excavations – and what next?’). Through the motto ‘understand – remember – care,’ it highlights social responsibility for the protection of heritage and the possibilities for individual involvement in its preservation.

1071. The making of the prehistoric site “Ouriakos” archaeology film. A case study

Authors: Eleni Stoumpou (Ephorate of Antiquities of Chalkidiki and Mount Athos)
Format: Oral

In 2006, Nikos Efstratiou, Professor of prehistoric Archaeology at the Aristotle University of Thessaloniki, Greece, came across an unprecedented discovery: thousands of Paleolithic stone tools dispersed over a distant beach of the island of Lemnos. Twelve years later, he was our host in front of the camera at the excavation of the University of Thessaloniki on the site and explained the finds, the questions, and the problems of the research. He also attempted to portray those groups of hunters and gatherers who spent their summers on that remote wind-beaten shore of the Northern Aegean around 10.500 BCE, at a time of climatic crisis, when some Aegean islands were still connected to the mainland. For 15 days, the camera followed the phases of the excavation, discussion, and treatment of the finds without intervention. The editing included sketches and graphics for educational purposes. In this paper, we will present the making of the film, which claims an unmediated gaze into the excavation process and is also an educational tool for beginners and the general public. We will also assess lessons learned from this experience and propose guidelines for future archaeologist-film makers in the excavation field.

1613. Let's Not Grind the Past: A Case Study in Interdisciplinary Training, Community Participation, and Accessible Heritology

Authors: Mila Mitrovic (University of Belgrade - Faculty of Architecture | Neozoik Foundation) – Nemanja Pavlović (University of Belgrade - Faculty of Philosophy | Neozoik Foundation) – Boris Rančev (University of Niš - Faculty of Civil Engineering and Architecture | Center for Sustainable Spatial Development "BalkanARHitrav") – Simeun Srdanović – Anastasija Stojanović (University of Belgrade - Faculty of Philosophy | Neozoik Foundation) – Jelena Mihailović (University of Belgrade - Faculty of Architecture)
Format: Oral

This paper presents "Let's Not Grind the Past", an interdisciplinary heritage project developed by a non-governmental organization as a case study in making heritology accessible through education, outreach, and community engagement. The project focuses on the documentation and interpretation of the last remaining traditional watermill in the village of Senokos, Serbia, a rapidly disappearing form of rural heritage. Bringing together students and early-career professionals from archaeology, architecture, and ethnology, the project combines preparatory training, field-based learning, and public dissemination into a single educational framework. Participants engage in hands-on activities including ethnographic interviews, architectural recording, photogrammetry, and 3D modeling, while working directly with local residents as knowledge holders and stakeholders. The paper explores how NGO-led initiatives can function as flexible platforms that connect academic knowledge, professional expertise, and local experience. Particular attention is given to the role of interdisciplinary collaboration, digital tools, and storytelling in transforming technical documentation into accessible narratives for wider audiences. Exhibitions, on-site signage, public discussions, and conference presentations are analyzed as outreach tools that extend archaeological research beyond institutional boundaries. By situating heritology within contemporary social, environmental, and economic contexts, the project demonstrates how educational outreach can foster empathy, strengthen local identity, and encourage long-term stewardship of cultural heritage. The case study contributes to broader discussions on participatory heritage practices, youth engagement, and the potential of collaborative models in times of increasing cultural and environmental uncertainty.

1553. Evidence-Based Archaeological Outreach: An Eye-Tracking Study of a Medieval Fashion Show at the Bode Museum

Authors: Tomasz Michalik (University of Szczecin) – Tobiasz Trawiński (Liverpool Hope University)
Format: Oral

Engaging present-day audiences with the past requires innovative approaches that make heritage both accessible and relevant. This challenge is particularly pronounced with archaeological textiles: although clothing is a familiar aspect of everyday life, surviving textile remains are often fragmentary and typically displayed in static museum settings, limiting their accessibility for non-specialist audiences. Presenting textile reconstructions through fashion shows offers a promising alternative, bringing archaeological garments to life through movement and performance. However, it remains unclear whether viewers in fashion shows focus on the garments themselves or on the models, given that human perception naturally prioritises faces in social contexts. In 2025, we investigated how audiences attend to this new format of heritage presentation during a catwalk show dedicated to reconstructions of medieval Nubian garments. Using mobile eye-tracking during a live public event at the Bode Museum (Berlin), the study examined how viewers directed their visual attention when encountering reconstructed garments in motion. The findings indicate that the fashion show format effectively drew attention to the garments themselves, countering the well-documented tendency to focus on faces, and thereby supporting object-based learning without explicit instruction. By integrating cognitive methods with museum-based education and outreach, this study contributes to discussions on inclusive, accessible, and evaluable public programmes. It demonstrates that experimental tools such as eye-tracking can inform the design and assessment of educational initiatives at museums and excavations, offering practical insights into how archaeological storytelling, emerging technologies, and performative formats can enhance public engagement with the past.

2399. Social Media as a battlefield arena of archaeology: The case of ArqueologAs/Herstory 8M campaign

Authors: Valentina Valiente Arizmendi – Carito Tavera-Medina – Jorge Del Reguero (Universitat de Barcelona) – Margarita Díaz-Andreu (ICREA | Universitat de Barcelona)
Format: Oral

The increasing visibility of archaeology on social media is reshaping the discipline by relocating key processes of science communication beyond academic settings. This paper presents the results of a campaign created by the project of ArqueologAs/Herstory, as part of a wider social media project, developed in connection with International Women's Day (8M). Conceived and disseminated entirely through the social media platform of Instagram, "ArqueologAs: 8M" operated within a digital space not created by academia, yet actively inhabited by academic actors and diverse publics. The campaign spotlighted female archaeologists, highlighting archaeological discoveries that reshaped how history understands the role of women in the past. The project facilitated high levels of engagement, allowing social media to be examined as a participatory contact zone where scholarly narratives, user-generated content, emotional responses, and contemporary identity politics intersect. Rather than functioning as a unidirectional outreach tool, the platform became a site of dialogue, negotiation, and co-presence between academic knowledge and public memory-making. The study combines quantitative and qualitative indicators of engagement—including interaction patterns, commentary dynamics, sharing practices, and audience positioning—to analyse how different content strategies shaped participation around gender, heritage, and the archaeological past. Particular attention is paid to how the symbolic framework of 8M amplified affective engagement and transformed archaeological storytelling into a catalyst for broader social conversations. This paper argues that social media should be understood as an integral arena of contemporary academic archaeological practice. By conceptualising digital platforms as contact zones rather than neutral or purely instrumental spaces, the study offers evidence-based insights into participatory culture, storytelling, and the dissemination of memory in networked communication environments. Taking into consideration that ArqueologAs/Herstory (REF. PID2023-149477NB-I00) is a funded project that responds to public policies of the Ministry of Science, Innovation and Universities (MICIU) of Spain that have gender as a primary focus in research.

59. Objects of Interest: archaeology, education and community in Zeeland, the Netherlands

Authors: Helle Hochscheid (University College Roosevelt - Utrecht University)
Format: Poster

In the past years, the author of this paper has designed several community archaeology projects in Walcheren, a region in Zeeland in the Netherlands. The first project was a cooperation of University College Roosevelt with the Royal Zeeland Society of Sciences, the official owner of a large collection of archaeological, ethnographic and art objects that are housed in the Zeeuws Museum. Much of this collection is available online, but since the museum has limited exhibition capacity, actual display is impossible for many objects. Moreover, many local residents do not visit the museum or know the collection, among other reasons because they do not feel particularly represented by the objects highlighted online or in the museum displays. To give these members of the community a chance to directly interact with the collections and let their voices be heard, we called for volunteers bringing objects, heirlooms, objets trouvés or cherished purchases that they felt represented them. These objects were studied by the students and owners together, using materials from the Royal Zeeland Society of Sciences for comparison and historical context. The results of the research were put into a book, which was presented at a communal event. Subsequently, we explored how a similar approach could be used for a younger demographic. We invited a class of primary school children from the local school ABS Middelburg to bring objects that were special to them or their families to school. Students of UCR worked with the children to research the objects together. They then created research posters that were put into a temporary exhibition at the school. This poster will compare the results of these two projects for their qualities and limitations, and will outline how they managed to bring archaeology and museums collections into the respective communities.

800. Histoires d'os: Engaging Audiences with Astragali through Storytelling and Hands-On Educational Practices

Authors: Barbara Care (University of Lausanne)
Format: Poster

"Histoires d'os" is a public outreach and educational project developed within the framework of a SNSF Agora project and grounded in my long-term research on astragali. The project addresses a persistent distortion in both scholarly and popular narratives, which tend to interpret astragali primarily as toys or proto-dice. Drawing on archaeological, archaeozoological, and historiographical research, Histoires d'os challenges these traditional readings by foregrounding the material specificity, anatomical nature, and culturally embedded uses of astragali in ancient societies. The project translates current research findings into interactive experiences designed for museums, schools, and public events. Through hands-on workshops, the use of replicas for object handling, illustrated game-based activities, and short narrative formats derived from ancient sources, participants are invited to explore astragali as complex objects situated at the intersection of anatomy, play, ritual practice, and social meaning. Presented as a case study, this contribution reflects on methodologies for transforming advanced archaeological research into inclusive and accessible outreach programs. It demonstrates how object-based storytelling and educational game-based learning can serve as effective tools for public engagement while maintaining a critical stance toward simplified or misleading interpretations of the past.

1120. Unearthing Curiosity: 20 Years of School Archaeology Programmes at the Museum of Prague

Authors: Linda Danecková – Vendula Dedkova – Veronika Klimesova (Museum of Prague)
Format: Poster

Over the past two decades, the Museum of Prague has developed and refined its innovative archaeology programmes designed for school children—from primary to high school, including those with visual or cognitive disabilities. These programmes introduce young learners to the fundamentals of archaeology by exploring what the discipline is, why it is essential to our cultural heritage, and what archaeologists do—all through interactive, hands-on activities that reveal the fun and engaging side of the field. A cornerstone of these programmes is the opportunity for children to experience history first-hand. Whenever possible, students are invited to handle genuine artefacts or exact replicas—allowing them to feel thousands-of-years-old vessels, stone tools, or even prehistoric jewellery; to use real grinding stones and rotary querns; and to immerse themselves in the tactile reality of the past. This direct contact not only transforms abstract historical concepts into tangible experiences but also deepens their connection to cultural heritage. Reflecting on two decades of successful practice, this presentation explores how such immersive, sensory learning can evolve, including the integration of digital tools, experiential learning techniques, and community engagement, to continually

inspire future generations, ensuring that museums remain dynamic and vital educational partners in an ever-changing world. In 2025, this continuous concept of archaeological programs was awarded the Golden Mammoth Award for the presentation and popularization of archaeology.

1633. Public Archaeology in Action: Community Memory of Zadar's Centuriated Landscape

Authors: Josipa Baraka Perica (University of Zadar) – Gregory Zaro (University of Maine)
Format: Poster

Under the auspices of the project "Remember me: Valorization of Spatial and Social Changes in Zadar's Ancient Cadastre," we elevate and promote a community engaged approach within a broader research initiative focused on the spatial and social transformations of Zadar's ancient centuriated landscape. Zadar's centuriation system is among the best-documented Roman cadastral landscapes in the eastern Adriatic, with its remarkable preservation particularly evident in the road network outside the historic peninsula. However, traces of this past remain largely unrecognized by local residents, who often perceive the historic city to be restricted primarily to the walled peninsula. Understanding how citizens relate to spaces beyond the fortifications is therefore central to bridging professional archaeological research and public awareness. Here, we present strategies for incorporating public participation into archaeological interpretation, exploring both spatial perception and collective memory. The project engages multiple generations, inviting participants to share personal memories and reflections on how the urban and peri-urban landscape functioned during their childhoods. This approach allows professional interpretations of the ancient cadastre to intersect with lived experiences, revealing what aspects of the landscape people value, remember, or overlook. While the overall project examines the historical evolution and societal implications of urban and peri-urban landscapes, this project specifically addresses how the public engages with, perceives, and values these spaces and the archaeology within them.

1836. Digital archaeology as a bridge to experiencing the past and understanding our place in the present

Authors: Marta Cyran (National Museum in Lublin | Doctoral School of Humanities and Arts UMCS in Lublin) – Aleksandra Sztal (National Museum in Lublin) – Ingvild Andreassen – George Pantos (Museum of Cultural History, University of Oslo)
Format: Poster

This poster explores how digital archaeology can support accessible education, outreach and public engagement beyond the confines of the museum building and across different social and geographical contexts. It presents a virtual exhibition with a companion mobile exhibit developed as part of the Accessible Culture programme as well as a subsequent mobile exhibit based on the same principles. The virtual exhibition "Magic of Ornaments. Virtual Treasures of Archaeology" was conceived as a barrier-free platform offering open access to archaeological heritage. Based on thematic storytelling and object-based learning, it presents high-quality 3D models of artefacts from both Poland and Norway. The comparative presentation highlights cultural connections and historical similarities that cross modern borders, while three-dimensional documentation enhances the understanding of ornamentation, symbolism and the technological approach of modern-day archaeology. Accompanying this digital resource the Polish travelling exhibition "Magic of Ornaments. Archaeological Treasures of the Lublin Region", transforms digital documentation into sensory experiences. Presented in small towns, it provided hands-on experience, active learning. This physical presentation focused on local archaeological heritage and addressed the specific needs of local communities as a starting point to build bridges between communities and regions with the addition of the digital resources. The concepts and methodologies developed in these exhibitions formed the basis for a subsequent mobile exhibit called "The world beneath us" tailored to the needs of rural communities in Norway. By combining the virtual exhibition with locally adapted mobile outreach programmes, we demonstrate how digital technologies can support accessible education and hands-on engagement. These complementary formats strengthen local connections to archaeological heritage and address diverse audience needs while also providing access to broader national and international contexts. The case studies highlight flexible and inclusive exhibition models that support museums in their educational and outreach missions in the era of global challenges that affect us all.

1923. Potsherd Pavements as a Tool for Community Engagement and Changing archaeological narratives in West Africa: Insights from northern Yorùbáland, Nigeria

Authors: Bolaji Owoseni (Sainsbury Research Unit, University of East Anglia)
Format: Poster

Potsherd pavements represent one of the most visible yet underexplored forms of pre-colonial architecture archaeology in West Africa. Constructed from deliberately arranged ceramic fragments set into compacted earth, these pavements are found in palaces, shrines, elite compounds, and historic urban spaces, where they remain embedded in everyday movement and collective memory. Their material durability and continued presence within living communities make them particularly effective media for community-centred archaeological engagement. Drawing on recent archaeological and community-engaged research in Ìlọrin, northern Yorùbáland Nigeria. This poster explores how potsherd pavements can serve both as practical tools for public archaeology and as conduits for examining changing sociopolitical narratives in early West African communities. The study integrates archaeological documentation with participatory engagement involving community leaders, residents, museum professionals, heritage custodians, and local media. Rather than treating pavements as static archaeological features, this research foregrounds them as lived surfaces constructed, walked upon, and socially activated through which historical knowledge is produced and transmitted. The poster examines a range of engagement initiatives developed around potsherd pavements, including guided heritage walks, collaborative interpretation with community elders, and the translation of pavement patterns and histories into community exhibitions and educational resources that see the architectural feature as a pedagogical tool, fostering accessibility, dialogue, and the co-production of knowledge in West African archaeology.

2059. The Role of Student Initiatives in Archaeological Education in Odesa (Ukraine)

Authors: Anastasiia Pecherska (Odesa Archaeological Museum of the National Academy of Sciences of Ukraine)
Format: Poster

In 2015, the Nucleus, student research community formed at the Department of Archaeology and Ethnology of Ukraine, Odesa I. I. Mechnikov National University. The initiative united students, graduate students, and young scholars to promote involvement in archaeological research and foster cooperation. The community operated under the department and its archaeological laboratory. Maintaining social media accounts enabled a mixed (online and offline) work format and greater accessibility. The community significantly expanded students' direct involvement in field research, professional skill-building, and partnerships with leading academic institutions. Over ten years, members actively contributed to projects with the Odesa Archaeological Museum and the Institute of Archaeology, advancing their experience and career development. This continuity became especially important as the need for such communities has grown during the full-scale war. During this period, the number of students and faculty at universities and other academic institutions has decreased significantly, and field research in the Odesa region has been reduced due to security risks. The community continues to operate in a mixed format, inviting specialists from various fields and engaging students in volunteer activities in expeditions and rescue research in safer regions of Ukraine. Cooperation with the Odesa Archaeological Museum remains a priority, especially projects to digitize collections (photography, scanning, photogrammetry). Nucleus demonstrates that student research communities are effective at preserving scientific continuity, building networks, and sustaining research during crises.

2088. Making Stone Age coastal hunter-fisher-gatherer legacies relevant: "The Classroom of Europe" and other outreach activities in the Doctoral network ArCHe

Authors: Almut Schülke (University of Oslo, Museum of Cultural History)
Format: Poster

Coastal areas as transitional zone between land and water have attracted human beings since time immemorial. They bear testimony to crucial aspects of past human activity, and provide rich sources of archaeological data, including the remains of Stone Age hunter-fisher-gatherer living. However, these remains are highly vulnerable and threatened by environmental and anthropogenic impact. The combination of fragile material traces, often difficult to identify, as well as regional variation of preservation, leads to a missing awareness of this heritage. Combined with a generally low knowledge of (coastal) hunter-fisher-gatherers and their past and present relevance, this topic is often under-communicated to the public. The HORIZON MSCA Doctoral network ArCHe "Archaeological Coastal Heritage: Past, present and future of a hidden prehistoric legacy" (www.arche.uio.no ; 2024-2027; project number 101119258) educates 10 Doctoral candidates in five European countries in increasing the scientific and public value of this legacy in an international, interdisciplinary and intersectoral perspective. One important pillar of the project is outreach, with activities addressed at various target groups. Amongst them is the ArCHe-communication initiative "The Classroom of Europe", which produces open access teaching material for school children, translated into relevant languages. Addressed at diverse age groups ongoing research from the PhD-projects is communicated to teachers and school children across Europe – with the aim to foster interest in the use of the coast in the Stone Age and its relevance for today and for a more sustainable future. This poster presents this initiative as well as other outreach activities in the project which engage the public – in the classroom, museums and in the field.

89 MICRO-AGENCIES, SUBALTERNITY AND CAUSALITY IN ARCHAEOLOGICAL THINKING

Theme: 6. Transient theories
Organisers: Borja Legarra Herrero (UCL Institute of Archaeology) – Juan Antonio Quirós Castillo (Universidad del Pais Vasco - Euskal Herriko Unibertsitatea)
Keywords: agency, subaltern, bottom-up, historical explanation
Format: Regular session

SESSION ABSTRACT

Archaeologists are joining other disciplines in sharing a dissatisfaction with simplistic models that divide human societies into elites and the rest, and with the over-reliance of top-down historic explanations. Inspired by ideas such as 'collective action' and 'anarchical' perspectives that explore the agency of any type of individual (e.g. subalterns, peasantry) including those normally considered marginalised, we are beginning to explore the transformative power of combinations of these other agencies. This raises important questions: • What are examples of innovation and change that emerge from bottom-up processes, even within hierarchical societies?

• Has our limited recognition of other types of agencies led us to ignore significant parts of the human past? • Can subaltern and marginalised groups be agents of change? • How can we model relational approaches that reveal dialogues between different agencies across the full social spectrum? • How can we build explanations that recognise the agency involved in everyday situations? • How might we visualise the roles of 'intermediate' groups situated between elites and subalterns? The session invites studies that examine the different ways in which everyday or subaltern/marginalised agents were able to initiate and drive change. Contrasting case studies from a variety of regions and periods would help us reflect on the types of data, analytical frameworks and methodologies that can help to discover the actions of diverse agents and incorporate them into broader explanations of past processes and dynamics. These may include (but not limited to) the rise and fall of social institutions, cultural interactions, landscapes, power networks, ideological and ontological frameworks, concepts of value and morality, legitimacy discourses, and instances of conflict and resistance. We welcome contributions that address major societal changes but also those that identify smaller, often overlooked, instances that capture better the complexity and diversity of the human past.

CONTRIBUTION ABSTRACTS

1651. The transformative power of the fringes and in-betweens. Exchange and change in the Bronze Age Mediterranean

Authors: Borja Legarra Herrero (University College London)
Format: Oral

The presentation uses the case of prehistoric Crete to explore a conundrum. Why would elites in power aim to change the status-quo? We have grown to think about exchange in the Mediterranean as being transformative in a top-down manner, with local elites changing society based on the opportunities that new connections bring. Here we explore a different narrative: connectivity in the Mediterranean produced a wide range of individuals at the fringes and in-betweens: sailors, outcasts, marginalised populations, migrants, refugees, the dispossessed... Could these individuals be major agents of change through introducing new ideologies, economic systems, and social links? To illustrate the possibilities we will present the case of state formation on Crete at the start of the 2nd millennium BCE. In this case we have struggled to fit the evidence of new ties with the east Mediterranean with a top-down narrative of change. Here, we will present an alternative bottom-up model, fuelled by a more dynamic understanding of exchange and interaction.

2019. Interstices of Colonialism: Ceramic Approaches to a Critical Archaeology of European Expansion in the Andes (15th–19th Centuries)

Authors: Mauricio Uribe – Claudio Wande (Universidad de Chile)
Format: Oral

Archaeological research in the Andes has developed a systematic understanding of pre- Hispanic periods. However, little archaeological work has addressed the period following the fall of the Inca Empire and European colonial expansion, which has been largely dominated by historical and documentary studies, undervaluing the interpretive potential of material evidence. Against this backdrop, an interpretive void persists regarding key actors in colonial processes: the multifaceted local actors themselves. To address this gap or handicap, the archaeological study of pottery technologies offers a critical perspective on the constitution of the indigenous, black people and mestizos as social actors. This research explores the constitution of colonial worlds in the Atacama Desert through ceramic technologies, whose dynamics, continuities, transformations, and palimpsests during the Colonial Period remain poorly understood. Particular attention is given to fragments and vessels that subtly combine, or do not combine, local and Old World features, including new vessel forms, experimental or irregular techniques, and apparently European pieces that nonetheless reveal local knowledge and creative innovation. We propose that long-standing pre-Hispanic ceramic traditions followed diverse trajectories shaped by impositions, resistances, negotiations, coexistence, and juxtapositions. Not all of these persisted over time; some instead left micro-histories embedded in the interstices of grand historical narratives. By focusing on these interstices, we can begin to recognise subaltern local subjects constituted as colonial peoples, particularly the "indios". Through ceramic analysis, this study attends to subtle gestures, diversity, scarcity, isolated cases, fragmentation, failure, and irregularity, rather than subsuming these expressions within homogeneous categories. We argue that such an approach is essential for identifying the material subtleties that allow us to reconstruct the histories of subjects distanced from their own past by the very processes of the colonisation of the Americas.

896. Social complexity in Neolithic Thessaly: Case studies from the settlements of Dimini, Mandra, and Palioskala

Authors: Theodoros Malachtaris (University of Thessaly)
Format: Oral

The complexity of prehistoric societies is often correlated with hierarchy, social differentiation, and linear evolution, in accordance with evolutionist models. Research into social complexity is frequently confined to economics and hierarchical relations, while a tendency to dichotomize societies into simple or complex is observed. Adopting a different theoretical framework, social complexity was investigated across three Neolithic settlements in Thessaly, located in central Greece. The social complexity of the settlements at

Dimini, Mandra, and Palioskala was examined through various theoretical concepts, such as heterarchy, self-management, solidarity, and moral economy. The research on social complexity examined micro-agencies, the practices through which individuals, groups, and communities coexisted, the processes by which social cohesion was maintained, social relations within the inter-communal geographical environment of Thessaly, and the conditions under which collective memory was formed. The architecture of the three settlements reflects specialized construction knowledge, communal planning, and collective labor. The open spaces, the enclosures, and the common orientation of the buildings -as seen in Dimini- suggest a social environment that encouraged intra-settlement relations and interaction. The term moral economy could reflect the economic functioning of the three settlements, in accordance with their practices of production and circulation of goods, as well as the strong relations, obligations, and bonds developed among the inhabitants. It is noted that the material culture is uniformly distributed, with no evidence of accumulation of material remains that would suggest social differentiation. Social complexity within the three settlements reflects collective decision-making based on the values of equality and justice, rather than a hierarchical model of social organization. The recognition and investigation of micro-agencies during the Neolithic period are of significant importance to archaeological discourse, underscoring the need to examine the everyday practices of individuals and groups across every period of the human past.

970. The Body Politic: what the iconography of the human body can reveal about the sociopolitical structure of Minoan Crete

Authors: Michele Mitrovich (University of Heidelberg)
Format: Oral

The present study provides a new cross-disciplinary analytical approach to the iconography of the human body in Minoan Crete that seems to indicate a sociopolitical structure standing in stark contrast to the common model considered characteristic of the Eastern Mediterranean societies in the Bronze Age, where the top-down, class-conscious pyramidal hierarchy of power often marginalized the lower-class population and restricted the agency of subaltern individuals. Application of methodological tools borrowed from diverse disciplines such as sociobiology, evolutionary psychology, and other psychological sciences that study the expression and impact of power on the individual and on their sense of agency via their body, which we all share in common with our most ancient ancestors, can provide additional pieces of the puzzle that will aid us in our reconstruction of Minoan society, religion, political system, and relationships between power and a common individual. The present analysis of Minoan Protopalatial and Neopalatial iconography of the human body using these tools suggests a society defined not by an autocratic power hierarchy but rather by the power distribution that is more equitable, where a power differential between the governing and the governed is intrinsically minimized and/or outwardly deemphasized. The results of the study indicate that the religious and political model in Minoan Crete was not presented as fundamentally based on fear and physical submission as its dominant factor. The mechanisms of state propaganda and coercion appear to have been of a more subtle and community-based nature. The study also suggests that Minoan, pre-Mycenaean-domination Crete was likely a society characterized by a relatively high sense of agency and self-confidence among the population at large and by a surprisingly firm resistance to mold the distinctive nature of their culture and society to the powerful and widely influential models prevalent in the neighboring Near East and Egypt.

581. The emergence of inequality and socio-political complexity in early Mycenaean Laconia: a bottom-up story?

Authors: Youp Beld (Groningen University and Macquarie University)
Format: Oral

This paper explores the increase of inequality and the emergence of more hierarchical socio-political systems in the early Mycenaean period in Laconia, Greece. So far, research into Mycenaean political trajectories has been mostly top-down, focusing mainly on the "palatial" centers that stood at the top of the political hierarchy. Consequently, we lack understanding of the role of non-palatial settlements in processes of socio-political change, as well as the unclear pre-palatial situation, which should form the basis of our explanations of emerging power structures. Accordingly, socio-political change in Mycenaean Greece is mostly imagined as elite-driven, predicated on competition and control over resources, with the ultimate goal to dominate others. This view is increasingly hard to align with recent archaeological and anthropological work that stress the relational and dialectic nature of power. Although this idea is not new to the Aegean, when political developments are viewed from a landscape perspective, most researchers still fall back on domination-driven narratives. This paper recontextualizes the emergence of inequality by combining an analysis of settlement patterns, monumental construction and the distribution of (prestige) goods in a bottom-up network approach. Substantiated by cooperation research, which stresses the importance of strategic contingent cooperation as an organizing principle for social groups, this paper gives agency to subaltern groups in processes of emerging inequality and socio-political complexity. Using a network approach that extrapolates from the assumption that cooperation will benefit all agents involved, interaction models and measurements of network properties (mainly centrality) will be used to predict where in the settled landscape inequality can emerge through cooperative mechanisms. These theoretical results are then compared against the actualization of inequality in the Laconian archaeological record. Offering an alternative narrative, I argue that the socio-political trajectory of this particularly understudied region can be better explained through mechanisms of quotidian bottom-up cooperation.

2649. Non-palatial Agency in Mycenaean Settlement Development

Authors: Sarah Hilker (University of North Carolina at Chapel Hill)
Format: Oral

The socio-political landscape of the Late Bronze Age in mainland Greece is characterized by the development and collapse of the palatial administration system(s). The extent of palatial control has been challenged in some respects, but top-down historical narratives still predominate and grant significant agency to the palace centers or palatial elites. Even away from the palaces, the archaeological record still privileges communities that may have had a degree of prominence. Truly marginalized groups of the Aegean Bronze Age are difficult to identify as promotors of settlement change, but shifting the focus away from palatial centers adds nuance to our understanding of Mycenaean settlement development. In this paper, I use examples from mainland Greece to consider the diachronic development of the Mycenaean settlement landscape with a focus on choices and responses that may have been made by individuals and communities potentially unaffiliated with palatial centers. Non-palatial decision-making processes happened at multiple scales, from singular buildings to the whole settlement. Individuals or families likely made choices regarding the placement, construction, and renovation of buildings within the confines of their means and social norms. Settlement foundations, restructuring, and abandonment, however, may have been the result of local, perhaps community-wide, decisions even when responding to larger socio-political events like palatial expansion or collapse.

2692. Building Agency in Late Bronze Age Crete: Architectural micro-history as an approach to social change

Authors: Tia Sager (University of Toronto)
Format: Oral

The monumental labyrinthine structures that we know as the 'Minoan palaces' have captivated the scholarly imagination for over a century. Significant work has focused on the circumstances that led to the emergence of these impressive built environments, but far less attention has been paid to the changing architectural landscape of Late Bronze Age Crete after the fall of Neopalatial society ca. 1450 BCE (Hayden 1981). The architecture of the proceeding periods (the so-called Final Palatial and Postpalatial) has been of less interest to archaeologists and architectural historians alike, due to the poor preservation of architectural remains dating to this period, and the pervasive reuse and remodelling of existing built environments that defies straightforward typological or stylistic categorization. But during this somewhat marginal period, bookended by two significant societal 'collapses,' architectural innovation and change begins to take place through bottom-up processes. These processes involve small, almost architecturally insignificant changes at the level of individual built environment- such as the blocking of doorways, the raising of floors, and remodelling of existing earlier built environments (Sager 2024). But these seemingly local architectural adaptations were remarkably widespread. By tracing architectural micro-histories at the building level, individual agencies can be brought to life, bringing us closer to understanding the ways in which individuals responded to changing circumstances and a changing society. Using an approach that combines spatial analysis (Space Syntax Analysis) with a phenomenological perspective grounded in the Theory of Affordances (Gibson 1979), this paper argues that architectural micro-histories are a microcosm of broader collective actions in response to changing economic and socio-political circumstances and concepts of value, particularly during transitional periods that have often been overlooked due to their less impressive material remains.

1774. Agencies in Iron Age eastern Iberia: what clay figurines may reveal

Authors: Jaime Vives-Ferrandiz Sanchez (Museu de Prehistòria de València) – Mireia López-Bertran (Universitat de València)
Format: Oral

Clay figurines of the Iberian Iron Age (roughly 6th-1st centuries BC) are a relevant source of information for dealing with social aspects of the communities that created and used them. As in many other Mediterranean contexts, these objects have been mainly studied from an iconographic and contextual perspectives. The study of clay figurines can shed light on an array of aspects such as technological processes, ritual practices, group and gender identities, and body conceptions. Little emphasis has been placed on their potential to explore different agencies involved in the production and also in the manipulation on a daily basis. This paper aims at addressing these issues. On a empirical level, we will present Iberian clay figurines from settlements in the territory of the ancient city of Edeta (nowadays Llíria; Valencia, Spain) dated to the 3rd-2nd centuries BC. Our methodology in the project TERRACOT underscores the value of tracing technical gestures and body worlds. First, because the production of figurines may be mediated by the technological traditions of groups -which are specific to modelling, gestures, or symbolic aspects- structural variations in manufacturing processes would reveal communities with social ties determined by learning through modelling practices. Secondly, a comparative perspective of figurines at different spatial scales -from the landscape to the site; from the shrine to the house- would enable us to uncover the agencies of a diversity of people that interacted in everyday life in this territory. The ultimate objective is to gain a better understanding of the social practices of the communities that produced and used clay figurines in the past. TERRACOT (PID2023-150349NBI00) is funded by the Spanish Ministry of Science, Innovation, and Universities.

304. Commercial Subalternity: Economic Tactics of the Urban Non-elite: Four Seasons of Excavation at Pompeii I.14

Authors: Gabriel Higgs (Higgs Heritage Consulting) – Allison Emmerson (Tulane University) – Mary-Evelyn Farrior (Princeton University) – Jordan Rogers (North Carolina State University)
Format: Oral

Tulane University's Pompeii I.14 Project now has completed four seasons of excavation in a large building complex located on the southeastern side of Pompeii. We have identified several major activities conducted here at the time of Vesuvius's eruption in 79 CE and in the decades prior—activities presented in Roman literary sources as associated firmly with the lower classes—while also reconstructing the urban development and pre-urban history of the broader neighborhood over several centuries. This paper presents the initial results of the project in summary, focusing especially on the later phases of the building's occupation. By the mid-first century CE, the complex featured three shops, a take-away restaurant, a dine-in restaurant with both interior and garden dining spaces, and a workshop dedicated to producing reed mats and baskets; it likely also housed the workers who staffed and managed these businesses. While preliminary, the results suggest three strategies by which sub-elites living in Pompeii navigated an economy undergoing intense changes across the first centuries BCE and CE. The first is diversification, with the building bringing together several types of industrial and commercial activity under one roof. At the same time, those activities show signs of spatial clustering, given that both reed-weaving and commercial dining extended to neighboring buildings that appear to have shared management and resources with the central complex. Finally, the complex shows increasing commodification of its spaces over time, a tendency made particularly clear through changes to its garden and water infrastructure. Our findings indicate the potential complexity of Pompeii's urban spaces, undermining common attempts to understand the city by interpreting individual buildings in isolation and assigning them to single functional categories, while shedding new light on how non-elite agencies shaped the form of the local market but also the physical spaces of insula I.14.

2584. Enslaved workers as drivers of change in fourth century BCE Laurion

Authors: Sara Eriksson (Finnish Institute at Athens)
Format: Oral

In the fourth century BCE, the ancient mining region of Laurion just south of Athens underwent a transformation. Innovations in mining and ore processing techniques exposed new, rich veins of silver- and leadbearing ore. New tools and methods increased the output of the ore processing workshops, which during this period were developed into walled compounds featuring towers that could serve as controlled quarters for the enslaved work force. While these developments of mining and processing techniques led to a boom for the industry, many of the changes made the tasks involved more dangerous and debilitating for the enslaved workers performing them. In 413 BCE, just prior to this period of increased industrialization, Athens lost large territories to Sparta in the Peloponnesian war. This loss, which included the Laurion mining district, led to 20,000 χειροτέχναι, 'handicraftpeople', running away and joining the Spartan enemy. In this paper, I ask how this mass flight of workers relates to the changes that the mining industry underwent in century that followed. I argue that reading archaeological traces of mining activities and historical recordings of enslaved resistance through each other allows for tracing enslaved agencies that contributed to the ways that the Laurion mining industry developed. Theoretical approaches to agency and practice open up for using traces of change in the archaeological record to understand the actions and intentions that created that change – including in cases where a change might be the opposite of what was intended by those who initiated it.

1562. Fracture Management in the Viking Age – Exploring Community Care and Agency through the Analysis of Fracture Patterns and Healing

Authors: Madeleine Lamer (University of British Columbia, Department of Anthropology) – Benjamin Raffield (University of Uppsala, Department of Archaeology and Ancient History) – Darlene Weston (University of British Columbia, Department of Anthropology)
Format: Oral

The management of skeletal trauma following an injury can impact the prognosis of an injury, and whether the injured individual will face permanent disability. The success of post-injury treatment is also dictated by the level of care received by the individual while they are actively healing, during which the individual may require additional assistance. Several individuals from the Viking Age cemetery of Kopparsvik (900-1050AD), Sweden, had evidence of well-healed but complex skeletal trauma, indicating that they received adequate medical attention and care following their injuries. In some cases, despite the well-healed nature of the fractures, it is possible that the affected individuals experienced permanent disability and a decrease in mobility, resulting in the likely increased need for care during life. This presentation explores how the study of fractures and fracture healing can showcase the agency of community members in providing medical care to individuals of varying socioeconomic status. Case studies involving individuals with severe injuries such as an open cranial fracture, a well-healed trochanteric femur fracture, a healed possible flail chest segment, and a vertebral fracture with possible neurological deficits will be examined. These case studies exemplify both the level of medical knowledge possessed by the individuals residing at Kopparsvik, as well as the level of care provided to these individuals to facilitate their recovery and long-term survival of their injuries. While the individuals providing care to the injured community members remain unknown, their actions and decisions while providing care have a visible and lasting effect on Kopparsvik, resulting in the

survival of individuals who may otherwise perished from their injuries. The study of fractures and healing can therefore be seen as a window into the agency of everyday individuals by illuminating the decisions taken while providing long term care to those in need.

90 INTEGRATING MICROMORPHOLOGY: EMERGING TRENDS AND RESEARCH TRANSFORMATION IN THE APPLICATION OF ARCHEOLOGICAL SOIL MICROMORPHOLOGY

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Daniel Fallu – Laura Matilde Magno (University of Groningen | Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA) – Panagiotis Karkanas (Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA)
Keywords: Geoarchaeology, Soil Micromorphology, Multidisciplinary Research, Biomolecular, Archaeobotany, aDNA
Format: Regular session

SESSION ABSTRACT

The technique of soil micromorphology and its application to archaeology have improved tremendously in recent years allowing researchers not just to bridge the scale difference existing between the field macro scale and the microscopic scale but also to connect and integrate geoarchaeological data with results acquired from other methods such as biomolecular analysis, geochemistry, geochronology, and archaeobotany, among others. This integration permits researchers to better place state-of-the-art methods in their stratigraphic, chronological, and pedological contexts. This, in turn, provides a stronger foundation for understanding the taphonomic, environmental, and cultural implications of the results. With this session, we seek to bring together the current states of the art in micromorphology and the greater archaeological sciences. We invite studies showcasing the integration of micromorphology with new and innovative methods from other scientific fields. Topics for consideration include (but are not limited to) micromorphology, isotopes, scanning and imaging, biomarkers and biomolecules including aDNA. Methodological and theoretical contributions at both site and landscape scale are welcome with no restrictions to specific geographic areas or time periods, including experimental studies.

CONTRIBUTION ABSTRACTS

2073. Site Formation Processes at Apidima: a Preliminary Micromorphological Framework

Authors: Aristeidis Varis (Department of Earth Sciences, University of Oxford | Senckenberg Centre; Human Evolution & Palaeoenvironment, University of Tübingen | German Research Foundation Centre for Advanced Studies, University of Tübingen) – Panagiotis Karkanas (Malcolm H. Wiener Laboratory for Archaeological Science, ASCSA) – Vangelis Tourloukis (School of Archaeology, University of Ioannina | Department of Geosciences, Paleoanthropology, University of Tübingen) – Katerina Harvati (Senckenberg Centre; Human Evolution & Palaeoenvironment, University of Tübingen | Department of Geosciences, Paleoanthropology, University of Tübingen | German Research Foundation Centre for Advanced Studies, University of Tübingen | HUMAN ORIGINS-Cluster of Excellence, University of Tübingen)
Format: Oral

The site of Apidima is a key location for the study of human evolution, given the discovery of the oldest Homo sapiens skulls in Eurasia and a sediment record spanning across five caves [1, 2]. Ongoing excavations at the Apidima caves aim to provide a clearer understanding of human activity and site use, as well as reconstruct the depositional history of the fossil record preserved within the sediments. This paper focuses on the lower part of the Apidima sequence, using micromorphology to establish a preliminary framework for the formation processes in caves A, B, E, and their adjacent talus. Despite their differences in fabric, the Apidima deposits share similarities in terms of geogenic input. The main sediment sources include limestone fragments and weathering by-products derived from the talus infill and cave collapse, along with finer sediments originating from the terra rosa deposits mantling the cliffs and the aeolian material blown into the caves. A high frequency of combustion by-products, mainly ashes and charcoal fragments, provide evidence for human activity in the microscale. The formation histories of these combustion by-products vary depending on the depositional and, especially, post-depositional context of each cave. Cementation and bioturbation in particular have greatly influenced the taphonomy of the Apidima record, resulting in a complex overlap of formation processes. Overall, the Apidima caves were not exclusively used by humans but also served as carnivore dens, as evidenced by the frequent carnivore coprolites embedded in the sediments. These results highlight the dynamic depositional environment in Apidima, provide additional evidence for human activity at the site, and address challenges for future research.

1728. Micromorphology reviling processes of floor renewal and resurfacing in the Temple of Artemis Amarysia in Amarynthos, Euboea

Authors: Dimitrios Roussos – Panagiotis Karkanas – Myrsini Gkouma (American School of Classical Studies at Athens) – Tamara Saggini – Jérôme André – Samuel Verdan – Thierry Theurillat (Swiss School of Archaeology in Greece) – Angeliki Simosi (Ephorate of Antiquities of Euboea) – Sylvian Fachard (Swiss School of Archaeology in Greece) – Olga Kyriazi (Ephorate of Antiquities of Euboea)
Format: Oral

Excavations at the site of Artemis Amarysia in Amarynthos, Euboea, have brought to light an extensive temple complex with multiple occupation phases. The area of the central temple has been constantly evolved, including several architectural phases from the Mycenaean up to the Archaic period. Up until and including its Early Archaic phase the building was composed of three distinct rooms, each containing its own hearth/altar, where grand pyres were maintained and animal sacrifice took place. Archaeological soil micromorphology coupled with Fourier Transform Infrared Spectroscopy (FTIR) conducted on the deposits related to these periods of the temple's history, revealed a complex microstratigraphy composed of multiple floor surfaces and occupation deposits. In more detail, it has allowed us to identify a purposeful process of constant floor renewal and resurfacing tightly linked with the use of the altars. This process is expressed through the presence of alternating fine white floors made of lime and mud plastered floors, often intercalated with layers composed of the altar's debris that bare evidence of careful sweeping, and resurfacing. This cycling process including any variations, evident throughout the entire length of the temple and transcending all the aforementioned periods, has helped us to understand the internal dynamics of the temple's use both spatially and temporally. Moreover, it has allowed us to identify diachronic practices that were repeated with devotion and care and helped refine the chronology of the temple's deposits.

867. Soils and sedimentary records in human-enviroment interaction in prehispanic populations of Mexico.

Authors: Thania Alejandra García Zeferino (ENAH | INAH)
Format: Oral

This work presents evidence of anthropic or natural impacts at three archaeological sites in pre-Hispanic Mexico: Templo Mayor in Mexico City, El Pitayo in Michoacán and Cerro del Teúl in southern Zacatecas. The paleosols and subsequent soils of these sites were studied based on the identification of pedogenic processes and the type of construction materials use to build large cities. In the case of Templo Mayor, an archaeological site in the center of Mexico City located in a lake environment, the stratigraphic profiles of operations 29 and 44 were analyzed, which consist mainly of floors, firms and fillings. The other two sites studied, El Pitayo in Michoacán and Cerro del Teúl in Zacatecas, are associated with volcanic events that caused the migration of the populations settled in the sites. At the Cerro el Teúl site, a white layer was observed that covered the site and corresponded to an eruption of the Ceboruco volcano, located near the city of Nayarit, specifically the Jala phase (990-1020 AD). This evidence suggests that, despite this event, the inhabitants did not completely abandon the site. In addition, they used this ash in a mixture with soil to use it as construction material for the following stages of the site such as the Patio Hundido. In the case of El Pitayo, the activity from the Michoacán-Guanajuato Volcanic Field caused architectural changes and modification during the occupation of the site. These results allow us to conclude that, despite human intervention, the paleosols and construction fills record both natural and anthropogenic events as well as their impact on pre-Hispanic populations.

2213. Investigating human activity and sediment formation through micromorphology: a case study of cut features in Early Neolithic Paliambela, Greece

Authors: Georgia Koromila (University of Reading)
Format: Oral

Pit structures commonly found in Early Neolithic sites in SE Europe pose challenges for archaeologists as their variability seems to resist firm, consistent, overarching interpretations. Micro-contextual approaches are thus well suited to investigate such features; by examining these at the microscale level and placing them within their specific spatial and temporal configurations, we can aim to disambiguate this wide-ranging category. This paper employs archaeological soil micromorphology to investigate histories of sediment formation in an Early Neolithic stratigraphic sequence at the prehistoric site of Paliambela, Greece. The sequences examined comprise features cut into the natural calcareous bedrock, with complex, intersecting stratigraphic relationships. Samples of intact sediment blocks were collected from targeted areas of interest based on macrostratigraphic observations of deposit variation and potential for layering preservation. The subsequent microstratigraphic examination led to identification, categorisation, and interpretation of thin section micro-units and sequences, offering insights into the pre- and post-depositional histories of these sediments. The evidence suggests unique processes of infilling for different features, variability in preservation of depositional episodes and surface indicators, fluctuations in the rhythm of sediment build-up, and variable anthropogenic impact on sediment formation. These insights can further our understanding of key questions about intensity of use, continuity and discontinuity / abandonment processes, and preservation bias, and ultimately help paint a picture of early neolithic lifeways as richly configured realities.

1564. Integrating Archaeological Micromorphology, Phytoliths, and Chemical Proxies from Earthen Building Materials at Motya (Sicily)

Authors: Melis Uzdurum (University of Helsinki) – Doğa Karakaya (Istanbul University) – Benjamin Cutillas-Victoria (University of Murcia) – Marta Lorenzon (University of Helsinki) – Paola Sconzo (University of Palermo)
Format: Oral

This paper presents an integrated study of earthen building materials from the Phoenician settlement of Motya (Mozia, Sicily), a

key Mediterranean site of the 6th–5th centuries BCE where earthen and calcareous construction technologies intersect in an urban setting. The materials examined derive from different architectural contexts within the settlement, allowing intra-site comparisons of construction practices. Archaeological soil micromorphology, phytolith analysis (from both bulk samples and thin sections), and X-ray fluorescence (XRF) data from mudbrick and mortar reveal marked variability in construction recipes, including clay-rich, calcareous, and mixed materials. Blurred boundaries between mudbrick and mortar point to flexible building practices and material recycling within the chaîne opératoire of earthen construction, from raw material selection and preparation to use and reworking. Phytolith assemblages indicate vegetal inputs largely derived from raw material sources rather than systematic tempering, while XRF analyses support compositional contrasts between contexts. Together, these results highlight the value of integrated micro-scale approaches for interpreting construction practices and material circulation in Mediterranean earthen architecture.

2289. A micromorphological approach to phytoliths

Authors: Luc Vrydaghs (Archaeology, Environmental Changes & Geo-chemistry Research Group - VUB) – Monica Alonso-Eguiluz (Archaeology, Environmental Changes & Geo-chemistry Research Group - VUB | Universität Innsbruck, Institut für Archäologien, Innsbruck, Austria) – Alexandre Chevalier (Royal Belgian Institute of Natural Sciences) – Yannick Devos (Archaeology, Environmental Changes & Geo-chemistry Research Group - VUB)
Format: Oral

The presence of mineral plant microremains, such as silicophytoliths, is often reported in archaeological soil and sediment thin sections across a wide range of contexts, periods and regions. Yet, the full interpretative potential of these observations is often underexploited. Over the last decades, it has become clear that thin section silica phytolith analysis is particularly well-suited to understand their depositional and post-depositional processes . Beyond taphonomical reconstruction, silicophytoliths analysis in thin sections can also improve their botanical attribution. Although reference collections confirm that some taxa produce very distinctive types at different taxonomic levels, closely related taxa may generate highly similar forms – a phenomenon known as redundancy. This is especially critical for domesticated plants. Morphometric approaches – measurements of different sizes and shapes of phytoliths – have proven effective in overcoming this limitation. Nevertheless, to obtain confident results all measured phytoliths must originate from single taxa, individuals and plant parts. Detailed examination in thin sections enables to record silicophytoliths that meet this criterium. Through a series of case studies, this contribution intends to illustrate the potential of a fully integrated approach to obtain more reliable botanical attributions of silicophytoliths observed in archaeological contexts.

2661. Detecting Disturbance: Integrating Micromorphology, Geochemistry, and Luminescence to Disentangle Cemetery Site Formation in Bronze Age Greece

Authors: Daniel Fallu – Sofia Voutsaki (University of Groningen)
Format: Oral

Burial grounds are an integral, and often stratigraphically complicated, aspect of human communities. Soil and sediment memory allow researchers to delve further into the history of burial grounds, beyond the evidence provided by human remains and grave goods. This paper presents the preliminary results of the MSCA-funded project Geoarchaeological Reconstruction of Ancient Burials in their ENvironment (GRABEn). Through the application of soil micromorphology, augmented by geochemistry and the novel application of portable optically stimulated luminescence (pOSL) to isolate instances of grave disturbance and re-opening, the project seeks to provide evidence of grave use and re-use where more traditional methods are wanting. The primary case study, the Bronze Age Northern Cemetery of Ayios Vasileios in Lakonia, Greece, represents an important point in time, where mortuary traditions where transitioning into the Mycenaean palatial period. The cemetery (ca. 1700-1500 BCE) comprises a varied collection of burials, including simple single burials and more complex multiple burials. Traditional soil micromorphology, paired with pXRF and FTIR geochemistry, and pOSL were applied in order to establish the formation processes both in the graves and in the greater archaeological fills used in the construction of the cemetery. Importantly, the history of sunlight exposure provided by the pOSL analysis confirms observed changes in the movement of calcium and formation of calcite features in the soil, highlighting episodes of disturbance and reopening even in supposed single use burials. The integrated method we propose allows researchers to detect re-openings and manipulation of the sediment and remains providing, in this case, a fuller picture of developing mortuary traditions at an important point in the development of Greek Bronze Age society. It is our hope that a broader application of these methods will aid researchers in reconstructing the specific actions involved in burial traditions.

2215. Major and Trace Elements as Markers of Anthropogenic Activity at the Neolithic Site of Cova de les Cendres

Authors: Gianni Gallello – Oreto García-Puchol (University of Valencia) – Salvador Pardo-Gordó (University of La Laguna) – Joan Bernabeu Auban (University of Valencia)
Format: Oral

Major and trace element analyses are widely used to characterize archaeological sediments and to identify geochemical markers of human activity, complementing mineralogical and sedimentological approaches. This study presents elemental concentration data from the Neolithic site of Cova de les Cendres, located in the western Mediterranean region. The excavated cave preserves a continuous stratigraphic sequence spanning from the Neolithic to the Bronze Age. Several stratigraphic units have been interpreted

as corral-related combustion features associated with the stabling of ovicaprids. The sequence is interpreted as a multifunctional settlement. Evidence suggests a mixed subsistence strategy that included livestock husbandry, agricultural activities, and the exploitation of marine resources. Concentrations of major elements, together with trace elements—including rare earth elements—provide valuable insights into both anthropogenic inputs and post-depositional processes affecting the sedimentary record. Geochemical data are integrated with sedimentological and archaeological information to improve the interpretation of site formation processes. Multivariate statistical analyses reveal geochemical patterns that distinguish anthropogenic contributions within the cave profile, supporting the interpretation of activity areas and occupation phases. These results highlight the effectiveness of elemental geochemistry as a tool for reconstructing human activities and understanding depositional dynamics in complex archaeological contexts.

1001. Excellent Data, Terrible Timing: pXRF at a Site Excavated 150 Years Too Early

Authors: Michaela Schauer (Natural History Museum Wien | Vienna Institute for Archaeological Science | Research Network Human Evolution and Archaeological Sciences) – Mario Wallner (GeoSphere Austria) – Raimund Karl (University of Vienna) – Tanja Trausmuth – Helga Rösel-Mautendorfer (Independent)
Format: Oral

Geophysical survey at a former orchard, now a meadow, in the centre of Sollenau, near Wiener Neustadt (Austia), identified several circular anomalies interpreted as levelled burial mounds. To assess their character, we conducted a systematic portable X-ray fluorescence (pXRF) survey of archaeological soils before and after topsoil removal, applying a regular 2 m grid with targeted high-resolution sampling. Elemental distributions derived from uncalibrated analytical pXRF data for Cu, Zn, Pb and locally As delineate mound structures and distinguish individual features in the field. Such patterns would normally be taken as evidence for metal grave goods or burial-related deposition. Excavation and in depth archival research, however, later showed that the site had already been excavated in the nineteenth century and that artefacts were removed. This contradiction shifts the focus from interpretation to methodology: if the materials are gone, what exactly are we mapping? To address this question, we compare different approaches to processing and visualizing pXRF data – including raw counts, instrument-derived concentrations, and alternative mapping strategies – and demonstrate how these choices substantially change anomaly visibility, patterning, and archaeological inference. Rather than offering a definitive explanation, the paper uses this disturbed context as a stress test for pXRF-based prospection and highlights the interpretive uncertainty that remains when chemical signatures outlast the objects, that we think, might have produced them.

2250. Schrödinger's Sample - informing the micro through the macro: using field science to visualise and prioritise archaeological sampling

Authors: Chris Carey – Andy Boucher – Ruschane Joginder (Headland Archaeology)
Format: Oral

This contribution focuses on the interrelationship between the macro-scale excavation, recording and sampling of archaeological features and their relationship to the microscale analyses that are undertaken during post excavation. At its simplest level, the sampling of any archaeological sequence provides a gateway to application of scientific analyses at the micro-level. Whist significant attention has been paid to the integration of micro-level analyses back to the feature level of archaeological recording, there has been less consideration of how suitable samples are collected during the fieldwork stage of a project. The selection of whether to sample an archaeological deposit sequence is often based upon specialist advice or knowledge of archaeological science methods by the field excavator. As the scientific evidence that is uncovered at the micro-level is often invisible at the macro-level, how do we as archaeologists understand what features have been sampled and how do these features compare across sites and landscapes? Headland Archaeology has been developing the magnetic susceptibility scanning of archaeological features during excavation to inform sampling processes. Through the development of a bespoke integrated analysis system, a whole site population of scanned sections can be cross compared, identifying variation in their depositional histories. This cross comparison allows the identification of features or sequences that are 'different', alongside providing a way to group together features with similar patterns of magnetic susceptibility. As such, it provides a holistic overview across a site population and allows the alignment of features to the samples retrieved, facilitating in the prioritisation of stratigraphically intact samples for further micro-analysis. Furthermore, the display of the stratigraphic sections across each scanned feature, allows a direct relationship to be drawn between the wider processes of sedimentation referenced by a depositional environment and the detail of the micro-scale analyses, which can further unlock our understanding of past human activities.

2411. From grain size to landscape scale: an interdisciplinary geochemical and chronostratigraphic approach towards archaeological landscape biographies

Authors: Doris Jetzinger (University of Vienna) – Michaela Schauer (Natural History Museum Vienna) – Tim Kinnaird – Aayush Srivastava (University of St Andrews) – Wolfgang Wanek (University of Vienna)
Format: Oral

One of the biggest challenges in archaeological landscape research is the four-dimensional nature of landscapes, encompassing all three spatial dimension and the fourth dimension, time. A holistic understanding of an archaeological landscape's history therefore comprises the identification of evidence of anthropogenic activity, use of space, and formation processes, as well as establishing

connections between identified events and processes and a chronological framework or specific archaeological time periods. To identify traces of cultural activity in the landscape's sedimentary record and enable their chronological classification, we present an interdisciplinary methodological approach that centres on the combined use of geochemistry and chronostratigraphy. The approach is implemented in the "Life of a Landscape" project that aims at creating an archaeological landscape biography of the Kreuttal microregion in Lower Austria. We employ pXRF of bulk sediment as a key method to trace evidence of anthropogenic presence and activity in the sediment archive, supplemented by C and N stable isotope analysis, while relative and absolute chronological context is provided by portable OSL profiling and OSL dating. Sediment samples were collected via percussion coring from stratigraphic sequences of landscape features of potential anthropogenic origin, as well as from natural features to provide neutral background data for comparison. We screen samples with pXRF for enrichment of elements that are associated with human activity to trace anthropogenic presence and land use and use OSL to date anthropogenic features. The combination with OSL and sedimentological data also allows us to study formation processes and their influence on the localisation, movement, and preservation of these soil and sediment trace elements. Preliminary results from selected cores demonstrate that studying all four dimensions of the project's landscape through geochemical and chronometric applications facilitates insights into human-landscape interactions and anthropogenic space and land use through time.

539. Improving micromorphological analysis with CNN-based segmentation of flint/obsidian, bone and charcoal

Authors: Pedro García-Villa (AMBILAB, University of La Laguna) – Rafael Arnay – Javier Hernández-Aceituno (Department of Computer Engineering and Systems, University of La Laguna) – Sara Rueda-Saiz – Carolina Mallol (AMBILAB, University of La Laguna)
Format: Poster

This study explores the use of Deep Learning for quantitative micromorphological analysis of scanned thin sections using Convolutional Neural Networks (CNN). A total of 57 high-resolution thin-section scans were subdivided into 2000 × 2000 pixel images and manually annotated for bone, charcoal, and flint/obsidian. These annotations were used to train CNN models combining different encoder–decoder architectures. Model performance was assessed using the Intersection over Union (IoU) metric and results were contextualized using standard abundance classes. The final dataset comprised 5,054 annotated images, split into training (70%), validation (20%), and testing (10%) subsets. Three decoders (U-Net, FPN, PSPNet) were paired with four pre-trained encoders (ResNet, VGG, InceptionV4, Xception), generating 42 experimental configurations. The best performance was achieved by the U-Net–InceptionV4 combination, with IoU values of 0.96 for flint/obsidian, 0.82 for charcoal, and 0.80 for bone. Test images were further classified into Stoops' abundance categories based on pixel proportions. Performance differences among categories reflect intrinsic variability in fragment morphology and texture. Lower accuracy for bone and charcoal is linked to their higher heterogeneity, the inclusion of multiple preservation states within single classes, and annotation difficulties, whereas flint and obsidian benefit from more uniform optical characteristics. Abundance classification revealed a dominance of "Very Few" and "Few" categories. Overall, the results demonstrate the robustness and scalability of CNN-based micromorphological analysis, while highlighting future improvements such as dataset expansion, AI-assisted annotation, and full thin-section reconstruction.

2407. Earth building materials study from the Early Bronze Age settlement at Tell Galabovo, Stara Zagora, Bulgaria

Authors: Bozhidar Todorov (Paul Valéry University Montpellier 3) – Hanna Aleksandrova (National Archaeological Institute with Museum - Bulgarian Academy of Sciences)
Format: Poster

The transformation and degradation of earthen building materials are fundamental processes influencing the accumulation, stratigraphy, and morphology of tell settlements, particularly in present-day Bulgaria. This study is researching Early Bronze Age architectural remains from Tell Galabovo in the Upper Thrace Valley. The analyzed assemblage comprises fragments from hearth installations, plastered dwelling walls, and roof elements, examined through integrated macroscopic and microscopic analyses to reconstruct technological practices and material selection. The research aims to characterize the composition and structural variability of earthen construction materials and to identify primary raw resources alongside anthropogenic modifications introduced during production. A multidisciplinary methodological framework is established: meso- and micromorphological analyses, archaeobotanical analyses, FTIR spectroscopy, etc. The total number of samples is twenty. Results demonstrate the intentional or not incorporation of tempering agents – sand, straw, ceramic fragments, bone, and plant residues – into raw aggregates to enhance cohesion. Micromorphological observations reveal variability in porosity and compactness; in some cases, increased density appears linked to anthropogenic shaping processes, including manual pressure applied during wall construction or surface finishing. Archaeobotanical analyses identify hulled wheats and barley, by-products of threshing used as temper, as various grassy plants, reflecting the selective exploitation of plant resources for construction purposes. Variations in mineral and organic inclusions indicate diverse technological choices and adaptive strategies in response to locally available resources. It can be said that all the studied samples of earth building materials have largely similar indicators at the meso- and micro scales. There are also many of those that distinguish them from each other. Integrating archaeobotanical, micromorphological, and complementary analytical data allows the reconstruction of production techniques and emphasizes human–environment interactions. This interdisciplinary approach demonstrates how such evidence contributes to understanding settlement formation, construction strategies, and adaptive responses of Early Bronze Age communities in the region.

2504. Stronger Together: The Global pXRF Network (GopXRF.net)

Authors: Michaela Schauer (Vienna Institute for Archaeological Science | Natural History Museum Wien | Research Network Human Evolution and Archaeological Sciences) – Roger Doonan (AtkinsRéalis) – Luisa Dallai (University of Siena) – Michelle Richards (University of Melbourne) – Mai Abdelgawad (Centre d'Études Alexandrines | Université Bordeaux Montaigne) – Brandon Drake (University of New Mexico) – Ioannis Liritzis (Alma Mater Europaea University)
Format: Poster

Portable X-ray fluorescence (pXRF) has become a routine tool in archaeology and heritage science, enabling rapid, non-destructive geochemical analysis directly in the field, laboratory, and museum. Despite its widespread adoption, users often face persistent challenges, including limited access to methodological expertise, inconsistent analytical protocols, and a lack of shared standards for data acquisition, processing, and interpretation. These issues hinder reproducibility, comparability, and training across the discipline. The Global portable XRF Network (GopXRF.net) addresses these gaps by establishing an open, volunteer-led international community that connects specialists and newcomers and promotes best practice in archaeometric pXRF applications. The network provides a collaborative platform for knowledge exchange, mentoring, and teaching, and centralises key resources such as reference materials, calibration guidance, and methodological documentation. Current activities include an online colloquium series, research forums, conference workshops, a developing web portal, and task forces dedicated to material-specific guidelines, beginning with soils and ceramics. This poster introduces the aims, structure, and first initiatives of GopXRF.net and invites participation from researchers, students, and practitioners. By fostering communication and standardisation, the network seeks to improve data quality, transparency, and accessibility, strengthening the role of pXRF across archaeological and heritage research contexts.

2798. Using light elements in portable XRF analyses to interpret French and German archaeological and experimental contexts

Authors: Clara De Clercq (INRAP Hauts-de-France) – Kai Fechner (INRAP Hauts-de-France | CNRS/ UMR 7041 ARSCAN Archéologies environnementales) – Frederic Broes (INRAP Hauts-de-France) – Guillaume Hulin (INRAP Direction scientifique et technique) – Annaelle Belloche (—)
Format: Poster

Archaeological and experimental soils were compared using both classical laboratory soil analyses and results of the Bruker portable XRF from the Environmental Archaeology team of the CNRS (UMR ARSCAN). In a second step, a statistical approach limited to phosphorus validated a sample preparation method that yielded similar results (90-99%) in both approaches. These results validated the portable XRF as an alternative tool to the laboratory XRF, if correctly applied. The lack of such preparations limit the validity of results obtained with the portable device directly on a soil surface in the field, as for instance for precise chemical mapping within former architectural units. Light elements other than phosphorus, in particular magnesium, have been the subject of a specific approach as it is important for certain types of soil studies (initial fertility and mineral fertilisation in the past; types of excrements, etc.). Ultimately, a generalisation of an approach initiated by F. Bazile, based on a combination of mineral elements, is proposed. It has been applied to a reference set, selected from 35 years of sampling, of approximately 850 samples collected in well-dated (Late Glacial to modern) and well characterised contexts (pits, enclosures, surface horizons, cumulative anthropogenic layers, architectural units, etc.). Finally, some of these analyses will be duplicated by Near Infra-Red spectrometry for 400 of them (D. Ertlen, Univ. Strasburg), and by molecular organic chemistry for 40 samples (E. Jardé, Univ. Rennes). A particularly large and well-preserved site, currently being excavated over 18 months (Bourlon, Pas-de-Calais, France) serves as a test site for systematic application of these approaches (C. De Clercq, F. Broes, K. Fechner) and their combination with others (magnetic properties, G. Hulin, A. Belloche).

91 RESONANT CUSTODIES: RESTORING PAST IDENTITIES THROUGH FORENSIC AND ARCHAEOLOGICAL COLLABORATION

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Joanna Drath (Pomeranian Medical University) – Victoria Swenson – Nicholas Herrmann (Texas State University) – Andrzej Ossowski (Pomeranian Medical University)
Keywords: Forensic archaeology, Forensic anthropology, Human identification, Isotope and genetic analysis, Post-conflict recovery, Provenance and context
Format: Regular session

SESSION ABSTRACT

Forensic archaeology has become an increasingly prominent field, situated at the nexus of scientific investigation legal accountability and social memory. Individuals serve as enduring witnesses to lives once lived and to events that continue to shape the present. From ancient cemeteries or recent conflict sites, skeletal remains carry evidential, ethical, and emotional weight. Yet, processes of recovery, curation, and interpretation often fracture what might be understood as the chain of custody—the continuum of context,

documentation, and care that connects individuals to their life histories, identities, and descendants. This symposium invites contributions that explore the methodologies, casework, and ethical responsibilities of practitioners working in a variety of legal, humanitarian, and post-conflict contexts across Europe and beyond. Participants will present research that highlights archaeological expertise in the recovery and documentation of human remains; the reconstruction of events through material evidence; and return meaning and identities to dislocated remains. Such work exemplifies how scientific practice can become an act of remembrance and social repair. Presenters will discuss the methods in which the investigation of human remains resonates with contemporary concerns and how forensic and archaeological methods can contribute to post-conflict reconciliation, historical accountability, and the re-humanization of the past. We welcome papers that address the: • recovery and identification of individuals from mass disasters, armed conflicts and/or human rights investigations; • comparative case studies linking archaeological and forensic practice; • management and ethical stewardship of human remains; • theoretical reflections on documentation and the social life of evidence. • use of isotopic and genetic analysis to trace migration; By bringing together specialists from diverse fields, this session bridges laboratory, archival, and field practices, showing that restoring provenance and contextual integrity is not merely procedural but an act of reconnecting evidence, identity, and history.

CONTRIBUTION ABSTRACTS

2513. Operation Identification: A holistic anthropological approach to restoring identity in Texas

Authors: Courtney Siegert – Molly Kaplan – Chloe Mcdaneld – Victoria Swenson – Kate Spradley – Nicholas Herrmann (Texas State University)
Format: Oral

Operation Identification (OpID), a humanitarian forensic project based at Texas State University, operates within a deeply fragmented medicolegal landscape to restore identities to deceased migrants who would otherwise structurally disappear within the state's mixed Medical Examiner and Justice of the Peace system. OpID employs a holistic anthropological approach to resolving unidentified persons cases by integrating forensic science with community-engaged practice. This approach encompasses community outreach and informal interviews with local stakeholders, cemetery surveys using geophysical methods to locate and map unmarked burials, and biocultural interpretations of forensic anthropological assessments of both decomposing and skeletal remains. Through these combined efforts, OpID works to educate local actors, improve local capacity, and re-establish chains of custody broken by poor documentation, ad hoc burials, and minimal inter-agency coordination. Since 2013, the project has managed over 700 migrant decedent cases from 20 border and border-adjacent counties near the US-Mexico border in Texas. Over the years, the project has evolved from a primary focus on exhumation of the long-term dead to increasingly receiving direct transfers from county officials, necessitating OpID's incorporation of postmortem fingerprinting into operational workflows. This presentation provides an overview of OpID's work and our current advocacy efforts towards restructuring the medicolegal system in Texas.

2708. The Humanitarian Border Crisis: Burial Practices in Dignity of Unidentified Presumed Migrants from South Texas Cemeteries on the US-Mexico Border

Authors: Alaska Justice – Kate Spradley – Victoria Swenson – Molly Kaplan – Courtney Siegert – Chloe Mcdaneld (Texas State University)
Format: Oral

This research examines unidentified presumed migrant burials exhumed by Texas State University's Operation Identification at six South Texas cemeteries to evaluate how dignity is materially expressed in mortuary practice. Previous research documented deficiencies in identification efforts and procedural compliance, as well as burial practices that may be considered undignified, such as face-down placement and unconventional containers. This study extends this archaeological inquiry by incorporating data from additional exhumation sites and quantifying dignity in the treatment of unidentified migrant decedents through a necropolitics framework. Dignity is applied through a systemic assessment of the burial context of unidentified individuals buried in six border-county cemeteries: Tres Norias Cemetery, Willacy County; Maverick County Cemetery, Maverick County; Panteon de Guadalupe #4 Cemetery, Dimmitt County; Sacred Heart Cemetery, Brooks County; and Río Grande City Cemetery and La Grulla Cemetery, Starr County. Variables assessed include grave depth, body positioning, burial contents, usage of grave markers, documentation within the National Missing and Unidentified Persons System (NamUs), and evidence of identification attempts or autopsy before interment. Multifactorial analysis using anthropological reports, NamUs records, and field documentation reveals a broad expanse of burial conditions ranging from unmarked/shallow graves, those with medical waste or multiple individuals, and varying containers. This study demonstrates that materially observable burial neglect represents failure in ethical care for both the dead and their families and introduces significant barriers to future identification. By highlighting dignity, these findings contribute to the ongoing discourse of ethics, structural violence, and stakeholder accountability in burial contexts. It underscores the need for standardized forensic mortuary protocols and highlights the role of forensic archaeology in developing best practices in resource-limited jurisdictions.

2456. Postmortem Fingerprinting of Decomposed and Exhumed Human Remains: A Case Study from the U.S.–Mexico Border

Authors: Victoria Swenson – Molly Kaplan – Courtney Siegert – Chloe Mcdaneld – Kate Spradley (Texas State University)
Format: Oral

Since 2012, Texas has surpassed Arizona as the U.S. state with the highest number of migrant deaths, yet medico-legal responses remain highly decentralized. Unlike in Arizona where medical examiners offices have the capacity to investigate death, in Texas is county dependent, with only 14 of 254 counties operating medical examiner offices. Consequently, statutory requirements for the investigation and identification of unidentified remains— including fingerprinting and DNA sampling—are inconsistently applied. This has led to the burial of hundreds of unidentified individuals without meaningful identification efforts. Recent shifts in migration routes have made Maverick County a new epicenter of migrant deaths, overwhelming local capacity and creating a chronic mass-fatality crisis. This presentation demonstrates how postmortem fingerprinting can facilitate identification of migrants recovered in advanced stages of decomposition. In March of 2024, Operation Identification (OpID), a forensic humanitarian project of the Forensic Anthropology Center at Texas State University (FACTS), completed advanced postmortem fingerprint training with the FBI Disaster Victim Identification (DVI) Unit. During this training, OpID personnel fingerprinted four individuals at FACTS who were previously exhumed from Maverick County Cemetery in 2022 and 2023, using multiple techniques including degloving, dermal rehydration, boiling, and an automated fingerprint system. This effort resulted in the identification of one individual, demonstrating the viability of these methods for long-term cases, even after burial. These results underscore the value of advanced fingerprinting techniques for decomposed remains and argue for their routine application in unidentified death investigations. This presentation further highlights the critical role of interagency and international collaboration in humanitarian identification efforts.

1578. A Forensic Anthropological Study of a Soviet-Era Mass Grave in the Republic of Georgia

Authors: Meri Gonashvili (Georgian Association of Forensic Anthropology | Tbilisi State Medical University) – Nicholas Herrmann (Texas State University) – Kelly Kamnikar (University of Nebraska Lincoln) – Keegan Beane (Texas State University)
Format: Oral

The Soviet repressions left a profound and enduring legacy in the Republic of Georgia, yet the material traces of this violence remain largely undocumented and scientifically understudied. Thousands of individuals were extrajudicially executed or forcibly disappeared and buried in clandestine, mass graves intended not only to conceal death, but to erase identity, suppress mourning, and remove victims from social and historical memory. This paper examines how Soviet power operated through both mass killing and long-term disappearance, and how this necropolitical erasure has persisted into the post-Soviet period through institutional neglect and delayed forensic engagement. We address the consequences of unsystematic recovery practices through the examination of five of the six mass graves excavated in Adjara. In 2017, four graves were excavated by local religious authorities without professional oversight, resulting in commingling of remains and loss of contextual data. No comprehensive forensic investigation followed, leaving the physical evidence of violence largely unexamined. In response, the Georgian Recovery, Documentation, and Identification Project (GRDIP) was launched in 2021 as the first interdisciplinary, evidence-based initiative to investigate Soviet-era mass graves in Georgia. We present the forensic anthropological examination of individuals excavated from Grave 5 under controlled conditions within the framework of the GRDIP, with a focus on identification and trauma interpretation. Methods include documentation and analysis of trauma morphology and patterns, which demonstrate all individuals from Grave 5 sustained perimortem gunshot injuries. These injuries predominantly affect the cranial vault and exhibit consistent entrance and exit wound characteristics. Trauma uniformity across individuals indicates a systematic method of killing consistent with execution. By identifying execution patterns, this study demonstrates how forensic anthropology functions as both a scientific and ethical endeavor. In contexts where archival records are incomplete or silent, biological evidence provides testimony to state violence and enables the reconstruction of individual identities and historical justice.

1560. Understanding Patterns of Violence through Archaeology: A comparison of two mass graves in Georgia

Authors: Keegan Beane – Nicholas Herrmann (Texas State University) – Kelly Kamnikar (University of Nebraska, Lincoln) – Meri Gonashvili (Tbilisi State Medical University | Georgian Association of Forensic Anthropology)
Format: Oral

The Great Terror (1937-1938) during the Soviet occupation of the Republic of Georgia resulted in the execution of thousands of civilians and their burial in clandestine mass graves across the country. In 2017, four mass graves were discovered on an abandoned Soviet military base near Batumi, Georgia, and excavated by the local Dioceses without anthropological expertise. When a fifth mass grave was discovered in 2021, public outcry led to the development of the Georgian Association of Forensic Anthropology who initiated the Georgian Recovery, Documentation, and Identification Project to anthropologically exhume and analyze the victims, including those previously excavated. A sixth grave was excavated and the results published in 2022 by the Polish Institute of National Remembrance. Literature surrounding mass graves in Georgia is limited. Individuals discussed here represent victims of the Soviet-era of Terror in Georgia exhumed from mass graves, providing the first physical evidence of the events that occurred. Understanding patterns of spatial positioning and placement sequences within these graves allows knowledge gained here to extend beyond isolated contexts to understand patterns of execution and burial if additional mass graves are discovered. Further, victims, families, and the community have the right to know the truth, both through identification of remains and knowing the circumstances surrounding the violent event. Answers can help families and communities begin the process of reconciliation. This research compares Graves 5 and 6 to identify patterns in the deposition of individuals within the graves. The spatial and depositional structure of the graves is detailed, including body positioning, burial placement, and placement sequence, using a Harris Matrix. The study examines each

grave individually and then compares the graves to identify patterns of deposition that shed light on the violent events resulting in these graves and contribute to the historical record, reconciliation, and families' right to know.

2053. Project Recover – America's Promise Upheld by a Motley Crew

Authors: Svenja Weise (University of Southern Denmark | Project Recover)
Format: Oral

For over 30 years, Project Recover (PR) has been a citizen-led, non-profit organization committed to search and recover American service members missing in action in order to provide recognition and closure for the families. As partner of the Defense POW/MIA Accounting Agency (DPAA), PR conducts missions on land and underwater. Co-Founders include the Scripps Institution of Oceanography and the University of Delaware's School of Earth, Ocean, and Environment, which contribute cutting-edge science and technology. The team also includes historians, archaeologists, forensic anthropologists, and a Family Outreach Team for families requesting assistance. Diving expertise is provided by Legion Underseas Services (LUS), a Veteran-owned commercial diving company. In 2021 and 2023, PR carried out two underwater recovery missions at a TBM-1C Avenger crash site in the Republic of Palau, leading to the successful identification of all three missing servicemen by the DPAA. The diverse excavation team comprised archaeologists, commercial divers, volunteers from different backgrounds, and a Palauan entrepreneur who supplied equipment and local workers, which are vital part of the team. While the cooperation between scientific and commercial diving personnel requires constant matching of expectations, it is precisely this constant adjustment that leads to focused teamwork and valuable results. Using these excavations as example, the talk will highlight the complexity of these missions, showcasing the positive cooperation with local authorities, the teamwork between scientists and veterans during excavation, and the profound impact on the families of the identified MIAs.

2352. Reliability of documentary autopsies in the context of Francoist repression in Spain: The case of Castellnou de Bages (1945)

Authors: Xavier Jordana (Research Group of Biological Anthropology, Universitat Autònoma de Barcelona) – Marta Riba-Vidal – Antònia Díaz-Carvajal (Laboratori d'Antropologia de Fosses, Universitat Autònoma de Barcelona) – Ignasi Galtés Vicente (Institut de Medicina Legal i Ciències Forenses de Catalunya)
Format: Oral

In June 2025, a mass grave associated with Francoist repression in the post-Spanish Civil War, was excavated in Castellnou del Bages (Barcelona), within the framework of the exhumation project promoted by the Directorate-General for Democratic Memory (DGMD) of the Government of Catalonia. The grave contained the remains of four individuals killed during the night of 22–23 February 1945 by the Guardia Civil: two maquis (guerrilla fighters) and a married couple of tenant farmers who had been sheltering them at the Creu del Perelló farmhouse. Following the recovery of the remains, comprehensive anthropological and genetic studies were carried out with the aim of identifying the victims. The anthropological analysis included the reconstruction of the biological profile, the assessment of antemortem alterations, and the detailed description of perimortem trauma. In parallel, historical research conducted by the DGMD led to the discovery of the original autopsy reports of the four individuals, dated 24 February 1945 and preserved in the Municipal Courts of Castellnou de Bages. This documentation provides an opportunity to compare the trauma descriptions recorded during the autopsies with current osteological evidence and to assess the reliability of such documentary sources in forensic identification. The comparison revealed significant discrepancies between the historical autopsy reports and the findings of the forensic anthropological analysis, affecting both injury descriptions and the medico-legal procedures reportedly performed, including the absence of osteological evidence for some of the procedures described. Similar inconsistencies have been documented in other exhumations related to the Spanish Civil War and Francoist dictatorship. In conclusion, this case underscores the need for a critical, interdisciplinary approach to the use of historical documentation as secondary evidence in forensic identification processes, particularly in contexts of armed conflict, political repression and authoritarian governance.

1772. From Battlefield to Burial. Bioarchaeological Analysis of a First World War Mass Grave at Cima Cady, Northern Italy

Authors: Daniel Gaudio (Department of Archaeology, Durham University) – Wiktoria Baranowska – Cyrus Edgcombe (Department of Archaeology, Durham University) – Mauro Gobbi (Climate and Ecology Unit, MUSE-Science Museum) – Stefano Vanin (Department of Earth, Environmental and Life Sciences-DISTAV, University of Genoa) – Geoffrey Nowell (Department of Earth Sciences, Durham University) – Janet Montgomery (Department of Archaeology, Durham University) – Franco Nicolis (Archaeological Heritage Office of the Autonomous Province of Trento)
Format: Oral

During World War I, intense fighting took place in areas of the Italian Alps, including the Tonale Pass and Cima Cady (provinces of Brescia and Trento). Based on testimonies preserved in a war diary describing "Operation Avalanche" (12–13 June 1918), an archaeological investigation was undertaken to locate the documented mass graves. In 2022, a mass grave containing the remains of Austro-Hungarian soldiers was identified at Cima Cady, at an altitude of 2,309 m asl. The remains were subsequently excavated and recovered, and a multidisciplinary analysis of the remains was conducted. The osteological investigation included the estimation of

the minimum number of individuals, the reconstruction of biological profiles, the assessment of skeletal trauma and pathologies, and the evaluation of taphonomic evidence and processes affecting the remains. Fragments of insects associated with the remains were analysed. Geographical isotope analysis was undertaken to narrow down possible places of origin, analysing strontium, oxygen, and lead isotope ratios in dental tissues, where available. The skeletal remains were characterised by poor preservation, primarily due to acidic soil erosion, with widespread reddish staining affecting over 80% of the elements. This staining was linked to invasive shrub root activity, specifically Juniperus sp. Entomological evidence, including ground beetles (Pterostichus multipunctatus) and puparia of blow flies (Protophormia terraenovae), indicates colonisation of largely exposed remains. The analysis identified twelve male soldiers, with an estimated age at death between 18 and 35 years. Dental and skeletal pathologies were observed, including caries, osteoarthrosis, and signs of cribra orbitalia. Five individuals exhibited evidence of perimortem skeletal trauma (blast and projectile trauma). Geographical isotope analysis suggests probable origins for six individuals, primarily from Debrecen (Hungary) and Timişoara (Romania), with additional tentative links to Bela Crkva (Serbia) and Sabinov (Slovakia). The twelve soldiers were reburied at Castel Dante (Italy), in March 2024, with full military honours.

2447. Recovering What Was Lost: Research on 20th-Century East Prussian Necropolises

Authors: Joanna Ciesielska – Magdalena Kozicka (Wojewódzki Urząd Ochrony Zabytków w Olsztynie)
Format: Oral

The former province of East Prussia was the site of extensive military activity during both World Wars in the 20th century. During the First World War, much of the region served as a continuous frontline. Military operations at the end of the Second World War caused the complete destruction of certain places, resulting in the disappearance of numerous villages. Some of them are cut by the border with Russia. Ongoing management of cultural heritage in Warmia and Masuria, combined with increasing anthropogenic pressure, has led to the frequent discovery of forgotten cemeteries during construction activities. For war cemeteries, the legal context is relatively well-defined and established procedures exist. However, identifying the deceased's nationality and determining the appropriate treatment of their remains often presents considerable challenges. In contrast, civilian cemeteries lack a clear procedural framework. Nevertheless, a general practice for managing the remains of the deceased has emerged over time. Simultaneously, a distinct approach to the recent heritage of these lands has emerged. Minimally invasive archaeological research is increasingly used to restore the memory of former inhabitants displaced by geopolitical changes. This study presents recent archaeological investigations in Masuria, highlighting best practices and the positive, though challenging, transition associated with the growing adoption of the forensic archaeology paradigm, notable especially amid investor-driven pressures.

836. Reconstructing Forgotten Identities Through the Bioarchaeological Relocation of the Historic Crawley-Wilson Cemetery

Authors: Alexandra Bybee – Hannah Whelan (Cultural Resource Analysts, Inc.) – Jaycee Castro (University of Kentucky)
Format: Oral

On a rural water utility plant in the heart of the Bluegrass region of Kentucky, a forgotten late nineteenth through early twentieth-century cemetery was subjected to archaeological relocation in 2024. The Crawley-Wilson Cemetery was found to contain 12 graves consisting of infants through elderly adults, most of whom were not identified at the time of excavation because the graves lacked in situ inscribed gravemarkers. Biological profiles obtained from skeletal and dental remains, in conjunction with details obtained from extensive archival research and analysis of the recovered mortuary and cultural materials, revealed the probable identities of all 12 individuals. Further, involvement by descendants before, during, and after the relocation of the historically interred Crawley and Wilson families shed light on the lives of these people around the turn of the twentieth century. This paper will present the process of cemetery relocation in Kentucky and the results of the bioarchaeological excavation and analysis, with a focus on the importance of communicating with descendant communities.

1494. Beware of scholar ghouls! The problem of illegal use of historical and contemporary skeletal remains for educational purposes

Authors: Agata Bisiecka (Pomeranian Medical University in Szczecin)
Format: Oral

In 2026, narratives of grave robbery may seem like relics lifted from the pages of Mary Shelley or R. L. Stevenson. On the contrary, however, this constitutes a significant legal challenge in the academic education of medical and paramedical students. It is closely linked to the issue of protecting cultural heritage—which can include human skeletal remains—as well as to the broader phenomena of governance and ethical oversight of human skeletal remains. Moreover, the discussed phenomenon directly affects the real image of the protection of the identity of remains and respect for the rights related to them. In Poland, a persistent practice among students of medical and related universities is the illegal acquisition (through entrustment or purchase) of human bones, intended for study in osteology and the anatomy of the human skeletal system. Such practices may contravene regulations pertaining to the protection of cultural monuments, particularly when the remains being traded originate from the liquidated historical graves — remains that may, in fact, form part of a broader archaeological burial site requiring proper and multifaceted scientific analysis. Furthermore, they constitute a direct violation of Article 262, paragraph 1 of the Polish Penal Code, punishable by a fine, restriction of liberty, or imprisonment for up to two years. The speaker will present a summary of information gathered through individual

interviews conducted among medical and paramedical students at various Polish universities (intentionally unnamed) between January and April 2026. The purpose of these interviews is to obtain data regarding students' knowledge and attitudes towards the aforementioned practice, as well as to diagnose its causes and identify potential preventive measures, with the analysis of possible impact on the archaeological heritage. The issue will be illustrated through a case study —a forensic assessment conducted by the author in a case concerning the alleged desecration of human remains.

92 HANDS, CLAY, AND FIRE: PEOPLE, PRACTICES AND PRODUCTIONS

Theme: 1. Widening perspectives in material culture studies
Organisers: Julie Marchand (Université Libre de Bruxelles) – Natacha Massar (Royal Museums of Art and History, Brussels) – Sonja Willems (Université Catholique de Louvain) – Elpiniki Naoum (Hellenic Ministry of Culture, Ephorate of Antiquities of Pella)
Keywords: Workshop, chaine opératoire, clay, tool, skill
Format: Discussion session

SESSION ABSTRACT

Pottery, one of the most ubiquitous materials, has long been the subject of extensive investigation, addressing every stage of its life cycle. The present session focuses on the production of pottery and terracotta objects—such as lamps, figurines, and architectural elements—in all its aspects. This craft encompasses a complex system involving materials, tools, spaces and individuals. It requires knowledge, skills, and experience, through a series of chaînes opératoires from clay extraction to firing. Techniques and styles developed and transformed in response to new functional requirements, changing tastes, innovations, technological advances, and broader social, cultural, and economic transformations. Workspaces are also places of learning and transmission organized around a stable core of master craftsmen. They constitute dynamic loci of both material and immaterial culture, where knowledge is continuously negotiated and reshaped. This panel focuses on all material, technical and social aspects of pottery and terracotta production prior to sale of goods, without chronological or geographical boundaries. Approaches emphasizing material, technical, and human dimensions of production are encouraged. By examining workshops as dynamic spaces of manufacture, innovation, and knowledge transmission, it fosters dialogue between archaeological, archaeometric, and anthropological perspectives. We address the following topics: • Workshop location and organization: spatial setting, internal organisation, from fuel-supply to clay treatment or drying and storage facilities. • Production techniques: raw materials, water availability, clay processing, surface treatment, firing procedures. • Tools and marks: potter's wheels and molds, tools, as well as marks, signatures, and other identifying features. • Workshops as social communities: the roles of potters, training, transmission and specialization, interactions with other crafts and mobility of artisans. • Innovation and transformation: origins, mechanisms, and consequences of technological or organizational change. • Economic and cultural connections: market demands and fashion trends, processes of adaptation, acculturation, and cultural interaction.

CONTRIBUTION ABSTRACTS

934. Buto (Delta, Egypt) : Productions and connections with the Mediterranean world in the Hellenistic and Early Roman periods

Authors: Pascale Ballet (Nanterre University)
Format: Oral

This paper will present the pottery workshops of Buto (north-west of the Delta, Egypt), during 5 centuries of activity, from the Early Hellenistic/Ptolemaic period to the Early Roman time. The French mission, in the frame of the Deutsches Archäologisches Institut (Cairo) concession, has engaged a large program to investigate the evolution of the workshops, and their connections and influences with and from the Mediterranean world. In the Hellenistic time, four workshops are showing different kinds of adaptation to the Greek pottery (overpainted, black, table and common wares). Concerning the local Black wares, if they show some morphological influences from the Greek Black ware, the firing process is different, using a reduction firing technic. For the cooking wares, the adaptation of the Greek types is one of the main change in the local pottery repertory. During the Roman period, beside a workshop producing table and common wares, sometimes painted, a group of kilns located in the north part of the settlement is remarkable due to the use of 'radial heating' system of firing. In this peculiar bipartite type of kiln, smoke and heat were conducted through columns of tubes set into the upper chamber (continuously oxidizing firing) with a complex ventilation system in the lower chamber. It underlines the highly elaborated technique used by the local potters who want to imitate the more prestigious production of sigillata, with flasks for perfume industry. The beginning of this kind of this production must have been relatively early, around the very end of the first century BC. These workshops provide the first examples of this technic in the Near East and show evidence for connections with the Eastern Mediterranean centers producing Eastern Sigillata A (without archaeological proof for this radial heating) and the Western workshops (Arezzo or La Graufesenque).

1348. Beyond the use of tools. Molds, punches and signatures of the Macedonian workshop circle of relief vases

Authors: Elpiniki Naoum (Hellenic Ministry of Culture, Ephorate of Antiquities of Pella)
Format: Oral

The relief ceramic production, and specifically the relief bowls, is one of the most representative type of Hellenistic pottery. The use of specific tools, such as molds and punches, was essential for their production, and finding them is particularly rare. In the region of Macedonia, relief vases have been found in several locations such as Pella, Thessaloniki, Aigai, Veria, Aiani, Polymylos Kozani, Florina, Petres, Amphipolis, Heraclea Lynkestis, and Isar-Marvici, while it is certain that relief pottery workshops also operated in those places. It seems that there was an active network of ceramic workshops (Macedonian workshop circle) in the area of central and Western Macedonia, and possibly in eastern and northern areas, which communicated and exchanged products under the influence of the workshop of the capital, Pella, that exported molds, punches, vessels, due to the specialization it had particularly in the construction of relief vessels with narrative representations. In this paper, we will examine the tools used in the construction of relief vessels in the region of Macedonia which reveal the high technological level and demonstrate the required specialization, overturning the image of their mechanistic easy production. At the same time, the exchange of expertise between the ceramic workshops will be highlighted, and questions will be raised regarding the circulation of tools among the workshops and their small number. Furthermore, the examination of the tools reveal elements of the way the workshops operated as well as information about their internal organization. Finally, there will be a brief mention of the minimal signatures of the Macedonian workshop circle and their significance.

561. In Pistillus' workshop: immersion in the work of a coroplast from Roman Gaule in the early 3rd century AD

Authors: Loïc Androuin (EPHE | ANHIMA)
Format: Oral

Pistillus was probably the most famous coroplast – a craftsman who made terracotta figurines – in Roman Gaul. Hundreds of his signed figurines, found in the western provinces of the Roman Empire, attest to the quality and abundance of his work, as well as its widespread distribution. The discovery of two potter's workshops containing his production equipment enabled archaeologists to determine that he worked in Augustodunum (modern-day Autun, France) in the early 3rd century AD. These excavated workshops provide essential information for understanding how the workspaces were organised. The function of the different sectors is determined by the presence of specific structures, such as kilns, storage pits and potter's wheels, while the distribution of moulds and production waste enables us to hypothesise about where the figurines were shaped. A detailed analysis of moulds and production waste provides new insights into the techniques employed by craftsmen and the operational processes involved in this craft. The development of a new typology, exhaustive and standardised recording in a database and the use of three-dimensional digital models make the operational chain easier to understand. Iconographic developments and influences between workshops and coroplasts become visible, revealing a rich and complex artisanal landscape.

1195. From Raw Material to the Consumer: Coroplastic Workshops and Distribution on Late Hellenistic Delos

Authors: Eléonore Favier (École française d'Athènes)
Format: Oral

The site of Delos stands out for the preservation of its remains, made possible by the absence of modern urban occupation. Extensive excavations have thus allowed for a precise reconstruction of the urban layout dating to the late second and early first centuries BC. Despite this rich body of archaeological evidence, production activities, workshops, and their organization remain poorly understood. Ceramic workshops in particular are absent from the archaeological record, and the question of how the city was supplied with vessels and tableware has been a longstanding issue for decades. The only workshops working clay currently identified on Delos are coroplastic workshops. This paper focuses on these two workshops, examining their location within the urban fabric, their functioning, and their clientele. The analysis is based on a study of the production chaîne opératoire, considered in all its stages, in order to shed light not only on the internal organization of the workshops but also on broader aspects of Delian production. The absence of local clay resources necessarily implies the importation of raw materials by sea, a constraint that may also have applied to the supply of fuel. A comparative examination of the two workshops reveals distinct yet complementary structural and spatial characteristics. The discovery of molds and finished products provides insight into manufacturing processes and raises the question of a possible spatial division of labor between the two sites, thereby prompting reflections on the identity of the producers and workshop owners. Finally, the study addresses the distribution of the products by considering their destination and the identity of their purchasers. Beyond objects intended for domestic contexts, the workshops also supplied statuettes to the city's sanctuaries, in particular the sanctuary of Apollo, located in the vicinity of one of the workshops.

2070. Knowledge transmission systems among the Early Chalcolithic pottery-making communities from

Eastern Romania

Authors: Florica Matau (Alexandru Ioan Cuza University of Iasi)
Format: Oral

This study explores the relationship between the transformations that occurred in the decorative style and the technological traits developed by the Early Chalcolithic potters located in Eastern Romania. Our objective is twofold: first, to assess their abilities to innovate and to produce elaborate objects, and then to identify the transmission mechanisms that influence the "technological choices." In our approach, we have considered ceramics as the result of a wide range of conscious choices made by the potters regarding the raw materials they select and transform in various ways. These choices are a result of a learning process acquired and passed on via social relationships. The various sequential choices made by the potters are determined by their enrollment in a community of practice, which represents a group of participants acting in a similar learning environment and sharing a common practice. The study will use the chaîne opératoire methodology to investigate the learning and cultural transmission systems practiced within the Early Chalcolithic communities. To determine how communities of practice acted within the pottery production chain, the theory of artifact design will be applied to target the high- and low-visibility attributes revealed by macroscopic observations and petrographic investigations.

2093. Traces of touch: contrasting Egyptian and Greek craft traditions through fingerprint analysis

Authors: Leonie Hoff (University of Oxford)
Format: Oral

This work is based on a chapter from my PhD thesis on the production of terracotta figurines found at Thonis-Heracleion in the western Egyptian Nile delta. Although the site is an Egyptian city (now submerged underwater following several natural disasters), it witnessed extensive contacts with the Greek cultural sphere across its occupation from the Late Period to the mid-Ptolemaic Period (ca. 600-150 BCE). A range of different terracotta figurines have been found at the site, consisting of a mixture of imported Greek figurines and locally produced Egyptian specimens. In the current absence of evidence for workshop spaces at Thonis-Heracleion, I incorporated anthropological methods of fingerprint analysis to gain insight into the population segments who were involved in the production of these figurines. This analysis especially highlighted the involvement of women and children, while also presenting differences in the production- and possible apprenticeship processes of Egyptian and Greek coroplastic traditions. To further contrast Egyptian and Greek figurine production I will be drawing on a range of other sources about the production of figurines and ceramics more widely, including also textual evidence and inscriptions on the figurines. The evidence that has emerged from fingerprint analysis will be integrated with theories about workshop organisation and the social makeup of workshops, shedding light on artisanal professions about whom relatively else is little known.

947. Potters' Signatures in the Islamic World (8th–15th Centuries): A Diachronic Synthesis

Authors: Julie Marchand (Université libre de Bruxelles)
Format: Oral

The practice of signing ceramic objetcs – apparently unknown in the proto-Byzantine world – re-emerges in the Islamic sphere from the eighth century onwards. This practice displays considerable formal diversity, shaped by the complex structure of Arabic names (ism, kunyā, nasab, nisba, laqab) as well as by their social uses. Initially produced by molding, signatures gradually became handwritten from the Fatimid period (969–1171) onwards. Adopting a long-term perspective, this study compares different modes of signing (molded versus handwritten): whether the name is visible or hidden on the pottery, integrated into the decorative program or isolated and thus emphasized. Since artisans were also identified by their specialisations (such as Naqqāš, the painter, or al Muʿallim, the Master), the paper also explores the organisation and composition of several major workshops. Finally, through selected case studies, this paper addresses the question of whether the practice of signing is compatible with large-scale production and the possible added-value it may brought to objects.

2667. Crafting Identity: Exploring Terracotta Production and Knowledge Networks in the Mature Indus Period

Authors: Sutapa Lahiri (University of Calgary)
Format: Oral

The Indus craft industry produced a wide array of objects from diverse raw materials. It was during the Mature phase of the Indus civilization (c. 2600–1900 BCE), which witnessed the expansion and intensification of craft production, offering critical insights into how technological practices contributed to the formation of shared cultural identities across a vast and diverse landscape. While terracotta objects formed a persistent and ubiquitous component of Indus craft traditions and are abundantly recovered from settlements across the civilization, systematic research into their manufacturing techniques and the mechanisms of knowledge transmission involved in their production remains limited to date. In this presentation, I demonstrate that terracotta artifacts, ranging from personal adornments to figurines, exhibit a range of technical choices that can be effectively investigated using the chaîne opératoire approach. The results of this study highlight the presence of complex and resilient learning networks, as well as cross-crafting practices that are instrumental in sustaining a shared Indus identity in craftsmanship.

2246. Continuities and discontinuities in pottery practices around the archaeological site of Mahasthangarh (Bangladesh)

Authors: Coline Lefrancq (CNRS UMR 7041 ArScAN)
Format: Oral

The archaeological site of Mahasthangarh located in the Northwestern part of Bangladesh was founded around the 4th c. BCE and occupied until at least the 13th/14th c. CE when its decline began. However, this fortified site built on a terrace overlooking the Karatoya River has never been completely abandoned and the modern village has expanded in the southeast part of the citadel. The different excavations conducted in Mahasthangarh and its surroundings have yielded thousands and thousands of potsherds dated to the different periods of occupation of the site. This abundance, especially of 'local' pottery groups, led to think that Mahasthangarh was a production centre at certain times. This practice remained until the contemporary times. Indeed, several potters communities were identified in the surroundings villages attesting of the continuity of certain technical features (manufacturing, decorative and firing processes). In this presentation, I will highlight some case studies illustrating these continuities and discontinuities in pottery practices.

150. Reconstructing Production: A Chaîne Opératoire Study of Corinthian and Attic Plastic Vases

Authors: Mostafa Alskaf (Université libre de Bruxelles)
Format: Oral

This paper presents a study of the technological and organisational factors involved in the production of plastic vases in archaic Greek pottery, focusing on workshops in Corinth and Attica from the 7th to the 5th c. BC. We examine pottery production methods, tool marks, workshop dynamics, and the impact of technological change. By applying the chaîne opératoire framework, the research traces the manufacturing process, beginning with the shaping of clay and continuing through to the final stages of decoration. The use of microscopic, macroscopic, and X-ray analyses helps to identify specific technological choices and workshop practices, drawing attention to both regional characteristics and broader cultural connections within ancient Greek society. Our study of 682 vases reveals seven principal forming techniques, ranging from mould-made and wheel-thrown to hand-modelled and hybrid methods. Corinthian workshops displayed versatility, using wheel-coiled and wheel-modelled approaches, while Attic workshops preferred the specialised wheel-mould technique. Careful examination of finishing processes, piercing, smoothing, polishing, painting, incising, and modelling, shows potters' attention to detail through tool marks, fingerprints, and decorations that conceal joins and enhance appearance. Regional styles are clear: Corinthian vases frequently feature dotted patterns with incisions, whereas Attic plastic vases are notable for their extensive red-figure and black-figure scenes, reflecting distinct artistic traditions within each region. The analysis of tool marks, signatures, decorative styles, and potting decisions reveals how technical and artistic knowledge circulated and how workshops adapted to external influences and changing economic conditions. Distinct regional decorative styles and manufacturing choices highlight the exchange of expertise across local and wider networks. By examining the evolution of production techniques, this study reveals how skills and motifs transferred between workshops, highlighting collaborative ancient Greek craftsmanship. Combining technical analysis with insights into workshop organisation, this paper clarifies both regional differences and shared traditions in archaic Greek plastic vase production.

2077. Early Pottery from Gournia (Crete): facts, hints and traces. Reconstructing the inner workings of a Late Prepalatial Production Centre.

Authors: Agnieszka Kaliszewska (Systems Research Institute, PAS)
Format: Oral

Since the discovery of the site and the early excavations, pottery has been a significant focus of the research on Gournia. The site, being one of the few non-palatial sites in Crete, provided evidence of the daily lives of the Minoans. The seminal article of Edith Hall, "Early painted pottery from Gournia, Crete", published in 1905, presented the pottery coming from the so-called North Trench: a large deposit of Prepalatial pottery, predominantly decorated with a distinctive decoration in white paint on a dark background. The article introduced the Light-on Dark style to the study of Minoan pottery, as Gournia became the type-site for this style. Since 1905, pottery of the Light-on Dark style has been found on many sites, but never in abundance. In 2011, the Gournia Excavation Project excavated a section of the North Trench and obtained a large sample of the pottery, same as the pottery published by Hall in 1905. The presentation explores the production techniques and characteristics of the Late Prepalatial pottery from Gournia. Gournia was long assumed to be a significant centre of pottery production. The investigation of the North Trench deposit seems to point to the pottery production being an important craft at Gournia as early as Early Minoan III. In the presentation, we explore the style and production techniques that distinguish the Gournia pottery from its counterparts in other sites and regions of Crete.

1232. The process of creation: the role of the chaîne opératoire and scientific analysis in the study of

Mycenaean terracotta figurines

Authors: Mirtill Árvai (Institute of Archaeological Sciences, Eötvös Loránd University)
Format: Oral

One of the most characteristic objects from the Greek Late Bronze Age are small, hand-formed terracotta figurines. Their most common types—anthropomorphic figurines called Phi, Psi, and Tau, alongside animal-shaped examples—were fundamental elements of Mycenaean religious practice and daily life. In my presentation, I examine five Mycenaean terracotta figurines from the Collection of Classical Antiquities of the Museum of Fine Arts in Budapest (Hungary). As these artifacts are museum objects lacking their original archaeological context, their study requires a complex, interdisciplinary methodology to compensate for the lack of primary archaeological data. The fundamental goal of this research is to reconstruct the technical process of these objects through the chaîne opératoire approach, supplementing traditional typology with advanced scientific diagnostics and experimental methods. To understand the materials used, non-destructive portable XRF (pXRF) analysis determined the chemical composition of the clay and pigments, while multispectral imaging (MSI) revealed surface treatments and manufacturing traces invisible to the naked eye. A cornerstone of this research is experimental archaeology; by creating authentic replicas and physically re-enacting the entire production chain—from raw material processing to final decoration—it became possible to identify the technical nuances of ancient craftsmanship. This practical reconstruction not only allows for a deeper understanding of ancient manufacturing techniques but also brings us closer to identifying the identity and skill level of their makers. In my presentation, I will not only describe the technological phases but also attempt to outline the entire life cycle of the objects, touching on the role of their creators, the possible functions of the figurines, and their social significance in the Late Bronze Age Aegean.

1568. Pottery production in a Neolithic village – a case study from the LBK site Ludwinowo 7 in Kuyavia, north-central Poland

Authors: Joanna Pyzel (Maria Curie-Sklodowska University in Lublin) – Louise Gomart (CNRS Paris) – Marcin Szeliga – Gabriela Gdula – Maksymilian Łuszcz – Martyna Nawrocka (Maria Curie-Sklodowska University in Lublin)
Format: Oral

The earliest farmers in Central Europe produced pottery within their settlements, yet the organization and variability of this production remain unevenly studied across regions. In the Linear Pottery Culture of the North European Plain, detailed technological analyses of ceramic production are still lacking. This presentation introduces the preliminary results of an ongoing project applying the chaîne opératoire approach to LBK pottery from Kuyavia in north-central Poland. The aim is to apprehend technological variability, particularly at the vessel-forming stage, which can reflect distinct technical traditions, carried out by specific social groups. We focus on selected households from the LBK settlement at Ludwinowo 7, a site comprising more than 30 houses and occupied for at least six generations. By comparing technological practices between households, we seek to determine whether different learning networks can be distinguished and how these pottery-making groups developed and interacted through time within the settlement. Research is financially supported by the National Science Centre, Poland, OPUS 26 (project no. 2023/51/B/HS3/00207).

1975. From Prehistory to Present: Pottery Production in the Tao River Valley

Authors: Xueyang Cheng (University of Chinese Academy of Social Sciences)
Format: Oral

Pottery is an important prehistoric material for understanding the period from the late Neolithic to the early Bronze Age in northwestern China. Systematic research on pottery-making tools and workshops in this region remains insufficient, and ethnographic data, especially the involvement of modern potters in ancient ceramics, have been underemphasized in related studies. This study aims to fill these gaps, focusing on the pottery industry in the Tao River Valley in China, with an emphasis on the Majiayao and Qijia cultural periods. It proposes the use of multiple research methods: referring to archaeological excavation reports, conducting experimental simulations, carrying out ethnographic surveys, and integrating these approaches following the logic of chaînes opératoires to clarify the use of pottery-making tools and techniques, In addition, this study will also incorporate petrological data and analyze the existing pottery kilns and workshops reported in previous studies to further deepen the understanding of ceramic production technologies and potters' practices. By focusing on the local pottery industry, it provides empirical cases for prehistoric pottery production, fostering dialogue between archaeological and anthropological perspectives, and enriches the understanding of the production processes of prehistoric ceramics and their socio-cultural significance.

2375. Workshop management and adaptation to market demands: the Famars case (1–4 th c. AD; N-France, Valenciennes)

Authors: Sonja Willems (Catholic University of Louvain)
Format: Oral

Northern France is renowned for its numerous ceramic workshops, which interacted within complex local, regional and long-distance market networks. These interactions involved market sharing, competition and adaptation to local geographical and geological conditions. This lecture addresses differences in production management through the case study of Famars. With more than twenty kilns, its pottery production can only be understood in relation to other nearby workshops. The proximity to the Scheldt River played a key role, responding to increasing market demand. Excavations conducted between 2011 and 2014 revealed a wide range of production facilities and a complex evolution of fabric testing, adaptation and standardization from the 2nd to the early 4th century AD. These developments were initially interpreted in connection with workshops in the civitas capital, though several aspects remained unclear. New data from the 2019–2020 excavations now allow a better understanding of the beginnings of production from the late 1st century and their evolution through the 2nd to 4th centuries. Different categories of products can be identified, intended respectively for long-distance, regional or strictly local markets. These categories correspond to distinct modes of organization. Highly standardized, nucleated kiln groups contrast with isolated kilns located at the back of gardens or integrated into the urban fabric. The lecture explores divergences in fabric evolution linked to production categories and vessel types, as well as variations in kiln structures and their spatial distribution. It proposes a hypothesis of potter mobility driven by economic pressure, with craftsmen transferring their technical traditions to new and unfamiliar workshop settings.

2597. Convergent Adaptations in Archaic Greek Pottery: Parallel Responses to Common Clientele (6th c. BC)

Authors: Antoine Attout (Université libre de Bruxelles)
Format: Oral

It is now widely accepted that, on occasion, certain Greek pottery workshops of the 6th century BCE 'adapted' their production to appeal to foreign clientele, sometimes over long distances. However, the current state of research allows us to move beyond this observation: these dynamics of 'adaptation' were far more widespread and complex than previously thought. Above all, we can now observe, across various ceramic production centers in the Greek world, the existence of convergent adaptation strategies—all targeting the same customer base. Our research is based on a cross-analysis of the stylistic features of vases (shapes and decorations) and their geographical distribution. Through this approach, we have observed in a series of selected sites (Miletus, Tocra, Tarquinia) that multiple imported ceramic productions from major centers (such as Athens, Southern Ionia, Laconia, or Corinth) exhibited striking convergences. Clearly, these productions indicate that workshops from different regions of the Greek world could simultaneously target the same clientele and, in doing so, develop similar products. One might naturally wonder whether these workshops were competing with one another for control of a shared market. Regardless, the existence of these convergent adaptation dynamics underscores that such phenomena were relatively widespread and certainly not coincidental. They suggest a form of collective and coordinated response to demand—one that, while not formalized as a 'commercial strategy' in the modern sense, reveals an economic logic and remarkable responsiveness: as soon as a new demand emerged in a particular site, multiple workshops—sometimes located far from one another—could seek to meet it. This research invites us to reconsider workshops not as isolated entities, but as complexly interconnected actors capable of rapidly transforming their productions in response to evolving supply and demand.

1307. More than just imports: a local response to Greek pottery in Colchis in the 6th-4th centutries BC

Authors: Evgeniia Viaznikova (IMT School for Advanced Studies Lucca)
Format: Oral

Greek pottery was distributed over great distances from its original manufacturing areas and attracted the interest of different communities all over the ancient world. The area of the Black Sea, populated by culturally diverse peoples, was not exempt from this network. Various examples of East Greek and Attic ceramics were discovered as far as the Eastern Pontic shore, known in antiquity as Colchis. The paper aims to examine the use and interconnectivity of imported and local ceramic shapes in various contexts (settlements and burials) by the local population of Colchis between the 6th and 4th centuries BC. During this period, the area is believed to be a part of the Greek trade network, entailing a certain degree of intercultural contacts and exchange. Indeed, despite well-developed local pottery production, excavations of the area demonstrate the use of Attic vessels alongside local ones. This interaction between imported and local ceramics seems to have stimulated a response from local craftsmen, who attempted to incorporate certain foreign hapes into their production either by adapting Greek forms to local needs or directly imitating imported vessels. Case studies of imported and local pottery assemblages from different sites of Colchis are considered to understand the external cultural impact and internal reaction which shaped the local users' and producers' choice of pottery shapes. While the presence of local adaptations of foreign ceramics certainly reflects a transfer of technique, the shapes selection and their contextual placement demonstrates that the object – meaning connection might have been reevaluated by potters, following the consumers' demand. Overall, through contextual analysis of local and imported pottery shapes, the paper argues that Colchians had their own way of selection and interpretation of the imported pottery which was adapted to local cultural contexts and might have affected the choices and production repertoire of local craftsmen.

443. A Psychological Coding System for Cognitive Archaeology: Quantifying Three Millennia of Morphological Change in Jōmon Clay Figurines (Dogū)

Authors: Miki Kakinuma (Nippon Veterinary and Life Science University) – Shoko Hiranaka (Okinawa Christian Junior College) – Ayako Uechi (Clinic Prop) – Michiko Konno (Tokyo City University) – Mikihiko Wada (Hosei University) – Juko Ando (Keio University)
Format: Poster

Cognitive archaeology seeks to understand the minds of ancient peoples, yet faces a methodological challenge: how to move beyond intuitive interpretation toward empirical analyses of prehistoric cognition and material form. This study addresses this challenge by developing a systematic morphological coding framework adapted from developmental psychology and applying it to anthropomorphic clay figurines (dogū) from the Japanese Jōmon period. The large number of dogū and their clear temporal continuity over three millennia provide a dataset for examining long-term relationships between artefact form, production, and embodied experience. Although stylistic change in dogū has long been recognised, quantitative assessments of morphological variation and its relation to modes of making and social norms remain limited. To address this gap, we developed the Archaeological Figurine Coding System (AFCS), adapted from the Draw-a-Person test, which offers a standardized protocol for documenting bodily and facial features, including breasts, protruding bellies, eye shape, hairstyles, and ornamentation. Using this system, we analysed approximately 400 figurines from the Middle to Final Jōmon periods (c. 5500–2400 BP). Our results reveal several diachronic trends. Representations of pregnancy, prominent in the Middle Jōmon, decrease markedly over time. Facial depictions shift from naturalistic forms toward increasingly abstract and stylised expressions, while hairstyles and personal adornments become progressively more elaborate. These patterns suggest not only cognitive and cultural change but also transformations in the social roles of figurines, production norms, and visually mediated identities. By integrating quantitative morphology with psychologically informed coding, this paper demonstrates how artefact form records changing requirements of production and use. We argue that Jōmon dogū provide a unique case for exploring how repetitive material practices, socially mediated learning, and evolving modes of making shaped both object form and concepts of personhood. More broadly, this approach offers a transferable framework for investigating technological and functional evolution across archaeological contexts.

535. Characterizing and Dating of Pre-modern Stilts

Authors: Yastami Nishida (Institute of Cultural Studies, Chuo University) – Yorinao Shitaoka (RIssho University)
Format: Poster

The advancement of the pottery industry necessitated the invention of increasingly sophisticated firing techniques. With the emergence of glazed wares, potters faced new technical challenges, as these vessels required specialized handling to prevent damage during firing. This led to the development of "distancers," which allowed vessels to be stacked efficiently while preventing them from fusing to the kiln floor or to one another. Among these tools, stylized tripod-shaped stilts first appeared in China around the 2nd century and gained widespread adoption after the 6th century. The technology subsequently disseminated eastward to Korea and Japan, as well as westward toward Europe. Notably, similar stilts are documented in late Byzantine kilns and continued in use through to modern European ceramic production, demonstrating a remarkable technological continuity. However, other variations, such as serrated stilts, did not achieve the same level of global adoption. In the Japanese context, while the general use of stilts declined during the Middle Ages, serrated varieties saw a localized resurgence during the 18th and 19th centuries, particularly in Northeastern Japan. Because stilts often bear the unique technical markers of their makers, they serve as vital diagnostic artifacts for tracing the migration and exchange of potters. To further refine this chronology, we are currently utilizing thermoluminescence (TL) dating on pre-modern kiln furniture. Initial results show that estimated dates align closely with historical records, suggesting that the study can provide a reliable chronological framework for kilns where documentary evidence is otherwise absent.

872. Provenance and identification of technological features in pre-Hispanic ceramics from Tenayuca and Pol Box, Mexico

Authors: Thania Alejandra García Zeferino – Pamela Garcia Ramirez – Serafin Sanchez Perez (ENAH)
Format: Poster

Ceramics are the most abundant material found in archaeological excavations in Mexico; sometimes they are complete pieces, but more frequently they are fragments (tepalcates or sherds). Their abundance clearly demonstrates the everyday use of this material and its importance in daily activities. For geoarchaeological studies, this material has allowed for a deeper understanding of the knowledge that populations possessed of their natural environment and how they utilized it. In this sense, identifying the locations where raw materials were obtained will allow us to understand the qualities of the materials, their transformations, and the techniques used in their production. This work presents the results of research in two different regions of Mexico: 1) Aztec II ceramics, from the Postclassic period of Mesoamerica, in central Mexico; and 2) Maya ceramics from the Yucatán Peninsula, from the Preclassic to the Postclassic periods. In each of the sites studied, the manufacturing technique was developed according to the resources provided by the environment and was further refined according to the type and form of ceramic produced. This technique can be a characteristic of the group that created it. The studies presented focus on distinguishing the mineralogical and micromorphological characteristics that differentiate these ceramics, proposing the geological origin of the raw materials, and outlining the technological features used in their manufacture. The results indicate that in each of the sites studied they use the raw materials from their immediate environment, modifying them according to the characteristics they present, as in the case of the Pol Box site which, having mud rich in minerals of the smectite clay type, uses a large proportion of anti-plastic particles to prevent the contraction of these clays.

93 TRACING THE FLOW: NEW PERSPECTIVES ON ANCIENT IRRIGATION SYSTEMS AND THEIR LEGACIES

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Roberto Arciero – Johanna Lhuillier (Lab. Archéorient, CNRS - UMR 5133) – Jaafar Jotheri (University of Al-Qadisiyah)
Keywords: irrigation, water management, remote sensing, geoarchaeology, landscape
Format: Regular session

SESSION ABSTRACT

The study of ancient irrigation systems has long been central to understanding the emergence and development of complex societies across arid and semi-arid regions of the World. From the alluvial plains of Mesopotamia to the oases of Central Asia, the investigation of water management infrastructure has provided crucial insights into social organization, technological innovation, and environmental adaptation. Recent advances in archaeological methodologies, ranging from remote sensing and geoarchaeology to hydrological modeling, have profoundly transformed how we reconstruct ancient landscapes and interpret the socio-economic dimensions of irrigation. These approaches not only refine our comprehension of past human-environment interactions, but also illuminate the enduring legacies of ancient water systems that continue to shape local ecologies and cultural identities today in places such as Uzbekistan, Iraq or Jordan. This session aims to foster a cross-regional dialogue on ancient irrigation through three interrelated thematic pillars: 1. Methodologies of Investigation: approaches to documenting, analyzing, and modeling irrigation systems, including remote sensing, GIS-based hydrological studies, geoarchaeological approaches. 2. Case Studies: Case studies that highlight the regional diversity of technological adaptations to water management, social organization, and agricultural practices across the arid regions of West and Central Asia, North Africa, the Indus region, and the Mediterranean basin—with a focus on eastern Mediterranean. 3. Irrigation as Heritage: the cultural and historical importance of traditional irrigation systems, their continuity and transmission over time, and the threats they face today from climate change and dwindling water resources. We welcome contributions that address these themes through regional case studies (as outlined in point 2), interdisciplinary approaches, and theoretical reflections spanning from prehistory to the modern periods. Submissions focusing on methodological innovation, long-term irrigation dynamics, or the heritage management of irrigation systems are especially encouraged.

CONTRIBUTION ABSTRACTS

1246. Human Impact on Arid/Semi-arid Environments: Mixed Urbanization in the Water Systems of Murghab (Southern Turkmenistan) and Karakul (Western Uzbekistan) Rivers

Authors: Barbara Cerasetti (Freie Universität Berlin)
Format: Oral

Since ancient times, Central Asia and neighboring Iran have been affected by profound climate changes. The consequent radical transformations of the territory by human beings to survive have strongly endangered the delicate ecosystem of these geographical areas, often with catastrophic effects. During the 2nd millennium BCE, urbanization extensively modified and deeply influenced the local environment of vast water systems, from Helmand in Iranian Sistan to Murghab in prehistoric Margiana, and Karakul to the west of Bukhara region. A specific aspect of this phenomenon deserves to be taken into consideration, i.e. the resulting settlement pattern after the "distribution" of territories between GKC (Greater Khorasan Civilization) and Andronovo-related populations in the alluvial fan of the Murghab River (southern Turkmenistan) and the fossil system of Makhan-darya (western Uzbekistan). In particular, how the spatial interaction (intra/off-site) between these two cultures has been deeply influenced by the difficult adaptation of the techniques, known at that time, to the exploitation of water and primary resources.

300. From Springs to Karez: Investigating Water Infrastructure and Settlement Organization in the Pashkurt Valley, Uzbekistan

Authors: Roberto Arciero – Johanna Lhuillier (Lab. Archéorient, CNRS - UMR 5133) – Ulugbek Shapulatov (Termez State University)
Format: Oral

The Pashkurt Valley, situated in southwestern Uzbekistan along the Kugitang Mountains and the Amu Darya River, has emerged as a critical area for understanding settlement organization and water management in Central Asia. Since 2017, the French-Uzbek Mission (MAFBAP) has undertaken extensive multidisciplinary investigations at key sites, including Burgut Kurgan, Boyqushtepa, Kayrit Tepa, Kamyshtepa, Gaza Kutan, and Kuduk Bulak. From the outset, it became evident that the region's complex irrigation systems—previously dated primarily to the Soviet and contemporary periods—may have originated in much earlier phases. As part of the MAFBAP project, systematic investigations of the hydrological network linking these sites began in 2019. The research methodology has since been expanded to integrate remote sensing analyses, targeted excavations, and Optically Stimulated Luminescence (OSL) dating of canal sediments. Preliminary results reveal a multifaceted hydrological landscape, shaped by a combination of natural river systems, springs, and engineered irrigation structures, including karez (qanat) networks. More than 284 traces of karez

were identified, underscoring their central role in sustaining regional settlements. Canal excavations at Burgut Kurgan area document a stratified canal sequence, indicative of repeated reuse over extended periods since the Bronze Age. These findings offer novel insights into the interaction between natural and engineered water systems and the spatial and organizational dynamics of Iron Age settlements in Central Asia. They also highlight the importance of integrating hydrological and archaeological approaches to reconstruct past landscapes, providing a robust framework for examining long-term settlement strategies and resource management in arid environments.

2105. Redefining the Sherabad Oasis

Authors: Ladislav Stanco (Institute of Classical Archaeology, Faculty of Arts, Charles University) – Jan Petřík – Martin Hanáček (Department of Geological Sciences, Faculty of Science, Masaryk University)
Format: Oral

Understanding the functioning of artificially created water supply systems for settlements and agricultural production and their precise dating has always been key to understanding the dynamics of settlement patterns as such. For the Sherobod Oasis in southern Uzbekistan, we had attempted to reconstruct the irrigation system based on the historical maps, field observations and correlation with settlement patterns. Our conclusions were based on the assumption that the most accurate depiction of the remains of water canals in the landscape in this area is the Soviet topographic maps from before World War II. However, these lack precision and the depicted phenomena may be selective. After our publication in 2019, the possibilities for reconstructing the historical landscape were multiplied by the publication of a groundbreaking dataset – the images referred to as Hexagon. Moreover, at present, a Holocene floodplain level with archaeological sites dated to the Kushan, medieval and post-medieval periods is preserved along the Sherabad River. This floodplain is incised by the modern, dynamically evolving braided channel. This configuration indicates significant hydrological changes in the area, which we aim to place into a chronological framework through the study and dating of fluvial sediments. In this paper, we will use Hexagon along with new direct observations and dating of sediments to verify and perhaps redefine our model of historic water management in this otherwise archaeological relatively well-known oasis in southern Uzbekistan.

2095. Along the contour: New insights on irrigation and water management in the foothills of Northern Bactria

Authors: Jakub Havlík (Institute of Classical Archaeology, Charles University) – Jan Petřík (Department of Geological Sciences, Masaryk University) – Nikola Mořkovská (Institute of Classical Archaeology, Charles University)
Format: Oral

Given their indisputable importance for settlement development in arid and semi-arid environments, irrigation systems have long been one of the focal points of Central Asian archaeology. Unlike the lowlands of Northern Bactria, where decades of mechanized agriculture have largely erased traces of ancient irrigation, the much better-preserved foothill zones offer a unique opportunity for their study. This paper draws on the fieldwork of the Czech-Uzbekistani Archaeological Expedition in the foothills of the Kugitang mountain range, southern Uzbekistan. Special attention is paid to the dry valley, which hosted a Late Antique settlement of Kulal Tepa, however, for most of its past, it seems that seasonal use has been predominant there. Utilizing remote sensing, results of pedestrian survey, and OSL dating, this study explores the variety and long-term transformations of water management in the Kulal Tepa valley. The gathered evidence links the peak of the (Late) Antique human activities with the existence of a 5,5 km long canal fed from the Loylagan Say river – a feature that likely remained in use until the Soviet period. However, the research reveals a more complex hydraulic landscape: a sophisticated network of contour canals was developed, partly integrated with the main canal and partly operating as independent units. This network served not only for irrigation but indicates a deliberate, well-planned strategy of landscape water retention and rainwater harvesting.

2199. Reconstructing Water Management Systems: Interdisciplinary Methodologies Across Time and Landscapes

Authors: Ella Egberts – Soetkin Vervust – Ralf Vandam (Vrije Universiteit Brussel)
Format: Oral

Presenting three case studies spanning from the third millennium BCE to the early modern and contemporary periods, and drawing on nearly a decade of research, this paper explores technological and methodological developments in the study of water management systems across arid and semi-arid regions. The case studies address the urban waterscape of third-millennium BCE Girsu (southern Iraq), Late Islamic agricultural water management in remote and marginal landscapes of the Hajar Mountains (UAE), and the modern revival of historic water management systems in Cyprus as a response to present-day climate challenges. Each case applies a set of interdisciplinary approaches, including remote sensing, automated detection, hydrological modelling, geoarchaeological fieldwork, radiocarbon dating, optically stimulated luminescence (OSL) profiling and dating, and environmental proxy analyses. Together, these methods are used to reconstruct the socio-economic and environmental dimensions of water management practices across different temporal and regional contexts. By bringing these case studies together, the paper provides an overview of current methodological possibilities and reflects on their challenges and opportunities. The results allow for a comparative reconstruction of how water management infrastructures functioned within dynamic landscapes and how communities combined technologies

of varying cost, complexity, and labour organisation to respond to changing environmental and social conditions. In doing so, the paper highlights both the long-term adaptability of water management systems and their relevance as cultural heritage and potential resources for addressing contemporary sustainability concerns.

892. Rediscovering a Sumerian Hydraulic Legacy: Architectural Study and Conservation of the Girsu Bridge

Authors: Ebru Torun – Sebastien Rey – Göze Üner – Hamed Arnaout – Fatma Husain (The British Museum)
Format: Oral

During the early 20th-century excavations in southern Iraq, a monumental fired-brick structure was uncovered at the Sumerian city of Girsu, but its function remained uncertain until recently. After decades of abandonment, archaeological research restarted in 2016 with a project led by the British Museum. This paper presents the architectural study and conservation programme undertaken on the monument between 2018 and 2026. Research on the waterscapes of Girsu, combined with targeted excavations, demonstrated that the structure was built on a former canal bed. Aerial imagery revealed traces of a street joining the centre of the structure from the east. Based on these results, and because the monument narrows the canal from approximately 30 m to 4.6 m at its centre, it has been provisionally identified as the Girsu Bridge. High-resolution photogrammetric survey enabled the production of detailed measured drawings. The building materials and techniques were investigated, and inscribed bricks were studied epigraphically. Archival photographs and former excavation records were compared with recent imagery to assess change and deterioration. The lack of ancient parallels led to a comparison with modern hydraulic structures, revealing similarities to hydraulic flumes used to measure water flow. This supports an interpretation of the monument not only as a bridge foundation but also as a sophisticated hydraulic installation. This is further discussed in the context of the city's abandonment around 1750 BC due to drought. The study also mapped material decay and structural vulnerabilities, informing a programme of conservation completed in 2026. In parallel, the site was prepared for public access in collaboration with the Iraqi State Board of Antiquities and Heritage, tourism partners, and the local community. Nine bilingual interpretation panels now present the history of Girsu and the multiple functions of its bridge.

1486. When Water Becomes a Barrier: Least-Cost Path Modeling of Accessibility in Early Dynastic Southern Mesopotamia

Authors: Fatemeh Javanmardi – Tadeáš Červík (Universität Bern)
Format: Oral

The alluvial landscapes of southern Mesopotamia during the Early Dynastic period (c. 2900–2350 BCE) were structured by dense networks of rivers, canals, and wetlands that shaped both irrigation practices and patterns of mobility. While ancient waterways are often modeled as conduits of movement and exchange, they also constituted significant barriers to overland accessibility, particularly within low-relief floodplain environments. This paper presents a GIS-based least-cost path (LCP) approach to modeling accessibility between three Early Dynastic sites—Umma, Zabalam, and Tell Shimd—using slope-derived friction surfaces based on a 5 m DEM, combined with hypothetical reconstructions of irrigation canals and river courses. Multiple hydrological scenarios are tested, including topographically plausible water networks derived from DEM-based flow accumulation and alternative canal configurations modeled under slope constraints and archaeological plausible traces on the field. These waterways are incorporated into cost surfaces primarily as high-friction or impassable features, with controlled crossing points used to simulate fords or bridges. The resulting models demonstrate how different reconstructions of irrigation and drainage systems significantly alter accessibility patterns between settlements, even within a landscape characterized by minimal topographic variation. By foregrounding uncertainty and explicitly modeling waterways as barriers as well as components of irrigation infrastructure, this study offers a reproducible framework for integrating hydrological features into mobility modeling and highlights how irrigation systems structured both agricultural production and spatial interaction in Early Dynastic southern Mesopotamia.

11. The springs of the Iraqi western desert lasted for millennia and vanished within years

Authors: Jaafar Jotheri (University of Al-Qadisiyah | Durham University)
Format: Oral

The springs and oases associated with the Abu Jir lineament hold geological, cultural, and historical significance, situated at the intersection of the Arabian Desert and the Mesopotamian floodplain. A linear series of sites linked to the springs dates back to the Sasanian, Islamic, and Ottoman periods. They have served various purposes, including as defensive fortresses, residences, castles, and places of worship. The springs also supported agriculture through networks of canals and farms. Remote-sensing technology has been utilised to map water springs, fortresses, and various archaeological features, including settlements, roads, irrigation systems, and farms. Field trips are conducted for ground verification and site documentation, as well as interviews with residents, particularly older people, to gain insights into the community's recent history and changes over time. The results show that the strategic location of these springs has facilitated the emergence of communities that integrate and adapt to the diverse cultures of the desert Bedouins and the urban population. The Springs community is diverse in terms of tribal, professional, religious, and traditional aspects, enabling it to sustain harmonious relations with both distinct regions—the desert and the floodplain. Several notable landscape features associated with these springs have been documented, including fortresses built around them. Communities often connected springs to increase water availability for irrigation. When establishing connections between springs was not feasible, qanat-style irrigation systems were constructed. Secondary or tertiary canals branching from farms frequently form comb-like,

parallel patterns, while long canals from springs to farms create broom-shaped layouts. Springs could support either single or multiple farms, depending on capacity. Following 2003, poor groundwater management and severe climate conditions led to the drying up of most springs and oases. As a result, farms were deserted, populations relocated, and the ancient irrigation systems that had been used for thousands of years were left behind

10. New insights into ancient waterways and irrigation systems from the Ishan Hâfudh survey region of Southern Iraq

Authors: Bernhard Schneider (University of Wroclaw) – Jaafar Jotheri – Ali Al-Gburi (University of Al-Qadisiyah)
Format: Oral

Recent results from the Ishan Hâfudh fieldwork (project RuBab Rural Babylonia), situated within the "heartland of cities" coined by Robert McC. Adams (1981) in Southern Iraq, will be presented. First, the current situation of ancient waterways and irrigation systems in such a multilayered landscape will be outlined. The focus will lie the Ishan Hâfudh survey region in Southern Iraq (ca. 170 km to southeast of Baghdad). New insights are gained through remote sensing (modern and historical satellite imagery) and ground truthing (canal sections, sampling). Most of the current Geo-archaeological research in Mesopotamia is based heavily on 14C dating. This in turn may be influenced to an unknown degree by a hard-water effect (freshwater reservoir effect). Therefore, the presentation will also include the most recent results gained from OSL (Optically Stimulated Luminescence) dating of soil samples. Through this, in combination with archaeological and historical data from the region, a more nuanced picture of the situation within different periods of history can be gained.

1068. Water management in southern Mesopotamia: Zabalam waterways as a case study

Authors: Muntadher Aloda (University of Bern) – Jaafar Jotheri (University of Al-Qadisiyah) – Mirko Novak (University of Bern) – Tibor Lieskovský (Slovak University of Technology in Bratislava Faculty of Civil Engineering)
Format: Oral

In southern Mesopotamia's floodplains, rivers provided the primary water source since rainfall was scarce and there were neither springs nor accessible groundwater. As a result, effective river management became crucial for irrigation, transportation, daily needs, and the rise and fall of cities and communities. At Zabalam region we have identified ancient rivers, canals, and farmland using satellite images and on-the-ground research. We have also excavated several trenches along certain stretches of these waterways for OSL dating. Early findings show two main rivers running parallel to the site—one north, one south—linked by a connector through the middle, though the upstream and downstream sections are hidden by later sediments. The region features an elaborate canal system that doesn't connect directly to either major river. Instead, the canals create a hierarchy, sharing channels with another irrigation network northeast of the site, which links to additional archaeological sites upstream. In summary, Zabalam's agricultural and irrigation system consists of various water channels and distributaries that draw from a branch connected to the main canal. This paper examines the methods and treaties used to manage and allocate water resources among cities, districts, farmland, and landowners. Additionally, it addresses challenges related to organising labour for the excavation, maintenance, and construction of canals and dams.

2069. Tracing the flow in the Lower Diyala Region (Iraq) : Reconstructing the archeological landscape through remote sensing

Authors: Valentin Koszarek (Université Paris 1 Panthéon Sorbonne | Universita di Bologna | UMR 7041 ArScAn – VEPMO MSH Mondes)
Format: Oral

The Lower Diyala region has played a central role in discussions on the relationship between complex societies and large-scale irrigation systems in Mesopotamia. Since Robert McC. Adams' surveys in the 1950s, his reconstruction of irrigation networks has remained the main point of reference for the region and a staple of our discipline. This study revisits Adams' original survey data within the framework of the Floodplain Project (University of Bologna, dir. N. Marchetti). By combining his field observations with declassified CORONA imagery and multi-temporal satellite data, we corrected several spatial distortions in the original maps. This work identified a number of previously undocumented archaeological sites and hydraulic features. This revised spatial framework allows a closer alignment between irrigation layouts and local topography, offering a more robust basis for chronological interpretation. Adopting a longue durée perspective, the paper reassesses patterns of water management from the early historical periods to the Islamic era. The results highlight both long-term continuities and significant reorganizations of irrigation systems in response to changing political contexts and environmental conditions. More broadly, this contribution illustrates the value of reprocessing legacy datasets using methodological innovation to refine our understanding of ancient hydraulic landscapes in Mesopotamia.

1057. Water Management in a Changing Landscape: Reconstructing Hydrological Networks in the Kurdistan Highlands

Authors: Tomáš Náhlík (University of West Bohemia in Pilsen) – Lenka Starková – Karel Nováček (Palacký University in Olomouc)
Format: Poster

The detection, reconstruction, and evolution of historical hydrological systems is a topic currently gaining importance in connection with the availability of multitemporal remote sensing data. The current landscape of Iraqi Kurdistan is characterized by high geomorphological and climatic heterogeneity, where a major transformation of the settlement structure and the gradual disappearance of traditional rural settlements has occurred and continues to occur over the last decades. At the same time, in this predominantly deforested mountain environment, standard analyses of soil and crop marks or terrain remains—commonly used in more open lowland agrarian landscapes—cannot be fully utilized. This is due to the significantly fragmented terrain morphology, strong erosion processes, and difficult accessibility of the terrain. The mountainous areas of Northern Kurdistan represent a specific cultural-landscape type, in which the settlement structure is closely tied to mountain massifs functioning as a source of protection and key natural resources, especially water. The methods of its acquisition, accumulation, distribution, and transport to agriculturally used valley areas therefore show a high degree of technological and spatial variability. This research focuses in detail on capturing hydrological systems, their connection to various forms of settlement (sedentary vs. semi-nomadic), water acquisition strategies (gravity-fed irrigation, spring capture), and the density, hierarchy, and typology of water networks within the Siktan–Gomaspan Archaeological Project (SGAP) area in the mountain micro-region north of Koya (Iraqi Kurdistan). This contribution presents methodological possibilities for recognizing historical hydrological structures in a mountain environment by integrating remote sensing methods, GIS analyses, predictive modeling, and field verification. Multitemporal analysis of historical and current satellite data, Digital Elevation Models (DEM), and their derivatives (slope, aspect, curvature, hydrological flow accumulation, Topographic Wetness Index – TWI) are utilized. The identification of potential hydrological relics is further supported by visual interpretation methods and watershed analysis.

94 LAND-USE CHANGE (LUC) AND ARCHAEOLOGICAL HERITAGE: KEY CONCEPTS AND CONSIDERATIONS; WORKING TOWARDS GUIDELINES FOR BEST PRACTICE

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Emmet Byrnes (Forest Service; Department of Agriculture, Food and the Marine) – Karl Cordemans (Flemish Land Agency) – José Schreurs (Cultural Heritage Agency of the Netherlands)
Keywords: Landuse, Rewilding, Restoration, Rewetting, Conversion, Woodland
Format: Discussion session
Affiliation: EAA and EAC Working Group on Farming Forestry and Rural Land Management

SESSION ABSTRACT

In recent years, the EAA/EAC Working Group on Farming, Forestry and Rural Land Management has organised several successful sessions on the impact of different land use changes on archaeological heritage. Various issues and possible mitigation strategies have been identified, as well as numerous good practices. This did not escape the attention of the European Archaeological Council (EAC), which unites all national organisations charged by law with the management of archaeological heritage. This has led to the idea of creating guidance on Land-use Change (LUC)*, similar to previously published guidelines on development-led archaeology, use of LIDAR etc. The guidelines could start with a more general knowledge base, raising awareness of the impact of LUC, possible partners involved in LUC, tools and methods. The Working Group is especially interested in examples of impacts from LUC and good and bad practice in relation to the archaeological heritage from projects involving the conversion of farmland to low intensity production, change in forest management practice, conversion of forests to other habitats like heathland, re-wilding, natural woodland creation, peatland or wetland rewetting or restoration, or the use of land for renewable energy production infrastructure. We also plan to allow ample time to discuss what should be included in the guidelines and how they should be structured. For the purpose of reporting on the exchange of greenhouse gases LUC is technically defined as the change in the carbon stock of different carbon pools. More practically, LUC means any conversion of a piece of land's use from one purpose to another. For example, grassland to cropland; natural or semi-natural land to intensive uses; rewilded (changed to a more natural uncultivated state by reintroducing species of plants or animals); peatland or wetland rewetted or restored (by reversing drainage and raising water tables or encouraging recolonisation by particular species).

CONTRIBUTION ABSTRACTS

1028. Predictions for the future of archaeological monuments

Authors: Marie-José Schreurs (Cultural Heritage Agency of The Netherlands)
Format: Oral

Several years ago, the Cultural Heritage Agency of the Netherlands conducted research into the condition of archaeological national monuments, looking ahead to around 2030. The question was what the future prospects for archaeological national monuments

would be in the event of autonomous development. In this presentation, I will discuss the predicted spatial developments and some important policy tasks and risks that were outlined at the time, which are still relevant today and often apply to other countries as well. These include climate change, demographic developments and their spatial consequences, and developments in construction, the agricultural sector, nature and recreation. What are the threats and risks to archaeological heritage, and where are the opportunities? Certain interventions, such as reducing CO2 emissions, have an impact in multiple domains. Developments in policy are closely interrelated and lead to spatial challenges that have consequences for other sectors. For example, climate adaptation and developments in nature policy and the agricultural sector cannot be viewed in isolation from each other. It is concluded that changes in land use in particular pose risks to the preservation of heritage as a result of these challenges.

510. Land use changes and monument losses in the Free State of Saxony since the 19th century

Authors: Michael Strobel (Landesamt für Archäologie Sachsen)
Format: Oral

Archaeological monuments are central elements of the cultural landscape. Changes in land use have always been a major factor in the transformation of the cultural landscape. The extent of land use changes in the Free State of Saxony, especially in agricultural landscapes, has increased significantly since the 19th century. In particular, the conversion of forest into arable land is a widespread phenomenon and has led to considerable losses, especially among archaeological monuments that are still visible above ground and which – insofar as they have been recorded in cartographic memory – can also be reconstructed and accounted for. Conversely, changes in land use in the agricultural landscape offer opportunities not to reverse these losses, but at least to use them selectively for the preservation of monuments. The aim of this article is to illustrate the extent of the losses using striking examples and at the same time to point out prospects for protection through changes in land use.

356. Nature and cultural heritage - A clash of interests and how we can turn it into a win-win situation

Authors: Bjørnar Måge – Daniel Groß (Museum Lolland-Falster)
Format: Oral

In recent years, there has been an increased focus on establishing large solar parks in Denmark due to the goal of making the country CO2-neutral by 2035. Additionally, an agreement between the Danish government and agricultural- and nature organizations, the so-called green tripartite, sets out to make significant changes to the landscape by rewetting low-lying cultivated fields to restore bogs and small lakes. In this talk we will present the experiences we had in connection with archaeological investigations prior to the construction of solar parks. Projects that have proven to contain many opportunities but likewise many challenges. Furthermore, we will discuss the major challenges we as archaeologists and cultural heritage advocates are going to be faced with in the coming years: potential disagreements with authorities and decision-makers by pointing out to authorities and decision-makers that achieving a better balance in nature often has a due to the very destructive effects their actions can encompass for the rich cultural heritage found in wetlands. In connection with large rewetting projects, we will discuss which methods we consider recommendable regarding monitoring implemented earthworks activities, consequential discoveries, or monitoring of the area after renaturation activities has changed the conditions, but also the challenges we faced in contact with the responsible authorities.

1711. Archaeological heritage managment inmidst of the spruce dying in North Rhine-Westphalia, Germany

Authors: Eva Cott-Everding (LVR-State Service for Archaeological Heritage)
Format: Oral

From 2018 onwards, large parts of Central Europe experienced several summers of drought. As a result, spruce trees began to die at a rapid rate, leading to the complete disappearance of this tree species in many regions. This natural disaster caused a sharp increase in forestry activities in these calamity areas with deadwood clearance and reforestation measures. These activities, which were associated with considerable time and economic pressure, led to damage to archaeological sites in many places. In the German state of North Rhine-Westphalia, whose low mountain ranges are severely affected by spruce dying, this crisis situation was addressed on three levels: Firstly, damage was quantified and recorded using remote sensing methods. Secondly, emphasis was placed on providing information and training at various levels of the forestry authority and in municipal and private forests. In addition, active consultations were held on site where archaeological monuments had been affected by forestry activities. Individual concepts for the management of calamity areas that were both economically viable and protective of archaeological monuments were agreed with those involved in forestry work. This crisis has resulted in stronger cooperation between archaeological heritage conservation and the various stakeholders in forestry.

2370. Infrastructure for renewable energy and climate adaptation in England's archaeological landscapes and marine

Authors: Tim Allen (Historic England)
Format: Oral

Historic England is a state heritage service, we develop and deliver advice and guidance with government, industry and the

archaeological profession, and work hand in hand with our natural environment colleagues. We are engaged closely in nationally significant infrastructure projects and planning for developments affecting nationally important heritage assets. On key projects we provide strategic input on how these schemes can minimise their impacts on the historic environment whilst delivering the rapid change that is required to adapt and thrive in a changing environment. This presentation will update the group and wider audiences on latest developments in archaeological assessment and adaptive design in England and we hope provide positive input into the development of future EAC Land Use Change guidance. We are particularly keen to explore how a landscape archaeological approach can support a targeted process of assessment; proportionate in terms of time and cost. Well designed staged processes of investigation can deliver the effective management of archaeological impacts through design and field mitigation with sufficient levels of confidence for both developers and curators.

95 LATEST NEWS FROM THE LOWER DANUBE LIMES: NEW INTERPRETATIONS AND IDEAS IN THE LIGHT OF CURRENT RESEARCH

Theme: 5. Changing worlds and environments in the past, present and future
Organisers: Zdravko Dimitrov (National Archaeological Institute and Museum) – Ioan Opriș (University of Bucharest) – Mariya Avramova (Antiquity of Southeastern Europe Research Centre, University of Wasraw) – Alexandru Rațiu (Museum of Romanian National History in Bucharest)
Keywords: Roman Limes, Frontier Studies, new methodologies, UNESCO heritage sites, interdisciplinary collaborations
Format: Regular session
Affiliation: Archaeological Prospection Community

SESSION ABSTRACT

The study of the Lower Danube limes has captivated researchers for over a century due to its rich archaeological and historical significance. The area covering territories in modern Bulgaria and Romania is a beehive of research, yielding new finds with each archaeological season. The current preparations for an UNESCO (extension) file – Frontiers of the Roman Empire, Danube Limes Eastern Section, by four countries (Croatia, Serbia, Romania and Bulgaria) – have given a fresh impetus to a wide range of investigations in the area. New archaeological excavations, archival work, reassessment of old digs, field surveys, geophysics, aerial photography, and LiDAR mapping significantly enhanced the broader understanding of this Roman frontier, which lasted for over six centuries. The themes we would like to explore include, but are not limited to: · - Exploring recent research on the Lower Danube limes. · - New insights into the architectural development of the Lower Danube limes, including the construction of fortifications. · - Emphasising new insights into Roman defence and commerce and exploring the influence of the Roman army on local communities. · - Analysing novel methodologies, as remote sensing and geospatial analysis, to enhance our understanding of archaeological evidence. · - New interpretations of literary and epigraphic sources in the historical context of the Lower Danube limes. Our main goal is to encourage interdisciplinary collaborations among historians, archaeologists, and other scholars to deepen our understanding of the dynamics at play along the limes. This session is open to archaeologists, historians, and scholars of ancient studies, as well as to graduate students and researchers interested in the Roman Empire's Lower Danube frontier. By promoting an inclusive dialogue, we aspire to cultivate an environment conducive to the emergence of innovative ideas and the advancement of collaborative research.

CONTRIBUTION ABSTRACTS

2759. A Decade of Intensive Groundwork on the Romanian Lower Danube Limes (2016-2025). A Review and Update of Most Significant Assets

Authors: Ioan Carol Opris (University of Bucharest)
Format: Oral

A transnational project – Frontiers of the Roman Empire – Danube Limes Eastern Section (FRE–DLES) – is currently being carried out by Bulgaria, Romania, Serbia, and Croatia. The ongoing preparation of the technical documentation aims at including the Roman fortifications along the Danube frontier on the World Heritage List. It also provided an excellent opportunity to update existing information and publish the remarkable technical data now available, with aerial photographs, LiDAR surveys, magnetometric investigations, bathymetric measurements of the Danube riverbed, etc. Within the Limes Programme of the Romanian Ministry of Culture, significant progress has been achieved in documenting both well-known sites and previously uncharted or unexplored locations, as well as the still-preserved pillars of the two famous Roman bridges across the Danube. Field research has resulted in a more nuanced understanding of linear fortifications and bridgeheads on the left bank, known or presumed landing installations, river fords, customs stations, and emporia connected to the barbaricum. The study of late 19th- and 20th-century maps, compared with recent aerial imagery, has supported our comprehensive efforts to reconstruct the military geography through the analysis of topographic features: vantage points, issues of (co-)visibility, naturally defensible positions, suitable harbour conditions, effective communication routes and accessibility, and natural buffers (marshes, floodplains, lakes, and minor arms of the river, etc.). An updated, richly illustrated catalogue of the main military sites is available online (Ioan Carol Opriș, Florian Matei-Popescu, Ovidiu Țentea eds., Danube Limes in Romania, Mega Publishing House, Cluj-Napoca, 2025, 519 p.).

992. Excavation in the Northern Part of the Settlement of the Albertfalva Fort and along the Limes Road, 2024–2026

Authors: Csaba Szénásy (Hungarian National Museum, National Archaeological Institute)
Format: Oral

The National Archaeological Institute carried out a full-scale excavation in the northern part of the vicus of the auxiliary fort at Albertfalva. The excavation was carried out prior to the development of a 600-apartment residential complex. Two trenches, covering roughly 1.5 hectares, revealed several phases of the Roman settlement and a more than 100-metre-long stretch of the limes road. Settlement began during the Flavian dynasty; we excavated pit houses (sunken-floored dwellings), storage pits, post-frame buildings, and wells. The paved limes road was constructed at the beginning of the 2nd century. From the decades following the Marcomannic-Sarmatian Wars, a central-corridor stone building was uncovered. The road was paved with local limestone in some places, the worn limestone blocks were covered with gravel, and the wheel ruts remain clearly visible. The vicus ceased to exist in the 3rd century; during the Late Roman period, this specific section of the road was likely no longer in use, coinciding with the abandonment of the fort. The recovered material is diverse: alongside local pottery, a significant number of terra sigillata as well as Italian and Gaulish types, were found. The wells were lined with wooden barrels. Finds include, among others, harness pendants and strap distributors (a cavalry unit was stationed in the fort), enamelled brooches, coins (the earliest being a legionary denarius of Mark Antony, the latest an issue of Probus), various brooches including winged fibulae, a small bronze statuette of Victoria, a Luna-Diana antefix, altar fragments, and a votive altar dedicated by a beneficiarius soldier.

1303. Early Roman Bononia – First Data from Regular Excavations

Authors: Zdravko Dimitrov (National Archaeological Institute and Museum)
Format: Oral

Over the past twelve years (2014-2025), annual, regular and planned archaeological excavations have begun at the Roman city of Bononia. This is one of the most important centers of the Roman Empire on the Lower Danube, today under the center of Vidin. Fifty years ago, excavations were only rescue and sporadic. They unearthed parts of the city fortification walls and several towers. Now a small archaeological team has studied about 100 meters of the western fortress wall, two of its towers, buildings and streets in the fortified area. The chronology of the complexes is from the 1st to the 21st century, without interruption. Thebiggestproblem is that the earliest stage of the Bononia history is not clear at all. The layers of the Principate are on the depth of 6-7 meters. It is assumed that there was a road station on the Danube road, a military camp of a cohort (Cohors I Cisipadensia) and even a small town. But archaeological data with reliable documentation was absent. In recent years, we have discovered three buildings (with stone, brick and wood constructions, as well as their tegulae coverings), which are the first archaeological data providing field data for Bononia from the 1st-2nd century. From these buildings come excellent ceramic forms, fibulae, other household items and even a huge gold ring weighing 24 grams. The aim of the presentation is to present for the first time archaeological data from the earliest buildings of Bononia, dated in the period of establishment and early development of the Lower Danube Limes.

247. Salsovia, a lesser-known fortress on the Roman limes of the Lower Danube

Authors: Danut Aparaschivei (Institute of Archaeology in Iași - Romanian Academy-Branch Iași) – Andrei Baltag (Institute of Archaeology in Iași)
Format: Oral

The elements related to the historical background of the Salsovia fortress (Moesia Inferior province and, then, Scythia province), the results of archaeological research carried out in the early 2000s, but especially after the last three systematic archaeological campaigns, convinced us that we were dealing with a fortification that played a constantly important role in the gearing of the Roman limes from the Lower Danube, both in the early Roman period, but also later. As a military, administrative and religious center starting from the 1st century and up to, at least, the 6th century AD, Salsovia has not benefited, yet, of consistent research. Against this background, beginning with 2024 we started a systematic archaeological research that has already produced interesting results especially for the evolution of the site in the late Roman period, respectively from the 4th-6th centuries. In our paper we will refer precisely to aspects related to the last stages of the functioning of the Salsovia fortress, using the results of archaeological research, but also the analysis of other sources of the time. In addition to a brief presentation of the results of the last three archaeological campaigns, focusing on the stratigraphy of the site and the artifacts discovered so far, we will try to highlight the role of this fortress in the mechanism that supported the Roman border on the Lower Danube.

1055. The Late Roman Fort at Ulmetum and the integration of foederati in the province of Scythia

Authors: Constantin Bajenaru (Muzeul de Istorie Națională și Arheologie Constanța)
Format: Oral

The site of Ulmetum constitutes a nodal point of communication between the Danube Limes and the urban centers located on the Western Black Sea coast, being located at the crossroads of important roads in the province of Scythia. Archaeological research

carried out in the last 20 years has led to the establishment of the chronology of the stages of habitation and the identification of some elements of material culture that provide important data on the character of the settlements that succeeded each other over time in this place. This has led to the establishment of a model of evolution of a Roman vicus-type settlement (2nd-3rd centuries) and of a road station with an important military component (3rd-4th centuries) towards a fortified settlement, built during the last quarter of the 4th century. Archaeological data indicate the presence in the fortification of a large community of North-Danubian or North-Pontic barbarians who entered the province after 376 and were stabilized as foederati by the imperial authority. The barbarian component remains equally important throughout the 5th century, providing a suggestive picture of the integration of newcomers into the military and administrative system of the province of Scythia. Along with other fortifications located on the second line of defense of the Danube limes, Ulmetum becomes an important strategic point in the late Roman period, constantly maintained through the involvement of the imperial authority.

1322. Aegyssus – an outpost on the Danube during Roman Times

Authors: Marian Mocanu (ICEM Tulcea Romania)
Format: Oral

During Roman times, Aegyssus was an outpost situated on the last stretch before the Danube meets the Black Sea. The old indigenous settlement mentioned by the Roman poet Ovid at the beginning of the 1st century AD was transformed by the early 2nd century into a Roman settlement inhabited by colonists from the Mediterranean, most of them with an oriental cultural background. With the development of the Limes, especially from the late 3rd century, Aegyssus plays an important role not only in guarding the frontier but also as a trading post for the entire region. A large number of huge storage pots (dolia) unearthed during archaeological excavation stand as proof for an important role played by Aegyssus in the annona system. This paper will present some of the most relevant information obtained during the latest excavation seasons undertaken in the southern corner of the late Roman fortress, starting in 2016.

97. Medical infrastructure, mines, and veterans: A quantitative analysis of predictors of the worship of Asclepius in Roman Dacia

Authors: Tomas Glomb – Sebastian Kheml (Masaryk University)
Format: Oral

The Danubian provinces of the Roman Empire have proven to be a fertile ground for current research employing spatial modeling approaches, owing to the abundance of epigraphic and archaeological evidence for different aspects of Roman society. An example of this trend is a recent study, The Spread of the Cult of Asclepius in the Context of the Roman Army: A Spatial Proximity Analysis (Glomb 2021), which demonstrated that epigraphic evidence mentioning Roman physicians spatially positively correlates with material evidence for the healing cult of Asclepius in the Danubian region. However, the province of Dacia stood out as an outlier in this analysis, revealing a high concentration of Latin inscriptions mentioning Asclepius but very little epigraphic evidence for the presence of physicians. Therefore, in this paper, we revisit the "Dacia" research problem, testing whether the spatial distribution of inscriptions dedicated to Asclepius was potentially impacted by factors such as the presence of veterans, attested mining and medical infrastructure, or their combination. The rationale behind the selection of these factors is that 1) veterans in Dacia were potentially in need of medical and spa treatments due to their long service in the Roman army, 2) mining posed significant health risks for miners, and 3) medical infrastructure was directly associated with healing, which all could have led to increased worship of healing deities. With regard to data, the presence of veterans and the cult of Asclepius is approximated from inscriptions in the Epigraphic Database Heidelberg; mining activity in the region is digitally documented in the OXREP database, proxies for medical activity in Dacia include archaeological evidence of specialists (e.g., eye doctors), finds of medical tools, and geocoded spa facilities. These data have a detailed set of attributes, allowing for the conduct of a spatial proximity analysis in a GIS.

2760. Late Roman Military Headquarters on the Lower Danube: Rethinking the Role of the Principia in Frontier Forts

Authors: Alexandru Ratiu (National Museum of Romanian History, Bucharest) – Ioan Carol Opriș (University of Bucharest)
Format: Oral

The principia represent one of the most emblematic building types of Roman military architecture, traditionally interpreted as the administrative and ceremonial headquarters of a fortress. While its layout and functions are relatively well understood for the Early and Middle Imperial periods, the role of principia in Late Roman frontier forts remains insufficiently explored, particularly along the Lower Danube limes. This paper reconsiders the architectural development and functional significance of Late Roman principia through the case study of Capidava (Constanța county, Romania), where the headquarters building has been exhaustively excavated and documented. Recent archaeological research at Capidava has revealed a complex and prolonged use of the principia area, marked by significant architectural transformations, spatial reorganization, and changing patterns of use during Late Antiquity. By integrating stratigraphic evidence, architectural analysis, and contextual reinterpretation, this study challenges traditional models that view Late Roman principia as merely residual or symbolic structures. Placed within a wider comparative framework of the Lower Danube frontier, the evidence from Capidava highlights the continued centrality of military headquarters in the organization of Late Roman forts and contributes to current debates on frontier management and command dynamics along the Danube limes.

1676. Roman coinage in the former province of Dacia; Economic relations between Barbaricum and the Roman Empire in late antiquity

Authors: Radu Florescu ("Lucian Blaga" University of Sibiu)
Format: Oral

The Roman society in the province of Dacia disintegrated after its abandonment by the administration, authorities, and the imperial army, inevitably leading to a regression, at least quantitatively, particularly perceptible in terms of material culture. Thus, the society of the former Roman province from the late 3rd century to the late 4th A.D. century must have been a ruralized world composed of small, impoverished communities that gradually became isolated. During the 4th century, the region saw significant movements of the Goths and in the 5th century from the Huns resulting in a tumultuous period for the people living in the newly abandoned roman province. In this context, Roman coin finds in the former province during 4th and 5th centuries A.D. offer important insights into the nature of interaction between the Roman Empire and the communities inhabiting this area. The present study aims to correlate the newest archaeological finds to the older ones and to analyze isolated coin finds as well as coin hoards thus painting a more accurate picture of economic, military and political ties with the Roman Empire.

556. Interpreting the Reka Devnia Hoard through a Partial Coin Assemblage

Authors: Vanessa Kornhäuserová (Trnava University)
Format: Oral

This paper focuses on the Roman coin hoard from Reka Devnia (ancient Marcianopolis, province of Moesia Inferior) in relation to the Gothic raids of the mid-third century AD and focusing on methodological issues arising from the analysis of a secondarily separated assemblage. The original hoard contained around 81 000 coins, but only 2005 coins are currently preserved and available for study in the Czech Republic. This means that the analysed material represents only a small and incomplete part of the original deposit. The contribution discusses what kind of interpretations are still possible when working with such a limited assemblage. The fragmentary assemblage cannot support detailed quantitative or compositional analyses, but it can still provide meaningful insights into the chronological structure of the original deposit. However, the preserved coins can still be used to observe the general chronological range and the latest issues present in the hoard. These data are consistent with a deposition horizon with the events of 249–251 AD. Three main interpretative scenarios are discussed: an institutional deposit connected with Roman administration or the army, a private accumulation belonging to the urban elite of Marcianopolis, and a deposit linked to Gothic plunder after military conflict, including the Battle of Abritus. The paper demonstrates how even a partial assemblage, if treated carefully, can contribute to the discussion of crisis, mobility and hoarding behaviour in Roman frontier provinces.

262. Old documentation living a new life - Showcase Roman Campsa

Authors: Milica Tapavicki-Ilic (Institute of Archaeology)
Format: Oral

In the late 1960ties and early 1970ties, during the construction work for the Đerdap hydro-power plant, a large-scale rescue excavation took place. Many Roman forts on the Danube were excavated and after the Đerdap lake was formed, they remained sunken beneath the water surface. One of the forts that shared this destiny is Campsa. It was fully examined, but besides short annual reports, it was never fully published. This fort was established at the end of the 2nd or at the beginning of the 3rd century and over the next four centuries, it underwent several changes. It belonged to the bigger forts on this part of the Danube limes. Although the volume of the fort remained more or less unchanged, the shape of its towers was changed, but also of its gates. The documentation from Campsa was made in the 1960ties and 1970ties fashion: all of the plans and small finds were drawn by hand and the field diary was also hand-written, only partially re-typed in the later period. All of the photographs of the site and the small finds are black and white. In this paper, the attempt will be made to show all of the obstacles that needed to be overcome in order to establish the typology of oil-lamps. Oil-lamps were chosen since they represent rather numerous finds, at the same time chronologically very sensitive and indicative. Since Campsa is not the only one from the Iron Gates that was not published, this process can be applied to oil-lamps from other sites. Further on, the algorithm of the process can be applied to other types of small finds both from Campsa and other related sites. This might be a good way to save archaeological finds and cultural heritage from the Iron Gates sites from oblivion.

831. From Inventory to Infrastructure: Integrating the Danubian Limes into the Romanian National Archaeological Record (RAN)

Authors: Marius Streinu – Bogdan Șandric – Oana Borlean – Bogdan Tudor (National Institute of Heritage)
Format: Oral

Recent developments related to the UNESCO nomination of the Danubian sector of the Roman Limes (Frontiers of the Roman Empire – Dacia) have highlighted the need for a coherent, standardized, and spatially explicit integration of archaeological data into national heritage infrastructures. Over the past two years, a comprehensive geospatial workflow has been developed to support the implementation of the national Limes programme through the systematic updating and enrichment of the Romanian National Archaeological Record (RAN). This contribution presents the creation of a relational geodatabase that integrates archaeological sites associated with the Danubian Limes in Romania, including both nominated World Heritage properties and sites on the UNESCO Tentative List. The database structure is based on multiple feature classes—sites, buffer zones, and protected areas—each described through a standardized set of archaeological, environmental, administrative, risk-related, and bibliographic attributes. All spatial data were validated, normalized, and harmonized within a unified geodetic framework. The project further involved integrating authoritative geospatial resources (national cadastre, hydrology, transportation networks, land use, geomorphology, natural and anthropogenic risks) derived exclusively from verifiable institutional sources. These datasets were reprojected into the national Stereographic 1970 system, queried, and spatially linked to individual Limes sites to support both analytical assessment and heritage management requirements. The resulting geodatabase was published as a thematic GIS service via ArcGIS Server and made accessible through interactive WebGIS platforms, Map server for cultural heritage and a dedicated Leaflet-based web application. This approach enables dynamic visualization, spatial querying, and direct access to site metadata, while providing a scalable framework for future research and management needs. By integrating the Danubian Limes into RAN as a structured geospatial dataset, this work demonstrates how national archaeological inventories can evolve from static registers into interoperable research and decision-support infrastructures, directly supporting UNESCO nomination processes and long-term heritage management along the Lower Danube frontier.

354. The economic potential of Ibida (Moesia Inferior) during the Early Roman Empire

Authors: Lucretiu Birliba – Ana Odochiciuc (Universitatea Alexandru Ioan Cuza din Iasi)
Format: Poster

The new epigraphic and archaeological finds from Ibida, datable in the Early Roman Empire, reveal a rural settlement occupied by Roman citizens, peregrini and veterans. The stratigraphy is most from the Late Amntiquity, but the findd from the time of Principate should not be neglected. Our analysis focuses on the economic potential of the area in this period, studying some essential parameters: soil quality, proximity to fresh water sources, proximity to roads, proximity to military units. A central issue of our investigation is represented by a horreum partially excavated, which was covered by the foundation of the Late Roman precinct wall. The archaeological material dates the horreum from the 2nd c. AD. In the corner of the horreum, a fragment of a military diploma was found. We shall calculate the storage capacity of the granary and the possibility of cereal surpluses. Gathering all these information, we shall estimate the economic potential of Ibida and we shall try to connect the economic activities with the social distribution of the area.

517. Sucidava - a fortified North-Danubian commercial checkpoint

Authors: Mircea Negru (University of Craiova | Spiru Haret University Bucharest)
Format: Poster

In the 2nd-3rd centuries AD, Sucidava was a fortified rural settlement with a trapezoidal enclosure, which, according to the current stage of research, is unique in the province of Dacia Inferior (Malvensis). This fortification indicates a vulnerability of the settlement, situated only 25 km from the border of the Roman Empire, near the limes alutanus, but not part of it. By the mid-3rd century AD, the area of the fortification had been reduced by about half through the construction of a middle wall running east-west. During the reigns of Gallienus and Aurelian, in the context of the disturbances in Dacia and its abandonment, a Late Roman fortress was built and completed in the southeast corner of the former early Roman fortification, which was rebuilt and later used during the early Byzantine Period. After the Aurelian withdrawal, it remained a bridgehead north of the Lower Danube, becoming part of the defensive system of the province of Moesia Secunda. However, the new fortification seems more like a checkpoint for a trade route, which continued to operate between the Late Roman then Byzantine Empire and Barbaricum, serving at most as an observation outpost, without significant military relevance. The results of the archaeological research indicate an evolution of military architecture, including materials and construction techniques, which changed in the late 3rd century, as also evidenced by the latest physico-chemical investigations. Sucidava is a typical example where an important commercial hub between neighbouring Roman provinces is protected, inside Roman borders, later becoming a trade junction between the Late Roman, respectively Early Byzantine Empire, and Barbaricum.

2556. Unearthing the Subterranean Treasures: New Insights from the Thermae of Ratiaria (2025-2026)

Authors: Mariya Avramova (Antiquity of Southeastern Europe Research Centre, University of Warsaw) – Zdravko Dimitrov (National Archaeological Institute and Museum)
Format: Poster

The thermae of Ratiaria were initially identified through aerial photographs captured by Italian archaeologists in 1976. These images revealed an imperial-style bathing complex spanning more than 1 hectare. Archaeological investigations at this site commenced in 2020 and remain ongoing. As of 2024, excavations focused primarily on the architectural features and above-ground strata. However, in 2025, the research team redirected some of its efforts to explore the underground facilities associated with the thermae. This complex subterranean infrastructure has exhibited remarkable preservation. It comprises an intricate network of underground vaulted galleries situated directly beneath the thermae's walls. These galleries incorporate vertical ceramic pipes embedded within the load-bearing walls of the vaulted roof, with the openings of these pipes visible on the gallery walls. Similar systems have been documented in modern-day Bulgaria, particularly within the thermae of Odessos and Nicopolis ad Istrum. Nonetheless, the galleries

at Ratiaria exhibit significant distinctions in terms of dimensions, proportions, and overall construction. This poster presents the latest findings of the archaeological survey carried out in 2025 and 2026 while exploring potential future research directions.

96 IS IT IN THE RIGHT SPOT? NATURAL AND HUMAN-SHAPED LANDSCAPES FOR HUNTING ANIMALS

Theme: 7. Interaction, connectivity and mobility
Organisers: Marcel Bradtmöller (University of Rostock) – Ashley Lemke (University of Wisconsin) – Christophe Delaere (University of Brussels) – Harald Lübke (LEIZA)
Keywords: Kill sites, Hunting architecture, Mobility, Bottleneck topographies, Landscape
Format: Regular session
Affiliation: Palaeolithic and Mesolithic Community - PaM

SESSION ABSTRACT

The purpose of this session is to gather work on kill-sites from across the globe and throughout history, which encompass the utilization of both natural and human-made bottleneck topographies for the purpose of hunting. In this regard, we are seeking contributions in the form of case studies from sites such as the Ahrensburger Tunnel Valley in Germany, which show a suitable natural topography for herd hunting. On the other hand, we want to combine these with case studies dealing with hunting architecture, such as drive lanes and corrals, which artificially modify the landscape for hunting activities. Furthermore, we are seeking theoretical papers dealing with topics such as modelling approaches from large-scale survey projects, or the implications of these sites for the socio-economic strategies, systems of interaction and mobility of related societies. In doing so, the objective of this session is to search for patterns within and between these locations and related human activities, which can be, at best, linked to a best-practice for documentation, investigation and preservation.

CONTRIBUTION ABSTRACTS

1957. Introduction to the session topic: Is it in the right spot? Natural and human-shaped landscapes for hunting animals

Authors: Harald Lübke (Leibniz-Zentrum für Archäologie, Schleswig location) – Marcel Bradtmöller (University of Rostock) – Ashley Lemke (University of Wisconsin-Milwaukee) – Christophe Delaere (Free University of Brussels)
Format: Oral

The aim of our session 96, "Is it in the right spot?" is to compile a collection of work on hunting grounds from different eras around the world that make use of natural and artificial bottlenecks for hunting purposes. We will examine case studies of areas with suitable natural topography for herd hunting, such as the Ahrensburg Tunnel Valley in Germany. We will also consider case studies of hunting architecture, such as drive lanes and pens, which alter the landscape for this purpose. Additionally, we welcome theoretical contributions on modelling approaches from large-scale surveying projects. These could cover the extent to which early hunter-gatherer cultures created human landscapes and how these landscapes impacted the societies' socio-economic strategies, interaction systems, and mobility. Finally, the session will seek to identify patterns within and between these places and their associated human activities that should ideally be incorporated into best practices for documenting, investigating, and preserving such structures.

906. Long-term Coexistence of Herding and Hunting Camelids in the Andean Highlands: Evidence from Holocene Hunting Traps at Lake Titicaca, Bolivia

Authors: Christophe Delaere (Université libre de Bruxelles) – Romuald Housse (IFEA) – Sergio Durán Chacón (UMSA)
Format: Oral

This communication aims to explore the nature, chronology, and role of monumental bottleneck hunting structures with kite-like morphologies, also known as chacu or chaku, identified since 2024 on high-altitude plateaus (> 4,000 m asl) on the eastern slopes of the Lake Titicaca basin (Perú, Bolivia). While the earliest evidence for camelid domestication in the Lake Titicaca region dates to the Middle Holocene (ca. 4,400 BP), and recent models based on archaeozoological data (e.g., osteometry, age profiles) suggest a gradual transition from specialized hunting to herding beginning around 3,500 BP, shortly before the permanent sedentarization of lacustrine populations (e.g. Formative period), several lines of evidence call for a reassessment of this processual model. Ethnohistorical sources, chronologically heterogeneous archaeological material collected from surface contexts, and the analysis of this newly identified hunting structures indicate that the use of these monumental bottleneck traps and camelid hunting may have persisted and coexisted with pastoralism until the Early Colonial period (ca 450-350 BP) in the Lake Titicaca region. In particular, preliminary results suggest that the projectile points associated with these structures, dated between 7,000 and 1,500 BP, reflect the antiquity and long-term use of these hunting structures. Additionally, ceramic fragments recovered from these hunting sites—spatially isolated from any habitation areas—and dated from the Tiwanaku period (1,350-900 BP) to the Early Colonial period (450-350 BP), together with the remarkable state of preservation of the structures, suggest regular maintenance and continuity of use up to the Spanish

conquest. The role and chronology of these structures remain uncertain, as their function may have potentially shifted from kill-sites to camelid capture facilities used for wool shearing, raising several questions that this investigation aims to address.

1900. Submerged Hunting Architecture: how to study the potential for Late Glacial/ Early Holocene drive lanes in the Baltic Sea

Authors: Afke Van Zijverden – Marcel Bradtmöller (Universität Rostock) – Jacob Geersen (Leibniz Institute for Baltic Sea Research) – Jens Auer (Landesamt für Kultur und Denkmalpflege Mecklenburg-Vorpommern) – Harald Lübke (Leibniz-Zentrum für Archäologie)
Format: Oral

The study of newly discovered underwater structures of larger scale in the Baltic Sea offers a unique possibility to better understand, subsistence strategies, mobility patterns, hunting strategies and territorial developments of the first hunter- gatherers to follow the retreating ice sheets in northern Europe. However, due to its depth, size and lack of comparable studies in the Baltic Sea, archaeological field work is challenging and interpretation up to now uncertain. In order to better understand how to assess the origin (natural vs. anthropogenic) of these and to interpret the possible function comparable features from prehistoric and sub-recent times are to be evaluated and comparatively analysed using quantitative as well as qualitative data sets. In doing so, this review of existing structures and the conducted archaeological research there is a prerequisite for a solid scientific interpretation of the Blinkerwall and comparable structures which might exist elsewhere in the western Baltic Sea. This paper will present first comparative examples that are used to establish a new workflow. This workflow lays at the basis for why we currently consider a prehistoric "drive lane" to be the most likely explanatory model for the large structure on the Baltic Sea floor.

2737. When does the right spot stay the right spot? The hunting architecture to herding architecture hypothesis

Authors: Ashley Lemke (University of Wisconsin-Milwaukee)
Format: Oral

Hunting architecture in the from of drive lanes, hunting blinds, and other features, is ubiquitous across time, space, and cultures. Built structures channel prey animals into targeted areas, increasing the likelihood of hunting success and predictably of animal movements. While these structures can be difficult to identify – there had been a range of archaeological investigations both terrestrially and underwater on such features. The oldest structures dating thus far (n=3) are all within 9,000-10,000-year-old – and represent a change in subsistence strategies independently in different parts of the globe, including the Near East, Baltic, and Great Lakes. Such features continued to be used throughout the Holocene and share similarities with corrals and other herding features. This paper will present the hunting architecture to herding architecture hypothesis, positing that herding behaviours evolved from changes in hunting techniques that revolutionized social and economic behaviours of hunting and gathering populations and in some places lead to a direct route to herding of domesticated animals.

1656. Submerged Stone Structures in the Western Baltic Sea: Evaluating Natural and Anthropogenic Origins through Integrated Geoarchaeological Methods

Authors: Jacob Geersen – Warren Kwok – Peter Feldens (Leibniz Institute for Baltic Sea Research) – Marcel Bradtmöller – Afke Van Zijverden (University of Rostock)
Format: Oral

The Baltic Sea region has undergone multiple environmental phases since the end of the last glaciation (~15 ka), characterised by repeated sea-level fluctuations of up to 30 m. These phases have left distinct imprints on the landscape. While terrestrial landscapes are well studied, they have also been extensively modified by human activity. In contrast, submerged landscapes remain less investigated, disturbed, and understood, offering a unique opportunity to reconstruct the past. Advances in marine mapping have led to the identification of submerged stone structures, some of which may be anthropogenic in origin. The most prominent example is the Blinkerwall, a 971 m-long linear stone structure that may represent one of the oldest and largest megalithic constructions in Europe. Following this discovery, other anomalous stone features identified in earlier Baltic Sea surveys have been re-evaluated. The site selected for this study is located offshore from Heiligenhafen in the Fehmarnsund, the narrow strait separating mainland Germany from the island of Fehmarn. The anomaly was first reported by Franz Tauber in 2007, who identified the presence of rough linear and circular stone structures. These features have been noted to resemble certain architectural elements associated with desert kite trapping structures. However, before anthropogenic interpretations can be substantiated, it is essential to assess whether natural processes could account for their formation. This study therefore examines a range of potential geological mechanisms, including glacial till deposits (moraines), glaciofluvial formations (eskers), subglacial meltwater erosion (tunnel valleys and potholes), and ice stagnation and melt-out features such as kettle holes. By cross-examining regional examples of these processes against the characteristics of the Heiligenhafen site, this research aims to clarify its origin and seeks to contribute a methodological framework for distinguishing natural from anthropogenic submerged stone structures, which are likely to be identified increasingly as marine survey technologies continue to advance.

1000. The Andean Chacu: Intersection of ritual, dance, and hunting architecture

Authors: Adrián Oyaneder (Archaeology and History Department, University of Exeter | Departamento de Antropología, Universidad de Tarapacá)
Format: Oral

Collective ungulate capture using V- or funnel-shaped traps is well documented across many continents (e.g., desert kites) but has been sparsely studied in the South-Central Andes. Locally known as chacu, or "royal hunts", this cultural practice offers more than has previously been recognised. Known to have been employed by the Inka to capture ungulates, with the vicuña (Vicugna vicugna) as a specific target. Colonial records refer to a specialised group of vicuña hunters called the Choquela in the circum-Titicaca region, while in the lake's southwest, the Aymara Choquela ritual dance re-enacts chacu hunts. Among the Uru Chipaya people of Bolivia's Salar de Coipasa, myths recount a wind-borne vicuña hunt following a path from northern Chile's Pacific coast into the western Bolivian highlands. This path traces toponyms linked to nearly 300 traps distributed between 2800 and 4300 meters above sea level, an altitudinal range where chacu sites generally overlap with the habitats of the vicuña and Andean deer. Drawing on archival, ethnographic, rock-art, and remotely sensed evidence, this research broadens the understanding of these V-shaped traps in the South-Central Andes. It suggests that while this cultural practice has deep historical roots across the region, northern Chile concentrates by far the largest number of traps in the Andes, coincidentally the region that nowadays holds the lowest vicuña population.

2689. Step by step: Preliminary results from the archaeological fieldwork on submerged stone structures in the Baltic Sea

Authors: Marcel Bradtmöller (University of Rostock) – Harald Lübke (Leibniz-Zentrum für Archäologie, Schleswig location) – Afke Van Zijverden (University of Rostock) – Jacob Geersen (Leibniz Institute for Baltic Sea Research) – Jens Auer (Landesamt für Kultur und Denkmalpflege Mecklenburg-Vorpommern)
Format: Poster

Following the announcement of the discovery of the 'Blinkerwall' site off the Mecklenburg coast in the Baltic Sea in early 2024 — interpreted as the remains of an artificial drive lane used to hunt reindeer herds — indications of comparable-sized large-scale stone structures emerged in the Western Baltic Sea. To date, more than half a dozen such megastructures have been reliably identified along the coast of the German Baltic Sea, stretching from the Flensburg Fjord in the northwest to the island of Rügen in the east. Similar structures have also been reported in Danish waters. Most of these findings have not yet been investigated in depth by means of underwater archaeology and high-resolution marine geophysical data. However, from such legacy data, there is evidence that many of these structures share different morphological characteristics. This paper aims to present the current state of archaeological research into these newly or sometimes rediscovered stone structures on the seabed of the Western Baltic Sea. In doing so, we will discuss the recent challenges encountered during our fieldwork on these large-scale structures that are often located in water depths beyond 20 m.

97 ETHICAL STEWARDSHIP OF HUMAN REMAINS IN MUSEUMS, UNIVERSITIES, COMMERCIAL ARCHAEOLOGY FIRM COLLECTIONS, AND MEDICOLEGAL CONTEXTS

Theme: 3. Museums and cultural heritage in the era of 'permacrisis'
Organisers: Megan Fry (University of Cincinnati) – Alexandra Johnson (Forensic Access) – Samantha Mccrane (University of West Florida | District 1 Office of the Medical Examiner)
Keywords: Osteology, Forensic, Human Remains, Ethics, Stewardship, Museum
Format: Discussion session

SESSION ABSTRACT

This session explores the role of museums, educational institutions, archaeological firms, and medicolegal entities as stewards of humanity's past and present. Human remains maintain an important role in informing interpretations of peoples' stories, as well as educating future practitioners. However, clear guidelines on ethical care, use, and/or return of skeletal remains do not exist in many contexts. Oftentimes, human skeletal remains fall into legal and ethical gray areas, allowing subjective and inconsistent interpretations of stewardship and/or disposition requirements. Simply put, there is inadequate or ineffective legal framework in many localities to handle the complexities of engaging with human remains for education and scientific study. The recent changes to the Native American Graves Protection and Repatriation Act (NAGPRA) in the United States has seen an increased public support for the repatriation of Ancestors, but where does that leave those who continue to be held in the public trust such historic, non-Indigenous, or unidentified individuals? We encourage submissions that address the legal loopholes that govern the "ownership" and "sale or transfer" of human remains and how legilsation varies globally. What are some of the pros and cons of legislation in different countries and should we work toward constructing a global framework? How can osteological practitioners work collaboratively to ensure consistent and ethical treatment and use of human remains? How can descendant communities' wishes be incorporated into law to ensure culturally sensitive care? What alternatives are there to studying human remains from historically marginalized groups which were collected without consent? How have various fields (e.g., forensic anthropology, medical schools) worked to combat this issue? We especially encourage submissions with ongoing or successfully completed projects that are actively combatting these issues. We hope this session facilitates a lively discussion bridging the gap between laws, ethics, and science, while centering community knowledge and ethical stewardship.

CONTRIBUTION ABSTRACTS

2331. Jurisdictional Grey Zones: Ethical and Legal Challenges in the Disposition of Skeletonised Human Remains

Authors: Samantha Mccrane (University of West Florida Anthropology Department | District 1 Medical Examiner's Office) – Megan Fry (University of Cincinnati Anthropology Department) – Deanna Oleske (District 1 Medical Examiner's Office) – Heather Walsh-Haney (Florida Gulf Coast University Justice Studies Department) – Kathryn Miyar (Division of Historical Resources Florida Department of State)
Format: Oral

Recently, there has been an increased interest in transparency regarding retention of human remains, including their timely and ethical disposition. However, there is often little to no standardised guidance on best practices, and even fewer codified or legal specifications pertaining to skeletonised human remains without provenance. Within a medicolegal context, human remains with a deemed 'modern' or 'forensically relevant', trophy skulls, or relinquished anatomical specimens, often fall into a grey area, not within the defined purview of the medical examiner's office. They are also not old enough to definitively fall under the jurisdiction of the State Archaeologist. In these instances, disposition of remains is especially tricky because without clear legal jurisdiction, it becomes unclear who has the authority to dispose of the remains, in what manner that should occur, or to order further testing to establish provenance and/or postmortem interval. Likewise, there are complications when one attempts to determine if they are potentially NAGPRA eligible. Recent updates (88 FR 86452) to the regulations, established Duty of Care requirements (43 CFR 10.1(d)), which necessitates that Tribes must be consulted prior to any analyses. However, without some analysis (e.g., osteological ancestry/ population affinity estimation, analysis of associated artefacts), it is not possible to establish provenance to know which Tribes should be contacted or if the remains are in fact of Native American ancestry. This is especially true for remains which have been used in medical or teaching collections and no provenance information is available. Additional complications arise when legal regulations vary by state, providing protections for some individuals and not others. The legal grey area of jurisdiction of human skeletal remains leaves many individuals in legal limbo, forcing many to remain in storage within institutions who do not have a clear path for disposition.

2112. Return of the Resurrection Men: How Legal Loopholes Enable Grave Robbing and Illicit Trafficking of Human Remains

Authors: Megan Fry (University of Cincinnati) – Samantha Mccrane (University of West Florida)
Format: Oral

Across many national and international contexts, the ownership, sale/transfer, and/or disposition of human remains is governed by fragmented, outdated, or absent legal frameworks. This lack of comprehensive oversight has created regulatory gaps that facilitate the illicit trafficking of human remains through both formal and informal markets. Although laws addressing burial disturbance, forensic investigation, and Indigenous ancestral remains exist in some jurisdictions, these statutes frequently fail to account for skeletonised, disarticulated, or decontextualised remains that fall outside clearly defined medicolegal or archaeological categories. As a result, such remains often exist in a legal vacuum in which responsibility, authority, and accountability are unclear. Inconsistent legislation and limited enforcement mechanisms directly contribute to the growth of human remains trafficking. Drawing on case studies from academic collections, online marketplaces, and private dealers, this paper demonstrates how ambiguity surrounding provenance, jurisdiction, and ownership enables the commodification and circulation of human remains. These are compounded by narrow legal definitions of what constitutes "human remains," wherein some biospecimens - often including osseous specimens- are frequently excluded from meaningful regulation. This allows human remains to circulate with minimal scrutiny, often stripped of contextual information and severed from the individuals and communities they once belonged. This has contributed to the growth of illicit markets, particularly through online and social media platforms that are difficult to regulate. Procurement pathways—including grave robbing and unethical or illegal disposal by medical suppliers and mortuary practitioners—are similarly enabled by insufficient legal oversight. We argue that current regulatory approaches prioritise reactive enforcement over preventative governance, leaving institutions, practitioners, and descendant communities without clear guidance. We emphasise the need for cohesive legal standards that centre transparency, accountability, and respect for human dignity in order to disrupt trafficking networks and establish ethical pathways for the care and disposition of human remains.

2422. Tracing Origins and Confronting Legacies: Provenance Research at the Museum of the University

of Tübingen MUT

Authors: Anne Kremmer – Annika Vosseler (Museum of the University of Tübingen MUT)
Format: Oral

The Museum of the University of Tübingen MUT serves as an umbrella organisation for about eighty collections across all faculties of the University of Tübingen. These collections encompass a diverse range of holdings, and ancestral human remains, and reflect centuries of academic research, collecting practices, and scientific exchange. As custodians of these collections, the MUT is confronted with the ethical and practical challenges of caring for ancestral human remains in a context where binding legal frameworks remain limited or absent. In response, the MUT has established a sustained institutional commitment to provenance research and targeted projects focusing on ancestral human remains from colonial contexts. This work is guided by non-binding frameworks, particularly the Joint Guidelines (2025) and the Eckpunkte-Papier (2019), which the MUT uses as key points of orientation in the absence of comprehensive legislation. Within this framework, ancestral human remains are prioritised, with an emphasis on dignity, transparency, and cooperative decision-making wherever possible. Central to this approach is the re-humanisation of individuals who were removed from their original contexts under structural violence and unequal power relations. To support this work, the MUT follows a dual strategy combining a permanent institutional position dedicated to provenance research across the university's collections, with project-based research focusing specifically on ancestral human remains from colonial contexts. These initiatives seek to address the scientific legacies that objectify human bodies, encouraging and establishing a more sensitive and respectful approach in handling the individuals. By embedding provenance research as a sustained institutional commitment, the MUT critically engages with questions of ownership, ethical responsibility, and historical accountability. Its work also underscores the limitations of relying on guidelines in the absence of legal frameworks, while contributing to broader discussions on ethical care, restitution, and repatriation within university collections and providing an example for how universities can navigate these challenges.

787. Naming the Nameless: How the 'Liquidation Fallacy' Erases African History

Authors: Íosác Davidson (University of Cape Town)
Format: Oral

In the wake of South Africa's colonial and Apartheid history, thousands of human remains exist in a legal and ethical deadlock. This paper explores the "permacrisis" facing South African bioarchaeology: a conflict between modern European protocols of informed consent and the urgent moral mandate to restore identity to those buried without a name. We identify a growing danger termed the "Liquidation Fallacy"—the belief that if historical remains lack modern provenance, the most "ethical" path is to rebury them and delete their associated scientific data. We argue that this approach actually completes the work of the colonizer by erasing the last physical evidence of marginalized people, committing a "Double Erasure" of their existence. To find a way forward, we look to the "Golden Mean" (the Shvil ha-Zahav) of the 12th-century physician-scholar Maimonides. This framework of pre-colonial Afro-Mediterranean rationalism suggests that virtue lies in an ethical equilibrium—avoiding both the extreme of data destruction and the extreme of exploitative research. We demonstrate how modern science acts as a "biological fingerprint" that can return a name and a lineage to an ancestor. Ultimately, we argue that protecting the scientific pipeline is not just an academic goal; it is a human rights requirement. By refusing to let these individuals be "liquidated" into silence, we ensure that the dead are finally given their names back.

391. The Curation of Archaeological Human Remains in Türkiye: Comments on Legislation and Practice in the Case of the Juliopolis Research

Authors: Ali Büyükkarakaya (Hacettepe University)
Format: Poster

Archaeological research experience in Türkiye, dating back to before the founding of the Republic, has increased rapidly, especially since the 1930s. Although archaeological human remains unearthed from various contexts have been included in this general research from the outset, the fact that the relevant legislation has mostly focused on archaeological artifacts has led to ambiguities regarding the curation and research of human remains continuing to the present day. In the country, archaeological human remains are kept for preservation in the storage facilities of museums and are also stored in university anthropology laboratories for preservation, research, and educational purposes. While it is noted that the number and quality of anthropological studies at universities are increasing day by day, it is evident that the academic debate on the managing and exhibition of these remains is insufficient. Over 800 graves have been excavated in the cemetery areas of the ancient city of Juliopolis, located within the borders of Ankara, the capital of Türkiye. Most of the excavations were carried out by experts from the Museum of Anatolian Civilizations. The human remains excavated from these tombs were initially kept in the museum's storage facility, but since 2018, with the support of Koç University Vehbi Koç Ankara Research Center (KU VEKAM), they have been transferred to Human Behavioral Ecology and Archaeometry Laboratory (IDEA lab) at Hacettepe University. Since then, these remains have been preserved at the IDEA lab, used for educational purposes, studied bioarcheologically, and utilized in various ways in public archaeology events and exhibitions. The objectives of this study include sharing general information about archaeological human remains in Türkiye, evaluating the relevant national legislation and practices through the process carried out during the Juliopolis Anthropological Research, and

assessing the problems encountered and the solutions produced in terms of ethics and other social issues.

727. Teaching Collections as Dynamic Assemblages: Ethical Challenges of Storage, Handling, and Fragmentation in University Osteological Collections

Authors: Myrsini Voulgari – Jayneth Ordonez – Kimberly Grande Tepoz (Kean University)
Format: Poster

University osteological collections play a significant role in anatomical and bioarchaeological education. Nevertheless, long-term possession of the skeletal remains is shaped by legacy storage practices, repeated student handling, and limited resources for curation. This poster examines how these factors contribute to the fragmentation, commingling, data loss and poor storage of the teaching collections, framing student synergy as a way of post-collection alteration with ethical implications. Based on ongoing work with Kean University's skeletal collection used for anatomy instruction, this study documents patterns of intermixing, fragmentation and loss associated with overextended periods of use and storage conditions. The study focuses on the ethical tension between the accessibility for teaching and the responsibility to store and preserve the human skeletal remains with care, respect and scientific integrity. This poster shows the attempts to improve documentation, handling protocols and storage strategies while acknowledging the fact that teaching collections are dynamic assemblages. The goal of this study was to highlight the role and endeavors of the universities as long-term custodians of human skeletal remains and propose ways for balancing pedagogy with preservation.

995. Ethical Stewardship in Practice: Human Remains from Colonial Contexts in a German Regional Collection

Authors: Michaela Harbeck – Andrea Grigat – Albert Zink (SNSB, State Collection for Anthropology Munich)
Format: Poster

Museums, research institutions, and educational collections play a central role as stewards of human remains, balancing scientific inquiry, ethical responsibility, and legal regulation. While in Germany archaeological human remains recovered within national contexts are often governed by well-established legal frameworks, human remains from colonial contexts frequently occupy ethical and legal gray areas. Recent political and ethical developments have sought to address these complexities through coordinated national frameworks, culminating in the Joint Guidelines on Dealing with Cultural Property and Human Remains from Colonial Contexts (2025). These guidelines emphasize provenance research, transparency, dialogue with countries and descendant communities of origin, and case-by-case decision-making. However, their practical implementation remains uneven. This poster presents the results of an initial provenance assessment conducted at the Bavarian State Collection for Anthropology (SAM), a regionally focused archaeological collection with a limited number of non-European human remains. Based on surviving inventories, archival sources, and scholarly literature—and shaped by substantial documentation losses due to wartime destruction—the assessment identified several case clusters with potential colonial relevance. Rather than resolving provenance questions conclusively, the initial assessment functioned as a screening tool to determine where deeper investigation is ethically and historically required. While Germany now has developed a comparatively robust ethical framework, the SAM case demonstrates how legislative and policy advances alone are insufficient without sustained funding, specialized expertise, and international collaboration. By situating a concrete, ongoing project within broader debates on stewardship, legislation, and ethical practice, this contribution aims to foster comparative discussion on how institutions can bridge the gap between law, ethics, and the responsible care of human remains.

1844. Ethical Challenges in the Long-Term Storage of Unidentified Human Remains in Medicolegal Institutions

Authors: Niharika Niharika – Jagmahender Sehrawat (Department of Anthropology, Panjab University)
Format: Poster

Human remains lie at the heart of forensic research and medicolegal investigations, yet the ethical frameworks guiding their use remain uneven and fragmented. Deceased bodies, bones, tissues and biological samples form the foundation of forensic practice but there are no universally recognised ethical standards that govern their long term management, especially in cases where unidentified individuals are involved. Although forensic research differs fundamentally from clinical research on living subjects, it still has its own set of moral responsibilities. Ethical principles like Declaration of Helsinki serves as guiding values in this context that can be meaningfully adapted to the forensic setting. The main purpose of medico-legal investigation is the identification of the deceased to support criminal investigation, legal accountability and delivery of justice. Apart from its legal function, identification establishes a fundamental human right i.e. recognition as an individual and acknowledgement of identity after death. Long term unidentified human remains occupy a particularly vulnerable position within forensic systems. These individuals are gradually reduced to research or teaching material due to ethical neglect and limited identification efforts. Academic institutions and forensic laboratories should not be exempted from these concerns and carry a humanitarian responsibility towards the dead. Practical aspects of dead body management are adequately addressed within global health literature but the ethical and sociocultural dimensions to handle human remains are insufficiently examined. Lack of engagement with these issues leads to consequences felt by families, communities and cultural groups to whom the dead holds social and emotional significance. Framing stewardship as both an ethical and professional responsibility opens space for more transparent, equitable, and humane approaches to the long-term management and identification of human remains in medicolegal settings.

102 INACCESSIBLE ARCHAEOLOGIES: INTERDISCIPLINARY PATHWAYS IN MEDITERRANEAN AND NORTH AFRICAN ARCHAEOLOGY

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Lorena Lombardi (University of Pisa | CNR-ISPC Rome) – Alessia Brucato (Independent Researcher) – Giulia Muti – Rafael Laoutari (University of Cambridge | McDonald Institute for Archaeological Research)
Keywords: Inaccessible Archaeology, Methodology, Mediterranean, North Africa, Southwest Asia
Format: Regular session

SESSION ABSTRACT

From northern Africa to the Aegean, and from the Strait of Gibraltar to the Lebanese coast, the Mediterranean and its surrounding regions (including deserts) comprise vast archaeological landscapes often untouched by traditional research. Yet these challenging areas are crucial for redressing long-standing imbalances in the study of the Mediterranean from prehistory to the present, shaped by historical, political, and environmental asymmetries that have favoured certain regions and periods over others. This unevenness has been recently exacerbated by additional pressures, such as urban expansion, uncontrolled tourism, political instability and conflict, and natural resource exploitation. These factors have been compounded by climate-driven processes—including extreme weather events, desertification, and landscape erosion—that accelerate the loss of archaeological records. As a result, it is becoming increasingly difficult, and in some cases impossible, for archaeologists to access and excavate sites. Investigating these inaccessible archaeologies is therefore not only a matter of expanding datasets, but also a timely methodological and ethical necessity. Today, archaeologists must rethink how knowledge is produced when fieldwork is not feasible, devising new interdisciplinary, collaborative, and inclusive strategies for studying the Mediterranean and North Africa. This session aims to explore methodologies that can be universally applied to analyse physically inaccessible, unreachable, lesser-known, or vanishing archaeological contexts, moving beyond regional and chronological boundaries. By bringing together diverse case studies and methodological approaches, the session seeks to stimulate critical reflection on how to investigate contexts characterised by the impossibility or limitations of field research. It invites contributions that address these challenges and propose innovative approaches to the study of inaccessible archaeologies, particularly through: • museum collections and archival documentation; • innovative methodological frameworks for artefacts; • remote and proximal sensing, GIS, and digital modelling; • the application of computational archaeology, databases, and open-source tools; • ethical and deontological considerations in the investigation of inaccessible archaeologies.

CONTRIBUTION ABSTRACTS

1638. Legacy Data, Inherited Narratives: the Site of Philia/Vasiliko-Laksia tou Kasinou in Occupied Cyprus at the Dawn of the Bronze Age

Authors: Rafael Laoutari (McDonald Institute for Archaeological Research)
Format: Oral

The origins of the Bronze Age in Cyprus have fascinated scholars since Cypriot archaeology emerged as a discipline. From early culture-historical narratives, through processual and post-processual approaches, to recent studies emphasising the materiality of the record, interpretations remain divided. The ongoing debate centres on contrasting models: one prioritising migration, the other advocating for indigenous processes stimulated by foreign contact. A key factor sustaining this controversy is the limited material available, due in part to the enduring 'Cypriot Problem', which has constituted the northern, illegally occupied part of Cyprus inaccessible to fieldwork since the military invasion of 1974. The transitional phase marking the beginning of the Cypriot Bronze Age is known as the 'Philia Culture/Facies' (c.2500-2200BCE). The term derives from the cemetery at Philia/Vasiliko-Laksia tou Kasinou, the first site to yield associated material and now located in occupied Cyprus. Excavated in the 1940s-1950s, the multi-burial assemblages from its five tombs have never been systematically studied or fully published, despite a preliminary publication (1962) and the site's continued presence in the literature. The recent reassessment of the material from Philia/Vasiliko—stored in the Cyprus Museum since its excavation—offers new insights into the social processes that led to the beginning of the Cypriot Bronze Age. This presentation discusses the results of the systematic re-examination of this material (including ceramics, metal and other small finds) and contextualises them within social dynamics expressed through mortuary practices, both locally and across the island. It highlights continuities from the earlier Late Chalcolithic period, experimentation with newly introduced features, and the regional nature of the 'Philia Culture/Facies' phenomenon. Ultimately, this study contributes to a refined social narrative of the beginning of the Cypriot Bronze Age, demonstrating the importance of revisiting legacy museum collections and addressing interpretative biases created by archaeological inaccessibility caused by war and conflict.

345. Reassessing Egyptian Dynastic Lithic Production through Museum Collections: Methodological and Techno-Typological Approaches from Wadi el-Sheikh

Authors: Lorena Lombardi (University of Pisa | CNR-ISPC Rome)
Format: Oral

Between the late 19th and early 20th centuries, numerous museums worldwide acquired large quantities of artefacts from Egypt, including substantial lithic assemblages. Due to the paucity of contextual information and chrono-cultural diagnostic features, these collections have rarely been subjected to systematic investigation. This is the case for the artefacts collected by H. W. Seton-Karr in 1896 and 1897 at the Wadi el-Sheikh flint quarries in Middle Egypt, an area exploited from the Protodynastic period through to the Middle Kingdom. Following this initial phase, the region was only sporadically visited, initially due to the limited scholarly interest in dynastic lithic production and, more recently, as a consequence of the increasing constraints associated with conducting research in desert areas. Although later studies have clarified aspects of quarry organisation and extraction strategies, lithic technology remains poorly explored. This presentation aims to outline a suitable methodology and provide a reliable dataset related to dynastic production from a techno-economic perspective, starting from the Seton-Karr collection. For a long time, research on museum collections has primarily focused on collection histories rather than on the artefacts themselves or the societies that produced them. Despite the challenges posed by the dispersion of the artefacts and the selection made by Seton-Karr, a comprehensive analysis has been undertaken by integrating multiple collections held in Italy and the United Kingdom with a wide range of data sources, including archival documentation, historical maps, and detailed techno-typological analyses. By reassessing a long-neglected, poorly documented and inaccessible context, through the establishment of connections between these fragmented datasets and comparison with more recently excavated contexts from the Nile Delta and Eastern Desert, this study identifies long-term technical traditions dating back to the Predynastic period, as well as differing levels of craft specialisation and shifts in production organisation over time.

732. Beyond the Excavation: Reconstructing Labor and Lifeways from the Submerged Nubian Site of Sayala Using Bioarchaeological Legacy Collections

Authors: Joanna Ciesielska (Institute for Advanced Studies, University of Warsaw)
Format: Oral

Large areas of the Nile Valley have become archaeologically inaccessible due to dam construction, landscape transformation, and contemporary socio-political instability. The medieval Nubian site of Sayala in Lower Nubia exemplifies this challenge. Excavated during the UNESCO salvage campaign of the 1960s prior to the creation of Lake Nasser, much of the settlement and its surrounding landscape can no longer be investigated through traditional fieldwork. More recently, the outbreak of war in Sudan in 2023 has further disrupted archaeological research across the region, reinforcing the urgency of developing sustainable, non-invasive approaches to investigating the past through existing collections and archival data. This study investigates patterns of physical activity and biomechanical stress in the medieval Christian community of Sayala, located in southern Egypt. Analyzing human skeletal remains from Cemeteries I, J, and K (8th–10th centuries AD), the research integrates entheseal changes (ECs) and osteoarthritis (OA) to reconstruct the habitual labor and mobility of 72 adult individuals. Entheseal changes and osteoarthritis are widely used in bioarchaeology to reconstruct habitual activity, yet their multifactorial etiologies complicate interpretation. Results indicate a musculoskeletal profile characterized by mild, broadly distributed stress. Notably, the population displayed minimal directional asymmetry, suggesting that daily tasks involved bilateral, balanced mechanical demands rather than specialized, unilateral craft production. Statistical modeling revealed that age remains the primary predictor of musculoskeletal variation. Overall, the results suggest a pattern of moderate, repetitive, but non-intensive labor consistent with everyday domestic, agricultural, and mobility-related activities in a small Nile Valley settlement. The absence of pronounced hip and knee degeneration contrasts with expectations for intensive farming populations, suggesting diversified and seasonally variable activity rather than lifelong heavy labor. This study highlights the methodological and ethical value of museum-based research for reconstructing social and economic lifeways in archaeological landscapes that are physically inaccessible, permanently transformed, or endangered.

860. Submerged worlds and their recovery: the case of the Lower Nubia seen through the eyes of Ugo Monneret de Villard

Authors: Greta Rocchino (PIAC)
Format: Oral

The project focuses on the region of Lower Nubia, a territory profoundly altered by the construction of the Aswan Dam, which led to the permanent submergence of extensive areas along the Nile. As a result, numerous archaeological sites and cultural landscapes were lost, and their reconstruction now depends almost exclusively on documentation produced prior to the flooding. This study addresses the methodological challenge of reconstructing a vanished landscape through the critical use of archival sources. The primary sources consist of diaries, excavation notebooks, correspondence, photographs, drawings, and sketches produced during early twentieth-century archaeological missions in Lower Nubia. Photographs and drawings are examined to extract architectural, topographical, and contextual information. Particular attention is paid to the interaction between text and image, assessing how different media contribute to the construction of archaeological knowledge and how omissions, emphases, or inconsistencies emerge across sources. A central case study within this framework is the manuscript and photographic archive of Ugo Monneret de Villard, preserved in Rome. This archive represents a substantial and largely underexploited dataset for the study of Lower Nubia. Monneret de Villard, an Italian archaeologist active in the early twentieth century, was commissioned to document sites already perceived as endangered and destined to disappear beneath the waters of the Nile. His documentation is analyzed not only for the information it provides on specific sites, but also as evidence of contemporary recording practices, research priorities, and institutional constraints. Archival data are cross-referenced with modern sources to locate lost sites, reconstruct their original setting, and evaluate landscape change over time. By integrating archival classification, source criticism, visual analysis, and spatial comparison, the project proposes a replicable methodological model for reconstructing submerged or destroyed archaeological landscapes and demonstrates the analytical potential of archival sources when approached as structured datasets rather than isolated testimonies.

2299. Christian topography of Mauretania Sitifensis – challenges of research in Algeria

Authors: Michal Kuzminski (Pontifical Institute of Christian Archaeology)
Format: Oral

North Africa is renowned for its dense network of Roman-era archaeological sites, yet accessibility varies significantly across the region. In Algeria, a vast archaeological heritage extensively documented during the French colonial period saw a sharp decline in international scientific exchange, excavations, and surveys following independence. This paper addresses the challenges and methodologies of conducting research on Christian topography between the 4th and 7th centuries AD in Mauretania Sitifensis (modern-day eastern Algeria). The study utilizes archaeological data from 19th and early 20th-century excavations as a primary point of departure. These records have been integrated into a georeferenced database and reassessed using satellite imagery to determine their current condition and accessibility, particularly in the face of modern urban expansion. This data serves as the foundation for a predictive model employing the Weight of Evidence (WoE) method. By analyzing the environmental and spatial characteristics of known locations, the model identifies high-probability areas for undiscovered sites. The results can further be validated through remote sensing and, where feasible, targeted archaeological surveys, offering a possibility to continue the research, even despite the limited accessibility to the sites.

103 NON-TRADITIONAL ISOTOPES IN ARCHAEOLOGICAL RESEARCH

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Jessica Cardoso (Austrian Academy of Sciences) – Danaé Guiserix (Vrije Universiteit Brussels) – Klervia Jaouen (Géosciences Environnement Toulouse)
Keywords: Isotopes, Non-traditional isotopes, Diet, Provenance, Paleoenvironment, Technology
Format: Regular session

SESSION ABSTRACT

Isotopic analysis has long contributed to archaeological research by complementing evidence derived from material culture, human, faunal and botanical remains, and paleoenvironmental studies. While carbon, nitrogen, and strontium isotope systems have been foundational for reconstructing aspects of diet, mobility, and landscape use, recent developments in non-traditional isotope applications (including zinc, copper, calcium, iron, magnesium, and lead) have expanded the range of questions that can be addressed. These advances reflect broader interdisciplinary engagement within archaeology, where collaborations among geoarchaeologists, bioarchaeologists, zooarchaeologists, archaeobotanists, and specialists in ancient technologies allow for more nuanced and contextually grounded interpretations of past societies. This session aims to highlight not only methodological innovation but, above all, how emerging isotopic approaches contribute to archaeological interpretation. We welcome papers that employ non-traditional isotopes or unconventional applications of traditional systems. Possible topics include dietary reconstructions using zinc, calcium, or stable strontium isotopes; provenance studies of metals, pigments, or ceramics through lead, copper, or iron isotopes; investigations of physiological processes and mobility patterns with magnesium or Sr–Ca ratios; CSIA of amino acids or other biomolecules; and unconventional applications of traditional isotope systems, such as nitrogen isotope analyses in dental enamel or micro-scale isotopic mapping. We particularly encourage studies that integrate isotopic results with other archaeological datasets, such as material culture, bioarchaeology, and spatial or stratigraphic information, to address key research questions across different periods and contexts. By highlighting the combination of isotopic and archaeological evidence, this session aims to show how innovative isotopic tools can enhance understanding of past societies, foster interdisciplinary collaboration within archaeology, and open new pathways for future research. Contributions led by early-career researchers and case studies grounded in archaeological questions are especially welcome.

CONTRIBUTION ABSTRACTS

452. Reconstructing Diet in a Brazilian Shellmound (Piaçaguera site) through Compound-Specific Isotopic Analysis of Amino Acids

Authors: Marina Di Giusto (Géosciences Environnement Toulouse) – Veronica Wesolowski (University of São Paulo) – Klervia Jaouen (Géosciences Environnement Toulouse)
Format: Oral

Bulk collagen carbon and nitrogen isotope analyses (δ13C and δ15N) have become frequent in studies of human groups buried in Brazilian shellmounds (sambaquis), expanding our understanding of their dietary practices. More recently, compound-specific isotopic analysis of amino acids (CSIA-AA) has emerged as a method providing more detailed dietary information. Previous bulk δ13C and δ15N analysis of human remains recovered from the Piaçaguera shellmound (southeastern coast of Brazil; 7,163 – 5,703 years BP) suggested a mixed marine and terrestrial diet, with no sex-based differences, but with different degrees of terrestrial resource intake between two contemporaneous burial groups. The present study aims to further investigate this intra-group dietary variability at Piaçaguera through δ13C analyses of individual amino acids in bone collagen from 19 individuals. By applying this approach, we test the hypothesis that dietary practices within sambaqui-associated populations were not necessarily homogeneous, and that differential access to marine and terrestrial resources may have existed within the group.

1799. Investigating milk consumption using a novel calcium isotope proxy

Authors: Pierre-Jean Dodat (Organic Geochemistry Unit, University of Bristol | Bristol Isotope Group, University of Bristol) – Tim Elliott – Jamie Lewis (Bristol Isotope Group, University of Bristol) – Theo Tacail (The Isotoparium, California Institute of Technology) – Melanie Roffet-Salque (Organic Geochemistry Unit, University of Bristol)
Format: Oral

The onset of the Neolithic is characterised by the introduction of new foodstuffs into the human diet. Of these introductions, the consumption of milk and dairy products by adults represents one of the most significant changes in the human diet. However, assessing and quantifying milk consumption at the individual level in human populations remains challenging. The NeoCalcium project intends to use bone calcium isotope composition (δ44/42Ca) to obtain direct quantitative information on dairy product consumption in human populations. Previous studies (Tacail et al. 2021) proposed a correlation between Ca isotopic value and time (between 10 kyr and the present) based on the global increase of dairy products in diet since the Neolithic. However, this trend may not be accurate for regional and cultural variations. In this study, we compare a dairy consumption proxy (the δ44/42Ca values of bones) to a dairy production and transformation one (proportion of potsherds containing dairy lipids) in order to calibrate a model to quantify dairy consumption. New and published calcium isotopic data allow us to establish a correlation between δ44/42Ca bone values and the fraction of dairy residues in sherds from sites where both are available. This correlation matches the model of calcium isotope distributions in bones based on the Ca budget in diet estimated for Neolithic populations established by Tacail et al. 2021. This study paves the way to study dairy consumption at an individual level and explore dairy consumption during periods or in areas where populations did not use pottery.

1927. Multi-isotope dietary reconstruction of Modern and Beringian Gray Wolves

Authors: Eve Lindroos (Université de Toulouse | Géosciences Environnement Toulouse) – Auguste Hassler (University of Aberdeen | University of Ottawa) – Zoe Landry (University of Ottawa | Canadian Museum of Nature) – Danielle Fraser – Scott Rufolo – Gregory Rand (Canadian Museum of Nature) – Clement Bataille (Purdue University | University of Ottawa)
Format: Oral

Traditional isotopes such as carbon [$\delta^{13}C$] and nitrogen [$\delta^{15}N$] are widely applied as dietary proxies but are vulnerable to organic degradation and sensitive to environmental baseline shifts. Non-traditional isotopes (i.e., calcium [$\delta^{44/42}Ca$]) have been proposed as complementary and potentially more robust dietary proxies. Calcium isotopes are ideal for dietary reconstructions as they are diet-derived and exhibit predictable trophic-level fractionation. Additionally, calcium isotopes are well preserved in tooth enamel which is resistant to diagenesis and not susceptible to organic degradation. Beringia, the landmass that connected Alaska and Yukon to eastern Siberia for extended intervals throughout the Cenozoic, experienced significant climate warming during the terminal Pleistocene (~16,000–11,700 BP) and increasing human presence (~24,000–12,000 BP), coinciding with widespread North American megafaunal extinctions. Despite these ecological pressures, gray wolves (Canis lupus) survived, potentially due to dietary flexibility. We further tested this hypothesis by incorporating non-traditional isotopes ($\delta^{44/42}Ca$) alongside traditional isotopes ($\delta^{13}C$ and $\delta^{15}N$) as dietary proxies to reconstruct the dietary habits of gray wolves in Beringia over the last 50,000 years. Bayesian stable isotope mixing models (BSIMMs) based on $\delta^{13}C$ and $\delta^{15}N$ indicate that Pleistocene wolves primarily consumed large ungulates, specializing on horses. Whereas modern wolves exhibit a generalist diet. Incorporating $\delta^{44/42}Ca$ as a third dimension revealed a more pronounced shift, where Pleistocene wolf diets were comprised almost exclusively of horses, whereas modern wolves consumed a broader range of smaller prey, including smaller-bodied mammals. This dietary shift likely reflects the extinction and reduced abundance of large ungulates during the Late Pleistocene and supports the hypothesis that dietary flexibility was key to gray wolf survival. Our findings suggest that integrating traditional ($\delta^{13}C$ and $\delta^{15}N$) and non-traditional ($\delta^{44/42}Ca$) isotopes to investigate ancient diets and ecological structures presents an exciting development for numerous fields, including and not limited to, palaeoecology, palaeobiology, bioarchaeology, and zooarchaeology.

2351. Assessing the effects of food processing on $\delta^{88}Sr$ values in food resources

Authors: Hannah James – Christophe Snoeck (Archaeology, Environmental Changes & Geo-Chemistry, Vrije Universiteit Brussel)
Format: Oral

Stable strontium (δ88Sr) is an emerging proxy that is being increasing applied in archaeological and palaeoecological studies to reconstruct diet, environment, and trophic level relationships. However, the factors driving variation in δ88Sr in human tissues are likely complex and at this stage require further investigation. This study looks at one aspect introducing variation into human diet, the potential alteration of δ88Sr in food resources through processing. Strontium incorporated into human tissues reflects an average of strontium from all dietary components, but it is often dominated by high concentration resources. While the selection of particular food resources influences this strontium signal, but humans also do not just eat raw unprocessed food, we alter it

using processing, cooking, and preservation techniques. This study experimentally investigates the influence of boiling, roasting, and fermentation on the δ88Sr of both meat and plant food resources. These results are assessed alongside conventional 87Sr/86Sr and strontium concentrations ([Sr]) to assess the overall impact. Fractionation in δ88Sr is visible in temperatures less than 100oC, which lead to increased δ88Sr values, and compositional differences in tissue types lead to variable 87Sr/86Sr, δ88Sr, and [Sr] results. The implications of this human-induced variation in 87Sr/86Sr, δ88Sr, and [Sr] on dietary reconstruction and its potential to influence mobility estimations in archaeological studies will also be discussed.

565. New insights into Trans-Saharan gold trade in the Islamic Middle Ages revealed from gold coins multi-isotopic (Pb-Fe-Cu) and elemental characterization

Authors: Louise De Palaminy (TRACES, Toulouse | GET, Toulouse) – Baron Sandrine (TRACES, Toulouse) – Franck Poitrasson (GET, Toulouse) – Robert Kool (IAA, Jerusalem) – Maryse Blet-Lemarquand (IRAMAT-CEB, Orléans) – François-Xavier Fauvelle (Collège de France, Paris | CRJF, Jerusalem)
Format: Oral

The use of West African gold in medieval times is thought to have enabled the first globalised trade in history: the Trans-Saharan Trade, through the minting of Islamic dinars, which functioned as the equivalent of today's dollar or euro. Yet the precise origin of this gold remains debated, as archaeological evidence for such trade is scarce. While textual sources are numerous, they provide only indirect accounts, and the large corpus of surviving dinars has so far yielded limited insight as elemental analyses are not discriminating enough to establish geological provenance. To address this, a combined approach was applied, using multi-element data obtained by LA-ICP-MS and multi-isotope (Pb, Cu, and Fe) data measured by wet chemistry and MC-ICP-MS on 11 Fatimid dinars. This revealed two distinct metal stocks, differentiated by PGE concentrations and Cu isotopes. The heavy δ65Cu and δ57Fe isotope signatures could be consistent with supergene secondary oxidised ores, typical of West African gold mineralisation. In contrast, Pb isotopes (208Pb, 207Pb, 206Pb, 204Pb) and subsequent model ages and μ and κ parameters do not match the expected West African signatures, suggesting disruptions during the chaîne opératoire. This data further raises two key historical questions: the location of gold processing, whether it occurred North or South of the Sahara, and the possible reuse of older metal stocks.

1931. Lead Isotope Baselines and Human Enamel at Teotihuacan: Evaluating Possibilities for Paleomobility Research

Authors: Gina Buckley (Universidade do Algarve - ICArEHB) – Maria Fernanda García Hurtado – Peter Schaaf – Gabriela Solís-Pichardo (Universidad Nacional Autónoma de México) – George Kamenov (University of Florida) – Virginie Renson (University of Missouri Research Reactor)
Format: Oral

Lead (Pb) isotope analysis is increasingly recognized as a valuable tool in archaeological research, expanding beyond artifact provenance to address questions of human mobility and landscape interaction. While Pb isotopes have been successfully applied in parts of Europe where preservation is favorable and modern contamination is relatively limited, comparable approaches remain underdeveloped in much of the Americas. Extensive anthropogenic lead exposure and variable skeletal preservation have hindered the establishment of robust archaeological Pb-isotope baselines and their integration into bioarchaeological mobility studies. This paper evaluates the feasibility of Pb isotope analysis for paleomobility research at Teotihuacan, one of the largest urban centers of ancient Mesoamerica (AD 1–550). We establish regional Pb-isotope baseline data for the Basin of Mexico and surrounding geological zones through the analysis of bedrock and soil samples. Particular attention is given to labile soil fractions to assess the extent to which modern contamination may obscure natural isotopic variation. Preliminary Pb isotope results from human dental enamel are also presented, offering an initial framework for distinguishing local and non-local individuals within this complex urban landscape. By combining baseline development with bioarchaeological applications, this study highlights both the potential and the methodological challenges of implementing "non-traditional" isotope systems in mobility research in heavily impacted environments.

1759. Sr – Nd isotopic composition of ancient pottery from Moravia: first data from Central Europe

Authors: Julie Erban Kočergina – Tamara Sidorinova (Czech Geological Survey) – Jaroslav Peška (ACO Archaeological Center Olomouc, U Hradiska 42/6, 779 00 Olomouc, Czechia)
Format: Oral

This study presents the first combined Sr–Nd isotopic dataset for archaeological ceramics from Central Europe spanning the Neolithic to the Early Middle Ages, based on material from the long-occupied and culturally diverse site of Přerov–Předmostí (Czech Republic). The dataset establishes a practical methodological framework for applying Sr–Nd isotope systematics to ceramic materials and evaluating their potential for provenance and technological studies. Neodymium isotopes display high internal homogeneity across ceramic samples and appear largely insensitive to post-depositional alteration. In contrast, strontium isotopes show greater variability, reflecting modification related to vessel use, burial conditions, and the presence of surface pigments. These observations emphasize the necessity of careful sampling strategies, including the systematic removal of outer and inner surface layers prior to isotopic analysis. Ceramics from Přerov–Předmostí exhibit a consistent isotopic offset relative to local reference materials, including daub and loess, suggesting the exploitation of regional rather than strictly local clay resources. Isotopic overlap with the Třebíč pluton indicates a possible contribution of this unit to the coarse detrital fraction of local loess deposits. A distinct LBK ceramic

sample is characterized by elevated CaO, Sr, P, and Ba concentrations and comparatively low 87Sr/86Sr ratios, consistent with the use of Ca-rich clays and technological modification of the ceramic paste, potentially involving carbonate material and ash addition. Overall, the results demonstrate that combined Sr–Nd isotope systematics provide a robust tool for distinguishing local and non-local ceramic production, reconstructing clay and temper provenance, identifying technological modifications during paste preparation, and tracing long-term continuity in raw material exploitation. Quantitative mixing approaches remain challenging in isotopically heterogeneous and multi-component systems, underscoring the importance of integrating isotopic data with petrographic and geochemical analyses.

648. Lead Isotope Analysis and Comparison of Artifacts from the Terrestrial and Maritime Luna Settlement Sites

Authors: Alana Davis – Dominick Skultety (University of West Florida)
Format: Poster

As part of the excavation of the Emmanuel Points I and II shipwrecks that have been associated with the ill-fated site of Santa Maria de Ochuse, a mid 16th-century Spanish settlement in what is now Pensacola, United States that was struck by a hurricane early in its founding, several pieces of lead hull-sheathing were found in association with the maritime site. Previous lead isotope analysis has traced the origin of the lead used to manufacture the sheathing to Mina La Sultana, just north of Sevilla. Since then, however, excavations at the terrestrial site of the settlement itself have produced several lead net weights that appear to be hastily made. The purpose of this project is to use lead isotope analysis to determine whether the lead weights were made from salvaged pieces of sheathing from the shipwrecks after the hurricane destroyed them. This can reveal more about the provenience of their lead material and whether the source of it matches with Mina La Sultana. The results of this testing may closely match those of the lead hull sheathing of the shipwrecks, indicating that this material was reused to craft the net weights. Alternatively, if the lead isotope analysis suggests a different provenience for the lead, new details about its procurement and uses can be discovered.

724. Mercury isotopes as bioarchaeological markers: contributions and limitations for reconstructing past lifeways

Authors: Claire-Etoile Allexant (LAMPEA UMR-7269, Université d'Aix-Marseille, CNRS) – Klervia Jaouen – Jeroen E. Sonke (GET UMR-5563, Université de Toulouse, CNRS) – Guy Andre (LAMPEA UMR-7269, Université d'Aix-Marseille, CNRS) – Marina Di Giusto (GET UMR-5563, Université de Toulouse, CNRS) – Estelle Herrscher (LAMPEA UMR-7269, Université d'Aix-Marseille, CNRS)
Format: Poster

Since the 1970s, analytical advances have led to a rapid expansion of isotopic studies involving a wide range of elements. However, some elements remain largely unexplored, and their potential has yet to be fully assessed, including mercury (Hg) isotopes. Due to its dual isotopic fractionation and strong affinity for proteins, the analysis of mercury in bone and dentine collagen represents a promising approach for enhancing our understanding of the lifeways of prehistoric and historic populations. Even-mass number Hg isotopes (δ202Hg) only fractionate as a function of the trophic level of individuals, whereas odd-mass Hg isotopes (Δ199Hg) undergo mass-independent fractionation related to aqueous photochemical reactions. In this context, the combined use of Hg isotope ratios offers the opportunity to investigate both human activities and dietary practices, insofar as higher Δ199Hg values (≥0.3‰) would indicate shellfish or fish consumption, while lower values (~0‰) would be associated with activities related to metallurgy, tanning, and dyeing. To fully exploit this proxy, it is nevertheless necessary to quantitatively extract the mercury contained in collagen. However, collagen extraction protocols commonly used in bioarchaeology all involve a solubilisation step that may lead to partial mercury loss, given the volatile nature of this element. Different extraction protocols were therefore tested and compared to assess their impact on mercury preservation. Preliminary results indicate that some of the analysed samples, notably from the Neolithic site of Mentesh Tepe (South Caucasus) and the historic site of Saint-Laurent de Grenoble (France), contain mercury concentrations that are sufficient to allow isotopic measurements. The use of mercury isotope ratios thus appears to be a promising tool for reconstructing the lifeways of ancient populations.

1257. Evolution of anthropogenic pollution: novel sulfur isotope analysis of the Tyneside region of England from medieval period to modern day

Authors: Noel Hincha – Janet Montgomery – Ellen Kendall – Rebecca Gowland – Darren Grocke (Durham University)
Format: Poster

Bioarchaeologists traditionally use sulfur isotopes to reconstruct paleoenvironments for mobility and dietary studies; however, this study applies a non-traditional approach in bioarchaeological research, uniquely using sulfur isotopes to investigate the potential impact of anthropogenic sulfurous pollution on biogenic sulfur isotopes in the industrial past. To explore the probable role and legacy of the coal mining industry in northeastern England on human sulfur isotope values, this innovative study compares three distinct assemblages of human and faunal skeletal remains: the medieval Black Gate cemetery, Newcastle (n = 59); the post-medieval Coach Lane burial ground, North Shields (n = 66); and the post-medieval St. Hilda's cemetery of Coronation Street, South Shields (n = 59). Modern sulfur isotope values from the British Geological Survey open access dataset complement these bioarchaeological assemblages, enabling a comparative analysis that bridges socio-environmental impacts in the past with those in the present. The

findings show shifting temporal trends in the sulfur isotope values, with higher values in the medieval period than the Industrial Era and modern day—possibly reflecting a less polluted pre-industrial environment, among other socio-environmental factors. The results highlight the novel utility of sulfur isotopes as a proxy following the evolution of dynamic human-environment interactions at industrial sites, supplementing traditional industrial bioarchaeological methods such as osteological profiles and historical archives. Thus, this advancement in sulfur isotope analysis expands its application in bioarchaeology, providing an unconventional yet critical tool to better understand industrialization and its significance to past and present communities.

106 TO WHOM IT BELONGS – FINDS IN THE LIGHT OF DIVERSE BURIAL CONTEXTS IN THE NEOLITHIC PERIOD

Theme: 1. Widening perspectives in material culture studies
Organisers: Anja Behrens (Lower Saxony Inst. of Historical Coastal Research, Wilhelmshaven) – Daan Raemaekers (University of Groningen) – Moritz Mennenga (Lower Saxony Inst. of Historical Coastal Research, Wilhelmshaven)
Keywords: Neolithic Europe, Burial tradition, Grave goods, Social concepts
Format: Discussion session

SESSION ABSTRACT

Finds from burial contexts have traditionally led to the assumption that they were intentionally deposited as accompaniments to the deceased. However, in recent decades, investigations have increasingly adopted a broader interpretative view. At megalithic sites, for instance, artefacts are not only recovered from within grave chambers but also from passages and surrounding areas—such as atop or below mounds, adjacent to boulders, or within pits near the monument. Both the features themselves and, in particular, the material remains, point to different activities that once took place at these sites and further, raises questions about the complexity of practices associated with these locations. To what extent can deposits in burial context actually be linked to funerary rites, or do they reflect other ritual or social activities? This session seeks to examine whether different traditions and intentions are discernible in the artefact assemblages associated with burials—paralleling the diversity observed in complex grave architecture. We are especially interested in contexts where burial-related finds occur in association with varied architectural or spatial features. Are there identifiable patterns in the spatial distribution or composition of these assemblages? Furthermore, how should depositions located outside burial chambers or grave pits be interpreted in terms of their significance and function? Given that such aspects have often been overlooked in previous research, we particularly welcome contributions presenting new findings, contexts, or interpretative approaches. To enable cross-cultural comparison, the session focuses on the Neolithic period in Northern and Central Europe.

CONTRIBUTION ABSTRACTS

848. Hammar - an Early-Middle Neolithic (3700-3200 BC cal) multi-functional central gathering place in Scania, Southern Sweden

Authors: Magnus Artursson (Swedish Historical Museums)
Format: Oral

At Hammar in northeastern Scania, southern Sweden, a multi-functional central place including a sacrificial bog with depositions of ceramic vessels, flint and stone tools, fragments of human skulls and remains from butchering and processing of meat, bones and antlers from cattle, sheep, goats and pigs have been excavated during two field seasons 2024-2025. Also, waste in the form of ceramics and from the production of the stone and flint implements have been found, implying a close connection between everyday work and ritual activities. Close by the bog, ritual pits placed in a U-formed formation, combined with remains of free-standing wooden poles and façades, a small cult building and an inhumation burial have been identified. The site has been interpreted as a specialized gathering place for a local group of the Early Neolithic Funnel Beaker Culture (FBC). The combination of a sacrificial bog with ritual deposits and waste, an inhumation burial and features and constructions with ritual functions, implies a complex combination of activities at the site. Specialised ritual activities, butchering and feasting, burials and depositions of fragmented human skulls have been combined with everyday activities in the same space over hundreds of years, showing a diversified attitude towards different aspects of life and death. Interestingly, the Hammar site is situated just a few kilometers from a number of more or less contemporary passage graves at Fjälkinge with communal burials and large deposits of ceramics with great similarities with some of the vessels from Hammar. This implies some kind of division and versatility of attitudes concerning the processing and handling of ritual aspects and the dead. By comparing these different sites, questions how sacrificial depositions in bogs, butchering, feasting and other ritual activities can be linked to funerary rites can be discussed.

393. Pottery everywhere – diverse deposition traditions at megalithic graves in Wanna, dist. Cuxhaven, Germany

Authors: Anja Behrens (Lower Saxony Inst. of Historical Coastal Research, Wilhelmshaven) – Moritz Mennenga (Lower Saxony Inst. for Historical Coastal Research, Wilhelmshaven)
Format: Oral

Since 2019, a group of exceptionally well-preserved megalithic graves of the Funnel Beaker Culture has been the focus of research. The sites are located in the extensive bog area of Ahlen-Falkenberg (Wanna, district Cuxhaven) at the southern North Sea Coast in Northwest Germany . Due to the bog cover they have been significantly protected over thousands of years since their construction. Within a few excavation campaigns on three megalithic passage graves, complex architecture could be documented, and diverse find material retrieved from the structural elements, but also the surroundings of the sites. Finds in the chambers indicate active burial practices, while shattered pottery in the entrances suggests repeated use. Furthermore, scattered pottery and flint fragments around the monument emphasize activities occurring outside the chambers. Most recently, in 2025, the site of Wanna 1591 was further investigated. Particularly the protective outer construction of the monument—a complex composition of stone, sand, and gravel—revealed additional insights. Within the lower sand layers, covered by a massive stone packing, several vessel depositions were uncovered. Currently, it appears that only parts of pottery vessels were deposited, for example, half a Funnel Beaker or a quarter of a richly decorated bowl. Since these depositions are associated with the outer construction, their placement during the grave-building process can be assumed. How can these finds be interpreted in relation to the chamber depositions? Do we observe different activities and meanings in the use of objects? What does this tell us about Funnel Beaker society? With our contribution, we would like to present our results with focus on these questions.

2360. Non-burial ritual and mundane activities at the megalithic tombs in the Netherlands: patterns and interpretations

Authors: Daan Raemaekers (University of Groningen)
Format: Oral

The megalithic tombs in the Netherlands, a group of 88 tombs of which 54 are still present, have been researched quite intensively in the 20th century. As a result, we are relatively well informed about about tomb typology and ceramic chronology. So far, less attention was given to the use of these locations beyond their use as tomb. What evidence is there for ritual and mundane activities below, in or beyond the mounds? And to which periods do these archaeological remains date? Recent test trenches in two of the tombs yielded new information about activities that were carried out before, during and after the construction of the mounds. In the presentation, I will connect these new finds to the publications. This allows me to identify patterns and to see singular activities. The presentation will also focus on the continued but different use of these tomb locations by later groups, especially Corded Ware groups.

948. Funerary practices in the Mesolithic–Neolithic transition: evidence from the Cueva de los Murciélagos of Albuñol (Granada, Spain)

Authors: Pedro Henríquez-Valido (Área de Prehistoria - Universidad de Alcalá) – Jonathan Santana (Universidad de Las Palmas de Gran Canaria) – Rafael M. Martínez-Sánchez (Universidad de Córdoba) – Miriam Cubas (Área de Prehistoria - Universidad de Alcalá) – Maria Herrero-Otal (Universidad de La Laguna) – Blas Ramos-Rodríguez (Universidad de Granada) – Francisco Martínez-Sevilla (Área de Prehistoria - Universidad de Alcalá)
Format: Oral

Insects has become increasingly important for reconstructing human–environment interactions and funerary practices in archaeological sites, yet its application remains uneven across European prehistoric sites. This contribution presents new archaeoentomological evidence from the Cueva de Los Murciélagos of Albuñol (Granada, Spain), a karstic cave located approximately at 7 km inland from current southeastern Iberian coastline. It showa an exceptional preservation of organic materials by desiccation, dated from the Mesolithic to the Bronze age. Our analysis focuses on insect remains recovered from a systematic sediment sampling in the cave, identifying Diptera puparia and Coleoptera exoskeleton fragments associated primarily with cadaveric decomposition processes. The ecological preferences of these species and the climatic conditions inside the cave provide insights into the timing of corpse deposition and funerary practices from the Mesolithic to the Neolithic. In particular, the predominance of early-colonising Diptera and the absence of late-colonising Coleoptera suggests rapid access of insects to the bodies after death, pointing to primary deposition rather than prolonged pre-burial manipulation or outdoor desiccation. In addition, secondary insect taxa linked to food storage pest have been interpreted as accidental introductions related to the funerary behaviour alongside vegetal grave goods (e.g. baskets). Radiocarbon dating of selected insect remains situates part of the assemblage from the 5th millenium cal BC, while other remains extend back to the 10th millennium cal BC. This remarkably deep and continuous insect record reframes the cave as a long-term funerary space. Our results reflect that Archaeoentomology can offers an interpretative perspective for examining the biography and transformation of ritual spaces within archaeologically complex contexts.

989. Intentional Offering or Accidental Intrusion: A Flint Blade in the Burial of a Child

Authors: Tomasz Oberc (Institute of Archaeology and Ethnology, Polish Academy of Sciences)
Format: Poster

A Neolithic grave of 9–10-year-old child was discovered in 1967 at the Dziekanowice site in Lesser Poland (Kruk 1969). The skeleton's position and associated pottery are closely linked to the local variant of the Neolithic Lengyel Culture (Pleszów-Modlnica Group). However, a macrolithic flint blade was also found in the grave, and its attribution to this cultural group is uncertain. While

production and use of such blades are known from other sites of this culture, their presence - especially specimens made from non-local flint - is rare for this period. These unusual features, alongside the common association of similar tools with later contexts in nearby sites, raises questions about rare finds in burial settings. In this case, earlier archaeological observations reported that the skeleton was disturbed in the area where the flint tool was found. Additionally, the site had been disrupted, with more recent materials recovered from the topsoil, though not directly adjacent to the grave. This poster will examine various layers of interpretation of the artifact - as imported material, technological product, used tool, and grave good for a child - to argue for or against its intentional deposition and to illustrate the complexities of Neolithic burial practices. Kruk J. 1969, Sondażowe badania wykopaliskowe w rejonie wideł Nidzicy i Sancygniówki, Sprawozdania Archeologiczne 21, 57-65.

1488. New funeral monuments of the late Eneolithic in Central Bohemia

Authors: Milan Kucharik (Labrys o.p.s.) – Aleš Káčerik (ARCHEO Sever o. p. s.) – Josef Mašek (Labrys o.p.s.)
Format: Poster

Current rescue research in 2024 – 2025 on the construction of the D7 motorway (Kladno district, CZ) between towns Slaný and Panenský Týnec brings new findings of little-known or completely new types of burial monuments from the Late Eneolithic period, the Corded Ware culture and the Bell Beaker culture. In addition to the usual groups of flat skeletal graves, we uncovered two mounds of the Corded Ware culture with chamber graves and a variable wooden structure with interesting wooden details in the area of village Třebíz and two other mounds of the Bell-shaped Cup culture and probably a cult area next to them. In the area of village Hořešovičky we discovered two unusual cremation graves of the Bell Beaker culture with a burnt wooden structure – a palisade covered by a doubt, which were located within a larger area with a ditch enclosure in a dominant position. Next to them, there are a number of other graves of the culture with corded pottery, among them one with rich equipment with shell decorations. The discovered sites clearly indicate the placement of funerary monument complexes on flat elevations with a good view of the landscape. These monuments are directly connected to other burial grounds from the Early Bronze Age, the La Tène period and the Early Middle Ages.

107 BEYOND MONUMENTALITY: REFRAMING LARGE-SCALE ARCHITECTURAL FEATURES THROUGH MATERIALITY, MEMORY AND LANDSCAPE

Theme: 1. Widening perspectives in material culture studies
Organisers: Elise Luneau (CNRS, UMR 8215) – Regina Uhl (—)
Keywords: Eurasia, Monumentality, Large-scale architecture, Communal practice, Memory, Landscape
Format: Regular session

SESSION ABSTRACT

Large-scale architectural features - ranging from earthen burial mounds and long barrows to cairns, orthostats and other monumental constructions - represent some of the most visible and enduring outcomes of collective human activity. While such phenomena are attested globally, Europe and Central Asia provide particularly rich contexts for examining diverse traditions of large-scale architecture and their social, ritual, and mnemonic dimensions. This session approaches these features as dynamic, hybrid phenomena emerging at the intersection of materiality, social practice and landscape. Burial mounds and related constructions, whether lithic or earthen, become sites of collective memory and social significance through repeated engagement over time - deposition, ritual performance, and long-term interaction with communities. As enduring points of reference within the landscape, they structure social identities, genealogical memory and mythopoetic narratives, illustrating how cooperative agency and multi-generational use transform physical structures into lasting markers of communal practice and remembrance. By integrating "hardware" (architectural form and construction) with "software" (depositions, human remains, grave goods) and ritual or performative dimensions, the session encourages a critical reassessment of established interpretative frameworks. Theoretical perspectives such as hybridity, memoryscapes and collective agency offer tools for evaluating which aspects of past models remain productive, which may need reconsideration, and how methodological approaches can better account for the material, social and cognitive processes embedded in these constructions. We welcome contributions that provide new theoretical, methodological or regional insights, particularly from Europe and Central Asia, but with relevance for comparative studies elsewhere. By situating large-scale architectural features within long-term social practices and contemporary interpretation, the session aims to advance understanding of monumentality, memory and the enduring impact of collective architectural achievement.

CONTRIBUTION ABSTRACTS

1848. Upright Stones from the Nuratau Mountains (Uzbekistan): Monumentality, Memory, and Pastoral Landscapes in Central Eurasia

Authors: Elise Luneau (Centre national de la recherche scientifique, Trajectoires) – Nona Avanesova (Samarkand State University)
Format: Oral

Upright stones constitute one of the most enduring forms of monumental architecture across Eurasia. Their durability and visibility have allowed them to structure landscapes over long timescales, embedding social memory, ritual practice, and collective identities within specific places. This paper presents the first documentation of fourteen previously unrecorded upright stones from the Nuratau Mountains in central Uzbekistan. Based on archaeological survey, targeted test excavation, and GIS-based spatial analyses, the study examines their material characteristics, spatial distribution, and associations with funerary structures, water sources, grazing areas, and other archaeological features. Although absolute dating is currently unavailable, comparative analysis situates these monuments within a broad chronological framework spanning the Neolithic to the Bronze Age. Approached as hybrid monuments combining architectural "hardware" (monolithic stones, pavements, associated cairns and enclosures) with "software" (funerary contexts and repeated engagement), the Nuratau upright stones are interpreted as active elements in pastoral landscapes. Their placement suggests roles in marking resources, routes, and territories, while their frequent proximity to burial features points to their participation in mortuary practices and ancestral memory. Rather than functioning as isolated markers, these stones appear to have structured localized memoryscapes through cumulative, multi-generational use. Drawing on concepts of hybridity, collective agency, and long-term monument biographies, this paper advances debates on monumentality and memory, demonstrating how modest yet persistent architectural forms contributed to the long-term construction of social identities in Central Asian pastoral societies.

114. The last monument? segmentary and summative Silbury Hill (Wiltshire, UK)

Authors: Gerald Wait (Independent researcher)
Format: Oral

Silbury Hill is a 40-metre (130 ft) high Late Neolithic conical mound situated by the headwaters of the River Kennett, a major tributary of the River Thames in southern England. It is said to be Europe's largest prehistoric earthen 'round mound.' The interpretive thrust of recent work emphasised the stages in the growth of the monument from a small mound, rather than its final form. This paper reports upon the results of a field-based re-study of the mound by the presenter and colleagues between 2019 and 2023, and a first full aerial photogrammetric survey. New close observations of the external surfaces of the mound underline a view that interpretation needs to focus not only upon the successive early versions of the Silbury mound, or upon possible much later alterations, but rather upon aspects of its final form that have not hitherto received the attention they merit. These include observations that indicate the way in which the culminative phase of the mound was constructed: in design, building and 'affects' terms. Moreover, attention can also be drawn to possible cultural explanations for that final version of the mound as a deliberately facetted, nine-sided structure. In conclusion, the author argues for a segmentary as well as a summative 'reading' of the significance of this final form.

545. Constructing Monumentality and Memory: The Social Life of Early Neolithic Ditch Enclosures

Authors: Nikolina Nikolova (National Archaeological Institute & Museum - Bulgarian Academy of Sciences)
Format: Oral

Ditch enclosures are a widespread feature of European prehistory and appear in Southeast Europe with, or shortly after, the neolithisation of the region. Recent geophysical surveys have shown that many of the earliest Neolithic settlements in the Balkans were enclosed by single or multiple ditches, often arranged in complex systems. While monumentality is usually associated with tombs, buildings, walls, or megalithic constructions, it is essential to reconsider what Neolithic communities themselves perceived as worthy of sustained investment. Large-scale undertakings such as ditch construction required considerable time, labour, and coordination and were unlikely to be trivial or purely functional. Particular importance seems to have been attached to the places selected for settlement and enclosure. Through continued engagement, these locations acquired memorial qualities, transferred to the features and associated practices. This presentation focuses on ditch-digging practices documented at several Early Neolithic sites in Bulgarian Thrace. Archaeological evidence indicates that these ditches remained in use over long periods and were subject to regular maintenance. Episodes of digging, re-filling, and re-cutting suggest intentional and well-organized communal efforts to maintain social coherence and shared identities across generations. As enduring features within the landscape, ditches functioned as stable points of reference, structuring spatial organisation and collective memory. Clear patterns in depositional practices recur throughout different phases of ditch use, within individual sites, and across the region. Whole or deliberately broken pots were frequently placed at ditch bottoms, while linear deposits of burnt daub were arranged longitudinally, forming successive layers. The repetition of materials and arrangements points to shared traditions and ritualized practices embedded in the life histories of these features. Taken together, these observations highlight ditch enclosures as dynamic large-scale constructions whose significance lay not only in their physical form, but in the long-term practices through which they became central elements of Early Neolithic memoryscapes.

1245. Affordances of Monumentality: XR Approaches to Movement, Light, and Attention in Neolithic Megalithic Passage Graves

Authors: Noah Steuri (McDonald Institute for Archaeological Research, University of Cambridge)
Format: Oral

Passage graves are among the most enduring architectural markers of Neolithic collective building practices in Northwestern Europe. Functionally, their interior arguably served mainly as repositories for ancestral remains, and access was likely restricted to specific moments concerned with the deposition, reordering, or veneration of the dead. Their architecture reveals deliberate

intentions to shape experience: movement through the monument is physically constrained, requiring visitors to bend, squeeze, and proceed slowly through a sequence of thresholds, sometimes marked by carved motifs. Architecture, "rock art", and bodily movement thus work together to guide perception, making entry into the monument a highly choreographed experience. A key challenge for researching their experiential affordances is that these monuments rarely preserve their original sensory and spatial conditions. Modern intrusions and electric lighting fundamentally alter visibility, atmosphere, and movement. To address this, I present the Immersive Sensory Spatial Archaeology (ISSA) framework, integrating phenomenology and sensory archaeology with theories of architectural affordances and intentionality, operationalised through immersive Extended Reality (XR). ISSA does not claim access to the inner thoughts or culturally specific meanings of Neolithic individuals. Instead, it generates reproducible experiential data on how architectural form structured movement, illumination, and visual attention. XR enables the controlled restoration of sensory conditions (e.g. darkness and dynamic firelight) with high levels of immersion. Integrated eye-tracking and motion capture allow measurement of gaze, fixation, head movement, and posture across multiple participants, producing comparable response patterns rather than single, subjective impressions. The framework is demonstrated at the passage grave of Gavrinis (Brittany, France), showing how XR can advance the study of monumentality by better accounting for the spatial and experiential intentions embedded in large-scale prehistoric architecture.

468. Marks of Devotion: Pilgrims, Graffiti, and the Memoryscapes of Rome's Christian Catacombs

Authors: Christina Videbech (University of Bergen and Aarhus University)
Format: Oral

Monumental architectural features such as burial chambers and monuments are often understood as enduring markers of collective activity and memory formation. The same goes for the vaste network of Christian catacombs below Rome. Yet, smaller-scale human interventions within these spaces - particularly inscriptions, graffiti, and devotional markings - offer a complementary lens on social practice, memory, and identity. This paper examines late antique and early medieval Christian graffiti in the catacombs of Rome, focusing on how pilgrims and visitors both responded to and actively shaped these subterranean sacred spaces. By incising names, prayers, drawings, and other personal marks, individuals inscribed their presence into the fabric of the catacombs, embedding personal devotion, social affiliation, and mnemonic engagement within the enduring structures. Thus, these layered "memory scapes" illuminate the dynamic interaction between architecture, ritual performance, and collective identity. Approaching graffiti as both material inscription and performative act, the study highlights how these markings contributed to the social life of the catacombs, mediating between individual agency and communal memory. Furthermore, by integrating the epigraphic evidence with the archaeological and ritual contexts, the paper demonstrates that the catacombs were not merely static containers for burial but active sites of religious negotiation and long-term memory-making.

455. Persistent Landscapes: Reassessing the Bronze Age Burial Mounds of NE Romania through Geospatial Big Data and Collective Memory

Authors: Casandra Brasoveanu – Andrei Asandulesei – Radu-Alexandru Brunchi (Alexandru Ioan Cuza University of Iasi)
Format: Oral

The landscape of Northeastern Romania is defined by an exceptional density of burial mounds. Recent high-resolution remote sensing (LiDAR) and multi-temporal cartographic analyses have identified nearly 1,800 such sites, the majority of which were erected during the Early Bronze Age by the Yamnaya communities and re-utilized up until medieval times. This study moves beyond the "hardware" of these monuments—their morphology and spatial distribution—to explore their role as enduring anchors of social and mnemonic significance within a long-term perspective. By integrating "big data" geospatial analysis with toponymic studies and local oral traditions, we argue that these features represent a dynamic, hybrid phenomenon. While geophysical surveys and archaeological data confirm the physical reuse and re-adaptation of these mounds from the Bronze Age through the Early Medieval period, their significance extends into the modern era. We explore how these monuments have persisted in the collective memorial through specific toponymy and local narratives, illustrating how physical structures are transformed into lasting markers of communal practice and mythopoetic identity. The research highlights a remarkable continuity; despite the temporal distance, the local communities have maintained a cognitive connection to these landmarks, integrating them into the contemporary cultural landscape. By reframing these 1,800 burial mounds as a "memoryscape" rather than static funerary sites, this paper advocates for an interpretative framework that accounts for both the material "software" of past rituals and the enduring social impact of collective architectural achievement. This approach is particularly urgent as these vulnerable heritage assets face increasing threats from intensive modern agriculture.

1910. Iron Age Barrows in Estonia — Collective, Up to a Point

Authors: Pikne Kama (University of Tartu)
Format: Oral

Barrows in Estonia are circular or elongated sandy mounds surrounded by a shallow ditch, typically found in dry pine forests near water bodies. Barrows began to appear in eastern Estonia around 400 AD. A typical barrow contains the cremated remains of multiple individuals, and barrows most often occur in clusters. Consequently, both single barrows and barrow cemeteries functioned as collective burial sites. Prior to recent fieldwork, more than 1000 barrows were documented across 141 sites in Estonia. New fieldwork

conducted by the author in 2025, based on lidar-derived terrain models, has yielded an additional 117 barrows and 43 new sites. This represents an increase of approximately 12% in the total number of barrows and over 30% in the number of known sites. The results indicate that small-scale sites – often comprising only one or a few barrows – are more common than previously assumed. Several newly identified locations consist of a single barrow. This raises important questions. Do the isolated barrows express individuality in society and individuality in death? Alternatively, could a single barrow have served an entire community, reducing the need to construct additional barrows nearby? It is difficult to assess when a barrow was considered "full" or why a new barrow or an entirely new barrow cemetery was established in the vicinity. Current evidence from studied sites suggests that barrows in clusters were used for approximately 150 years. Although barrow cemeteries eventually ceased to serve as burial grounds for cremation burials, the memory of them and their significance persisted long after their primary use. In several cases, later inhumation burials dating to the Middle Ages (13th–16th centuries) have been discovered within earlier barrows. The presentation will explore how newly identified barrows and their spatial patterns contribute to interpretations of individuality and collectivity within the society of barrow users.

433. Blood on the Stones: Weaving Memory, Ritual, and Identity in a Transhistorical Sacred Landscape of the South Caucasus

Authors: Przemyslaw Polakiewicz (Tetritskaro Local Archaeologiacal Project and Iniciative) – David Gagoshidze (The University of Georgia)
Format: Oral

The presented project outlines an archaeological research programme conducted in the territory of the Tetritskaro Municipality in Kvemo Kartli, Sakartvelo (Georgia).Within the framework of the Tetritskaro Local Archaeological Project and Initiative (T.L.A.P.I.),several significant discoveries have been made.The research aims to analyse a cultural landscape shaped by millennia of human activity in a region situated at the interface of civilizational influences from the Middle East and the Eurasian Steppe. This territory maintained long-distance connections via important communication routes, at times associated with the Silk Roads. Previously unknown megalithic forms within the Caucasus region (e.g. propped stones),unrecorded stelae,possible sacrificial tables,and a rich assemblage of artefacts (pottery, obsidian,lithics, glass, and bone) were documented during archaeological reconnaissance.The preliminary construction of a new chronology for selected locations,including the Birtvisi Canyon,represents the outcome of the initial phase of the research.The study has fulfilled its primary objective of creating a coherent catalogue of monuments intended to support the management and protection of endangered heritage.Particular attention is given to the so-called "landscape of memory", comprising unstudied rock art (engravings, cup marks), local toponyms, and oral traditions related to historical events, which form an integral part of the analysis and enrich the presented survey.Based on the collected data, and prior to more intrusive fieldwork, several unexpected yet well-documented observations were formulated. Notably, some stone features, such as menhirs and offering stones located near churches, remain in active use, with ritual practices, including animal sacrifice, still taking place today.These observations allow the project to address the long-term weaving of memory, ritual, and identity within a sacred landscape whose meanings have been continuously renegotiated rather than interrupted.The survey methodology follows established international standards and includes the recording of GPS coordinates, spatial data analysis,photogrammetric documentation, and the use of a unified recording system.A digital database of documented artefacts and features has also been created

2673. Beyond Burial: The Reuse of Prehistoric Mounds in the Serbian Banat

Authors: Dragan Jovanovic (City museum Vršac)
Format: Oral

The landscape of today's Banat has undergone significant physical changes in the past 150 years. Despite this, prehistoric earthen mounds, which occur in large numbers, still represent significant geographical markers in the modern landscape. Their arrangement and position to a significant extent reflect the former morphology of the plain landscape with endless lakes and swamps, which is mainly how we interpret the unusual physical connection with the later archaeological contents. Firstly, we refer to the connection between prehistoric mounds and the so-called Megaforts of the Late Bronze Age, which can be interpreted in terms of similar motives regarding the choice of location. On this occasion, we will show examples of the contemporary use of these monumental monuments, reexamine the motives and attitude of the local population, where strongly expressed religious taboos can still be observed. Several large waves of migration, which have occurred over the last hundred years, have completely transformed the demographic landscape, offering an interesting perspective on the social interactions of certain groups with diverse ethnic and geographical origins.

1351. Barrows of Southern Ukraine: The Lost Heritage

Authors: Denys Sikoza (Kherson Regional Inspectorate for the Protection of Sites) – Oleksandr Symonenko – Olena Dzneladze (Institute of Archaeology of NAS of Ukraine)
Format: Oral

Steppe of the Kherson region is the area of most famous archaeological sites of ancient Ukraine – the barrows, tombs of ancient nomads. That is the place where two unique archaeological and ecological sites are located: Dolyna Kurhaniv (Barrow Valley) and Lysiachi Mohyly (Foxy Barrows). Both have the state rank "site of national importance". Dolyna Kurhaniv is located on the coast

of the Black Sea, on a steppe plain with salt marsh lakes. A total of more than 300 barrows from 7 to 0.5 meters high have been recorded here. The barrows are ranging along the coast of Yahorlyk Bay and stand in two groups along the bank of the desiccated Dnieper tributary. Lysiachi Mohyly are located on a small plateau, bounded from the west by the Tendra Bay of the Black Sea and surrounded by three salt lakes, within the protected zone of the Black Sea Biosphere Reserve. The site consists of 60 barrows along the seashore. Around of two highest mounds of 4.4 and 2.2 m high 58 smaller stand. The mounds were not plowing and are covered with intact steppe vegetation, valuable for scientific study. In addition, the endemic plants representing flora of the steppe, which has disappeared almost everywhere due to the anthropogenic factor, survived on the unplowed mounds. Now both sites have lost their pristine appearance. Russian occupiers dug many kilometers of trenches along the seashore between the mounds. Many of them are damaged by dugouts; the vulnerable vegetation of the steppe was torn by tank tracks and flooded with a fuel. What artifacts were unearthed during the spontaneous digging of the barrows and where they gone – no one can say now but it is clear that all of them are forever lost to science and culture.

212. Persistent Monuments: A Case Study in Reuse of Prehistoric Mounds in Southern Dalmatia

Authors: Filomena Sirovica (Archaeological Museum in Zagreb) – Dinko Tresić Pavičić (Kaducej Ltd.)
Format: Poster

Burials beneath mounds constructed of stones and sometimes earth constitute a distinct and persistent funerary phenomenon specific to the entire eastern Adriatic. This practice emerged at the onset of the third millennium BCE and continued throughout the Bronze and Iron Ages. The function of these mounds was not limited to their initial construction, and in southern Dalmatia, they exhibit a pronounced pattern of funerary reuse in all subsequent periods. Available data show that later burials in the stone mantle of the mound are recorded on a large number of Bronze Age mounds, with interments starting already in the Bronze Age. They persisted during all subsequent periods, with a particular frequency in the late medieval and early modern periods, which attests to a remarkably long-term continuity of this specific practice. In light of this regional framework, an analysis was conducted of a stone burial mound excavated at the Obličevac site. The excavation identified a primary burial of an adult male within a stone cist, dated to the Late Bronze Age (13th–12th centuries BCE). This phase was established via radiocarbon analysis and is further supported by the characteristics of the associated finds. The funerary reuse, with three graves secondary buried into the mantle of the mound, was dated in the late medieval and early modern periods (14th–17th centuries CE), as confirmed by additional radiocarbon dates. Given that these features align with the widespread regional phenomenon of reusing prehistoric mounds, the authors will examine both the methods and motivations behind prehistoric mound construction and their subsequent funerary reuse, and demonstrate broader considerations of this phenomenon in the late medieval and early modern period, which can be associated with contemporaneous cemeteries and graves with tombstones of “stećak” type.

386. Interdisciplinary investigation of ancient mounds with medieval churches in Szentes, Hungary

Authors: Ádám Bede (HUN-REN Centre for Ecological Research) – Máté Stibrányi – Gábor Mesterházy (Hungarian National Museum) – Balázs Deák (HUN-REN Centre for Ecological Research)
Format: Poster

Across the Great Hungarian Plain, churches from the Middle Ages (Árpád Era) were often built on prehistoric burial mounds (kurgans). In the study area, within the administrative boundaries of Szentes – a typical agricultural town – we surveyed six ancient kurgans that conceal medieval church foundation and a cemetery established around the churches. The mounds are Besenyő-halom, Kajáni-Temető-halom, Láp-halom, Szentlászló halma (destroyed), Tere-halom, and the Church Ruin of Ecser). These earth monuments are all Yamnaya kurgans dating to the Late Copper Age, and have several historical memories from the past five thousand years. The diverse history of the mounds is reflected for example in their multiple names. Within an interdisciplinary project, we conducted geophysical (non-invasive magnetometer survey), geomorphological, landscape historical and botanical investigations on the kurgans. For the landscape historical analyses, we collected and evaluated available the historical maps, aerial photos, local and archaeological literature. The mounds are not only significant from a heritage protection perspective, but also have outstanding nature conservation values, as their surfaces often preserved disturbed, yet still valuable loess vegetation, hosting typical dry grassland species and rare weeds. Since this is a relatively common phenomenon in the Great Hungarian Plain, it can be assumed that the sacrality of kurgans and churches was interconnected in the landscape perception (location choice) and traditions (living customs) of medieval communities. The concentrated presence of burial mounds in this otherwise flat landscape –similarity to sacred hills and their protected position (geomorphology, strategic/orientation functions) – may have reinforced this perception. From a heritage conservation perspective, these complex archaeological features play an outstanding role, therefore, their protection (for example through, declaring them as archaeological sites with special status) is particularly justified.

1537. Phrygian Tumuli in a Multi-Layered City: Monumentality, Memory, and Landscape in Ankara

Authors: Ela Alanyali Aral (METU) – Yiğit Erbil (Hacettepe University) – Buket Ergun Kocaili – Gizem Deniz Güneri (METU)
Format: Poster

The tumuli located in the city center of Ankara represent the mortuary tradition of the Phrygians, who entered Anatolia through Thrace in the early first millennium BCE. Rather than simple burial mounds, these monuments materialized social memory and

authority within the landscape. Through their scale, visibility, and deliberate placement, Phrygian tumuli transformed natural topography into a cultural and symbolic environment. The Phrygian cultural region, extending from the Phrygian highlands to central Anatolia, positioned Ankara alongside major centers such as Gordion within a network of political and ritual landscapes. Early records and excavations identified a limited number of tumuli, but recent research using historical aerial imagery and mapping demonstrates that the funerary landscape around Ankara exceeds one hundred mounds. Today, modern urbanization has incorporated many of these monuments into the fabric of a multi-layered city, where ancient funerary markers coexist with contemporary settlement. The spatial distribution of the tumuli reflects intentional monumentality. Their locations correspond closely with ridgelines, slopes, water courses, routes, and visibility corridors, as well as nearby settlements and cult areas. These mounds were not isolated graves but territorial and mnemonic markers that structured movement across the landscape. By controlling sightlines and approach paths, the tumuli directed how individuals encountered the land, producing a ritualized experience of space. This paper analyzes the locational principles of the Ankara tumuli through multi-layered spatial mapping. The study argues that the tumuli functioned as material anchors of collective memory and as symbolic statements of authority. Within the long-term development of Ankara, they demonstrate how monumental architecture can organize landscape perception and embed political meaning into everyday space.

1794. Cultural Interaction at the Western Edge of the Trzciniec Cultural Circle. Evidence from a Barrow Burial at Ostrowąsy, Poland

Authors: Mateusz Matula (Institute of Archaeology, University of Wrocław) – Agata Hałuszko (Institute of Archaeology, Maria Curie-Skłodowska University in Lublin | Archeolodzy.org Foundation) – Radosław Jarysz (Archaeological Museum in Wroclaw) – Wojciech Bronowicki (Institute of Archaeology, University of Wrocław) – Krzysztof Dołbizno (ASAP Akademickie Stowarzyszenie Archeologii Podwodnej)
Format: Poster

The Trzciniec Cultural Circle constituted one of the most extensive social formations of the Early and Middle Bronze Age in the second millennium BC, extending from central Poland to the eastern margins of present-day Ukraine. Within this cultural horizon, western and eastern zones can be distinguished. The present study focuses on the western zone, located at the interface with other cultural groups of Central Europe. In 2023, excavations were carried out at the eastern barrow at Ostrowąsy, site 15, situated on the borderland between Lower Silesia and Greater Poland, with the aim of determining the chronology and anthropogenic character of two mounds identified in the field and through LiDAR imagery. A trench opened in the southern part of the barrow revealed a stratigraphic sequence related to its construction, while a stone core recorded in the central part lacked additional architectural elements. Several stratigraphic levels within the core yielded numerous ceramic fragments, most belonging to a single vessel, a brownish grey vase decorated with horizontal incised lines. The stylistic features of the pottery indicate its affiliation with the Trzciniec horizon, whereas technological traits, including the presence of mica temper, point to influences from the Únětice culture dominant in Lower Silesia at the time. Charcoal samples from the lowest layer of the core were submitted for radiocarbon dating, and a bone fragment from the same level was selected for bioarchaeological analysis carried out within a project funded by the National Science Centre, Poland (grant no. 2023/48/C/HS3/00020). The results confirm the anthropogenic character of the eastern barrow and its dating to the Early Bronze Age. The monument represents one of the westernmost barrow graves associated with the Trzciniec horizon and one of its earliest examples, contributing to a better understanding of regional variability in funerary practices and sepulchral architecture.

2527. Large-scale water infrastructures in drylands as durable anchors of mobile lifeways: A case study from Sudan

Authors: Cornelia Kleinitz (Humboldt-Universität zu Berlin, Institute of Archaeology, AKNOA) – Alfatih Mohamed Ali Saeed (University of Khartoum) – Hassan Ebeid-Allah (Musawwarat Community Council)
Format: Poster

Large-scale water infrastructures are known from various parts of Africa, particularly from drylands. Hundreds of so-called Hafirs, circular monumental artificial water reservoirs with earthen walls, were dug to harvest water from temporary river beds in (ancient) Sudan. These water reservoirs were able to store large amounts of water for months, forming the basis of sustained use of the land by mobile, pastoralist populations long after the end of the rainy season. Their functioning relied on precise knowledge of seasonal weather phenomena and drainage patterns in the landscape. Their construction will have been a collective endeavour and they seem to have been maintained and (seasonally) used for long periods of time. Some appear to have been co-opted by the Kushite state from the mid-first millennium BCE onwards, when temples were constructed in their immediate vicinity and cults possibly alluded to the (royal and/or divine) control of water as a prerequisite for life and fecundity. The state may have contributed to their construction or extension, such as in the case of the Great Hafir at the ancient ceremonial centre of Musawwarat es-Sufra, which measured nearly 250m in diameter and 15m in depth. While their structural characteristics and economic role(s) in pastoralist societies have been studied before, this contribution examines such structures in respect to their role(s) as ‘sites of collective memory and social significance through repeated engagement over time’, from the day-to-day to seasonal and symbolic engagement to multi-generational use. Recent studies in collaboration with local communities at and around the archaeological site of Musawwarat es-Sufra have shown how water infrastructures – in this case mechanical wells constructed and used during the past two centuries – can be understood as ‘lasting markers of communal practice’ that act as mnemonic devices due to their centrality to pastoralist lifeways.

108 BEYOND THE HEDGES: ARCHAEOLOGICAL APPROACHES TO HISTORICAL GARDENS AND DESIGNED LANDSCAPES

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Emilia Jastrzebska (Royal Lazienki Museum in Warsaw | Polish Academy of Sciences) – Miroslav Dejmal – Michal Vágner (Masaryk University)
Keywords: Historical Gardens, Landscape Archaeology, Historical Archaeology, Cultural Heritage, Designed Landscapes, Environmental Archaeology
Format: Regular session
Affiliation: Archaeological Prospection Community

SESSION ABSTRACT

Historical gardens and designed landscapes—ranging from formal estates and pleasure grounds to colonial botanic gardens and early public parks—represent complex intersections of social status, leisure, scientific endeavor, and ecological manipulation. Yet, our understanding of these spaces is often dominated by historical records and aesthetic restoration efforts. This session seeks to move "beyond the hedges" by highlighting the vital role of archaeological investigation in revealing the hidden structures, social histories, and environmental processes embedded within these sites. We invite papers that explore diverse methodologies and theoretical frameworks applied to historical designed landscapes (circa 16th to 20th centuries). Contributions may focus on, but are not limited to: 1. Methodological Innovation: The integration of non-invasive methods (geophysical prospection, LiDAR) with invasive test-pitting and trenching to accurately define original planting schemes, path alignments, and structural foundations (e.g., fountains, statuary bases). 2. Environmental Archaeology: Utilizing archaeobotany, palynology, phytolith analysis, and soil chemistry to reconstruct specific plant communities, cultivation techniques, and changing ecological conditions. 3. Social and Cultural Interpretation: Gardens as expressions of power, identity, and exchange, including studies of colonial plant transfer, gendered spaces, and the material culture associated with gardening and leisure activities. 4. Conservation and Management: Case studies demonstrating how archaeological data informs authentic conservation and interpretation, particularly when the historical record is incomplete or misleading. This session will encourage interdisciplinary discussion, fostering a dialogue between historical archaeologists, landscape architects, environmental scientists, and conservators. The goal is to establish garden archaeology not merely as a technique for restoration, but as a critical tool for deeper cultural interpretation of human-nature relationships in the historical period.

CONTRIBUTION ABSTRACTS

2065. Urban Gardens as Cultural Practice: Perspectives from Medieval and Early Modern Sweden

Authors: Annika Nordström (National Historical Museums, Sweden | Uppsala University) – Ann-Mari Hållans Stenholm – Karin Lindeblad (National Historical Museums, Sweden)
Format: Oral

Over the past twenty years, we have examined a previously understudied yet often well-preserved and diverse archaeological record: historical gardens from urban and semi-urban contexts. The results show that gardens constituted an important part of past societies and reflected cultural practices, social organisation, and everyday life. Our research demonstrates that garden archaeology addresses questions not only related to horticulture, design and aesthetics, but also to self-sufficiency, economy, division of labour and gender relations. In this sense, garden archaeology encompasses several key dimensions of past societies. A multidisciplinary approach is essential for obtaining robust and reliable research results. In this paper, we focus on the development of urban gardens in medieval and early modern Sweden from a long-term perspective, integrating spatial design, cultivation techniques and plant use, as well as the material culture associated with gardening practices and domestic activities. The study is based on examples from large-scale contract archaeological excavations in Sweden.

224. From the Benedictine monastery garden to the English landscape park: Continuity and Change

Authors: Aja Guldåker (Kulturen)
Format: Oral

A Benedictine monastery was founded on a hill in eastern Denmark in the 1080s. This location offered fertile soil, access to water, building materials and a south-facing slope that was ideal for cultivation. A large brick monastery was constructed just north of the growing town of Lund, adjacent to important road networks. Although very little is known about the monastery gardens, archaeological and historical sources reveal the presence of waterworks to the east and southeast, a cemetery and buildings to the north, as well as some smaller structures in the surrounding area. Despite 450 years of activity, written records are sparse. During the Reformation in 1536, the monastery was burdened with taxes, but unlike many others it was not immediately dissolved. It continued to operate until 1552, after which it was granted to the king's chamberlain and left to fall into disrepair. From 1619, the district judge took over the site and carried out some repairs. Erik Dahlberg's depictions of the 1676 battles between Denmark and Sweden feature the impressive monastery ruins. Around 1700, Swedish troops blew up the remaining buildings and the ruins were used as a quarry for Lund. Although the structures disappeared, the hill became a popular walking destination. In the early 19th century, the bishop planted trees between the ponds and on the hill where the monastery walls may once have stood. Plans for fruit and kitchen gardens were abandoned due to the soil being filled with rubble. Instead, an English landscape park was established. Given the difficult subsoil, it is likely that tree planting targeted areas less burdened by debris. This landscape park raises questions about continuity: Do its paths or planted areas reflect earlier monastic layouts, preserving traces of medieval garden structures in a new form?

981. Integrated Geophysical and Archaeological Research of Historic Gardens and Landscapes in the Czech Republic

Authors: Michal Vágner (Department of Archaeology and Museology, Masaryk University) – Miroslav Dejmal (Department of Archaeology and Museology, Masaryk University | Archaia Brno z.ú., Brno) – Anna Rekemová – Jan Havelka – Peter Milo (Department of Archaeology and Museology, Masaryk University) – Michal Zezula (National Heritage Institute, Ostrava Regional Office) – František Zelinka (Regional Museum in Mikulov) – Jiří Havlice (National Heritage Institute, České Budějovice Regional Office) – Václav Kolařík (National Heritage Institute, Brno Regional Office) – Jiří Chleviš̌an (The Museum of the Bohemian Forest in Tachov)
Format: Oral

This paper presents selected applications of geophysical prospection in the investigation and restoration of historical gardens and landscaped heritage sites in the Czech Republic. It focuses on integrating non-destructive geophysical methods — primarily ground-penetrating radar, complemented in some cases by magnetometry — into the planning of archaeological research and the revitalisation of protected cultural monuments. The contribution discusses several case studies from castle and chateau parks and gardens, in which a geophysical survey served as a key step between archival study and targeted archaeological excavation. The results demonstrate that non-invasive prospection can successfully identify buried garden layouts, former communication networks, water-management features, demolished garden structures, and later disturbances. Special attention is paid to situations in which geophysical results directly informed excavation strategies and restoration decisions, reducing destructive interventions and improving the precision of heritage management measures. The presented examples illustrate that the close integration of geophysical survey and archaeological verification represents an efficient and sensitive approach to the exploration and renewal of historic gardens and monument sites.

267. Bathtubs and Pyramids in Royal Łazienki in Warsaw. Localization research of non-existent structures and objects in an eighteenth-century landscape residence

Authors: Arkadiusz Cegliński (Faculty of Archaeology, University of Warsaw) – Wiesław Małkowski (Independent researcher)
Format: Oral

This paper is devoted to research into the history of the Royal Łazienki Park in Warsaw, a classicist residence founded by King of Poland Stanisław II Augustus. This 18th-century palace and garden complex is one of the richest in this part of Europe in terms of ancient motifs, which are incorporated into the architecture and decoration of the palaces and garden pavilions. The paper will present the results of research into the history and location of no longer existing structures and objects located in the 18th century on the grounds of the Warsaw residence. This includes the Pyramidal Guardhouse, a guardhouse which form was inspired by ancient tombs, and the bathtubs located in the Palace on the Isle (the main palace in Łazienki), built in the 17th century as part of the furnishings of the baroque bath pavilion, which references the mythical Hippocrene spring. Furthermore, the research methods used will be discussed, including: historical research using archival materials (inventories, correspondence, plans and maps), georeferencing using GIS tools, and geophysical prospecting (electrical resistivity survey, magnetic survey, and electromagnetic survey using ground-penetrating radar). The use of all these methods allowed us to locate the remains of royal structures that had been gone for over two hundred years and obtain new data that will form the basis for possible future excavations.

1979. Forgotten Foundations: Strategies for the Sustainable Management of Archaeological Relics in Living Heritage Gardens

Authors: Emilia Jastrzebska (The Royal Łazienki Museum in Warsaw)
Format: Oral

Historical gardens are complex palimpsests where living botanical collections often obscure significant subsurface archaeological relics. The presentation will examine the multifaceted challenges of heritage management within these dynamic environments, focusing on the tension between preserving "in situ" archaeological remains and maintaining the aesthetic and functional integrity of a historical garden. Through a case study analysis of the Royal Łazienki Museum in Warsaw, the research identifies common risks, including root-related damage, environmental degradation, and the pressures of modern tourism. The study evaluates existing conservation policies and proposes an integrated management model that prioritizes non-invasive monitoring, sensitive landscaping, and public engagement. We will discuss approaches that integrate archaeological preservation with horticultural practices, focusing on minimizing disturbance while maximizing the educational and aesthetic value of both components. By treating archaeological relics not as isolated anomalies but as integral parts of the garden's historical narrative, we argue for a holistic approach that safeguards "hidden" heritage while enhancing the visitor experience. The presentation will draw on case studies to illustrate the challenges and opportunities and to highlight potential pitfalls, ultimately offering a framework for future discussion about best practices in managing a harmonious coexistence between archaeological heritage and historical landscapes.

1237. The garden of the "Pavilion frais" of Trianon: an interdisciplinary example of a garden's investigation

Authors: Annick Heitzmann (Centre de recherche du château de Versailles)
Format: Poster

In 1749 and 1750, King Louis XV and Madame de Pompadour laid out a garden near the Grand Trianon in Versailles, which is now known as the "Jardin français". To the south of this garden, a strip of land divided into several plots was added in 1751. In one of these plots, a garden was laid out surrounding a small building called the "Pavillon frais". This symmetrical garden was framed by a portico and consisted of two basins, each flanked by a flowerbed and lawn. The pavilion and its garden were destroyed between 1810 and 1840. The pavilion was rebuilt in 1980, but it was not until 25 years later that efforts were made to restore its landscaped setting. A documentary study was first carried out in the archives of the "Maison du Roi", which are well stocked with drawings and estimates, but in which most of the reports on the work actually carried out are missing. Then, prior to the archaeological excavations, a geophysical survey was carried out to obtain an overview of the foundations remaining underground. Field operations included an investigative phase in plan involving excavation of the basins and half of the portico foundations, which were symmetrical, and a stratigraphic analysis phase using trenches. These excavations were supplemented by scientific expertises (palynology, dendrochronology, etc.). Each sediment layer was interpreted using archives, and the field investigations confirmed, corrected, and supplemented the paper data, providing an almost exhaustive knowledge of this garden prior to its restoration.

111 RETHINKING MEDITERRANEAN ISLANDS: MOVEMENT, MATERIALITY, AND INTERCONNECTION ACROSS THE MIDDLE SEA AND BEYOND

Theme: 8. Beyond the Middle Sea: rethinking the Mediterranean in motion
Organisers: Maja Miše (UCL Institute of Archaeology) – Igor Borzić (University of Zadar, Department of Archaeology)
Keywords: island connectivity, archaeomaterials, bioarchaeology, geoarchaeology, maritime networks, environmental interaction
Format: Session with keynote presentation

SESSION ABSTRACT

This session reimagines Mediterranean islands as dynamic arenas of interaction—spaces where people, materials, and ideas moved across shifting maritime, cultural, and environmental networks. Moving beyond a view of the Mediterranean as a bounded or isolated world, we approach it as a living system of interlinked places whose insular, coastal, and peninsular communities shaped and reflected broader patterns of connectivity, adaptation, and innovation across the longue durée. We invite contributions from all archaeological periods that explore insularity, mobility, and exchange through diverse disciplinary and methodological lenses. Papers may address themes such as sustainability and resilience in coastal and island settings, migration and colonisation, or the relationships between inland and maritime zones. Comparative studies connecting the Mediterranean to other maritime regions worldwide are also welcome, as are reflections on the resonance of the Mediterranean beyond its shores. We particularly encourage interdisciplinary work that integrates archaeological science and theory. Bioarchaeological and geoarchaeological studies may reveal how populations interacted with their environments, while isotopic and material analyses can shed light on subsistence, identity, and health. Archaeomaterials research is invited to explore technological creativity, adaptability, and exchange, while underwater archaeology provides vital insights into harbours, shipwrecks, and maritime mobility. Contributions focusing on the reconstruction of past Mediterranean landscapes and seascapes are equally encouraged, offering perspectives on how environmental and social processes intertwined to shape insular lifeways. Studies examining sustainability and resilience strategies, interactions between coastal and inland areas, and the role of "continental islands" in regional connectivity are particularly relevant. By bringing together diverse perspectives, this session aims to move "beyond the middle sea," fostering an inclusive dialogue that situates the Mediterranean within global contexts of movement, interaction, and innovation—past and present.

CONTRIBUTION ABSTRACTS

1559. Pleistocene Stelida in the Mega-Cyclades: Bioenvironmental Contexts of Insularity, Connectivity, and Technological Adaptation

Authors: Danica Mihailovic (Institute of Archaeology, Belgrade) – Tristan Carter (McMaster University) – Daniel Contreras (University of Florida) – Justin Holcomb (The University of Kansas) – Christelle Lahaye (Université Bordeaux Montaigne) – Demetris Athanasoulis (Hellenic Ministry of Culture)
Format: Oral

The Pleistocene site of Stelida (Naxos), provides a deep-time perspective on Mediterranean islands as dynamic arenas of interaction rather than isolated spaces. During the Middle and Late Pleistocene, recurrent sea-level changes transformed the Cyclades into shifting configurations of islands, coastlines, and emergent land bridges - commonly described as the Mega-Cyclades, reshaping pathways of movement, connectivity, and resource access and blurring distinctions between insular, coastal, and inland zones.

Bioenvironmental data for the central Aegean remain limited due to poor organic preservation and the uneven history of palaeoecological research. Rather than introducing new environmental proxies, this paper synthesizes existing local and regional datasets derived from palaeogeography, geomorphology, botanical and faunal records, and insular biogeography, integrating them with site-specific archaeological and lithic evidence from Stelida. This integrative approach allows the site to be contextualized within broader landscape- and seascape-scale processes despite fragmentary environmental records. Within this framework, environmental instability, habitat restructuring, and faunal impoverishment likely structured mobility strategies and technological adaptation. Stelida's extensive chert sources and topographic prominence suggest its role as a persistent node within wider interaction networks linking inland, coastal, and maritime spaces. The study highlights the value of synthetic frameworks for exploring resilience and connectivity in Mediterranean island worlds and underscores the need for future interdisciplinary research to refine bioenvironmental baselines in the Cycladia.

165. The Impact of Changing Political Landscape of Anatolia on Cilicia's Maritime Connectivity during the Middle to Late Bronze Periods

Authors: Elif Ünlü (Boğaziçi University) – Ekin Kozal (Çanakkale Onsekiz Mart University)
Format: Oral

Cilicia is located on the southeastern coast of Anatolia encompassing fertile plains separated by river systems enclosed by the extensive Taurus Mountain Range in the north. While these natural boundaries could be traversed via mountain passes and river valleys, coastal harbors provided vital access to overseas regions. Within the northeastern Mediterranean, an increasingly dense network of maritime and overland connections developed throughout the Bronze Age, linking Cilicia with Cyprus and the Levant. These connections first emerged in the Early Bronze Age through the establishment of close ties that utilized both land and maritime routes and continued through the Middle and Late Bronze Ages, albeit with fluctuating intensity. During the Middle Bronze Age, political organization in the region was characterized predominantly by city-states, which functioned as key nodes within these interaction networks, mediating both regional and long-distance exchange. The beginning of the Late Bronze Age marks a significant shift in the political orientation of the region, driven by the foundation of the Kingdom of Kizzuwatna and the growing power of the Hittite state in central Anatolia and its ambition to gain access to the prosperous maritime trade networks of the eastern Mediterranean. Against this background, this study investigates the impact of the Hittite state's expanding political control over Cilicia on the region's established interaction networks with Cyprus and the Levant from the Middle Bronze Age (city-states) through Late Bronze I (Kingdom of Kizzuwatna) and II (Hittite hegemony). This investigation is based on a comparative analysis of ceramic assemblages from two key settlements representing different parts of the region: Tarsus–Gözlükule in Plain Cilicia and Kilise Tepe in Rough Cilicia.

1715. Beyond the Grey Area: Lesvos and the Northeast Aegean in Late Bronze Age Maritime Networks

Authors: Nicholas Kazamias (Macquarie University)
Format: Oral

The Northeast Aegean has long been considered a 'grey area' of Late Bronze Age archaeology: under-published, under-studied, and overshadowed by research focused on the southeast Aegean islands and the Cyclades. The Greek island of Lesvos in particular exemplifies this issue despite its strategic location between Mycenaean Greece and the Anatolian mainland. The island is crucial in understanding Late Bronze Age maritime mobility and cultural interaction in the region, and more broadly the eastern Mediterranean. Focusing on Lesvos within the broader context of the northeast Aegean as a dynamic maritime network, this paper draws on ceramic evidence from across the region (Lemnos, Chios, and the Troad) alongside legacy excavation data, and textual evidence. Rather than functioning as a passive periphery, the northeast Aegean islands actively shaped regional connectivity through deliberate engagement with Mycenaean and Anatolian spheres of influence whilst maintaining distinctive local traditions. Ceramic assemblages reveal hybridisation whereby the adoption of Mycenaean and Anatolian pottery forms were selectively integrated within local traditions. This demonstrates local agency in which two competing spheres of influence were being navigated. Hittite cuneiform references to Lazpa (Lesvos) and Wilusa (Troy) further corroborate the region's strategic significance within these overlapping networks. The evidence challenges passive periphery narratives and instead reveals how northeast Aegean island communities exercised cultural autonomy and choice while actively shaping Late Bronze Age connectivity.

1126. The Island that Made Sails: Landscape, Resources and Production of Maritime Textiles in Bronze and Iron Age Cyprus

Authors: Giulia Muti (Universität Bern, Institut für Archäologische Wissenschaften)
Format: Oral

This paper argues for the importance of integrating a landscape-based approach into the study of textile production on Cyprus in the Bronze and Iron Ages. As a large island characterised by pronounced environmental diversity and contrasting ecological potentials, Cyprus provides an ideal context for examining how insular landscapes structured, enabled or constrained one of the island's most pervasive and socially significant crafts. While textiles are most often discussed in relation to clothing, this paper highlights their crucial, yet largely overlooked, role in the maritime sphere. During the Bronze and Iron Ages, Cyprus was deeply embedded within networks of maritime connectivity. Textiles constituted essential components of seafaring technologies, including sails, rigging

and other elements of shipboard equipment, as well as transport containers, making textile production inseparable from practices of mobility, shipbuilding and exchange. The paper reconstructs the sourcing and organisation of textile and wooden resources for maritime uses across different regions of Cyprus, identifying potential areas of material procurement and production, and tracing patterns of circulation and consumption. In doing so, it addresses both internal interregional dynamics and external networks. Adopting a longue durée perspective, the study explores continuities and transformations in productive strategies, and the possible impacts of shifting socio-political structures and forms of control on resource management and craft organisation. Certain regions emerge as persistent or newly configured productive nodes, strategically located and resource-rich, that played leading roles in shipbuilding and textile manufacture within changing socio-political landscapes. Methodologically, the paper combines landscape capacity modelling and network analysis with spatial and contextual analysis of material evidence for textile production, integrated with written sources and ethnographic parallels. By framing textile manufacture as a territorially embedded process, this presentation conceptualises Cyprus simultaneously as a bounded productive territory and an active maritime node, offering a model for broader discussions of insular crafting lifeways.

562. Beyond the Aegean: Social Complexity, Agency, and Trade in Nuragic Sardinia

Authors: Laura Pisanu (Independent Researcher)
Format: Oral

Political and social dynamics shape global markets, influencing partnerships, import/export practices, and taxation. Similar patterns can be imagined for Bronze Age civilizations, where internal socio-political structures likely influenced choices regarding trade participation, export goods, and acquisition strategies. However, current understanding remains limited to the Aegean perspective, which portrays Aegeans as primary decision-makers and other societies as passive recipients. Nuragic Sardinia provides a valuable case study. The Nuragic civilization, known for its stone towers (nuraghi), began receiving imported products from the Aegean during the Middle Bronze Age (ca. 1600–1300 BCE) and later exported ceramics to Sicily, Crete, and Cyprus. To explain this trade, existing maximalist and minimalist models emphasize either direct long-distance contacts between Sardinia and the Aegean or indirect, multi-nodal networks with southern Italian communities acting as intermediaries. However, both theories largely neglect the role of internal Nuragic social dynamics in shaping trade decisions. By analyzing imported and exported material culture through the lens of Nuragic social complexity, this paper foregrounds local agency, decision-making, and socio-political organization and argues that exchanged goods reflect negotiated political and economic relationships. Finally, this paper adopts a decolonized perspective to highlight how Nuragic communities actively structured their participation in Mediterranean networks.

933. Recent Research on Neolithic Coastal Settlements on the Eastern Adriatic Islands

Authors: Mate Parica (University of Zadar)
Format: Oral

In recent years, research has continued on submerged Neolithic sites on the islands of the eastern Adriatic. Alongside the systematically investigated submerged settlement of Soline on the island of Korčula, new sites with similar characteristics have been discovered. Visible remains include stone and wooden architecture, dry-stone coastal walls, and fortifications. These findings demonstrate a significant departure from other forms of Neolithic architecture characteristic of the eastern Adriatic region. In addition to the distinctive architecture, the sites have yielded a rich assemblage of small archaeological finds, while the marine environment has also preserved organic remains and bioarcheological material. These findings suggest the existence of Neolithic communities that occupied the coastal zone, whose economic strength largely relied on seafaring. In this context, navigation and trade via Palagruža represent the beginnings of a strong maritime tradition in the Adriatic region. Through their control of trans-Adriatic trade, these Neolithic communities likely achieved significant economic success, reflected in the distinctive architecture of their settlements.

1349. Kopila hillfort (Korčula) – a polygon for defining relationship between Insular Indigenous and Hellenistic Communities in the Central Eastern Adriatic

Authors: Igor Borzic (University of Zadar) – Dinko Radić (Municipal Heritage Museum of Vis)
Format: Oral

Archaeological research of the Kopila hillfort (island of Korčula, Croatia), conducted since 2012 in cooperation of the Municipality of Blato, Vela Luka Cultural Centre, Department of Archaeology - University of Zadar, and Museum of Ancient Glass in Zadar has opened numerous new perspectives on the understanding of relationships between insular indigenous communities and Hellenistic colonial settlements in the central part of the eastern Adriatic. While historical sources predominantly place these groups on opposing interests' sides, the archaeological evidence points to exceptionally intensive and close interactions, primarily commercial, but potentially also the ones of other connotations. This paper will present a corpus of archaeological finds from both the settlement and the necropolis areas of the Kopila hillfort, whose provenance is primarily traced to Issaean, and subsequently Pharian workshops (ergasteria). In addition, the presentation will outline the potential of planned interdisciplinary bioarchaeological research aimed at achieving a more nuanced definition of population dynamics and, consequently, the social relationships among the communities involved.

2632. Across the Sea and Over the Mountains – Cultural Connectivity in the Iron Age Necropolis in Zakotorac (the Pelješac Peninsula)

Authors: Domagoj Perkic (Dubrovnik Museums, Archaeological Museum) – Hrvoje Potrebica (University of Zagreb, Faculty of Humanites and Social Sciensis) – Marko Dizdar (Institute of Archaeology)
Format: Oral

The research of the Iron Age necropolis Zakotorac – Gomile (the Pelješac Peninsula, Southern Croatia) has yielded a wealth of data on funerary practices and material culture that have significantly changed the current understanding of the Iron Age communities in the southern Adriatic. The funerary ritual and burial treatment show local characteristics and seem to be related to strong kinship ties, which will be explored further in future interdisciplinary research. Although, material culture also testifies of local development, large number of finds reflects large network of contacts with other communities on the eastern coast of the Adriatic, as well as with those on the other side of the Adriatic, and especially those settled in their Balkan hinterland. So far analysis of particular categories of archaeological material (female dress, ornaments, and to a lesser extent weapons) shows that dynamics of those connections changed over time. Greek pottery held an important place in everyday life, but also in the funeral ritual. It appears in Zakotorac graves from the 5th century BC and became more frequent in later phases, indicate an intensive connection with both the Greek centres in Italy as well as those which were established on the eastern coast of the Adriatic. The inventory of the Zakotorac graves reflects complex social dynamics within the community, as well as extensive cultural connectivity which was somehow important aspect of the local identity.

240. Dalmatian Islands and Adriatic Cultural Entanglement: Technological Innovation in Pottery Production

Authors: Maja Miše (UCL Institute of Archaeology)
Format: Oral

This paper explores processes of technological learning, knowledge transmission, and innovation in Dalmatian island pottery production during the first millennium BCE, using integrated archaeomaterials analysis as its primary evidential base. Drawing on new and existing geochemical datasets from workshops and consumption sites on Issa (Vis), Pharos (Hvar), and neighbouring islands, it reconstructs patterns of raw material procurement, paste preparation, and technological choice within insular craft communities. Compositional and technological groupings reveal both strong regional signatures and long-standing patterns of connectivity among Iron Age communities on both Adriatic coasts, alongside selective engagement with wider Mediterranean ceramic traditions. Rather than reflecting passive imitation following Greek expansion and settlement, these patterns point to cumulative processes of cultural and technological entanglement, rooted in earlier regional networks and intensified through later interaction with Greek and Hellenistic production systems. Local practices and external traditions became mutually constitutive through sustained contact, mobility, and material experimentation, generating distinctive Adriatic technological trajectories. By integrating scientific data with typological, contextual, and chaîne opératoire approaches, the paper demonstrates how island workshops functioned as dynamic nodes within broader networks of mobility and exchange. It highlights the role of apprenticeships, itinerant craftspeople, and material experimentation in shaping hybrid technological traditions and sustaining long-term innovation. More broadly, the study reframes the Dalmatian islands as active arenas of Adriatic cultural entanglement, where technological creativity emerged from the interaction between mobility, material resources, and local practice. In doing so, it illustrates how archaeomaterials research can contribute not only to provenance studies, but also to wider debates on insularity, agency, and cultural transmission in maritime societies.

698. Hill-fort Košljun in the Context of Settlement Patterns on the Island of Pag

Authors: Slavko Šarčević (Archaeological Museum Zadar) – Zrinka Serventi (Department of History, University of Zadar) – Igor Borzić (Department of Archaeology, University of Zadar) – Anamarija Eterović Borzić (Museum of Ancient Glass, Zadar)
Format: Oral

The island of Pag throughout history had a great strategic position in the Eastern Adriatic, connecting Southern Liburnia (especially the area of Ravni Kotari) with Northern Liburnia and its Kvarner area. Its placement on the Eastern Adriatic maritime route conditioned the development of various settlements, particularly during the Iron Age and Roman times. Unfortunately, apart from several more extensive surveys, archaeological excavations on the entire island have been scarce at best, with just a few locations drawing greater interest. Among those locations is the site of Caska bay, where on the coast a Roman period necropolis with unique burial types has been excavated, while underwater research discovered significant remains of harbour installations and sunken ships. In recent years, another Caska site has been more extensively researched, and that is the hill-fort Košljun. This settlement has a continuity of use from prehistory into early antiquity and Middle Ages, with remains of various prehistoric and Roman structures and material, as well as a Mediaeval church built on top of the hill. This all indicates a dynamic development of settlement patterns in the Caska area, the early acceptance of Roman culture and attests to the interconnectedness of this island with changes happening in the Adriatic and Mediterranean. Therefore, in this paper we shall present most recent research conducted at the site of Košljun, particularly in the context of the interdisciplinary scientific project "Transformation of South-Liburnian Territory in Early Antiquity". The site will be examined within the larger framework of Caska area and the evolution of settlement patterns in the entire island of Pag. The position of Caska bay in the context of maritime trade networks and historical change happening

during the transition from Late Iron Age into early Principate period will also be considered.

1117. Roman villas on Central Dalmatian islands: Brač and Hvar. Development and transformation of architecture and production facilities

Authors: Kristina Jelinčić Vučković (Institute of archaeology, Zagreb) – Emmanuel Botte (CNRS-Aix-Marseille-Université)
Format: Oral

Ruling rural Dalmatia's islands in Roman times can be seen through a large number of villae rusticae scattered throughout their hilly landscape and bays. Although picturesque and idyllic, such a layout requires careful planning and many factors to be considered. The complexity of deciding when, how, and by whom these island villas were built is much broader: it can be studied from different global perspectives: political and military, and through the eyes of economy and trade. Here, we present a local perspective, focusing on geography, climate, connectivity, and natural resources. Karst terrain, with modest areas of fertile soil, except for the Stari Grad plain, was wisely used to ensure the villas' self-sufficiency and longevity. These facts are more important on islands than on the mainland due to the challenges of supply and connectivity. Thus, they provided an important guideline for developing logistical and strategic plans to organize life in rural areas on islands. The first Roman arrival on the islands and the organization of the economy and rural life were carefully organized through small establishments. After a few decades of careful monitoring and experience in the area, they began building larger estates. In the 2nd century, we see well-planned, well-thought-out villas. These big villas functioned and flourished for almost two centuries. Late Antiquity brought a period of change and transformation that is evident throughout the former large villas. Their outline is not well organized as before; it looks more like an adaptation, use, and reuse of available goods. These stages are evident not only in the general floor plan but also in the organization and shape of production facilities.

1259. Scuttling ships in the bay of Caska at the island of Pag, Croatia

Authors: Irena Radic Rossi (University of Zadar) – Giulia Boetto (Aix-Marseillel University, CNRS, Centre Camille Jullian)
Format: Oral

A large archaeological site from the Roman era is situated in the bay of Caska on the island of Pag, in the Croatian province of northern Dalmatia. This economic complex, built during the late 1st century BC or the beginning of the 1st century AD, was probably in the possession of the Roman senatorial family Calpurnii Pisones. The complex includes a number of coastal structures, consisting of a large breakwater, an operational platform and smaller wooden piers, arranged along the eastern shore of the bay. During submarine archaeological research conducted between 2007 and 2024, the remains of four scuttled ships were discovered, which were used to strengthen port structures. The construction and use of ships are dated approximately by 14C to the Early Roman Imperial period, and their scuttling occurred after they ceased to serve their original purpose. All the ships were filled with rocks and then scuttled in selected places. The two smaller ships were built using the prehistoric Liburnian sewing technique, which survived into Roman times, while the other two were built using the classical Roman technique of joining planks with mortises and tenons. One smaller ship was used to create the operational platform, while the other was used to build a small wooden pier in front of a large retaining wall that supported an earthen terrace. The larger ship was scuttled on the outer side of the head of the large breakwater, to secure its most vulnerable part, while the purpose of the fourth has yet to be examined. Scuttling of the ships probably occurred within a short period of time, which testifies to the coexistence of Liburnian and Roman shipbuilding traditions on the island of Pag for more than a century after the Roman conquest.

1154. Life on an Adriatic island during Late Antiquity – Osteological indicators of health in a rural population from Unije

Authors: Barbara Kriletić (Institute for Anthropological Research, Zagreb) – Mario Novak (Institute for Anthropological Research, Zagreb | Faculty of Humanities, University of Primorska) – Matija Makarun – Uroš Bila (Arheo Kvarner, Vrbnik) – Mislav Čavka (University Hospital Centre Zagreb) – Katarzyna Talarczyk (Poznan University of Medical Sciences)
Format: Oral

The island of Unije, situated in the western part of Kvarner archipelago, had an important position alongside northern Adriatic maritime routes since prehistory. Protective archaeological excavations conducted in 2025 at the site of Vrulje in the southern part of the island uncovered a part of a Late Antique funerary complex, preliminarily dated to the late 4th and early 5th century CE. Five graves representing different burial types were documented, suggesting the area was used for funerary purposes during a longer period of time. In this study we use osteobiographic approach to reconstruct the life history of individuals buried at this site by combining direct AMS dating, conventional bioarchaeology, paleoradiology, isotopic and biomolecular approach to get a better insight into the general health, diet and genetic affinity of people inhabiting Unije during Late Antiquity. The special attention is given to Grave 1, a stone sarcophagus, containing partially preserved skeleton of a young adult female (20-25 years) showing pathological changes indicative of tuberculosis (TB) such as active new periosteal bone formation on all ribs as well as lytic lesions on the lumbar vertebrae and sacrum. Although TB has been documented in Antiquity through classical written sources and paleopathological cases have been reported throughout the Mediterranean, the individual from Unije represents the earliest case of this disease in the Adriatic region. The proposed approach will provide new important insights into the everyday life of rural populations from insular contexts during Late Antiquity but will also add to our knowledge about the occurrence and spread of TB in the Roman Empire. And lastly, the presented study represents an excellent example and highlights the importance of small island sites for studying different aspects of health and disease in Antiquity.

2520. External auditory exostoses and the evolution of aquatic activity in Cyprus from the Aceramic Neolithic to the Roman period

Authors: Bianca Casa (The Cyprus Institute)
Format: Oral

The Mediterranean Sea formed an integral component of island lifeways in Cyprus, structuring mobility and exchange. External auditory exostoses (EAEs) are bioarchaeological proxies for habitual engagement in aquatic activities. EAEs are osseous growths of the external auditory canal, with an accepted aetiology linked to chronic exposure to cold water and/or water in combination with wind, typically over prolonged periods. This study examines diachronic patterns of engagement in aquatic activities in Cyprus by assessing the frequency and palaeopathological expression of EAEs in skeletal remains dating from the Aceramic Neolithic to the Roman period. Archaeological skeletal assemblages from 67 sites were analysed, comprising 817 right and 789 left external auditory canals that were sufficiently preserved for macroscopic and microscopic assessment. EAEs were present in 3.4% of right and 2.78% of left external auditory canals. Frequencies were higher at coastal sites than at inland sites, and males exhibited a higher prevalence than females. Middle-aged adults showed higher frequencies of EAEs than young adults, while no nonadults were affected. Eleven sites presented individuals with EAEs in association with archaeological evidence of aquatic resource exploitation, and this relationship was statistically significant. Although the true extent of engagement in aquatic activities is likely underestimated, the results indicate that activities such as fishing, swimming, diving, and sailing were undertaken by a limited subset of individuals, primarily adult males from coastal communities, to an extent sufficient to promote EAE formation. When considered within their sociocultural, environmental, and temporal contexts, increases in EAE frequency correspond with periods characterised by greater archaeological evidence for maritime activities, aquatic resource procurement, purple dye production, and bathing practices. These findings contribute to interpretations of subsistence strategies, labour organisation, and long-term human-environment interactions in Cyprus.

2791. Keynote: Islands in the stream of science: new perspectives and new opportunities

Authors: Cyprian Broodbank (McDonald Institute for Archaeological Research, University of Cambridge)
Format: Oral

Scientific understanding and the analysis of island life have been creatively engaged since at least the 19th century, initially largely in relation to questions of animal and plant speciation, ecology and environmental change. The subsequent emergence of island archaeology as a more formally defined field during the 1970s and 1980s coincided with the scientific turn of the New Archaeology, which encouraged a series of analytical initiatives of lasting benefit to this day. Among these are analytical exploitation of the limited and often distinctive mineral resources of islands to fingerprint and identify distributions of their materials abroad and likewise to spot non-local imports (with insights into wider theories of trade and exchange); investigation of the anthropogenic impacts of human settlement on island environments and endemic species; and pioneering efforts at computational modelling of human dispersals in island settings. The potential of these extant avenues of enquiry continues to expand as scientific advances enable more sophisticated approaches, and as our socially oriented questions evolve, not least in the light of contemporary challenges. But equally, a series of new science-based approaches offer radically new perspectives on the long-term patterning island life. These come most obviously from the ongoing biomolecular, and in particular whole-genome, revolution, but also from different ways of thinking archaeologically with materials science. This paper offers an overview and explores Mediterranean case studies.

472. Across a Narrow Sea: Issa and Trans-Adriatic Connectivity in Diachronic Perspective

Authors: Filip Budic (Department of History, University of Zagreb)
Format: Poster

The Greek colonisation of Vis and Hvar in the fourth century BC marked a decisive turning point in the balance of power within the eastern Adriatic archipelago. In order to endure and develop into a stable and prosperous settlement, the incoming Greek population had to integrate into exchange networks, previously sustained by indigenous communities. This study focuses on Issa, the Greek settlement on the island of Vis, analysing key indicators of connectivity and highlighting its links to both the eastern and western Adriatic coasts. The discussion draws primarily on archaeological evidence for interaction, especially pottery and coinage, alongside onomastic data preserved in the epigraphic record. It also considers gaps in the material evidence, most notably the limited visibility of agricultural commodities, particularly crops. Adopting a diachronic approach, the study argues that Issaean connectivity was both continuous and structurally necessary, and it identifies comparable patterns in later periods, with particular attention to the early modern era. This approach opens space for the application of theoretical models that emphasise the interdependence of the central Dalmatian islands with the Adriatic mainland on both its eastern and western coasts. While the islands can be understood as microcosms in their own right, they were also firmly embedded in the wider communicative and economic framework of the so-called "Adriatic Bridge". This term is commonly used to describe the maritime route linking the mainland of central and southern Dalmatia with the opposite Italian coast. Within this system, Vis emerges as a nodal point of particular strategic importance.

Finally, the paper raises broader methodological questions regarding the extent to which diachronic models can be productively applied to prehistoric and ancient contexts, particularly given their shared foundation in premodern economic conditions.

775. The Roman Site on the Košljun Hill (Pag, Croatia): a Contribution to the Discussion on the Local Amphorae Production

Authors: Igor Borzic (University of Zadar) – Slavko Sarčević (Archaeological museum in Zadar)
Format: Poster

Ancient Liburnia stands out as one of the most economically dynamic and urbanistically developed regions within Roman Illyricum, later the province of Dalmatia. Despite considerable archaeological efforts, our understanding of local pottery production remains limited. Apart from the only systematically investigated workshop at Crikvenica (Ad Turres), which produced a broad range of architectural materials, transport and storage vessels, and tableware, most contributions to this topic are based on indirect archaeological indicators. These have led to the identification of several sites as potential figlinae, yet their ownership, production range, and chronological development are still insufficiently understood. One such case is the Roman agglomeration of Novalja–Caska on the western part of the island of Pag (ancient Cissa), where archaeological evidence strongly suggests a connection with the senatorial family of the Calpurnii. The presence of substantial quantities of ceramic production waste in Novalja, together with the identification of distinctive amphora forms (type Caska 1), as well as vessels produced in the tradition of Lamboglia 2 / Dressel 6A and Dressel 6B types, and locally attested tile stamps from both the harbour and settlement zones at Caska, all point to the existence of a local pottery manufacture. This production likely served the needs of an economy oriented towards agriculture and mariculture, as also confirmed by archaeological data. The present poster revisits this hypothesis and supports it with new evidence from the nearby settlement site of Košljun. The site has been investigated through a collaborative project involving the Municipality of Novalja, the Archaeological Museum Zadar, the University of Zadar, and the Museum of Ancient Glass in Zadar. The assemblage of amphorae and architectural ceramics corresponds closely to material from the previously identified locations, offering new insights into production intensity and function, patterns of distribution, and the extent to which local production followed broader trends in amphora design at the turn of the era. This poster forms part of the institutional interdisciplinary research project "Transformation of South-Liburnian Territory in Early Antiquity."

1014. "Barbaria" in the Provincia Sardinia: Beyond the "Constant of Resistance" Approach

Authors: Giuseppe Daga (University of Pisa | Scuola Normale Superiore)
Format: Poster

This paper reconsiders the traditional interpretation of the "Civitates Barbariae" in the Roman province of Sardinia, long understood as the core of a persistent and culturally homogeneous area of "resistance" opposed to Roman domination. Starting from a critical reassessment of the historiographical paradigm developed by Giovanni Lilliu and subsequently adopted by much of twentieth-century scholarship, the study questions both the analytical usefulness and the historical foundations of the Romania-Barbaria dichotomy. Through a close examination of literary, epigraphic, and archaeological evidence, the article argues that neither political resistance nor cultural isolation can be regarded as structural or constant features of the Barbagia region or of the island as a whole. Particular attention is devoted to the chronology, spatial extent, and administrative meaning of the designation "Civitates Barbariae", which emerged in the early Imperial period within a broader Roman strategy of territorial organization and control, gradually implemented through processes of mobility and settlement: the displacement of followers of Egyptian and Jewish cults in AD 19 and the encouraged settlement of a Lusitanian community at the Vicus Augusti, which contributed to introducing new religious practices to the island, and the increasing participation of local populations in military service as a pathway to Roman citizenship. Rather than representing a disconnected space, the "Civitates Barbariae" are therefore interpreted as a by-product of Roman attempts to foster imperial connectivity, shaped by administrative practices and embedded within wider Mediterranean networks. The paper also argues that this category rests upon a long-standing negative imaginary associated with Sardinia in Roman thought, reinforced by the development of the legal practice - known as "relegatio in insulam" - from the first century BC onwards.

1135. Osor (Cres Island, Croatia): Transdisciplinary Approaches to a Long-Term Investigated Site

Authors: Dušan Medin (Faculty for Culture and Tourism University of Donja Gorica | Association for Cultural Development "Bauo") – Martina Blečić Kavur – Boris Kavur (Faculty of Humanities University of Primorska)
Format: Poster

Osor, located on the low isthmus connecting the islands of Cres and Lošinj, is a site with over 3 millennia of continuous occupation and more than 150 years of archaeological research. This extensive research history has produced heterogeneous datasets, shaped by evolving research agendas, field strategies, and interpretive frameworks, which present significant challenges for data integration and reinterpretation. The international project Osor beyond the Myth addresses these challenges through a transdisciplinary framework that reassesses Osor as a historical palimpsest and a key case study in island archaeology. Rather than viewing insularity as isolation, the project conceptualises Osor as an insular space structured by connectivity, mobility, and changing maritime and terrestrial networks, critically engaging with the concept of insularity as a historically contingent condition. Methodologically, the project integrates geoarchaeology, geophysics, landscape and underwater archaeology, bioarchaeology, archaeometallurgy, and chemical and isotopic analyses (tin, lead, carbon and nitrogen, strontium, aDNA) with systematic re-analysis of legacy data and material culture. Central to this approach is the development of integrated data workflows that connect older excavation records with newly generated digital datasets, enabling multi-scalar and relational analyses across time and space. This data-driven yet interpretative framework allows for the critical reassessment of established narratives concerning settlement continuity, production, redistribution, and socio-economic networks. Osor thus exemplifies how long-term island sites can be reinterpreted through innovative data workflows and transdisciplinary collaboration, demonstrating the potential of island archaeology to move beyond static models towards dynamic interpretations of historical landscapes shaped by environment, connectivity, and human practice.

2695. Ionios — Between a Heroised Eponym and a Historical Ruler

Authors: Vinko Udiljak (Municipal Heritage Museum of Vis) – Mila Erceg (Center for Prehistoric Research)
Format: Poster

In Greek colonial narratives, it is well attested that newly founded settlements were often provided with a mythical ruler or founder, retrospectively inscribed into local tradition in order to legitimise territory and articulate identity. Such may also be the case with Ionios, a figure whose portrait and name appear on the fourth-century BCE coinage of the eastern Adriatic polis of Issa. Founded as a Syracusan colony on the island of Vis in the fourth century BCE, Issa adopted the practice of coin minting under Syracusan influence. This paper examines the so-called "Ionios-type" coinage and situates it within broader numismatic and ideological developments of the Greek world. It explores potential channels through which iconographic and conceptual models may have reached Issa—an exchange made plausible by the island's strategic position and its integration into Adriatic and wider Mediterranean trade networks. Particular attention is devoted to the poleis of Tegea, Aptera, and Metapontum, which, contemporaneously with Issa's minting activity, depicted their oikistai on coinage and rendered the founder's name in the nominative case, in contrast to the genitive form that otherwise predominated in Greek numismatic practice. In the Greek world, coinage functioned as a primary marker of civic autonomy and political self-representation. Oikistai, as mythical founders, were central not only to the colonising strategies of the Syracusan tyrants but also to the construction and maintenance of civic identity. The paper argues that Issa deliberately employed Ionios as a visual and ideological emblem of autonomy, projecting its political status and enhancing civic recognisability through a mythological figure embedded within the shared symbolic repertoire of the ancient Mediterranean. Methodologically, the study applies the model of interpretatio Graeca as an analytical framework for examining the integration, transformation, and reinterpretation of local mythical and cultic elements within the Greek cultural system.

113 UNDER PRESSURE: TRACING CHILDHOOD STRESS, GROWTH, AND HUMAN ADAPTATION IN THE PAST

Theme: 4. Transforming archaeology through interdisciplinarity
Organisers: Christina Papageorgopoulou (Democritus University of Thrace) – Sofija Stefanović (University of Belgrade)
Keywords: Bioarchaeology, growth and development, childhood health, isotopic and osteological analysis, weaning
Format: Regular session

SESSION ABSTRACT

Growth and development reflect the biological and physiological changes from conception to maturity. In bioarchaeology, studying these processes reveals how environmental, cultural, and biological factors shaped the health and adaptation of past populations. A range of analytical methods are employed to investigate growth patterns, biological maturity, and physiological stress. Long bone measurements provide evidence of linear growth, while deviations from expected lengths indicate stunting or malnutrition. Epiphyseal fusion timing serves as a marker of biological maturity, with delays often reflecting chronic illness or stress. Enamel hypoplasia record episodes of physiological disruption during development, while isotopic analyses help reconstruct weaning practices and dietary quality from infancy through lifespan. Such analyses illuminate childhood health, mortality patterns, overall population well-being, and long-term trajectories of human adaptation and evolution. The overarching goal of this session is to reconstruct life histories, evaluate health and stress across populations, and elucidate the social and environmental factors such as nutrition, inequality, and climatic stressors that shape human biology. We invite contributions employing osteometric, histological, isotopic, and comparative methodologies to advance understanding of childhood health variation, social stratification, and environmental adaptation. Together, these perspectives will provide essential insights into the biological and cultural resilience of human populations through time.

CONTRIBUTION ABSTRACTS

1187. Tracing Early-Life Stress Around Birth: Histological Evidence from Deciduous Teeth

Authors: Ani Martirosyan – Patricia Nieto (Universitat Autònoma de Barcelona) – Javier Irurita (Universidad de Granada) – Cristina Santos – Assumpció Malgosa – Xavier Jordana (Universitat Autònoma de Barcelona)
Format: Oral

Childhood stress leaves lasting biological signatures, beginning with birth, a major physiological challenge reflected in the neonatal

line (NNL) of dental enamel and dentin. This study compares prenatal and perinatal stress between archaeological and modern infants to evaluate differences in early-life stress and perinatal mortality. We analyzed 35 archaeological deciduous teeth from the Iberian period (8th–1st centuries BC) and 15 modern deciduous incisors with documented age at death. Thin sections were examined under a polarized light microscope to identify the NNL and accentuated lines (ALs) marking episodes of prenatal and postnatal stress. Prenatal stress was assessed by counting ALs and measuring their spacing relative to the NNL, while postnatal ALs were used to estimate the timing of stress events during the first days of life. In addition, 9 archaeological and 6 modern samples were analyzed using synchrotron radiation micro X-ray fluorescence (SR µ-XRF). Results indicate that most archaeological individuals died around the time of birth, corresponding to the period of highest infant mortality risk, with those who survived birth having postnatal stress episodes occurring shortly before death, highlighting pronounced perinatal vulnerability. Archaeological samples showed more prenatal stress markers, with an average of three ALs (range: 1–5), compared to two ALs (range: 1–3) in modern individuals. SR µ-XRF results revealed an increase in Zn levels at the NNL related to high Zn concentrations during early lactation. These findings suggest that prenatal stress was more frequent or intense in archaeological populations, likely reflecting environmental, nutritional, and maternal health constraints. By integrating dental histology with elemental analyses and modern comparative data, this study provides new insights into early-life stress, perinatal mortality, and human adaptation in the past.

2204. Infant health histories in ancient Samnium: enamel microstructures reveal stress and growth at Alfedena (Abruzzo, Italy, 6th–4th century BCE)

Authors: Jessica Bergamini – Roberto Germano (Sapienza University of Rome) – Luca Bondioli (Institute of Geological Sciences, Polish Academy of Sciences, Krakow) – Alfredo Coppa (Sapienza University of Rome) – Paola Cerrito (University of Zurich) – Giorgio Manzi – Alessandro Vanzetti – Alessia Nava (Sapienza University of Rome)
Format: Oral

The study of dental enamel microstructures provides insights into growth rates, ontogenetic trajectories, and physiological stress patterns in humans. This study examines odontochronologies, total frequency, and monthly prevalence of enamel Accentuated Lines (Als, physiological stress markers) in 31 teeth (24 permanent M1s, 7 deciduous dm2 and dc) from 25 individuals of the Iron Age necropolis of Alfedena (Abruzzo, 6th-4th cent. BCE). The daily enamel secretion rate (DSR; 3.37±0.29 µm/day) of M1s at Alfedena is faster than in modern populations (2.85 µm/day). This accelerated growth pace results in an average crown formation time (CFT) of 2.7±0.4 years, which is at the lower end of the range (2.4-3.6 years) reported for the only Iron Age site available for comparison, Pontecagnano (Campania, Italy, 7th- 6th century BCE). The ALs prevalence by months of life at Alfedena shows an initial stress phase between the 3rd and 4th months, followed by an increase in stress levels, reaching a plateau between 9 and 18 months, with the highest level occurring at 13 months. Results by biological sex (DNA-determined) reveal different temporal distributions of stress: females exhibit early vulnerability starting from the 6th month of life, whereas males show a later increase, peaking at 18 months. When comparing with the stress prevalence series available for Pontecagnano and the Roman Imperial site of Isola Sacra (Lazio, Italy, 2nd to 4th century CE), Alfedena shows a comparable shape of prevalence profiles. The average of stress episode occurrence per individual during the same individual timeframe appears higher in the Isola Sacra sample (12 ALs ± 4,8) than in the Alfedena (7 ALs ± 5,2) and Pontecagnano (11 ALs ± 4,5) samples. Overall, when compared with penecontemporary and Roman Imperial sites, Alfedena infants show accelerated crown formation times and sex-specific stress prevalence, associated with a lower average frequency of stress episodes.

281. Infant Lives in Medieval Sweden: Bioarcheological insights into Health, Caregiving, and Burial Practices

Authors: Emelie Jonsson (Stockholm University)
Format: Oral

This PhD project presents an ongoing bioarchaeological analysis of just over 100 perinatal and infant individuals recovered from three medieval sites in Sweden: the town cemeteries of Sigtuna (10th–15th centuries), the Dominican convent of St. Olof in Skänninge (13th–16th centuries), and Helgeandsholmen a hospital/almshouse cemetery in central Stockholm (13th–16th centuries) – sites which enables an interesting comparison between urban, monastic and institutional contexts. The study aims to reconstruct prenatal and postnatal health, growth trajectories, and aspects of caregiving, as well as critically addressing the continual underrepresentation of infants in the archaeological record. Preliminary osteological analyses include age-at-death estimation, skeletal preservation, and macroscopic indicators of pathological bone change. Early results indicate generally variable preservation, growth stunting in several individuals, and a noticeable spike of mortality within the first year of life, underscoring early infancy as a particularly vulnerable life stage. To refine the osteological interpretations, the project will also integrate biochemical analyses. Planned stable isotope analyses will investigate maternal diet, breastfeeding patterns, mobility, and potential environmental stress. Histological examination of dental microstructure targets the identification of a neonatal line, marking the significant physiological stress that comes with parturition, but also indicating live birth. Since osteological sex estimation is unreliable in infant remains, peptide-based amelogenin analysis is intended to be implemented as a minimally destructive method for biological sex determination, allowing further assessment of possible sex-related differences in health and burial treatment. Some preliminary results from the ongoing biochemical analyses are expected to be available and presented at the time of the conference. By integrating osteological, biochemical, and contextual data, the project situates infant health within broader medieval social frameworks, providing insight into vulnerability, caregiving practices, and societal responses to infant life and death in medieval Sweden.

1163. Beyond Teeth – Tracing Infant Dietary Stress during 19th-century Industrialisation in London

Authors: Andrea Czermak (University of Oxford | Bavarian State Collection for Anthropology SNSB) – Rick Schulting – Emily Longden (University of Oxford)
Format: Oral

"Please, Sir, I Want Some More" (Charles Dickens, Oliver Twist) Poverty and persistent insecurity regarding basic needs like food, shelter, and healthcare were harsh realities for many families during nineteenth-century industrialisation, with children bearing the greatest burden. This study investigates early-life dietary stress among infants and children buried during the height of industrialisation at New Covent Garden Cemetery, a then-deprived area of London, with nearly 40% of individuals interred being children under the age of twelve. Osteological evidence reflects sustained physiological stress, including malnutrition, chronic illness, and physical strain experienced by both children and adults. Our ability to reconstruct the lived experiences of infants who died before dental tissues formed is limited, as they are excluded from dentine-based spatio-temporal isotope analyses. We present a novel methodological approach by sequentially sampling infantile long bones to assess early-life nutritional stress using stable carbon ($\delta^{13}C$) and nitrogen ($\delta^{15}N$) isotope analysis. By targeting bone still undergoing interstitial growth and sampling from the centre toward the diaphyseal end, we present the first instance of significantly distinct sequential $\delta^{13}C$ and $\delta^{15}N$ signals captured within human infant long bones. Bone-length–based age estimation contextualised isotopic variation within early development. The results demonstrate that sequential long bone sampling can capture intra-individual dietary shifts and periods of nutritional stress in infants too young for dentine analysis. This approach offers a valuable new tool for bioarchaeological investigations of early-life stress in small children where dental tissues are absent or poorly preserved. Further work is needed to validate the method and refine isotopic age-alignment. However, this study underscores the strong potential of infant long bones as an alternative archive of early-life experience, advancing our understanding of childhood in past populations.

2133. Reconstructing weaning practices and the early diet of girls and boys in the Bronze Age necropolis Mokrin (2100-1800 BC)

Authors: Jelena Markovic (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade) – Elissavet Ganiatsou – Christina Papageorgopoulou (Laboratory of Biological Anthropology, Democritus University of Thrace | Institute of Applied Bioarchaeological Research, DUTH) – Sofija Stefanović (Laboratory for Bioarchaeology, Faculty of Philosophy, University of Belgrade)
Format: Oral

Early childhood diet provides a valuable lens to investigate cultural practices, social differentiation, and survival in past communities, as decisions about breastfeeding and complementary feeding were shaped at the communal level. This study aims: (1) to determine the breastfeeding duration between boys and girls; (2) to assess whether individuals of different social statuses had access to different food resources; (3) to establish whether children who lived longer were also breastfed for longer periods. To test whether biological sex or status influenced the dietary choices, we compared the duration of breastfeeding among children of different sexes and social status, as inferred from grave goods. By comparing children's diets across age groups, we gained insight into a potential relationship between childhood dietary practices and child mortality. We analyzed deciduous and permanent teeth from 27 children whose sex was determined by peptide analysis, from the Mokrin necropolis (2100-1800 BC) in Northern Banat, Serbia. Using serial dentine collagen stable isotope analysis ($\delta^{13}C$ and $\delta^{15}N$), we reconstructed weaning practices and the early diets of boys and girls, from birth to approximately six to seven years of age. The results showed there is no difference in the weaning and early diet of boys and girls, nor in the dietary patterns of children of different social statuses. However, a statistically significant difference indicated that the children who were breastfed for longer lived longer. This shows the critical role of breastfeeding in child survival and offers new insights into the relationship between early diet and mortality in Bronze Age communities.

2596. Assessing trace element composition in cremated pars petrosa of the human temporal bone through LA-ICP-MS: Implications for Childhood Life-History Reconstruction

Authors: Emma Stuart (Sapienza University of Rome) – Robert Anczkiewicz (Institute of Geological Sciences, Polish Academy of Sciences, Krakow) – Alessandro Vanzetti (Sapienza University of Rome) – Carmen Esposito (University of Bologna) – Szymon Mianowski (Sapienza University of Rome | Institute of Geological Sciences, Polish Academy of Sciences, Krakow) – Luca Bondioli (Institute of Geological Sciences, Polish Academy of Sciences, Krakow) – Alessia Nava (Sapienza University of Rome)
Format: Oral

A challenge in bioarchaeology concerns the isotopic and trace element analysis of cremated remains for life-history reconstruction. Cremation typically destroys time-resolved key archives such as dental enamel, though the pars petrosa of the temporal bone has emerged as a promising alternative, despite not being deposited in an appositional manner, due to its structural resistance to heat and resilience to diagenetic alteration. Forming within the first two years of life, the pars petrosa can chronologically substitute for dental enamel in childhood reconstructions as it does not remodel throughout an individual's life, as demonstrated in recent studies. However, the assumption that this structure is resistant to diagenesis and contamination remains undertested and may bias interpretations of mobility, diet, and nursing. This study investigates nine cremated pars petrosa samples using LA-ICP-MS to

assess variations in strontium (Sr) and other diagnostic trace elements across different regions of the pars petrosa. The primary aim is to estimate potential differences in elemental concentrations, between the dense, structurally resistant otic capsule and the more porous surrounding external bone areas. Results show that variable Sr concentrations exist within various areas of the pars petrosa and appear associated with diagenetic processes and/or contamination rather than dietary changes related to nursing. While most of the contaminants are easily eliminated in bulk analyses through leaching procedures, the use of high resolution LA based microanalysis is critical to assess time resolved trace element signals across the pars petrosa. These preliminary findings suggest that the pars petrosa may not be uniformly resistant to post-depositional alteration and that intra-bone variability requires careful consideration. Further investigation and methodological refinement are needed to improve the reliability of isotopic and trace element analyses on pars petrosa samples and enhance reconstructions of childhood stress, diet, and life histories in past populations.

358. Does early-life stress affect bone health in adulthood?

Authors: Antony Cevallos Alava – Carme Rissech (Universitat Rovira i Virgili)
Format: Oral

Bone loss is associated with several metabolic diseases characterized by reduced bone mineral density. These multifactorial conditions are shaped by genetic, environmental, and cultural influences and can be assessed using the second metacarpal cortical index (MCI). Early life stress can disrupt growth and development and exert long-term effects on health through interconnected biological and environmental pathways. Adult bone health reflects the cumulative impact of physiological, nutritional, and pathological factors across the life course. Linear enamel hypoplasia (LEH) is widely recognized as a reliable indicator of nonspecific stress experienced during early development. This study investigates whether early life stress, as indicated by LEH, is associated with cortical bone loss in adulthood, assessed through MCI. The sample comprised 153 adult individuals (83 males, 70 females) from Barcelona, Spain, dating from the 1st to the 18th centuries CE. Sex and age were estimated for all individuals,each presenting at least one well-preserved second metacarpal (antemortem trauma, postmortem breakage, or severe diagenic damage) and observable mandibular dentition (including at least one canine, one central incisor, and one lateral incisor). LEH was recorded macroscopically using a binary classification system: absence (NON-LEH) or presence (LEH) of at least one distinct defect. Cortical bone status was evaluated through traditional radiogrammetric measurement of MCI. Individuals were grouped by sex and age (21–30, 31–49, and 50+ years). Depending on data distribution, either the Student's t-test or the Mann–Whitney U test was applied. Statistically significant differences in MCI were identified in most sex and age categories. Individuals exhibiting LEH consistently showed lower MCI values than those without LEH. These findings indicate a potential association between LEH and lower MCI, suggesting that early life stress may have lasting negative effects on adult bone health. The results support the early-life programming hypothesis and provide a foundation for future paleopathological research.

1252. Dental Enamel Hypoplasia, a Marker of Early-Life Stress: Insights from a Diachronic Study on Portuguese Osteological Collections (Late Neolithic-21st century)

Authors: Liliana De Carvalho – Sofia Wasterlain (Research Centre for Anthropology and Health, University of Coimbra)
Format: Oral

Childhood health and disease represent an area of interest in bioarchaeology, since biosocial vulnerability of children makes them particularly important to the knowledge of the life conditions of past populations. The aim of this study is to investigate the frequency and patterning of dental enamel hypoplasia (DEH) in the Portuguese territory. More specifically, it is aimed to evaluate the diachronic variation in stress markers, average age of DEH formation, and differences by sex and age. The study also aims to explore the relationship between childhood stress and broader social and economic instability, age at death, and — when available— cause of death, within a DOHaD framework. The sample derives from multiple Portuguese osteoarchaeological assemblages spanning the Late Neolithic/Chalcolithic, Roman, Late Roman, and Medieval periods, as well as from contemporary identified osteological collections (Identified Osteological Collection from the University of Coimbra, the Luís Lopes Collection, and the 21st Century Identified Collection). In all, 545 adults over 20 years of age with at least one anterior tooth were analysed, in a total of 3494 teeth. A multidimensional methodology was applied, integrating documentary analysis, osteological and dental observation. The biological profile was assessed using widely accepted metric and morphological methods. DEH were recorded following Hillson (2001), and the age of defects formation was estimated using the method of Reid and Dean (2006). DEH frequencies increased from Prehistory to the Middle Ages, with the highest frequencies recorded in contemporary samples. The number of defects per individual was the most sensitive stress indicator, displaying a significant association with early mortality in several identified collections. The present study confirmed the critical impact of the first 1000 days of life on later health, consistent with DOHaD, with stress episodes between 0.9-2 years linked to earlier mortality. Childhood stress markers proved to be strong indicators of population vulnerability.

1242. Shared Skeletal Signatures of Early-Life Stress and Non-Specific Infection: An Avar-Period Necropolis from Serbia

Authors: Veda Mikasinovic (Faculty of Biology, University of Belgrade | Faculty of Medicine, University of Belgrade) – Vicky Papagianni (Department of Archaeology, University of York) – Ksenija Djukic (Faculty of Biology, University of Belgrade)
Format: Oral

Skeletal markers of early-life stress (ELS) are commonly interpreted as indicators of adverse developmental conditions, while skeletal traces of non-specific infectious disease, such as subperiosteal new bone formation (periostitis), may reflect chronic inflammatory or immune responses. However, the relationship between ELS and infection remains insufficiently explored in bioanthropology. This study examines ELS patterns and periostitis in relation to biological sex and age at death. It assesses the prevalence of periostitis among individuals with and without ELS markers, and evaluates whether individual or combined ELS indicators—cribra orbitalia (CO), porotic hyperostosis (PH), linear enamel hypoplasia (LEH), and cribra femoris (CF)—are associated with skeletal evidence of non-specific infection. Additionally, the relationship between periostitis and CO presence and severity, as well as the anatomical distribution of periostitis in relation to ELS indicators and CO severity, is explored. The analysed skeletal sample derives from Site 40 – Potes Gornje Sajlovo (Novi Sad, Serbia), dated to the Middle and Late Avar periods (7th-9th CE), and comprised 199 individuals. ELS markers were identified in 64.9% individuals, most frequently LEH and CO. Periostitis was observed in 12.2% of individuals, predominantly affecting cranial bones. In both the overall sample and among individuals with periostitis, the most common pattern was a single ELS marker. ELS indicators were significantly associated with biological sex and age at death, whereas periostitis was significantly associated only with age. No overall association was observed between ELS indicators and periostitis, except for PH, which occurred more frequently among individuals with periostitis. CO severity was significantly associated with the presence and anatomical distribution of periostitis on the right orbit only. These results suggest that ELS indicators may not necessarily be associated with non-specific infection. Instead, specific stress indicators and lesion severity may reflect distinct, non-linear aetiological pathways linking developmental stress and inflammatory skeletal responses.

1514. Childhood Stress, Disease Patterns, and Survivorship in a Saxon Cemetery Population

Authors: Ariadne Schulz (Pre-Construct Archaeology)
Format: Oral

A cemetery excavated at Land East of Sun Lane, Alresford, Hampshire, by Pre-Construct Archaeology has, at the time of writing, yielded 127 individual graves, of which 122 are identified as Saxon. Previous research has shown that rates of disease and biological stress fluctuated following the end of Roman administration, influenced by climate, settlement changes, and living conditions. This paper examines demographic structure, pathological prevalence, and biological stress indicators within the Sun Lane population, with particular emphasis on childhood stress and survivorship. Indicators of physiological stress and disease recorded in the population include cribra orbitalia, trauma, degenerative joint disease, dental pathology, and non-specific infection. Cribra orbitalia occurs at relatively high frequencies across age and sex groups, while other markers of childhood stress, such as linear enamel hypoplasia, are comparatively infrequent. Subadults are well represented within the cemetery, whereas neonates and infants are notably under-represented. Rare congenital conditions, including a probable case of Klippel–Feil syndrome and possible craniosynostosis, were also identified. This paper compares the Sun Lane assemblage with nearby and broadly contemporary cemetery populations and explores patterns of stress, disease, and survivorship observable within the current dataset. Particular attention is given to the relationship between childhood stress indicators and adult survivorship. This study evaluates interpretive frameworks for understanding anomalous stress and disease frequencies and considers the potential roles of environmental stressors, social buffering, and community care in shaping childhood health, resilience, and adaptation in early medieval Hampshire.

2270. Diet, disease, and development: growth and physiological stress in Medieval central Italy

Authors: Giulia Riccomi (University of Pisa | Max Planck Institute of Geoanthropology) – Martina Magliulo (University of Pisa) – Stefano Campana (University of Siena) – Bianca Casa (University of Pisa)
Format: Oral

Childhood in Medieval Italy was marked by high mortality and frequent physiological stress, shaped not only by disease and malnutrition but also by household, community, and societal conditions. This study investigates disease and physiological stress in relation to growth disruptions and childhood mortality in preadult skeletal remains from Medieval Italy. Previous research on the rural 10th-12th century CE cemetery of Pieve di Pava (Tuscany, Italy) indicates that inhabitants practised agriculture, livestock farming, and artisan activities. Skeletal remains of 91 preadult individuals (< 20 years) were macroscopically assessed to reconstruct their biological profiles (age at death, sex, stature) and evaluate stunted growth, physiological stress markers (cribra cranii and orbitalia, long bones subperiosteal new bone formation, enamel hypoplasia), metabolic diseases, and granular impressions as indicator of TB infection. Sex estimates include 29 males, 15 females, and 48 individuals of unknown sex. The adolescent age group (13-19 years) was most frequently represented (32.9%, 30/91). Stunted growth affected 46.9% (23/49) of preadults (38.1% moderate, 14.3% severe). Active cribra orbitalia occurred in 45% (23/51) of individuals and cribra cranii in 7.8% (4/51). Preadults exhibited active long bones subperiosteal new bone formation in 52% (26/50) and enamel hypoplasia in 60% (33/55). Scurvy occurred in 50% (21/42) of preadults and granular impressions in 47.05% (24/51). Among individuals with stunting, 65.2% (15/23) also had scurvy or granular impressions. The results position childhood in rural Medieval Italy as shaped by structural, environmental, and social constraints, leading to repeated periods of physiological stress, growth disruptions, and disease. Children's development and survival likely reflected agrarian economies, household resource allocation, and child-rearing practices, contributing to the burden of stress and disease observed in the rural skeletal assemblage from Pava. Future research will investigate weaning practices through biochemical analysis of incremental dentine.

680. Growing up in the Bronze Age: Tracing childhood stress, diet, and adaptation at Cârlomănești-Arman

Bronze Age cemetery

Authors: Mihai Constantinescu (Faculty of History, University of Bucharest | "Francisc I. Rainer" Institute of Anthropology, Bucharest)
Format: Oral

The Middle Bronze Age Monteoru Culture (2250-1550 cal BC) cemetery at Cârlomănești-Arman offers insights into population health and adaptation. Investigating childhood development is essential for tracing biological resilience, understanding early dietary practices, and evaluating how this population adapted to environmental and societal challenges. The study employes standardized bioarcheological methodologies on recovered osteological remains. Variables evaluated included bone conservation, dental pathology and physiological stress markers, while stable isotope analysis (δ13C, δ15N) was employed to reconstruct dietary transitions. The analyzed sample comprises of 241, recovered from 160 excavated graves, with inhumation being the dominant funerary rite (90.46%). The frequent practice of reinhumation severely complicated taphonomy and significantly reduced skeletal representation (causing the loss of small bones) compared to undisturbed, single primary inhumations. Inhumated subadults account for 37.89% of the total sample of inhumated individuals, totaling 86 individuals. Subadult bone surface conservation was significantly poorer than that of adults, largely due to taphonomic factors and soil conditions. Isotopic data revealed high δ15N levels in infants, indicating a reliance on maternal milk between 0-2 years of age. With the introduction of solid foods (likely lower trophic-level cereals), nitrogen and carbon values dropped to the adult community baseline by 3-4 years of age. Subadult mortality peaked during childhood (59.30% of the subadult group). While markers like LEH and Cribra orbitalia reflect acute vulnerability to physiological stress from difficult weaning or seasonal infections, the absence of chronic dental decay indicates a degree of biological resilience. These findings illustrate how early nutritional transitions and environmental pressures actively shaped childhood adaptation in the Bronze Age in communities from Eastern Carpathians.

702. Childhood growth patterns at the Middle Bronze Age necropolis in Ostojićevo (1650-1550 BCE)

Authors: Marija Marin – Marko Porčić (Faculty of Philosophy, University of Belgrade) – Bojan Petrović (Faculty of Medicine, University of Novi Sad) – Sofija Stefanović (Faculty of Philosophy, University of Belgrade)
Format: Oral

The development and physical growth of children and their respective growth trajectories offer key insights into growth disruption in past populations. Expected patterns of growth and development in boys and girls are well established in present-day populations; however, the extent to which children in prehistoric populations met these expectations remains unclear. This study examines patterns of growth and development in children from the Middle Bronze Age. The sample derives from the necropolis of Ostojićevo (1650–1550 BCE) in northern Banat, Serbia, where 103 children, aged up to seven years, were interred in ceramic vessels. We will examine whether reconstructed growth trajectories diverge from the expected sex- and age-specific developmental patterns. The stature of 40 subadult individuals from the Middle Bronze Age necropolis of Ostojićevo was reconstructed and compared with the sex- and age-specific expected growth parameters proposed by the World Health Organization (WHO 2006; 2007) for modern populations. This analysis focuses primarily on skeletal development relative to dental age. Additionally, potential correlations between growth delays and skeletal indicators of pathological conditions, including metabolic disorders, nutritional deficiencies, and infectious diseases, were examined.

2018. Tracing sex-specific childhood stress in Early Bronze Age Bavaria: Linear enamel hypoplasia, molecular sex determination, and female-associated animal tooth ornaments

Authors: Elsa Seyr – Corinna Alesi – Maren Velte – Albert Zink – Michaela Harbeck (State Collection for Anthropology Munich) – Nicolas Stewart (University of Brighton)
Format: Oral

Reconstructing sex-specific patterns of physiological stress during childhood remains a major challenge in bioarchaeology, particularly in prehistoric contexts where skeletal preservation is often poor and sex estimation is unreliable or impossible. This study addresses this limitation through amelogenin peptide–based molecular sex determination from tooth enamel, a minimally invasive and cost-efficient method that enables secure sex identification even in juvenile and fragmentary adult remains. The same proteomic approach is further extended to dog teeth used in ornamental necklaces, allowing the biological sex of the dogs to be determined through a newly developed analytical protocol. Focusing on Early Bronze Age Bavaria, the study investigates differences in the frequency and developmental timing of linear enamel hypoplasia (LEH) between males and females to evaluate sex-specific variation in early-life stress. The dataset comprises approximately 60 individuals from eight sites in northern and southern Bavaria, representing diverse ages and preservation states. Special attention is given to a distinctive mortuary feature of this period: necklaces made from animal teeth that occur exclusively in female burials. We test whether females buried with ornaments differ from other females in LEH prevalence, thereby exploring potential links between symbolic status, gendered social roles, and differential exposure to physiological stress during growth. Where present, LEH position was recorded by dividing the tooth crown into developmental zones and by measuring precise distances from the cementoenamel junction (CEJ). After correcting for crown height and dental attrition, ages at LEH formation were estimated using established dental development standards of AlQahtani (2010). By integrating developmental stress indicators, molecularly verified sex in both humans and associated animals, and gendered mortuary context, this study refines reconstructions of sex-specific childhood health, social inequality, and adaptive responses in Early Bronze Age populations. More broadly, it contributes to ongoing bioarchaeological discussions of growth, stress, and resilience in the human past.

722. Growing up in the Bronze Age: Health, Growth, and Development of Boys and Girls from Mokrin and Ostojićevo (2100–1700 BCE)

Authors: Mina Amzirkov – Sofija Stefanović (Department of Archaeology, Faculty of Philosophy, University of Belgrade)
Format: Oral

Differences in the burial practices of boys and girls at the Bronze Age Maros culture necropolises of Mokrin and Ostojićevo (2100–1700 BCE, northern Banat, Serbia) raise the question of whether they had differential access to care and resources during childhood. To address this, we reconstructed the health status, growth, and development of boys and girls and assessed whether age and biological sex influenced their lived experiences differently. We analyzed skeletal remains of 89 children, out of which biological sex was determined for 77 individuals using enamel peptide analysis. Health status was assessed through macroscopic paleopathological indicators of physiological stress, infection, dental disease, and trauma. Growth and development were reconstructed using estimates of stature and body mass, which were compared with modern reference standards to evaluate deviations from expected growth trajectories. By integrating biological and archaeological data, this study aims to identify potential sex-based differences in health, growth, and development among boys and girls. Together, the results will provide a more nuanced understanding of childhood and social organization in Bronze Age Maros communities, offering rare insight into how biological sex may affect quality of life.

771. Stressed out: multifaceted approach to (un)survived childhood stress at Mokrin necropolis (2100-1800 BC)

Authors: Marija Kreckovic Gavrilovic – Jelena Marković – Mina Amzirkov – Sofija Stefanović (Faculty of Philosophy, University of Belgrade)
Format: Oral

One of the challenges of studying childhood health is that it predominantly relies on evidence derived from the most vulnerable individuals, the children who did not survive. While non-adult skeletons provide direct evidence of frailty, adult skeletons preserve evidence of surviving childhood stress. By integrating evidence of childhood stress from both non-survivors (children) and adult individuals, this study aims to explore childhood stress in the Early Bronze Age population buried at Mokrin necropolis (2100-1800 BC) in Serbia with a more comprehensive approach. We integrate three complementary lines of evidence: linear enamel hypoplasia (LEH), Harris lines, and stable isotope analysis (δ13C and δ15N). LEH was recorded macroscopically for 91 adults and 60 children. Harris lines were assessed radiologically on the tibias of 64 adults and 6 children. Incremental isotopic analysis was done for 30 children of known biological sex, paying particular attention to weaning practices and signals of nutritional stress. Stress episodes were analysed in correlation with time-at-formation, biological sex, and social status derived from grave goods analysis. Previous studies on this skeletal series have shown a potential relationship between childhood stress and reduced longevity. By integrating different markers of stress derived from different parts of both children's and adults' skeletons, we were able to enlarge our highly fragmented and poorly preserved sample, as well as circumvent osteological paradox. Our findings contribute to a more nuanced understanding of health, survivorship, and fragility in the Bronze Age.

303. Child mortality rate of Fikris Gora cemetery

Authors: Tekle Ugulava (Ivane Javakhishvili Tbilisi state University History and Ethnology Institution)
Format: Oral

Child mortality is an important indicator of social well-being and population stability. Juvenile deaths may reflect epidemics, pandemics, genetic disorders, or malnutrition, as children generally have lower physiological resistance. Therefore, the statistical analysis of juvenile mortality can provide valuable insights into past health conditions and social environments. Information about juvenile mortality in the early medieval Caucasus remains limited. Preservation issues and local traditions of infant burial make it difficult to fully reconstruct mortality rates. Fiqris gora's cemetery belongs to ancient capital of Iberia Mtskheta. This cemetery is dated with 4th-6th century A.D. At this cemetery, 27 juvenile individuals were identified, representing all age categories from newborns to teenage years (12–14 years). Age at death was estimated based on bone length in younger individuals and tooth eruption in older individuals. Non-adults represent 14.36% of the total cemetery population. By comparison, some Roman-period sites show child mortality rates of 54% or higher. The relatively low proportion observed here may be related to burial practices and traditions, as juveniles were not always buried in cemeteries but often interred in household yards or gardens. The largest age groups among the studied individuals are children aged 7–8 years and early adolescents aged 10–12 years. Death at these ages may be associated with viral or infectious diseases. No evidence of violent trauma was identified. Two individuals aged 10–12 years exhibited a closed form of spina bifida, a condition also observed among adults in this population, mostly caused by prenatal deficits. In addition, many individuals show porotic hyperostosis on the cranial surface and tubular bones. Observed pathologies are commonly associated with metabolic stress and may indicate malnutrition affecting both mothers during pregnancy and children during early development, increasing susceptibility to infection.
